Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the

tessellation control shader **can** read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction **can** be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

9.14. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation's relative position within the subdivided patch, and outputs a single vertex and its associated data.

9.14.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

9.15. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

9.15.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by primitive assembly when tessellation is not in use. A shader can request that the geometry shader runs multiple instances. A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

9.16. Fragment Shaders

Fragment shaders are invoked as a fragment operation in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.17. Compute Shaders

Compute shaders are invoked via dispatching commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the `LocalSize` or `LocalSizeId` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.18. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using pipeline trace ray instructions (such as `OpTraceRayKHR`) and process the results.

9.18.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see Shader Binding Table for details) is passed directly into vkCmdTraceRaysKHR using the `pRaygenShaderBindingTable` parameter or vkCmdTraceRaysNV using the `raygenShaderBindingTableBuffer` and `raygenShaderBindingOffset` parameters .

9.19. Intersection Shaders

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the `OpReportIntersectionKHR` instruction.

An intersection shader communicates with any-hit and closest hit shaders by generating attribute values that they **can** read. Intersection shaders **cannot** read or modify the ray payload.

9.19.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.20. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current $[t_{min},t_{max}]$ of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader

calls the `OpIgnoreIntersectionKHR` instruction. Any-hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and **can** read or modify the ray payload.

9.20.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.21. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and **can** read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders **can** call pipeline trace ray instructions to recursively trace rays.

9.21.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.

9.22. Miss Shaders

Miss shaders **can** access the ray payload and **can** trace new rays through the pipeline trace ray instructions, but **cannot** access attributes since they are not associated with an intersection.

9.22.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

9.23. Callable Shaders

Callable shaders **can** access a callable payload that works similarly to ray payloads to do subroutine work.

9.23.1. Callable Shader Execution

A callable shader is executed by calling `OpExecuteCallableKHR` from an allowed shader stage.

9.24. Interpolation Decorations

Variables in the `Input` storage class in a fragment shader's interface are interpolated from the values specified by the primitive being rasterized.

NOTE Interpolation decorations can be present on input and output variables in pre-rasterization shaders but have no effect on the interpolation performed.

An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. Lines and polygons are interpolated in the same way as the primitive's clip coordinates. If the `NoPerspective` decoration is present, linear interpolation is instead used for lines and polygons. For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the `Flat` decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the provoking vertex. Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type **must** be decorated with `Flat`.

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the `Centroid` decoration is used, the interpolation position used for the variable **must** also fall within the bounds of the primitive being rasterized.
- If the `Sample` decoration is used, the interpolation position used for the variable **must** be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used, and the `sampleLocationSampleCounts` limit includes VK_SAMPLE_COUNT_1_BIT, the interpolation position **must** be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used and VK_SAMPLE_COUNT_1_BIT is not advertised in the `sampleLocationSampleCounts` limit, the interpolation position **must** be at the center of the fragment area.

NOTE As `Centroid` constrains the interpolation position to lie within the covered area of the primitive, using it may cause the position to differ between neighboring fragments when it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. Thus using `Centroid` with input variables used in derivative calculations is not recommended.

If the `PerVertexKHR` decoration is present on an input variable, the value is not interpolated, and instead values from all input vertices are available in an array. Each index of the array corresponds to one of the vertices of the primitive that produced the fragment.

If the `CustomInterpAMD` decoration is present on an input variable, the value **cannot** be accessed directly; instead the extended instruction `InterpolateAtVertexAMD` **must** be used to obtain values from the input vertices.

9.25. Push Constant Decorations

Variables in the `PushConstant` storage class **can** be decorated with additional parameters to control their placement and behavior within push constant banks.

The BankNV decoration specifies which hardware push constant bank a variable or block should be placed in. When present on a push constant variable or block, it indicates the hardware bank index to use for accessing the push constant data. When BankNV is absent, it behaves as if the value is 0.

The MemberOffsetNV decoration specifies an additional offset within a push constant bank for push constant variables or blocks. This decoration allows control over the placement of push constants within the specified bank, enabling more efficient memory layout and access patterns. When MemberOffsetNV is absent, it behaves as if the value is 0.

9.26. Static Use

A SPIR-V module declares a global object in memory using the OpVariable or OpUntypedVariableKHR instruction, which results in a pointer x to that object. A specific entry point in a SPIR-V module is said to *statically use* that object if that entry point's call tree contains a function containing an instruction with x as an id operand. A shader entry point also *statically uses* any variables explicitly declared in its interface.

9.27. Scope

A *scope* describes a set of shader invocations, where each such set is a *scope instance*. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

9.27.1. Cross Device

All invocations executed in a Vulkan instance fall into a single *cross device scope instance*.

Whilst the CrossDevice scope is defined in SPIR-V, it is disallowed in Vulkan. API synchronization commands **can** be used to communicate between devices.

9.27.2. Device

All invocations executed on a single device form a *device scope instance*.

If the vulkanMemoryModel and vulkanMemoryModelDeviceScope features are enabled, this scope is represented in SPIR-V by the Device Scope, which **can** be used as a Memory Scope for barrier and atomic operations.

If both the shaderDeviceClock and vulkanMemoryModelDeviceScope features are enabled, using the Device Scope with the OpReadClockKHR instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this **can** only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope

instances.

9.27.3. Queue Family

Invocations executed by queues in a given queue family form a *queue family scope instance*.

This scope is identified in SPIR-V as the `QueueFamily Scope` if the `vulkanMemoryModel` feature is enabled, or if not, the `Device Scope`, which **can** be used as a `Memory Scope` for barrier and atomic operations.

If the `shaderDeviceClock` feature is enabled, but the `vulkanMemoryModelDeviceScope` feature is not enabled, using the `Device Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this **can** only be done with API synchronization primitives.

Each invocation in a queue family scope instance **must** be in the same device scope instance.

9.27.4. Command

Any shader invocations executed as the result of a single command such as vkCmdDispatch or vkCmdDraw form a *command scope instance*. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in separate command scope instances. For ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific `Scope` for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here **can** be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance **must** be in the same queue-family scope instance.

For shaders without defined workgroups, this set of invocations forms an *invocation group* as defined in the SPIR-V specification.

9.27.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a *primitive scope instance*.

There is no specific `Scope` for communication across invocations in a primitive scope instance.

Any generated helper invocations are included in this scope instance.

Each invocation in a primitive scope instance **must** be in the same command scope instance.

Any input variables decorated with `Flat` are uniform within a primitive scope instance.

9.27.6. Shader Call

Any shader-call-related invocations that are executed in one or more ray tracing execution models form a *shader call scope instance*.

The `ShaderCallKHR Scope` can be used as `Memory Scope` for barrier and atomic operations.

Each invocation in a shader call scope instance **must** be in the same queue family scope instance.

9.27.7. Workgroup

A *local workgroup* is a set of invocations that can synchronize and share data with each other using memory in the `Workgroup` storage class.

The `Workgroup Scope` can be used as both an `Execution Scope` and `Memory Scope` for barrier and atomic operations.

Each invocation in a local workgroup **must** be in the same command scope instance.

Only task, mesh, and compute shaders have defined workgroups - other shader types **cannot** use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an *invocation group* as defined in the SPIR-V specification.

When variables declared with the `Workgroup` storage class are explicitly laid out (hence they are also decorated with `Block`), the amount of storage consumed is the size of the largest Block variable, not counting any padding at the end. The amount of storage consumed by the non-Block variables declared with the `Workgroup` storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active non-Block variables declared with `Workgroup` storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the Standard Storage Buffer Layout rules, and with `Boolean` values considered as 32-bit integer values for the purpose of this calculation. (This is equivalent to using the GLSL std430 layout rules.)

9.27.8. Subgroup

A *subgroup* (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The `Subgroup Scope` can be used as both an `Execution Scope` and `Memory Scope` for barrier and atomic operations. Other subgroup features allow the use of group operations with subgroup scope.

If the `shaderSubgroupClock` feature is enabled, using the `Subgroup Scope` with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same subgroup.

For shaders that have defined workgroups, each invocation in a subgroup **must** be in the same local workgroup.

In other shader stages, each invocation in a subgroup **must** be in the same device scope instance.

Only shader stages that support subgroup operations have defined subgroups.

NOTE

Subgroups are not guaranteed to be a subset of a single command in shaders that do not have defined workgroups. Values that are guaranteed to be uniform for a given command or sub command may then not be uniform for the subgroup, and vice versa. As such, applications must take care when dealing with mixed uniformity.

A somewhat common example of this would be something like trying to optimize access to per-draw data using subgroup operations:

```
buffer { uint draw_data[]; };

flat in int vDrawID; // Passed through from vertex shader

void main()
{
    uint local_draw_data = subgroupBroadcastFirst(draw_data[vDrawID]);
}
```

This can be done in an attempt to optimize the shader to only perform the loads once per subgroup. However, if the implementation packs multiple draws into a single subgroup, invocations from draws with a different drawID are now receiving data from the wrong invocation. Applications should rely on implementations to do this kind of optimization automatically where the implementation can, rather than trying to force it.

9.27.9. Quad

A *quad scope instance* is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in neighboring framebuffer locations (x_i, y_i), where:

- i is the index of the invocation within the scope instance.
- w and h are the number of pixels the fragment covers in the x and y axes.
- w and h are identical for all participating invocations.
- (x_0) = (x_1 - w) = (x_2) = (x_3 - w)
- (y_0) = (y_1) = (y_2 - h) = (y_3 - h)
- Each invocation has the same layer and sample indices.

In a mesh, task, or compute shader, if the `DerivativeGroupQuadsKHR` execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation IDs (x_i, y_i), where:

- i is the index of the invocation within the quad scope instance.
- (x_0) = (x_1 - 1) = (x_2) = (x_3 - 1)
- (y_0) = (y_1) = (y_2 - 1) = (y_3 - 1)

- x_0 and y_0 are integer multiples of 2.
- Each invocation has the same z coordinate.

In a mesh, task, or compute shader, if the `DerivativeGroupLinearKHR` execution mode is specified, each invocation in a quad scope instance is formed of invocations with adjacent local invocation indices (l_i), where:

- i is the index of the invocation within the quad scope instance.
- $(l_0) = (l_1 - 1) = (l_2 - 2) = (l_3 - 3)$
- l_0 is an integer multiple of 4.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent subgroup invocation indices (s_i), where:

- i is the index of the invocation within the quad scope instance.
- $(s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)$
- s_0 is an integer multiple of 4.

Each invocation in a quad scope instance **must** be in the same subgroup.

In a fragment shader, each invocation in a quad scope instance **must** be in the same primitive scope instance.

Fragment , mesh, task, and compute shaders have defined quad scope instances. If the `quadOperationsInAllStages` limit is supported, any shader stages that support subgroup operations also have defined quad scope instances.

9.27.10. Fragment Interlock

A *fragment interlock scope instance* is formed of fragment shader invocations based on their framebuffer locations (x,y,layer,sample), executed by commands inside a single subpass.

The specific set of invocations included varies based on the execution mode as follows:

- If the `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` execution modes are used, only invocations with identical framebuffer locations (x,y,layer,sample) are included.
- If the `PixelInterlockOrderedEXT` or `PixelInterlockUnorderedEXT` execution modes are used, fragments with different sample ids are also included.
- If the `ShadingRateInterlockOrderedEXT` or `ShadingRateInterlockUnorderedEXT` execution modes are used, fragments from neighboring framebuffer locations are also included. The shading rate image or fragment shading rate determines these fragments.

Only fragment shaders with one of the above execution modes have defined fragment interlock scope instances.

There is no specific `Scope` value for communication across invocations in a fragment interlock scope instance. However, this is implicitly used as a memory scope by `OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT`.

Each invocation in a fragment interlock scope instance **must** be in the same queue family scope instance.

9.27.11. Invocation

The smallest *scope* is a single invocation; this is represented by the `Invocation` `Scope` in SPIR-V.

Fragment shader invocations **must** be in a primitive scope instance.

Invocations in fragment shaders that have a defined fragment interlock scope **must** be in a fragment interlock scope instance.

Invocations in shaders that have defined workgroups **must** be in a local workgroup.

Invocations in shaders that have a defined subgroup scope **must** be in a subgroup.

Invocations in shaders that have a defined quad scope **must** be in a quad scope instance.

All invocations in all stages **must** be in a command scope instance.

9.28. Group Operations

Group operations are executed by multiple invocations within a scope instance; with each invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a `Scope` defining the desired scope instance to operate within. Only the `Subgroup` scope **can** be used for these operations; the `subgroupSupportedOperations` limit defines which types of operation **can** be used.

9.28.1. Basic Group Operations

Basic group operations include the use of `OpGroupNonUniformElect`, `OpControlBarrier`, `OpMemoryBarrier`, and atomic operations.

`OpGroupNonUniformElect` **can** be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return `true`.

The Memory Model appendix defines the operation of barriers and atomics.

9.28.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:

- Do all active group invocations agree that an expression is true?
- Do any active group invocations evaluate an expression to true?
- Do all active group invocations have the same value of an expression?

NOTE	These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

9.28.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

9.28.4. Ballot Group Operations

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

9.28.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a group.

9.28.6. Shuffle Relative Group Operations

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

9.28.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size **must** be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

9.28.8. Rotate Group Operations

The rotate group operations allow invocations to read values from other invocations within the group relative to the current invocation and modulo the size of the group. Clustered rotate group operations perform the same operation within individual partitions of a group.

The partitions for clustered rotate group operations are consecutive power-of-two size groups of invocations and the cluster size **must** be known at pipeline creation time.

9.29. Quad Group Operations

Quad group operations (`OpGroupNonUniformQuad*`) are a specialized type of group operations that only operate on quad scope instances. Whilst these instructions do include a `Scope` parameter, this scope is always overridden; only the quad scope instance is included in its execution scope.

Fragment shaders that statically execute either `OpGroupNonUniformQuadBroadcast` or `OpGroupNonUniformQuadSwap` **must** launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is i, as described for a quad scope instance, defined as the *quad index* in the SPIR-V specification.

For `OpGroupNonUniformQuadBroadcast` this value is equal to `Index`. For `OpGroupNonUniformQuadSwap`, it is equal to the implicit `Index` used by each participating invocation.

9.30. Derivative Operations

Derivative operations calculate the partial derivative for an expression P as a function of an invocation's x and y coordinates.

Derivative operations operate on a set of invocations known as a *derivative group* as defined in the SPIR-V specification.

A derivative group in a fragment shader is equivalent to the quad scope instance if the `QuadDerivativesKHR` execution mode is specified, otherwise it is equivalent to the primitive scope instance. A derivative group in a mesh, task, or compute shader is equivalent to the quad scope instance.

Derivatives are calculated assuming that P is piecewise linear and continuous within the derivative group.

The following control-flow restrictions apply to derivative operations:

- If the `QuadDerivativesKHR` execution mode is specified, dynamic instances of any derivative operations **must** be executed in control flow that is uniform within the current quad scope instance.
- If the `QuadDerivativesKHR` execution mode is not specified:
  - dynamic instances of explicit derivative instructions (`OpDPdx*`, `OpDPdy*`, and `OpFwidth*`) **must** be executed in control flow that is uniform within a derivative group.
  - dynamic instances of implicit derivative operations **can** be executed in control flow that is not uniform within the derivative group, but results are undefined.

Fragment shaders that statically execute derivative operations **must** launch sufficient invocations

to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

NOTE In a mesh, task, or compute shader, it is the application's responsibility to ensure that sufficient invocations are launched.

Derivative operations calculate their results as the difference between the result of P across invocations in the quad. For fine derivative operations (`OpDPdxFine` and `OpDPdyFine`), the values of $DPdx(P_i)$ are calculated as

$$DPdx(P_0) = DPdx(P_1) = P_1 - P_0$$

$$DPdx(P_2) = DPdx(P_3) = P_3 - P_2$$

and the values of $DPdy(P_i)$ are calculated as

$$DPdy(P_0) = DPdy(P_2) = P_2 - P_0$$

$$DPdy(P_1) = DPdy(P_3) = P_3 - P_1$$

where i is the index of each invocation as described in Quad.

Coarse derivative operations (`OpDPdxCoarse` and `OpDPdyCoarse`), calculate their results in roughly the same manner, but **may** only calculate two values instead of four (one for each of DPdx and DPdy), reusing the same result no matter the originating invocation. If an implementation does this, it **should** use the fine derivative calculations described for P_0.

NOTE

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser LOD being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

$$DPdx(P_n)' = DPdx(P_n) / w$$

$$DPdy(P_n)' = DPdy(P_n) / h$$

where w and h are the size of the fragments in the quad, and $DPdx(P_n)'$ and $DPdy(P_n)'$ are the pixel derivatives.

The results for OpDPdx and OpDPdy **may** be calculated as either fine or coarse derivatives, with implementations favoring the most efficient approach. Implementations **must** choose coarse or fine consistently between the two.

Executing OpFwidthFine, OpFwidthCoarse, or OpFwidth is equivalent to executing the corresponding OpDPdx* and OpDPdy* instructions, taking the absolute value of the results, and summing them.

Executing an OpImage*Sample*ImplicitLod instruction is equivalent to executing OpDPdx(Coordinate) and OpDPdy(Coordinate), and passing the results as the Grad operands dx and dy.

NOTE	It is expected that using the ImplicitLod variants of sampling functions will be substantially more efficient than using the ExplicitLod variants with explicitly generated derivatives.

9.31. Helper Invocations

When performing derivative or quad group operations in a fragment shader, additional invocations **may** be spawned in order to ensure correct results. These additional invocations are known as *helper invocations* and **can** be identified by a non-zero value in the HelperInvocation built-in. Stores and atomics performed by helper invocations **must** not have any effect on memory except for the Function, Private and Output storage classes, and values returned by atomic instructions in helper invocations are undefined.

NOTE	While storage to Output storage class has an effect even in helper invocations, it does not mean that helper invocations have an effect on the framebuffer. Output variables in fragment shaders can be read from as well, and they behave more like Private variables for the duration of the shader invocation.

If the MaximallyReconvergesKHR execution mode is applied to the entry point, helper invocations **must** remain active for all instructions for the lifetime of the quad scope instance they are a part of. If the MaximallyReconvergesKHR execution mode is not applied to the entry point, helper invocations **may** be considered inactive for group operations other than derivative and quad group operations. All invocations in a quad scope instance **may** become permanently inactive at any point once the only remaining invocations in that quad scope instance are helper invocations.

9.32. Cooperative Matrices

A *cooperative matrix* type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations **may** support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```
// Provided by VK_EXT_cooperative_matrix_maintenance1
VkResult vkGetPhysicalDeviceCooperativeMatrixProperties2EXT(
    VkPhysicalDevice                                physicalDevice,
    const VkPhysicalDeviceCooperativeMatrixInfo2EXT* pCooperativeMatrixInfo,
    uint32_t*                                       pPropertyCount,
    VkCooperativeMatrixProperties2EXT*              pProperties);
```

- `physicalDevice` is the physical device.
- `pCooperativeMatrixInfo` is a pointer to a VkPhysicalDeviceCooperativeMatrixInfo2EXT structure describing which cooperative matrix properties to query.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of VkCooperativeMatrixProperties2EXT structures.

If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available cooperative matrix properties were returned.

The implementation **must** not return `pPropertyCount` equal to `0` for the following parameters, when VkPhysicalDeviceCooperativeMatrixInfo2EXT::`flags` does not contain VK_COOPERATIVE_MATRIX_SATURATING_ACCUMULATION_BIT_EXT:

- `scope` equals VK_SCOPE_SUBGROUP_KHR and `subgroupSize` is `0`
- `scope` equals VK_SCOPE_SUBGROUP_KHR and `subgroupSize` is equal to VkPhysicalDeviceSubgroupProperties::`subgroupSize`
- if the VkPhysicalDeviceCooperativeMatrix2FeaturesNV::`cooperativeMatrixWorkgroupScope` feature is supported: `scope` equals VK_SCOPE_WORKGROUP_KHR, `invocations` is any power of two between VkPhysicalDeviceSubgroupProperties::`subgroupSize` and `cooperativeMatrixWorkgroupScopeMaxWorkgroupSize` inclusive, and `subgroupSize` is either `0` or equal to VkPhysicalDeviceSubgroupProperties::`subgroupSize`

For each of the above required parameters, at least one property **must** be returned for each of the following combinations of component types:

- `AType` and `BType` are VK_COMPONENT_TYPE_FLOAT16_KHR, `CType` and `ResultType` are either both VK_COMPONENT_TYPE_FLOAT16_KHR or both VK_COMPONENT_TYPE_FLOAT32_KHR
- `AType` and `BType` are VK_COMPONENT_TYPE_UINT8_KHR, `CType` and `ResultType` are either both VK_COMPONENT_TYPE_UINT32_KHR or both VK_COMPONENT_TYPE_SINT32_KHR
- `AType` and `BType` are VK_COMPONENT_TYPE_SINT8_KHR, `CType` and `ResultType` are VK_COMPONENT_TYPE_SINT32_KHR

Valid Usage

- VUID-vkGetPhysicalDeviceCooperativeMatrixProperties2EXT-cooperativeMatrixProperties2-13371
  The `cooperativeMatrixProperties2` feature **must** be supported by `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeMatrixProperties2EXT-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceCooperativeMatrixProperties2EXT-pCooperativeMatrixInfo-parameter
  `pCooperativeMatrixInfo` **must** be a valid pointer to a valid VkPhysicalDeviceCooperativeMatrixInfo2EXT structure
- VUID-vkGetPhysicalDeviceCooperativeMatrixProperties2EXT-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceCooperativeMatrixProperties2EXT-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkCooperativeMatrixProperties2EXT structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkPhysicalDeviceCooperativeMatrixInfo2EXT` structure is defined as:

```
// Provided by VK_EXT_cooperative_matrix_maintenance1
typedef struct VkPhysicalDeviceCooperativeMatrixInfo2EXT {
    VkStructureType                sType;
    const void*                    pNext;
    VkScopeKHR                     scope;
    uint32_t                       invocations;
    uint32_t                       subgroupSize;
    VkCooperativeMatrixFlagsEXT    flags;
} VkPhysicalDeviceCooperativeMatrixInfo2EXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `scope` is the scope of the matrices, of type VkScopeKHR.
- `invocations` is the number of invocations within the local workgroup. `invocations` is ignored unless `scope` is VK_SCOPE_WORKGROUP_KHR.
- `subgroupSize` is the size of the subgroup.
- `flags` is a bitmask of VkCooperativeMatrixFlagBitsEXT selecting which class of matrix properties are being queried.

If `subgroupSize` is equal to `0`, then the properties returned will be valid for use with shaders that execute with a varying subgroup size, and the returned properties are not guaranteed to be valid for any specific effective subgroup size.

If `scope` is VK_SCOPE_WORKGROUP_KHR, `invocations` specifies the number of invocations in the local workgroup, otherwise the properties returned will be valid for all supported local workgroup sizes.

NOTE

If `scope` is VK_SCOPE_WORKGROUP_KHR scope, the retrieved properties will only be valid for shaders in which `invocations` is a multiple of the shader's effective subgroup size.

NOTE

The intended usage of `subgroupSize` is:

- If the matrix will be used with a pipeline that enables VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT or a shader that enables VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT, or a SPIR-V module version 1.6 or later with no required subgroup size specified, the application should query the properties with `subgroupSize` equal to `0`, since the effective subgroup size is not known at pipeline creation time.
- If the matrix will be used with a shader whose subgroup size is forced via VkPipelineShaderStageRequiredSubgroupSizeCreateInfo, or VkShaderRequiredSubgroupSizeCreateInfoEXT for shader objects, the application should query with `subgroupSize` equal to the required value.
- Otherwise (the SPIR-V module version is less than 1.6, and the shader neither

requests a specific subgroup size nor allows it to vary), the effective subgroup size is VkPhysicalDeviceSubgroupProperties::subgroupSize, and the application should query with that value.

Valid Usage

- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-scope-13372
  scope **must** equal VK_SCOPE_SUBGROUP_KHR or VK_SCOPE_WORKGROUP_KHR
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-cooperativeMatrixWorkgroupScope-13373
  If the VkPhysicalDeviceCooperativeMatrix2FeaturesNV::cooperativeMatrixWorkgroupScope feature is not supported, scope **must** not equal VK_SCOPE_WORKGROUP_KHR
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-subgroupSize-13374
  If subgroupSize does not equal 0, subgroupSize **must** be a power of two
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-scope-13375
  If scope is VK_SCOPE_SUBGROUP_KHR, subgroupSize does not equal 0, and the subgroupSizeControl feature is supported, subgroupSize **must** be greater than or equal to minSubgroupSize
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-scope-13376
  If scope is VK_SCOPE_SUBGROUP_KHR and the subgroupSizeControl feature is supported, subgroupSize **must** be less than or equal to maxSubgroupSize
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-scope-13377
  If scope is VK_SCOPE_SUBGROUP_KHR, the subgroupSizeControl feature is not supported, and subgroupSize does not equal 0, subgroupSize **must** be equal to VkPhysicalDeviceSubgroupProperties::subgroupSize
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-invocations-13378
  If scope is VK_SCOPE_WORKGROUP_KHR, invocations **must** be a power of two
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-subgroupSize-13379
  If scope is VK_SCOPE_WORKGROUP_KHR, and subgroupSize does not equal 0, invocations **must** be a multiple of subgroupSize
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-scope-13380
  If scope is VK_SCOPE_WORKGROUP_KHR, invocations **must** be less than or equal to cooperativeMatrixWorkgroupScopeMaxWorkgroupSize
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-invocations-13381
  If scope is not VK_SCOPE_WORKGROUP_KHR, invocations **must** be equal to 0

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_INFO_2_EXT
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-pNext-pNext

pNext **must** be NULL

- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-scope-parameter
  scope **must** be a valid VkScopeKHR value
- VUID-VkPhysicalDeviceCooperativeMatrixInfo2EXT-flags-parameter
  If flags is not 0, flags **must** be a valid combination of VkCooperativeMatrixFlagBitsEXT values

Bits which **can** be set in VkPhysicalDeviceCooperativeMatrixInfo2EXT::flags to select the class of cooperative matrix properties being queried are:

```
// Provided by VK_EXT_cooperative_matrix_maintenance1
typedef enum VkCooperativeMatrixFlagBitsEXT {
  // Provided by VK_EXT_cooperative_matrix_maintenance1
    VK_COOPERATIVE_MATRIX_SATURATING_ACCUMULATION_BIT_EXT = 0x00000001,
} VkCooperativeMatrixFlagBitsEXT;
```

- VK_COOPERATIVE_MATRIX_SATURATING_ACCUMULATION_BIT_EXT specifies that the query returns properties for which the shader **must** use the SaturatingAccumulation operand on OpCooperativeMatrixMulAddKHR. If this bit is not set, the query returns properties for which the shader **must** not use the SaturatingAccumulation operand on OpCooperativeMatrixMulAddKHR.

```
// Provided by VK_EXT_cooperative_matrix_maintenance1
typedef VkFlags VkCooperativeMatrixFlagsEXT;
```

VkCooperativeMatrixFlagsEXT is a bitmask type for setting a mask of zero or more VkCooperativeMatrixFlagBitsEXT.

To enumerate the supported cooperative matrix types and operations, call:

```
// Provided by VK_KHR_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkCooperativeMatrixPropertiesKHR*           pProperties);
```

- physicalDevice is the physical device.
- pPropertyCount is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- pProperties is either NULL or a pointer to an array of VkCooperativeMatrixPropertiesKHR structures.

If pProperties is NULL, then the number of cooperative matrix properties available is returned in pPropertyCount. Otherwise, pPropertyCount **must** point to a variable set by the application to the number of elements in the pProperties array, and on return the variable is overwritten with the

number of structures actually written to pProperties. If pPropertyCount is less than the number of cooperative matrix properties available, at most pPropertyCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available cooperative matrix properties were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pPropertyCount-parameter
  pPropertyCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties **must** be a valid pointer to an array of pPropertyCount VkCooperativeMatrixPropertiesKHR structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To enumerate additional supported cooperative matrix types and operations, call:

```
// Provided by VK_NV_cooperative_matrix2
VkResult vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkCooperativeMatrixFlexibleDimensionsPropertiesNV* pProperties);
```

- physicalDevice is the physical device.
- pPropertyCount is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- pProperties is either NULL or a pointer to an array of VkCooperativeMatrixFlexibleDimensionsPropertiesNV structures.

If pProperties is NULL, then the number of flexible dimensions properties available is returned in pPropertyCount. Otherwise, pPropertyCount **must** point to a variable set by the application to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of flexible dimensions properties available, at most pPropertyCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available flexible dimensions properties were returned.

If the cooperativeMatrixFlexibleDimensions feature is not supported, the implementation **must** advertise zero properties.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV-pPropertyCount-parameter
  pPropertyCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties **must** be a valid pointer to an array of pPropertyCount VkCooperativeMatrixFlexibleDimensionsPropertiesNV structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To enumerate the supported cooperative matrix types and operations, call:

```
// Provided by VK_NV_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesNV(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkCooperativeMatrixPropertiesNV*            pProperties);
```

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of VkCooperativeMatrixPropertiesNV structures.

If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available cooperative matrix properties were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pPropertyCount-parameter
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesNV-pProperties-parameter
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` VkCooperativeMatrixPropertiesNV structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Each VkCooperativeMatrixPropertiesKHR or VkCooperativeMatrixPropertiesNV structure describes a single supported combination of types for a matrix multiply/add operation (OpCooperativeMatrixMulAddKHR or OpCooperativeMatrixMulAddNV). The multiply **can** be described in terms of the following variables and types (in SPIR-V pseudocode):

```
    %A is of type OpTypeCooperativeMatrixKHR %AType %scope %MSize %KSize %MatrixAKHR
    %B is of type OpTypeCooperativeMatrixKHR %BType %scope %KSize %NSize %MatrixBKHR
    %C is of type OpTypeCooperativeMatrixKHR %CType %scope %MSize %NSize
%MatrixAccumulatorKHR
    %Result is of type OpTypeCooperativeMatrixKHR %ResultType %scope %MSize %NSize
%MatrixAccumulatorKHR

    %Result = %A * %B + %C // using OpCooperativeMatrixMulAddKHR
```

```
    %A is of type OpTypeCooperativeMatrixNV %AType %scope %MSize %KSize
    %B is of type OpTypeCooperativeMatrixNV %BType %scope %KSize %NSize
    %C is of type OpTypeCooperativeMatrixNV %CType %scope %MSize %NSize
    %D is of type OpTypeCooperativeMatrixNV %DType %scope %MSize %NSize

    %D = %A * %B + %C // using OpCooperativeMatrixMulAddNV
```

A matrix multiply with these dimensions is known as an *MxNxK* matrix multiply.

The VkCooperativeMatrixProperties2EXT structure is defined as:

```
// Provided by VK_EXT_cooperative_matrix_maintenance1
typedef struct VkCooperativeMatrixProperties2EXT {
    VkStructureType       sType;
    void*                 pNext;
    uint32_t              MGranularity;
    uint32_t              NGranularity;
    uint32_t              KGranularity;
    VkComponentTypeKHR    AType;
    VkComponentTypeKHR    BType;
    VkComponentTypeKHR    CType;
    VkComponentTypeKHR    ResultType;
} VkCooperativeMatrixProperties2EXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- MGranularity is the granularity of the number of rows in matrices A, C, and Result. The rows **must** be an integer multiple of this value.
- KGranularity is the granularity of columns in matrix A and rows in matrix B. The columns/rows **must** be an integer multiple of this value.
- NGranularity is the granularity of columns in matrices B, C, Result. The columns **must** be an

integer multiple of this value.

- `AType` is the component type of matrix `A`, of type VkComponentTypeKHR.
- `BType` is the component type of matrix `B`, of type VkComponentTypeKHR.
- `CType` is the component type of matrix `C`, of type VkComponentTypeKHR.
- `ResultType` is the component type of matrix `Result`, of type VkComponentTypeKHR.

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by vkGetPhysicalDeviceCooperativeMatrixProperties2EXT.

At least one entry in the list **must** have power of two values for all of `MGranularity`, `KGranularity`, and `NGranularity`.

Valid Usage (Implicit)

- VUID-VkCooperativeMatrixProperties2EXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_2_EXT
- VUID-VkCooperativeMatrixProperties2EXT-pNext-pNext
  `pNext` **must** be `NULL`

The `VkCooperativeMatrixPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesKHR {
    VkStructureType       sType;
    void*                 pNext;
    uint32_t              MSize;
    uint32_t              NSize;
    uint32_t              KSize;
    VkComponentTypeKHR    AType;
    VkComponentTypeKHR    BType;
    VkComponentTypeKHR    CType;
    VkComponentTypeKHR    ResultType;
    VkBool32              saturatingAccumulation;
    VkScopeKHR            scope;
} VkCooperativeMatrixPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices `A`, `C`, and `Result`.
- `KSize` is the number of columns in matrix `A` and rows in matrix `B`.
- `NSize` is the number of columns in matrices `B`, `C`, `Result`.
- `AType` is the component type of matrix `A`, of type VkComponentTypeKHR.
- `BType` is the component type of matrix `B`, of type VkComponentTypeKHR.

- `CType` is the component type of matrix `C`, of type VkComponentTypeKHR.
- `ResultType` is the component type of matrix `Result`, of type VkComponentTypeKHR.
- `saturatingAccumulation` indicates whether the `SaturatingAccumulation` operand to `OpCooperativeMatrixMulAddKHR` **must** be present or not. If it is VK_TRUE, the `SaturatingAccumulation` operand **must** be present. If it is VK_FALSE, the `SaturatingAccumulation` operand **must** not be present.
- `scope` is the scope of all the matrix types, of type VkScopeKHR.

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR.

At least one entry in the list **must** have power of two values for all of `MSize`, `KSize`, and `NSize`.

If the `cooperativeMatrixWorkgroupScope` feature is not supported, `scope` **must** be VK_SCOPE_SUBGROUP_KHR.

Valid Usage (Implicit)

- VUID-VkCooperativeMatrixPropertiesKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_KHR
- VUID-VkCooperativeMatrixPropertiesKHR-pNext-pNext
  `pNext` **must** be `NULL`

The `VkCooperativeMatrixFlexibleDimensionsPropertiesNV` structure is defined as:

```
// Provided by VK_NV_cooperative_matrix2
typedef struct VkCooperativeMatrixFlexibleDimensionsPropertiesNV {
    VkStructureType       sType;
    void*                 pNext;
    uint32_t              MGranularity;
    uint32_t              NGranularity;
    uint32_t              KGranularity;
    VkComponentTypeKHR    AType;
    VkComponentTypeKHR    BType;
    VkComponentTypeKHR    CType;
    VkComponentTypeKHR    ResultType;
    VkBool32              saturatingAccumulation;
    VkScopeKHR            scope;
    uint32_t              workgroupInvocations;
} VkCooperativeMatrixFlexibleDimensionsPropertiesNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MGranularity` is the granularity of the number of rows in matrices `A`, `C`, and `Result`. The rows **must** be an integer multiple of this value.

- `KGranularity` is the granularity of columns in matrix `A` and rows in matrix `B`. The columns/rows **must** be an integer multiple of this value.
- `NGranularity` is the granularity of columns in matrices `B`, `C`, `Result`. The columns **must** be an integer multiple of this value.
- `AType` is the component type of matrix `A`, of type VkComponentTypeKHR.
- `BType` is the component type of matrix `B`, of type VkComponentTypeKHR.
- `CType` is the component type of matrix `C`, of type VkComponentTypeKHR.
- `ResultType` is the component type of matrix `Result`, of type VkComponentTypeKHR.
- `saturatingAccumulation` indicates whether the `SaturatingAccumulation` operand to `OpCooperativeMatrixMulAddKHR` **must** be present or not. If it is VK_TRUE, the `SaturatingAccumulation` operand **must** be present. If it is VK_FALSE, the `SaturatingAccumulation` operand **must** not be present.
- `scope` is the scope of all the matrix types, of type VkScopeKHR.
- `workgroupInvocations` is the number of invocations in the local workgroup when this combination of values is supported.

Rather than explicitly enumerating a list of supported sizes, `VkCooperativeMatrixFlexibleDimensionsPropertiesNV` advertises size granularities, where the matrix **must** be a multiple of the advertised size. The M and K granularities apply to rows and columns of matrices with `Use` of `MatrixA`, K, and N apply to rows and columns of matrices with `Use` of `MatrixB`, M, and N apply to rows and columns of matrices with `Use` of `MatrixAccumulator`.

For a given type combination, if multiple workgroup sizes are supported there **may** be multiple `VkCooperativeMatrixFlexibleDimensionsPropertiesNV` structures with different granularities.

All granularity values **must** be powers of two.

NOTE	Different A/B types may require different granularities but share the same accumulator type. In such a case, the supported granularity for a matrix with the accumulator type would be the smallest advertised granularity.

Valid Usage (Implicit)

- VUID-VkCooperativeMatrixFlexibleDimensionsPropertiesNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_FLEXIBLE_DIMENSIONS_PROPERTIES_NV
- VUID-VkCooperativeMatrixFlexibleDimensionsPropertiesNV-pNext-pNext
  `pNext` **must** be `NULL`

The `VkCooperativeMatrixPropertiesNV` structure is defined as:

```
// Provided by VK_NV_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesNV {
    VkStructureType      sType;
    void*                pNext;
    uint32_t             MSize;
    uint32_t             NSize;
    uint32_t             KSize;
    VkComponentTypeNV    AType;
    VkComponentTypeNV    BType;
    VkComponentTypeNV    CType;
    VkComponentTypeNV    DType;
    VkScopeNV            scope;
} VkCooperativeMatrixPropertiesNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `MSize` is the number of rows in matrices A, C, and D.
- `KSize` is the number of columns in matrix A and rows in matrix B.
- `NSize` is the number of columns in matrices B, C, D.
- `AType` is the component type of matrix A, of type VkComponentTypeNV.
- `BType` is the component type of matrix B, of type VkComponentTypeNV.
- `CType` is the component type of matrix C, of type VkComponentTypeNV.
- `DType` is the component type of matrix D, of type VkComponentTypeNV.
- `scope` is the scope of all the matrix types, of type VkScopeNV.

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by vkGetPhysicalDeviceCooperativeMatrixPropertiesNV.

At least one entry in the list **must** have power of two values for all of `MSize`, `KSize`, and `NSize`.

Valid Usage (Implicit)

- VUID-VkCooperativeMatrixPropertiesNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_NV
- VUID-VkCooperativeMatrixPropertiesNV-pNext-pNext
  `pNext` **must** be `NULL`

Possible values for VkScopeKHR include:

```
// Provided by VK_KHR_cooperative_matrix
typedef enum VkScopeKHR {
    VK_SCOPE_DEVICE_KHR = 1,
    VK_SCOPE_WORKGROUP_KHR = 2,
    VK_SCOPE_SUBGROUP_KHR = 3,
    VK_SCOPE_QUEUE_FAMILY_KHR = 5,
  // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_DEVICE_NV = VK_SCOPE_DEVICE_KHR,
  // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_WORKGROUP_NV = VK_SCOPE_WORKGROUP_KHR,
  // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_SUBGROUP_NV = VK_SCOPE_SUBGROUP_KHR,
  // Provided by VK_NV_cooperative_matrix
    VK_SCOPE_QUEUE_FAMILY_NV = VK_SCOPE_QUEUE_FAMILY_KHR,
} VkScopeKHR;
```

```
// Provided by VK_NV_cooperative_matrix
// Equivalent to VkScopeKHR
typedef VkScopeKHR VkScopeNV;
```

- VK_SCOPE_DEVICE_KHR corresponds to SPIR-V `Device` scope.
- VK_SCOPE_WORKGROUP_KHR corresponds to SPIR-V `Workgroup` scope.
- VK_SCOPE_SUBGROUP_KHR corresponds to SPIR-V `Subgroup` scope.
- VK_SCOPE_QUEUE_FAMILY_KHR corresponds to SPIR-V `QueueFamily` scope.

All enum values match the corresponding SPIR-V value.

Possible values for VkComponentTypeKHR include:

```
// Provided by VK_KHR_cooperative_matrix, VK_NV_cooperative_vector
typedef enum VkComponentTypeKHR {
    VK_COMPONENT_TYPE_FLOAT16_KHR = 0,

- VK_COMPONENT_TYPE_FLOAT16_KHR corresponds to SPIR-V `OpTypeFloat` 16.
- VK_COMPONENT_TYPE_FLOAT32_KHR corresponds to SPIR-V `OpTypeFloat` 32.

- VK_COMPONENT_TYPE_FLOAT64_KHR corresponds to SPIR-V OpTypeFloat 64.
- VK_COMPONENT_TYPE_SINT8_KHR corresponds to SPIR-V OpTypeInt 8 0/1.
- VK_COMPONENT_TYPE_SINT16_KHR corresponds to SPIR-V OpTypeInt 16 0/1.
- VK_COMPONENT_TYPE_SINT32_KHR corresponds to SPIR-V OpTypeInt 32 0/1.
- VK_COMPONENT_TYPE_SINT64_KHR corresponds to SPIR-V OpTypeInt 64 0/1.
- VK_COMPONENT_TYPE_UINT8_KHR corresponds to SPIR-V OpTypeInt 8 0/1.
- VK_COMPONENT_TYPE_UINT16_KHR corresponds to SPIR-V OpTypeInt 16 0/1.
- VK_COMPONENT_TYPE_UINT32_KHR corresponds to SPIR-V OpTypeInt 32 0/1.
- VK_COMPONENT_TYPE_UINT64_KHR corresponds to SPIR-V OpTypeInt 64 0/1.
- VK_COMPONENT_TYPE_BFLOAT16_KHR corresponds to SPIR-V OpTypeFloat 16 BFloat16KHR.
- VK_COMPONENT_TYPE_SINT8_PACKED_NV corresponds to four 8-bit signed integers packed in a 32-bit unsigned integer.
- VK_COMPONENT_TYPE_UINT8_PACKED_NV corresponds to four 8-bit unsigned integers packed in a 32-bit unsigned integer.
- VK_COMPONENT_TYPE_FLOAT_E4M3_NV corresponds to a floating-point type with a sign bit in the most significant bit, followed by four exponent bits, followed by three mantissa bits.
- VK_COMPONENT_TYPE_FLOAT_E5M2_NV corresponds to a floating-point type with a sign bit in the most significant bit, followed by five exponent bits, followed by two mantissa bits.
- VK_COMPONENT_TYPE_FLOAT8_E4M3_EXT corresponds to SPIR-V OpTypeFloat 8 Float8E4M3EXT.
- VK_COMPONENT_TYPE_FLOAT8_E5M2_EXT corresponds to SPIR-V OpTypeFloat 8 Float8E5M2EXT.
- VK_COMPONENT_TYPE_FLOAT6_E2M3_EXT corresponds to SPIR-V OpTypeFloat 6 Float6E2M3EXT.
- VK_COMPONENT_TYPE_FLOAT6_E3M2_EXT corresponds to SPIR-V OpTypeFloat 6 Float6E3M2EXT.
- VK_COMPONENT_TYPE_FLOAT4_E2M1_EXT corresponds to SPIR-V OpTypeFloat 4 Float4E2M1EXT.
- VK_COMPONENT_TYPE_FLOAT8_UNSIGNED_E8M0_EXT corresponds to SPIR-V OpTypeFloat 8 Float8UnsignedE8M0EXT.
- VK_COMPONENT_TYPE_MXINT8_EXT corresponds to SPIR-V OpTypeFloat 8 MXInt8EXT.

9.32.1. Cooperative Matrix Property Matching

Cooperative matrix types and instructions match cooperative matrix properties as defined in this section.

VkCooperativeMatrixPropertiesKHR Matching

The following rules define how cooperative matrix types and instructions match a

VkCooperativeMatrixPropertiesKHR structure returned by vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR.

VkCooperativeMatrixPropertiesKHR Type Matching

An OpTypeCooperativeMatrixKHR type matches a VkCooperativeMatrixPropertiesKHR structure if all of the following conditions are satisfied:

- Its scope matches VkCooperativeMatrixPropertiesKHR::scope.
- If Use is MatrixA, its number of rows matches VkCooperativeMatrixPropertiesKHR::MSize, its number of columns matches VkCooperativeMatrixPropertiesKHR::KSize, and its component type matches VkCooperativeMatrixPropertiesKHR::AType.
- If Use is MatrixB, its number of rows matches VkCooperativeMatrixPropertiesKHR::KSize, its number of columns matches VkCooperativeMatrixPropertiesKHR::NSize, and its component type matches VkCooperativeMatrixPropertiesKHR::BType.
- If Use is MatrixAccumulator, its number of rows matches VkCooperativeMatrixPropertiesKHR::MSize, its number of columns matches VkCooperativeMatrixPropertiesKHR::NSize, and its component type matches either VkCooperativeMatrixPropertiesKHR::CType or VkCooperativeMatrixPropertiesKHR::ResultType.

VkCooperativeMatrixPropertiesKHR Multiply-Add Matching

The operands of an OpCooperativeMatrixMulAddKHR instruction match a VkCooperativeMatrixPropertiesKHR structure if all of the following conditions are satisfied:

- The type of A has Rows matching VkCooperativeMatrixPropertiesKHR::MSize, Columns matching VkCooperativeMatrixPropertiesKHR::KSize, Use equal to MatrixAKHR, and ComponentType matching VkCooperativeMatrixPropertiesKHR::AType.
- The type of B has Rows matching VkCooperativeMatrixPropertiesKHR::KSize, Columns matching VkCooperativeMatrixPropertiesKHR::NSize, Use equal to MatrixBKHR, and ComponentType matching VkCooperativeMatrixPropertiesKHR::BType.
- The type of C has Rows matching VkCooperativeMatrixPropertiesKHR::MSize, Columns matching VkCooperativeMatrixPropertiesKHR::NSize, Use equal to MatrixAccumulatorKHR, and ComponentType matching VkCooperativeMatrixPropertiesKHR::CType.
- The type of Result has Rows matching VkCooperativeMatrixPropertiesKHR::MSize, Columns matching VkCooperativeMatrixPropertiesKHR::NSize, Use equal to MatrixAccumulatorKHR, and ComponentType matching VkCooperativeMatrixPropertiesKHR::ResultType.
- MatrixASignedComponents is used if and only if VkCooperativeMatrixPropertiesKHR::AType is a signed integer type.
- MatrixBSignedComponents is used if and only if VkCooperativeMatrixPropertiesKHR::BType is a signed integer type.
- MatrixCSignedComponents is used if and only if VkCooperativeMatrixPropertiesKHR::CType is a signed integer type.
- MatrixResultSignedComponents is used if and only if VkCooperativeMatrixPropertiesKHR::ResultType is a signed integer type.

- `SaturatingAccumulationKHR` is used if and only if VkCooperativeMatrixPropertiesKHR::`saturatingAccumulation` is VK_TRUE.
- `SaturatingAccumulationKHR` is not used if and only if VkCooperativeMatrixPropertiesKHR::`saturatingAccumulation` is VK_FALSE.
- The scope of all cooperative matrix operands matches VkCooperativeMatrixPropertiesKHR::`scope`.

VkCooperativeMatrixProperties2EXT Matching

The following rules define how cooperative matrix types and instructions match a VkCooperativeMatrixProperties2EXT structure returned by vkGetPhysicalDeviceCooperativeMatrixProperties2EXT.

VkPhysicalDeviceCooperativeMatrixInfo2EXT Query Applicability

A query using a VkPhysicalDeviceCooperativeMatrixInfo2EXT structure is applicable to a cooperative matrix type in a shader if all of the following conditions are satisfied:

- VkPhysicalDeviceCooperativeMatrixInfo2EXT::`scope` matches the type's scope.
- If VkPhysicalDeviceCooperativeMatrixInfo2EXT::`scope` is VK_SCOPE_WORKGROUP_KHR, VkPhysicalDeviceCooperativeMatrixInfo2EXT::`invocations` matches the number of invocations in the local workgroup.
- If the shader was created with VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT or VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT set, or if the SPIR-V module is version 1.6 or later and no structure specifying a required subgroup size was chained, VkPhysicalDeviceCooperativeMatrixInfo2EXT::`subgroupSize` is `0`.
- If a structure specifying a required subgroup size was chained, or if the SPIR-V module is less than version 1.6 and the shader was not created with VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT or VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT set, VkPhysicalDeviceCooperativeMatrixInfo2EXT::`subgroupSize` equals the shader's effective subgroup size.

VkCooperativeMatrixProperties2EXT Type Matching

An `OpTypeCooperativeMatrixKHR` type in a shader matches a VkCooperativeMatrixProperties2EXT structure returned by a query if all of the following conditions are satisfied:

- The query is applicable to the type in the shader as defined in VkPhysicalDeviceCooperativeMatrixInfo2EXT Query Applicability.
- If `Use` is `MatrixA`, its number of rows is a multiple of VkCooperativeMatrixProperties2EXT::`MGranularity`, its number of columns is a multiple of VkCooperativeMatrixProperties2EXT::`KGranularity`, and its component type matches VkCooperativeMatrixProperties2EXT::`AType`.
- If `Use` is `MatrixB`, its number of rows is a multiple of VkCooperativeMatrixProperties2EXT::`KGranularity`, its number of columns is a multiple of VkCooperativeMatrixProperties2EXT::`NGranularity`, and its component type matches VkCooperativeMatrixProperties2EXT::`BType`.

- If Use is MatrixAccumulator, its number of rows is a multiple of VkCooperativeMatrixProperties2EXT::MGranularity, its number of columns is a multiple of VkCooperativeMatrixProperties2EXT::NGranularity, and its component type matches either VkCooperativeMatrixProperties2EXT::CType or VkCooperativeMatrixProperties2EXT::ResultType.
- If the cooperativeMatrixFlexibleDimensions feature is not enabled, the dimensions match the granularities exactly.

VkCooperativeMatrixProperties2EXT Multiply-Add Matching

The operands of an OpCooperativeMatrixMulAddKHR instruction in a shader match a VkCooperativeMatrixProperties2EXT structure returned by a query if all of the following conditions are satisfied:

- The query is applicable to every cooperative matrix operand type in the shader as defined in VkPhysicalDeviceCooperativeMatrixInfo2EXT Query Applicability.
- The type of A has Rows that are a multiple of VkCooperativeMatrixProperties2EXT::MGranularity, Columns that are a multiple of VkCooperativeMatrixProperties2EXT::KGranularity, Use equal to MatrixAKHR, and ComponentType matching VkCooperativeMatrixProperties2EXT::AType.
- The type of B has Rows that are a multiple of VkCooperativeMatrixProperties2EXT::KGranularity, Columns that are a multiple of VkCooperativeMatrixProperties2EXT::NGranularity, Use equal to MatrixBKHR, and ComponentType matching VkCooperativeMatrixProperties2EXT::BType.
- The type of C has Rows that are a multiple of VkCooperativeMatrixProperties2EXT::MGranularity, Columns that are a multiple of VkCooperativeMatrixProperties2EXT::NGranularity, Use equal to MatrixAccumulatorKHR, and ComponentType matching VkCooperativeMatrixProperties2EXT::CType.
- The type of Result has Rows that are a multiple of VkCooperativeMatrixProperties2EXT::MGranularity, Columns that are a multiple of VkCooperativeMatrixProperties2EXT::NGranularity, Use equal to MatrixAccumulatorKHR, and ComponentType matching VkCooperativeMatrixProperties2EXT::ResultType.
- MatrixASignedComponents is used if and only if VkCooperativeMatrixProperties2EXT::AType is a signed integer type.
- MatrixBSignedComponents is used if and only if VkCooperativeMatrixProperties2EXT::BType is a signed integer type.
- MatrixCSignedComponents is used if and only if VkCooperativeMatrixProperties2EXT::CType is a signed integer type.
- MatrixResultSignedComponents is used if and only if VkCooperativeMatrixProperties2EXT::ResultType is a signed integer type.
- SaturatingAccumulationKHR is used if and only if VkPhysicalDeviceCooperativeMatrixInfo2EXT::flags contains VK_COOPERATIVE_MATRIX_SATURATING_ACCUMULATION_BIT_EXT.
- If the cooperativeMatrixFlexibleDimensions feature is not enabled, the dimensions match the granularities exactly.

VkCooperativeMatrixFlexibleDimensionsPropertiesNV Matching

The following rules define how cooperative matrix types and instructions match a

VkCooperativeMatrixFlexibleDimensionsPropertiesNV structure returned by vkGetPhysicalDeviceCooperativeMatrixFlexibleDimensionsPropertiesNV.

VkCooperativeMatrixFlexibleDimensionsPropertiesNV Type Matching

An OpTypeCooperativeMatrixKHR type matches a VkCooperativeMatrixFlexibleDimensionsPropertiesNV structure if all of the following conditions are satisfied:

- Its scope matches VkCooperativeMatrixFlexibleDimensionsPropertiesNV::scope.
- If Use is MatrixA, its number of rows is a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity, its number of columns is a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::KGranularity, and its component type matches VkCooperativeMatrixFlexibleDimensionsPropertiesNV::AType.
- If Use is MatrixB, its number of rows is a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::KGranularity, its number of columns is a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity, and its component type matches VkCooperativeMatrixFlexibleDimensionsPropertiesNV::BType.
- If Use is MatrixAccumulator, its number of rows is a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity, its number of columns is a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity, and its component type matches either VkCooperativeMatrixFlexibleDimensionsPropertiesNV::CType or VkCooperativeMatrixFlexibleDimensionsPropertiesNV::ResultType.
- If its scope is VK_SCOPE_WORKGROUP_KHR, the number of invocations in the local workgroup matches VkCooperativeMatrixFlexibleDimensionsPropertiesNV::workgroupInvocations.

VkCooperativeMatrixFlexibleDimensionsPropertiesNV Multiply-Add Matching

The operands of an OpCooperativeMatrixMulAddKHR instruction match a VkCooperativeMatrixFlexibleDimensionsPropertiesNV structure if all of the following conditions are satisfied:

- The type of A has Rows that are a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity, Columns that are a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::KGranularity, Use equal to MatrixAKHR, and ComponentType matching VkCooperativeMatrixFlexibleDimensionsPropertiesNV::AType.
- The type of B has Rows that are a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::KGranularity, Columns that are a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity, Use equal to MatrixBKHR, and ComponentType matching VkCooperativeMatrixFlexibleDimensionsPropertiesNV::BType.
- The type of C has Rows that are a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity, Columns that are a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity, Use equal to MatrixAccumulatorKHR, and ComponentType matching VkCooperativeMatrixFlexibleDimensionsPropertiesNV::CType.
- The type of Result has Rows that are a multiple of

VkCooperativeMatrixFlexibleDimensionsPropertiesNV::MGranularity, Columns that are a multiple of VkCooperativeMatrixFlexibleDimensionsPropertiesNV::NGranularity, Use equal to MatrixAccumulatorKHR, and ComponentType matching VkCooperativeMatrixFlexibleDimensionsPropertiesNV::ResultType.

- MatrixASignedComponents is used if and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::AType is a signed integer type.
- MatrixBSignedComponents is used if and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::BType is a signed integer type.
- MatrixCSignedComponents is used if and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::CType is a signed integer type.
- MatrixResultSignedComponents is used if and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::ResultType is a signed integer type.
- SaturatingAccumulationKHR is used if and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::saturatingAccumulation is VK_TRUE.
- SaturatingAccumulationKHR is not used if and only if VkCooperativeMatrixFlexibleDimensionsPropertiesNV::saturatingAccumulation is VK_FALSE.
- The scope of all cooperative matrix operands matches VkCooperativeMatrixFlexibleDimensionsPropertiesNV::scope.
- If the scope is VK_SCOPE_WORKGROUP_KHR, the number of invocations in the local workgroup matches VkCooperativeMatrixFlexibleDimensionsPropertiesNV::workgroupInvocations.

9.33. Cooperative Vectors

A *cooperative vector* type is a SPIR-V vector type optimized for the evaluation of small neural networks.

SPIR-V defines the types and instructions, but does not specify rules about what combinations of types are valid, and it is expected that different implementations **may** support different combinations.

To enumerate the supported cooperative vector type combinations, call:

```
// Provided by VK_NV_cooperative_vector
VkResult vkGetPhysicalDeviceCooperativeVectorPropertiesNV(
    VkPhysicalDevice                            physicalDevice,
    uint32_t*                                   pPropertyCount,
    VkCooperativeVectorPropertiesNV*            pProperties);
```

- physicalDevice is the physical device.
- pPropertyCount is a pointer to an integer related to the number of cooperative vector properties available or queried.
- pProperties is either NULL or a pointer to an array of VkCooperativeVectorPropertiesNV structures.

If pProperties is NULL, then the number of cooperative vector properties available is returned in pPropertyCount. Otherwise, pPropertyCount **must** point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of cooperative vector properties available, at most pPropertyCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available cooperative vector properties were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeVectorPropertiesNV-physicalDevice-parameter
  physicalDevice **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceCooperativeVectorPropertiesNV-pPropertyCount-parameter
  pPropertyCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceCooperativeVectorPropertiesNV-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties **must** be a valid pointer to an array of pPropertyCount VkCooperativeVectorPropertiesNV structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Each VkCooperativeVectorPropertiesNV structure describes a single supported combination of types for a matrix-vector multiply (or multiply-add) operation (OpCooperativeVectorMatrixMulNV or OpCooperativeVectorMatrixMulAddNV).

The VkCooperativeVectorPropertiesNV structure is defined as:

```
// Provided by VK_NV_cooperative_vector
typedef struct VkCooperativeVectorPropertiesNV {
    VkStructureType       sType;
    void*                 pNext;
    VkComponentTypeKHR    inputType;
    VkComponentTypeKHR    inputInterpretation;
    VkComponentTypeKHR    matrixInterpretation;
    VkComponentTypeKHR    biasInterpretation;
    VkComponentTypeKHR    resultType;
    VkBool32              transpose;
} VkCooperativeVectorPropertiesNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `inputType` is the component type of vector `Input`, of type VkComponentTypeKHR.
- `inputInterpretation` is the value of `InputInterpretation`, of type VkComponentTypeKHR.
- `matrixInterpretation` is the value of `MatrixInterpretation`, of type VkComponentTypeKHR.
- `biasInterpretation` is the value of `BiasInterpretation`, of type VkComponentTypeKHR.
- `resultType` is the component type of `Result Type`, of type VkComponentTypeKHR.
- `transpose` is a boolean indicating whether opaque layout matrices with this combination of input and output types support transposition.

VK_COMPONENT_TYPE_SINT8_PACKED_NV and VK_COMPONENT_TYPE_UINT8_PACKED_NV **must** not be used for members other than `inputInterpretation`.

The following combinations **must** be supported (each row is a required combination):

inputType	inputInterpretation	matrixInterpretation	biasInterpretation	resultType
FLOAT16	FLOAT16	FLOAT16	FLOAT16	FLOAT16
UINT32	SINT8_PACKED	SINT8	SINT32	SINT32
SINT8	SINT8	SINT8	SINT32	SINT32
FLOAT32	SINT8	SINT8	SINT32	SINT32
FLOAT16	FLOAT_E4M3	FLOAT_E4M3	FLOAT16	FLOAT16
FLOAT16	FLOAT_E5M2	FLOAT_E5M2	FLOAT16	FLOAT16

Valid Usage (Implicit)

- VUID-VkCooperativeVectorPropertiesNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_COOPERATIVE_VECTOR_PROPERTIES_NV
- VUID-VkCooperativeVectorPropertiesNV-pNext-pNext
  `pNext` **must** be `NULL`

- VUID-VkCooperativeVectorPropertiesNV-inputType-parameter
  `inputType` **must** be a valid VkComponentTypeKHR value
- VUID-VkCooperativeVectorPropertiesNV-inputInterpretation-parameter
  `inputInterpretation` **must** be a valid VkComponentTypeKHR value
- VUID-VkCooperativeVectorPropertiesNV-matrixInterpretation-parameter
  `matrixInterpretation` **must** be a valid VkComponentTypeKHR value
- VUID-VkCooperativeVectorPropertiesNV-biasInterpretation-parameter
  `biasInterpretation` **must** be a valid VkComponentTypeKHR value
- VUID-VkCooperativeVectorPropertiesNV-resultType-parameter
  `resultType` **must** be a valid VkComponentTypeKHR value

To query the size of a cooperative vector matrix, or to convert a matrix to another layout and type, call:

```
// Provided by VK_NV_cooperative_vector
VkResult vkConvertCooperativeVectorMatrixNV(
    VkDevice                                    device,
    const VkConvertCooperativeVectorMatrixInfoNV* pInfo);
```

- `device` is the device.
- `pInfo` is a pointer to a VkConvertCooperativeVectorMatrixInfoNV structure containing information about the layout conversion.

If `pInfo->dstData` is `NULL`, then the number of bytes required to store the converted matrix is returned in `pDstSize`. Otherwise, `pInfo->pDstSize` **must** point to a variable set by the user to the number of bytes in `pInfo->dstData`, and on return the variable is overwritten with the number of bytes actually written to `pInfo->dstData`. `pInfo->srcData` **can** be `NULL` when `pInfo->dstData` is `NULL`. If `pInfo->pDstSize` is less than the number of bytes required to store the converted matrix, no bytes will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not enough space was provided.

Valid Usage

- VUID-vkConvertCooperativeVectorMatrixNV-pInfo-10073
  If `pInfo->srcData.hostAddress` is `NULL`, then `pInfo->dstData.hostAddress` **must** be `NULL`
- VUID-vkConvertCooperativeVectorMatrixNV-pInfo-10074
  If `pInfo->srcData.hostAddress` is not `NULL`, then `pInfo->srcSize` **must** be large enough to contain the source matrix, based either on the standard matrix layout or based on the size filled out by this command
- VUID-vkConvertCooperativeVectorMatrixNV-pInfo-10075
  If `pInfo->dstData.hostAddress` is not `NULL`, then the value pointed to by `pInfo->pDstSize` **must** be large enough to contain the destination matrix, based either on the standard matrix layout or based on the size filled out by this command

- VUID-vkConvertCooperativeVectorMatrixNV-pInfo-10076
  If `pInfo->dstData.hostAddress` is not `NULL`, the source and destination memory ranges **must** not overlap

Valid Usage (Implicit)

- VUID-vkConvertCooperativeVectorMatrixNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkConvertCooperativeVectorMatrixNV-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkConvertCooperativeVectorMatrixInfoNV structure

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Each `VkConvertCooperativeVectorMatrixInfoNV` structure describes a request to convert the layout and type of a cooperative vector matrix.

The `VkConvertCooperativeVectorMatrixInfoNV` structure is defined as:

```
// Provided by VK_NV_cooperative_vector
typedef struct VkConvertCooperativeVectorMatrixInfoNV {
    VkStructureType                       sType;
    const void*                           pNext;
    size_t                                srcSize;
    VkDeviceOrHostAddressConstKHR         srcData;
    size_t*                               pDstSize;
    VkDeviceOrHostAddressKHR              dstData;
    VkComponentTypeKHR                    srcComponentType;
    VkComponentTypeKHR                    dstComponentType;
    uint32_t                              numRows;
    uint32_t                              numColumns;
    VkCooperativeVectorMatrixLayoutNV     srcLayout;
    size_t                                srcStride;
    VkCooperativeVectorMatrixLayoutNV     dstLayout;
    size_t                                dstStride;
} VkConvertCooperativeVectorMatrixInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSize` is the length in bytes of `srcData`.
- `srcData` is either `NULL` or a pointer to the source data in the source layout.
- `pDstSize` is a pointer to an integer related to the number of bytes required or requested to convert.
- `dstData` is either `NULL` or a pointer to the destination data in the destination layout.
- `srcComponentType` is the type of a source matrix element.
- `dstComponentType` is the type of a destination matrix element.
- `numRows` is the number of rows in the matrix.
- `numColumns` is the number of columns in the matrix.
- `srcLayout` is the layout of the source matrix.
- `srcStride` is the number of bytes between a consecutive row or column (depending on `srcLayout`) of the source matrix, if it is row-major or column-major.
- `dstLayout` is the layout the matrix is converted to.
- `dstStride` is the number of bytes between a consecutive row or column (depending on `dstLayout`) of the destination matrix, if it is row-major or column-major.

When called from vkCmdConvertCooperativeVectorMatrixNV, the `deviceAddress` members of `srcData` and `dstData` are used. When called from vkConvertCooperativeVectorMatrixNV, the `hostAddress` members of `srcData` and `dstData` are used.

For each of the source and destination matrix, if the layout is not either VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_ROW_MAJOR_NV or VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_COLUMN_MAJOR_NV, then the corresponding stride

parameter is ignored.

The size of the destination is only a function of the destination layout information, and does not depend on the source layout information.

Conversion **can** be used to convert between VK_COMPONENT_TYPE_FLOAT32_KHR or VK_COMPONENT_TYPE_FLOAT16_KHR and any supported lower-precision floating-point type. In this case, the conversion uses round-to-nearest-even rounding.

Valid Usage

- VUID-VkConvertCooperativeVectorMatrixInfoNV-srcLayout-10077
  If `srcLayout` is row-major or column-major, then `srcStride` **must** be greater than the length of a row/column, and a multiple of the element size
- VUID-VkConvertCooperativeVectorMatrixInfoNV-dstLayout-10078
  If `dstLayout` is row-major or column-major, then `dstStride` **must** be greater than the length of a row/column, and a multiple of the element size
- VUID-VkConvertCooperativeVectorMatrixInfoNV-srcComponentType-10079
  If `srcComponentType` is not a supported VkCooperativeVectorPropertiesNV::`matrixInterpretation` value as reported by vkGetPhysicalDeviceCooperativeVectorPropertiesNV, then `srcComponentType` **must** be VK_COMPONENT_TYPE_FLOAT32_KHR
- VUID-VkConvertCooperativeVectorMatrixInfoNV-dstComponentType-10080
  If `dstComponentType` is not a supported VkCooperativeVectorPropertiesNV::`matrixInterpretation` value as reported by vkGetPhysicalDeviceCooperativeVectorPropertiesNV, then `dstComponentType` **must** be VK_COMPONENT_TYPE_FLOAT32_KHR
- VUID-VkConvertCooperativeVectorMatrixInfoNV-srcComponentType-10081
  If `srcComponentType` and `dstComponentType` are not equal, then one **must** be VK_COMPONENT_TYPE_FLOAT32_KHR or VK_COMPONENT_TYPE_FLOAT16_KHR and the other **must** be a lower-precision floating-point type
- VUID-VkConvertCooperativeVectorMatrixInfoNV-dstComponentType-10082
  If `dstComponentType` is VK_COMPONENT_TYPE_FLOAT_E4M3_NV or VK_COMPONENT_TYPE_FLOAT_E5M2_NV, then `dstLayout` **must** be VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_INFERENCING_OPTIMAL_NV or VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_TRAINING_OPTIMAL_NV

Valid Usage (Implicit)

- VUID-VkConvertCooperativeVectorMatrixInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_CONVERT_COOPERATIVE_VECTOR_MATRIX_INFO_NV
- VUID-VkConvertCooperativeVectorMatrixInfoNV-pNext-pNext
  `pNext` **must** be `NULL`

- VUID-VkConvertCooperativeVectorMatrixInfoNV-srcData-parameter
  `srcData` **must** be a valid VkDeviceOrHostAddressConstKHR union
- VUID-VkConvertCooperativeVectorMatrixInfoNV-pDstSize-parameter
  `pDstSize` **must** be a valid pointer to a `size_t` value
- VUID-VkConvertCooperativeVectorMatrixInfoNV-dstData-parameter
  `dstData` **must** be a valid VkDeviceOrHostAddressKHR union
- VUID-VkConvertCooperativeVectorMatrixInfoNV-srcComponentType-parameter
  `srcComponentType` **must** be a valid VkComponentTypeKHR value
- VUID-VkConvertCooperativeVectorMatrixInfoNV-dstComponentType-parameter
  `dstComponentType` **must** be a valid VkComponentTypeKHR value
- VUID-VkConvertCooperativeVectorMatrixInfoNV-srcLayout-parameter
  `srcLayout` **must** be a valid VkCooperativeVectorMatrixLayoutNV value
- VUID-VkConvertCooperativeVectorMatrixInfoNV-dstLayout-parameter
  `dstLayout` **must** be a valid VkCooperativeVectorMatrixLayoutNV value

Possible values for VkCooperativeVectorMatrixLayoutNV include:

```
// Provided by VK_NV_cooperative_vector
typedef enum VkCooperativeVectorMatrixLayoutNV {
    VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_ROW_MAJOR_NV = 0,
    VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_COLUMN_MAJOR_NV = 1,
    VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_INFERENCING_OPTIMAL_NV = 2,
    VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_TRAINING_OPTIMAL_NV = 3,
} VkCooperativeVectorMatrixLayoutNV;
```

- VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_ROW_MAJOR_NV corresponds to SPIR-V `RowMajorNV` layout.
- VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_COLUMN_MAJOR_NV corresponds to SPIR-V `ColumnMajorNV` layout.
- VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_INFERENCING_OPTIMAL_NV corresponds to SPIR-V `InferencingOptimalNV` layout.
- VK_COOPERATIVE_VECTOR_MATRIX_LAYOUT_TRAINING_OPTIMAL_NV corresponds to SPIR-V `TrainingOptimalNV` layout.

All enum values match the corresponding SPIR-V value.

Row-major layout has elements of each row stored consecutively in memory, with a controllable stride from the start of one row to the start of the next row. Column-major layout has elements of each column stored consecutively in memory, with a controllable stride from the start of one column to the start of the next column. Inferencing-optimal and Training-optimal layouts are implementation-dependent, and the application **can** convert a matrix to those layouts using vkConvertCooperativeVectorMatrixNV or vkCmdConvertCooperativeVectorMatrixNV. Training-optimal layout with VK_COMPONENT_TYPE_FLOAT16_KHR or VK_COMPONENT_TYPE_FLOAT32_KHR type has the additional guarantee that the application **can**

reinterpret the data as an array of elements and perform element-wise operations on the data, and finite values in any padding elements do not affect the result of a matrix-vector multiply (inf/NaN values **may** still cause NaN values in the result).

To convert a matrix to another layout and type, call:

```
// Provided by VK_NV_cooperative_vector
void vkCmdConvertCooperativeVectorMatrixNV(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    infoCount,
    const VkConvertCooperativeVectorMatrixInfoNV* pInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of layout conversions to perform.
- `pInfos` is a pointer to an array of VkConvertCooperativeVectorMatrixInfoNV structures containing information about the layout conversion.

This command does the same conversions as vkConvertCooperativeVectorMatrixNV, but executes on the device. One conversion is performed for each of the `infoCount` elements of `pInfos`.

This command's execution is synchronized using VK_PIPELINE_STAGE_2_CONVERT_COOPERATIVE_VECTOR_MATRIX_BIT_NV.

Valid Usage

- VUID-vkCmdConvertCooperativeVectorMatrixNV-pInfo-10083
  For each element of `pInfos`, `srcData.deviceAddress` **must** be a valid VkDeviceAddress
- VUID-vkCmdConvertCooperativeVectorMatrixNV-pInfo-10895
  For each element of `pInfos`, `dstData.deviceAddress` **must** be a valid VkDeviceAddress
- VUID-vkCmdConvertCooperativeVectorMatrixNV-pInfo-10084
  For each element of `pInfos`, `srcData.deviceAddress` **must** be 64 byte aligned
- VUID-vkCmdConvertCooperativeVectorMatrixNV-pInfo-10085
  For each element of `pInfos`, `dstData.deviceAddress` **must** be 64 byte aligned
- VUID-vkCmdConvertCooperativeVectorMatrixNV-pInfo-10086
  For each element of `pInfos`, `srcSize` **must** be large enough to contain the source matrix, based either on the standard matrix layout or based on the size filled out by vkConvertCooperativeVectorMatrixNV
- VUID-vkCmdConvertCooperativeVectorMatrixNV-pInfo-10087
  For each element of `pInfos`, the value pointed to by `pDstSize` **must** be large enough to contain the destination matrix, based either on the standard matrix layout or based on the size filled out by vkConvertCooperativeVectorMatrixNV
- VUID-vkCmdConvertCooperativeVectorMatrixNV-None-10088
  Memory accessed by the sources and destinations of all of the conversions **must** not overlap

Valid Usage (Implicit)

- VUID-vkCmdConvertCooperativeVectorMatrixNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdConvertCooperativeVectorMatrixNV-pInfos-parameter
  `pInfos` **must** be a valid pointer to an array of `infoCount` valid VkConvertCooperativeVectorMatrixInfoNV structures
- VUID-vkCmdConvertCooperativeVectorMatrixNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdConvertCooperativeVectorMatrixNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdConvertCooperativeVectorMatrixNV-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdConvertCooperativeVectorMatrixNV-suspended
  This command **must** not be called between suspended render pass instances
- VUID-vkCmdConvertCooperativeVectorMatrixNV-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdConvertCooperativeVectorMatrixNV-infoCount-arraylength
  `infoCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	Action

Conditional Rendering

vkCmdConvertCooperativeVectorMatrixNV is not affected by conditional rendering

9.34. Validation Cache

Validation cache objects allow the result of internal validation to be reused, both within a single application run and between multiple runs. Reuse within a single run is achieved by passing the same validation cache object when creating supported Vulkan objects. Reuse across runs of an application is achieved by retrieving validation cache contents in one run of an application, saving the contents, and using them to preinitialize a validation cache on a subsequent run. The contents of the validation cache objects are managed by the validation layers. Applications **can** manage the host memory consumed by a validation cache object and control the amount of data retrieved from a validation cache object.

Validation cache objects are represented by `VkValidationCacheEXT` handles:

```
// Provided by VK_EXT_validation_cache
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkValidationCacheEXT)
```

To create validation cache objects, call:

```
// Provided by VK_EXT_validation_cache
VkResult vkCreateValidationCacheEXT(
    VkDevice                                    device,
    const VkValidationCacheCreateInfoEXT*       pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkValidationCacheEXT*                       pValidationCache);
```

- `device` is the logical device that creates the validation cache object.
- `pCreateInfo` is a pointer to a VkValidationCacheCreateInfoEXT structure containing the initial parameters for the validation cache object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pValidationCache` is a pointer to a VkValidationCacheEXT handle in which the resulting validation cache object is returned.

NOTE

Applications **can** track and manage the total host memory size of a validation cache object using the `pAllocator`. Applications **can** limit the amount of data retrieved from a validation cache object in `vkGetValidationCacheDataEXT`. Implementations **should** not internally limit the total number of entries added to a validation cache object or the total host memory consumed.

Once created, a validation cache **can** be passed to the `vkCreateShaderModule` command by adding this object to the VkShaderModuleCreateInfo structure's `pNext` chain. If a VkShaderModuleValidationCacheCreateInfoEXT object is included in the VkShaderModuleCreateInfo::`pNext` chain, and its `validationCache` field is not VK_NULL_HANDLE, the implementation will query it for possible reuse opportunities and update it with new content. The use of the validation cache object in these commands is internally synchronized, and the same validation cache object **can** be used in multiple threads simultaneously.

NOTE	Implementations **should** make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreateShaderModule` command.

Valid Usage (Implicit)

- VUID-vkCreateValidationCacheEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateValidationCacheEXT-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkValidationCacheCreateInfoEXT structure
- VUID-vkCreateValidationCacheEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateValidationCacheEXT-pValidationCache-parameter
  `pValidationCache` **must** be a valid pointer to a VkValidationCacheEXT handle
- VUID-vkCreateValidationCacheEXT-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkValidationCacheCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_validation_cache
typedef struct VkValidationCacheCreateInfoEXT {
    VkStructureType                 sType;
    const void*                     pNext;
    VkValidationCacheCreateFlagsEXT flags;
    size_t                          initialDataSize;
    const void*                     pInitialData;
} VkValidationCacheCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

- `initialDataSize` is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the validation cache will initially be empty.
- `pInitialData` is a pointer to previously retrieved validation cache data. If the validation cache data is incompatible (as defined below) with the device, the validation cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

Valid Usage

- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01534
  If `initialDataSize` is not `0`, it **must** be equal to the size of `pInitialData`, as returned by `vkGetValidationCacheDataEXT` when `pInitialData` was originally retrieved
- VUID-VkValidationCacheCreateInfoEXT-initialDataSize-01535
  If `initialDataSize` is not `0`, `pInitialData` **must** have been retrieved from a previous call to `vkGetValidationCacheDataEXT`

Valid Usage (Implicit)

- VUID-VkValidationCacheCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_VALIDATION_CACHE_CREATE_INFO_EXT
- VUID-VkValidationCacheCreateInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkValidationCacheCreateInfoEXT-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkValidationCacheCreateInfoEXT-pInitialData-parameter
  If `initialDataSize` is not `0`, `pInitialData` **must** be a valid pointer to an array of `initialDataSize` bytes

```
// Provided by VK_EXT_validation_cache
typedef VkFlags VkValidationCacheCreateFlagsEXT;
```

`VkValidationCacheCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Validation cache objects **can** be merged using the command:

```
// Provided by VK_EXT_validation_cache
VkResult vkMergeValidationCachesEXT(
    VkDevice                                    device,
    VkValidationCacheEXT                        dstCache,
    uint32_t                                    srcCacheCount,
    const VkValidationCacheEXT*                 pSrcCaches);
```

- `device` is the logical device that owns the validation cache objects.
- `dstCache` is the handle of the validation cache to merge results into.
- `srcCacheCount` is the length of the `pSrcCaches` array.
- `pSrcCaches` is a pointer to an array of validation cache handles, which will be merged into `dstCache`. The previous contents of `dstCache` are included after the merge.

NOTE	The details of the merge operation are implementation-dependent, but implementations **should** merge the contents of the specified validation caches and prune duplicate entries.

Valid Usage

- VUID-vkMergeValidationCachesEXT-dstCache-01536
  `dstCache` **must** not appear in the list of source caches

Valid Usage (Implicit)

- VUID-vkMergeValidationCachesEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkMergeValidationCachesEXT-dstCache-parameter
  `dstCache` **must** be a valid VkValidationCacheEXT handle
- VUID-vkMergeValidationCachesEXT-pSrcCaches-parameter
  `pSrcCaches` **must** be a valid pointer to an array of `srcCacheCount` valid VkValidationCacheEXT handles
- VUID-vkMergeValidationCachesEXT-srcCacheCount-arraylength
  `srcCacheCount` **must** be greater than `0`
- VUID-vkMergeValidationCachesEXT-dstCache-parent
  `dstCache` **must** have been created, allocated, or retrieved from `device`
- VUID-vkMergeValidationCachesEXT-pSrcCaches-parent
  Each element of `pSrcCaches` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `dstCache` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Data **can** be retrieved from a validation cache object using the command:

```
// Provided by VK_EXT_validation_cache
VkResult vkGetValidationCacheDataEXT(
    VkDevice                                    device,
    VkValidationCacheEXT                        validationCache,
    size_t*                                     pDataSize,
    void*                                       pData);
```

- `device` is the logical device that owns the validation cache.
- `validationCache` is the validation cache to retrieve data from.
- `pDataSize` is a pointer to a value related to the amount of data in the validation cache, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the maximum size of the data that **can** be retrieved from the validation cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the maximum size that **can** be retrieved by the validation cache, at most `pDataSize` bytes will be written to `pData`, and `vkGetValidationCacheDataEXT` will return VK_INCOMPLETE instead of VK_SUCCESS, to indicate that not all of the validation cache was returned.

Any data written to `pData` is valid and **can** be provided as the `pInitialData` member of the VkValidationCacheCreateInfoEXT structure passed to `vkCreateValidationCacheEXT`.

Two calls to `vkGetValidationCacheDataEXT` with the same parameters **must** retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications **can** store the data retrieved from the validation cache, and use these data, possibly in a future run of the application, to populate new validation cache objects. The results of validation, however, **may** depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to `pData` **must** be a header consisting of the following members:

Table 12. Layout for Validation Cache Header Version
VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT

Offset	Size	Meaning
0	4	length in bytes of the entire validation cache header written as a stream of bytes, with the least significant byte first
4	4	a VkValidationCacheHeaderVersionEXT value written as a stream of bytes, with the least significant byte first
8	VK_UUID_SIZE	a layer commit ID expressed as a UUID, which uniquely identifies the version of the validation layers used to generate these validation results

The first four bytes encode the length of the entire validation cache header, in bytes. This value includes all fields in the header including the validation cache version field and the size of the length field.

The next four bytes encode the validation cache version, as described for VkValidationCacheHeaderVersionEXT. A consumer of the validation cache **should** use the cache version to interpret the remainder of the cache header.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`.

NOTE

This query does not behave consistently with the behavior described in Opaque Binary Data Results, for historical reasons.

If the amount of data available is larger than the passed `pDataSize`, the query returns up to the size of the passed buffer, and signals overflow with a VK_INCOMPLETE success status instead of returning a VK_ERROR_NOT_ENOUGH_SPACE_KHR error status.

Valid Usage (Implicit)

- VUID-vkGetValidationCacheDataEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetValidationCacheDataEXT-validationCache-parameter
  `validationCache` **must** be a valid VkValidationCacheEXT handle
- VUID-vkGetValidationCacheDataEXT-pDataSize-parameter
  `pDataSize` **must** be a valid pointer to a `size_t` value
- VUID-vkGetValidationCacheDataEXT-pData-parameter
  If the value referenced by `pDataSize` is not `0`, and `pData` is not `NULL`, `pData` **must** be a valid pointer to an array of `pDataSize` bytes
- VUID-vkGetValidationCacheDataEXT-validationCache-parent
  `validationCache` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Possible values of the second group of four bytes in the header returned by vkGetValidationCacheDataEXT, encoding the validation cache version, are:

```
// Provided by VK_EXT_validation_cache
typedef enum VkValidationCacheHeaderVersionEXT {
    VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT = 1,
} VkValidationCacheHeaderVersionEXT;
```

- VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT specifies version one of the validation cache.

To destroy a validation cache, call:

```
// Provided by VK_EXT_validation_cache
void vkDestroyValidationCacheEXT(
    VkDevice                                    device,
    VkValidationCacheEXT                        validationCache,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the validation cache object.
- `validationCache` is the handle of the validation cache to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyValidationCacheEXT-validationCache-01537
  If `VkAllocationCallbacks` were provided when `validationCache` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyValidationCacheEXT-validationCache-01538
  If no `VkAllocationCallbacks` were provided when `validationCache` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyValidationCacheEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyValidationCacheEXT-validationCache-parameter
  If `validationCache` is not VK_NULL_HANDLE, `validationCache` **must** be a valid VkValidationCacheEXT handle
- VUID-vkDestroyValidationCacheEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyValidationCacheEXT-validationCache-parent
  If `validationCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `validationCache` **must** be externally synchronized

9.35. CUDA Modules

9.35.1. Creating a CUDA Module

CUDA modules **must** contain some kernel code and **must** expose at least one function entry point.

CUDA modules are represented by `VkCudaModuleNV` handles:

```
// Provided by VK_NV_cuda_kernel_launch
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCudaModuleNV)
```

To create a CUDA module, call:

```
// Provided by VK_NV_cuda_kernel_launch
VkResult vkCreateCudaModuleNV(
    VkDevice                                    device,
    const VkCudaModuleCreateInfoNV*             pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkCudaModuleNV*                             pModule);
```

- `device` is the logical device that creates the shader module.
- `pCreateInfo` is a pointer to a VkCudaModuleCreateInfoNV structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

- `pModule` is a pointer to a VkCudaModuleNV handle in which the resulting CUDA module object is returned.

Once a CUDA module has been created, the application **may** create the function entry point, which **must** refer to one function in the module.

Valid Usage (Implicit)

- VUID-vkCreateCudaModuleNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateCudaModuleNV-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkCudaModuleCreateInfoNV structure
- VUID-vkCreateCudaModuleNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateCudaModuleNV-pModule-parameter
  `pModule` **must** be a valid pointer to a VkCudaModuleNV handle
- VUID-vkCreateCudaModuleNV-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkCudaModuleCreateInfoNV` structure is defined as:

```
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkCudaModuleCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    size_t             dataSize;
    const void*        pData;
} VkCudaModuleCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` **may** be `NULL` or **may** be a pointer to a structure extending this structure.

- `dataSize` is the length of the `pData` array.
- `pData` is a pointer to CUDA code.

Valid Usage

- VUID-VkCudaModuleCreateInfoNV-dataSize-09413
  `dataSize` **must** be the total size in bytes of the PTX files or binary cache passed to `pData`

Valid Usage (Implicit)

- VUID-VkCudaModuleCreateInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_CUDA_MODULE_CREATE_INFO_NV
- VUID-VkCudaModuleCreateInfoNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCudaModuleCreateInfoNV-pData-parameter
  `pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-VkCudaModuleCreateInfoNV-dataSize-arraylength
  `dataSize` **must** be greater than `0`

9.35.2. Creating a CUDA Function Handle

CUDA functions are represented by `VkCudaFunctionNV` handles. Handles to `global` functions **may** then be used to issue a kernel launch (i.e. dispatch) from a commandbuffer. See Dispatching Command for CUDA PTX kernel.

```
// Provided by VK_NV_cuda_kernel_launch
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCudaFunctionNV)
```

To create a CUDA function, call:

```
// Provided by VK_NV_cuda_kernel_launch
VkResult vkCreateCudaFunctionNV(
    VkDevice                                    device,
    const VkCudaFunctionCreateInfoNV*           pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkCudaFunctionNV*                           pFunction);
```

- `device` is the logical device that creates the shader module.
- `pCreateInfo` is a pointer to a VkCudaFunctionCreateInfoNV structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFunction` is a pointer to a VkCudaFunctionNV handle in which the resulting CUDA function object is returned.

Valid Usage (Implicit)

- VUID-vkCreateCudaFunctionNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateCudaFunctionNV-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkCudaFunctionCreateInfoNV structure
- VUID-vkCreateCudaFunctionNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateCudaFunctionNV-pFunction-parameter
  `pFunction` **must** be a valid pointer to a VkCudaFunctionNV handle
- VUID-vkCreateCudaFunctionNV-device-queuecount
  The device **must** have been created with at least `1` queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkCudaFunctionCreateInfoNV` structure is defined as:

```
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkCudaFunctionCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkCudaModuleNV     module;
    const char*        pName;
} VkCudaFunctionCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `module` is the CUDA VkCudaModuleNV module in which the function resides.
- `pName` is a null-terminated UTF-8 string containing the name of the shader entry point for this stage.

Valid Usage (Implicit)

- VUID-VkCudaFunctionCreateInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_CUDA_FUNCTION_CREATE_INFO_NV
- VUID-VkCudaFunctionCreateInfoNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCudaFunctionCreateInfoNV-module-parameter
  `module` **must** be a valid VkCudaModuleNV handle
- VUID-VkCudaFunctionCreateInfoNV-pName-parameter
  `pName` **must** be a null-terminated UTF-8 string

9.35.3. Destroying a CUDA Function

To destroy a CUDA function handle, call:

```
// Provided by VK_NV_cuda_kernel_launch
void vkDestroyCudaFunctionNV(
    VkDevice                                    device,
    VkCudaFunctionNV                            function,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the Function.
- `function` is the handle of the CUDA function to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage (Implicit)

- VUID-vkDestroyCudaFunctionNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyCudaFunctionNV-function-parameter
  `function` **must** be a valid VkCudaFunctionNV handle
- VUID-vkDestroyCudaFunctionNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyCudaFunctionNV-function-parent
  `function` **must** have been created, allocated, or retrieved from `device`

9.35.4. Destroying a CUDA Module

To destroy a CUDA shader module, call:

```
// Provided by VK_NV_cuda_kernel_launch
void vkDestroyCudaModuleNV(
    VkDevice                                    device,
    VkCudaModuleNV                              module,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the shader module.
- `module` is the handle of the CUDA module to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage (Implicit)

- VUID-vkDestroyCudaModuleNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyCudaModuleNV-module-parameter
  `module` **must** be a valid VkCudaModuleNV handle
- VUID-vkDestroyCudaModuleNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyCudaModuleNV-module-parent
  `module` **must** have been created, allocated, or retrieved from `device`

9.35.5. Reading back CUDA Module Cache

After uploading the PTX kernel code, the module compiles the code to generate a binary cache with all the necessary information for the device to execute it. It is possible to read back this cache for later use, such as accelerating the initialization of further executions.

To get the CUDA module cache call:

```
// Provided by VK_NV_cuda_kernel_launch
VkResult vkGetCudaModuleCacheNV(
    VkDevice                                    device,
    VkCudaModuleNV                              module,
    size_t*                                     pCacheSize,
    void*                                       pCacheData);
```

- `device` is the logical device that destroys the Function.
- `module` is the CUDA module.
- `pCacheSize` is a pointer containing the amount of bytes to be copied in `pCacheData`.
- `pCacheData` is a pointer to a buffer in which to copy the binary cache.

If `pCacheData` is `NULL`, then the size of the binary cache, in bytes, is returned in `pCacheSize`. Otherwise,

`pCacheSize` **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by `pCacheData`, and on return the variable is overwritten with the amount of data actually written to `pCacheData`. If `pCacheSize` is less than the size of the binary shader code, nothing is written to `pCacheData`, and VK_INCOMPLETE will be returned instead of VK_SUCCESS.

The returned cache **may** then be used later for further initialization of the CUDA module, by sending this cache *instead* of the PTX code when using vkCreateCudaModuleNV.

NOTE

Using the binary cache instead of the original PTX code **should** significantly speed up initialization of the CUDA module, given that the whole compilation and validation will not be necessary.

As with VkPipelineCache, the binary cache depends on the specific implementation. The application **must** assume the cache upload might fail in many circumstances and thus **may** have to get ready for falling back to the original PTX code if necessary. Most often, the cache **may** succeed if the same device driver and architecture is used between the cache generation from PTX and the use of this cache. In the event of a new driver version or if using a different device architecture, this cache **may** become invalid.

NOTE

This query does not behave consistently with the behavior described in Opaque Binary Data Results, for historical reasons.

If the amount of data available is larger than the passed `pCacheSize`, the query returns a VK_INCOMPLETE success status instead of a VK_ERROR_NOT_ENOUGH_SPACE_KHR error status.

Valid Usage (Implicit)

- VUID-vkGetCudaModuleCacheNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetCudaModuleCacheNV-module-parameter
  `module` **must** be a valid VkCudaModuleNV handle
- VUID-vkGetCudaModuleCacheNV-pCacheSize-parameter
  `pCacheSize` **must** be a valid pointer to a `size_t` value
- VUID-vkGetCudaModuleCacheNV-pCacheData-parameter
  If the value referenced by `pCacheSize` is not `0`, and `pCacheData` is not `NULL`, `pCacheData` **must** be a valid pointer to an array of `pCacheSize` bytes
- VUID-vkGetCudaModuleCacheNV-module-parent
  `module` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_INCOMPLETE

- VK_SUCCESS

Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

9.35.6. Limitations

CUDA and Vulkan do not use the device in the same configuration. The following limitations **must** be taken into account:

- It is not possible to read or write global parameters from Vulkan. The only way to share resources or send values to the PTX kernel is to pass them as arguments of the function. See Resources sharing between CUDA Kernel and Vulkan for more details.
- No calls to functions external to the module PTX are supported.
- Vulkan disables some shader/kernel exceptions, which could break CUDA kernels relying on exceptions.
- CUDA kernels submitted to Vulkan are limited to the amount of shared memory, which can be queried from the physical capabilities. It may be less than what CUDA can offer.
- CUDA instruction-level preemption (CILP) does not work.
- CUDA Unified Memory will not work in this extension.
- CUDA Dynamic parallelism is not supported.
- `vk*DispatchIndirect` is not available.

9.36. Shader Instrumentation

Shaders **can** be instrumented to provide a runtime shader cost analysis.

Shader instrumentation is enabled for a pipeline when VK_PIPELINE_CREATE_2_INSTRUMENT_SHADERS_BIT_ARM is included in VkPipelineCreateFlags2CreateInfoKHR::`flags`.

Shader instrumentation is enabled for a shader object when VK_SHADER_CREATE_INSTRUMENT_SHADER_BIT_ARM is included in VkShaderCreateInfoEXT::`flags`.

NOTE	Shader instrumentation will incur a runtime performance cost. Applications or tools are only expected to enable shader instrumentation during development, for performance profiling or debugging purposes, and to leave it disabled in production use of the applications.

9.36.1. Shader Instrumentation Metrics

To enumerate the available shader instrumentation metrics, call:

```
// Provided by VK_ARM_shader_instrumentation
VkResult vkEnumeratePhysicalDeviceShaderInstrumentationMetricsARM(
    VkPhysicalDevice                                physicalDevice,
    uint32_t*                                       pDescriptionCount,
    VkShaderInstrumentationMetricDescriptionARM* pDescriptions);
```

- `physicalDevice` is the physical device.
- `pDescriptionCount` is a pointer to an integer related to the number of shader instrumentation metrics available or queried.
- `pDescriptions` is either `NULL` or a pointer to an array of VkShaderInstrumentationMetricDescriptionARM structures.

If `pDescriptions` is `NULL`, then the number of shader instrumentation metrics available is returned in `pDescriptionCount`. Otherwise, `pDescriptionCount` **must** point to a variable set by the application to the number of elements in the `pDescriptions` array, and on return the variable is overwritten with the number of structures actually written to `pDescriptions`. If `pDescriptionCount` is less than the number of shader instrumentation metrics available, at most `pDescriptionCount` structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available shader instrumentation metrics were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceShaderInstrumentationMetricsARM-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkEnumeratePhysicalDeviceShaderInstrumentationMetricsARM-pDescriptionCount-parameter
  `pDescriptionCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkEnumeratePhysicalDeviceShaderInstrumentationMetricsARM-pDescriptions-parameter
  If the value referenced by `pDescriptionCount` is not `0`, and `pDescriptions` is not `NULL`, `pDescriptions` **must** be a valid pointer to an array of `pDescriptionCount` VkShaderInstrumentationMetricDescriptionARM structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkShaderInstrumentationMetricDescriptionARM structure is defined as:

```
// Provided by VK_ARM_shader_instrumentation
typedef struct VkShaderInstrumentationMetricDescriptionARM {
    VkStructureType    sType;
    void*              pNext;
    char               name[VK_MAX_DESCRIPTION_SIZE];
    char               description[VK_MAX_DESCRIPTION_SIZE];
} VkShaderInstrumentationMetricDescriptionARM;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- name is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a short human readable name for this shader instrumentation metric.
- description is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description for this shader instrumentation metric.

Valid Usage (Implicit)

- VUID-VkShaderInstrumentationMetricDescriptionARM-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SHADER_INSTRUMENTATION_METRIC_DESCRIPTION_ARM
- VUID-VkShaderInstrumentationMetricDescriptionARM-pNext-pNext
  pNext **must** be NULL
- VUID-VkShaderInstrumentationMetricDescriptionARM-name-parameter
  name **must** be a null-terminated UTF-8 string whose length is less than or equal to VK_MAX_DESCRIPTION_SIZE
- VUID-VkShaderInstrumentationMetricDescriptionARM-description-parameter
  description **must** be a null-terminated UTF-8 string whose length is less than or equal to VK_MAX_DESCRIPTION_SIZE

9.36.2. Shader Instrumentation Objects

Shader instrumentation metrics are captured via instrumentation objects.

Shader instrumentation objects are represented by VkShaderInstrumentationARM handles:

```
// Provided by VK_ARM_shader_instrumentation
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderInstrumentationARM)
```

To create a shader instrumentation object, call:

```
// Provided by VK_ARM_shader_instrumentation
VkResult vkCreateShaderInstrumentationARM(
    VkDevice                                    device,
    const VkShaderInstrumentationCreateInfoARM* pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkShaderInstrumentationARM*                 pInstrumentation);
```

- device is the logical device that creates the shader instrumentation object.
- pCreateInfo is a pointer to a VkShaderInstrumentationCreateInfoARM structure containing information about how the shader instrumentation object is to be created.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pInstrumentation is a pointer to a handle in which the resulting shader instrumentation object is returned.

Valid Usage

Valid Usage (Implicit)

- VUID-vkCreateShaderInstrumentationARM-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkCreateShaderInstrumentationARM-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkShaderInstrumentationCreateInfoARM structure
- VUID-vkCreateShaderInstrumentationARM-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateShaderInstrumentationARM-pInstrumentation-parameter
  pInstrumentation **must** be a valid pointer to a VkShaderInstrumentationARM handle
- VUID-vkCreateShaderInstrumentationARM-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkShaderInstrumentationCreateInfoARM` structure is defined as:

```
// Provided by VK_ARM_shader_instrumentation
typedef struct VkShaderInstrumentationCreateInfoARM {
    VkStructureType    sType;
    void*              pNext;
} VkShaderInstrumentationCreateInfoARM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkShaderInstrumentationCreateInfoARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SHADER_INSTRUMENTATION_CREATE_INFO_ARM
- VUID-VkShaderInstrumentationCreateInfoARM-pNext-pNext
  `pNext` **must** be `NULL`

To destroy a shader instrumentation object, call:

```
// Provided by VK_ARM_shader_instrumentation
void vkDestroyShaderInstrumentationARM(
    VkDevice                                    device,
    VkShaderInstrumentationARM                  instrumentation,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the shader instrumentation.
- `instrumentation` is the handle of the shader instrumentation to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyShaderInstrumentationARM-instrumentation-12374
  All submitted commands that refer to `instrumentation` **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyShaderInstrumentationARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyShaderInstrumentationARM-instrumentation-parameter
  If `instrumentation` is not VK_NULL_HANDLE, `instrumentation` **must** be a valid VkShaderInstrumentationARM handle
- VUID-vkDestroyShaderInstrumentationARM-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyShaderInstrumentationARM-instrumentation-parent
  If `instrumentation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `instrumentation` **must** be externally synchronized

9.36.3. Shader Instrumentation Capture

To begin shader instrumentation, call:

```
// Provided by VK_ARM_shader_instrumentation
void vkCmdBeginShaderInstrumentationARM(
    VkCommandBuffer                             commandBuffer,
    VkShaderInstrumentationARM                  instrumentation);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `instrumentation` is the handle of the shader instrumentation object that will capture the metrics.

After beginning shader instrumentation, shader instrumentation is considered *active* within the command buffer it was called in until shader instrumentation is ended.

The shader instrumentation object has an implicit result index where the per-shader metrics will be written. The result index is set to 0 when the object is created by calling `vkCreateShaderInstrumentationARM`, and incremented by `1` for each draw, dispatch, and ray tracing command recorded while the shader instrumentation object is active.

The result index is also incremented by 1 when vkCmdExecuteGeneratedCommandsEXT is recorded.

While shader instrumentation is active, instrumented shaders write to the instrumentation object. These writes **must** be synchronized using the instrumented shader's stage with access mask VK_ACCESS_2_SHADER_WRITE_BIT. If no instrumentation object is bound, writes are discarded.

If a command buffer is submitted multiple times, the shader instrumented metrics for all submissions will be aggregated in the instrumentation object, unless the metrics are cleared between submissions.

Valid Usage

- VUID-vkCmdBeginShaderInstrumentationARM-commandBuffer-12375
  This command **must** not be recorded while shader instrumentation is active within `commandBuffer`
- VUID-vkCmdBeginShaderInstrumentationARM-commandBuffer-12376
  `commandBuffer` **must** not be a protected command buffer

Valid Usage (Implicit)

- VUID-vkCmdBeginShaderInstrumentationARM-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBeginShaderInstrumentationARM-instrumentation-parameter
  `instrumentation` **must** be a valid VkShaderInstrumentationARM handle
- VUID-vkCmdBeginShaderInstrumentationARM-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBeginShaderInstrumentationARM-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support VK_QUEUE_COMPUTE_BIT, VK_QUEUE_DATA_GRAPH_BIT_ARM, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdBeginShaderInstrumentationARM-suspended
  This command **must** not be called between suspended render pass instances
- VUID-vkCmdBeginShaderInstrumentationARM-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdBeginShaderInstrumentationARM-commonparent
  Both of `commandBuffer`, and `instrumentation` **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to `instrumentation` **must** be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_DATA_GRAPH_BIT_ARM VK_QUEUE_GRAPHICS_BIT	Action State

Conditional Rendering

vkCmdBeginShaderInstrumentationARM is not affected by conditional rendering

To end shader instrumentation, call:

```
// Provided by VK_ARM_shader_instrumentation
void vkCmdEndShaderInstrumentationARM(
    VkCommandBuffer                             commandBuffer);
```

- commandBuffer is the command buffer into which this command will be recorded.

Once recorded, shader instrumentation is no longer considered *active* within the command buffer.

Valid Usage

- VUID-vkCmdEndShaderInstrumentationARM-commandBuffer-12377
  Shader instrumentation **must** be active within commandBuffer
- VUID-vkCmdEndShaderInstrumentationARM-commandBuffer-12378
  commandBuffer **must** not be a protected command buffer

Valid Usage (Implicit)

- VUID-vkCmdEndShaderInstrumentationARM-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdEndShaderInstrumentationARM-commandBuffer-recording

commandBuffer **must** be in the recording state

- VUID-vkCmdEndShaderInstrumentationARM-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support VK_QUEUE_COMPUTE_BIT, VK_QUEUE_DATA_GRAPH_BIT_ARM, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdEndShaderInstrumentationARM-suspended
  This command **must** not be called between suspended render pass instances
- VUID-vkCmdEndShaderInstrumentationARM-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_DATA_GRAPH_BIT_ARM VK_QUEUE_GRAPHICS_BIT	Action State

Conditional Rendering

vkCmdEndShaderInstrumentationARM is not affected by conditional rendering

9.36.4. Shader Instrumentation Retrieval

Data **can** be retrieved from an instrumentation object in units of metric blocks. The size of each metric block in bytes is sizeof(VkShaderInstrumentationMetricDataHeaderARM) + sizeof(uint64_t) × VkPhysicalDeviceShaderInstrumentationPropertiesARM::numMetrics.

To retrieve metric blocks from an instrumentation object, call:

```
// Provided by VK_ARM_shader_instrumentation
VkResult vkGetShaderInstrumentationValuesARM(
    VkDevice                                    device,
    VkShaderInstrumentationARM                  instrumentation,
    uint32_t*                                   pMetricBlockCount,
    void*                                       pMetricValues,
    VkShaderInstrumentationValuesFlagsARM       flags);
```

- `device` is the logical device that was used to capture shader instrumentation data.
- `instrumentation` is the shader instrumentation object to retrieve values from.
- `pMetricBlockCount` is a pointer to an integer related to the number of metric blocks available or queried.
- `pMetricValues` is either `NULL` or a pointer to an application-allocated buffer where the results will be written.
- `flags` is reserved for future use.

If `pMetricValues` is `NULL`, then the number of metric blocks available is returned in `pMetricBlockCount`. Otherwise, `pMetricBlockCount` **must** point to a variable set by the application to the number of elements in the `pMetricValues` array, and on return the variable is overwritten with the number of metric blocks actually written to `pMetricValues`. If `pMetricBlockCount` is less than the number of metric blocks available, at most `pMetricBlockCount` elements will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available metric blocks were returned.

Metrics are written to `pMetricValues` as a tightly packed array of metric blocks, where each block consists of a `VkShaderInstrumentationMetricDataHeaderARM` header followed by `VkPhysicalDeviceShaderInstrumentationPropertiesARM::numMetrics` unsigned 64-bit values. The order of the metrics matches the order in which they are enumerated by vkEnumeratePhysicalDeviceShaderInstrumentationMetricsARM.

Valid Usage (Implicit)

- VUID-vkGetShaderInstrumentationValuesARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetShaderInstrumentationValuesARM-instrumentation-parameter
  `instrumentation` **must** be a valid VkShaderInstrumentationARM handle
- VUID-vkGetShaderInstrumentationValuesARM-pMetricBlockCount-parameter
  `pMetricBlockCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetShaderInstrumentationValuesARM-flags-zerobitmask
  `flags` **must** be `0`
- VUID-vkGetShaderInstrumentationValuesARM-instrumentation-parent
  `instrumentation` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

```
// Provided by VK_ARM_shader_instrumentation
typedef VkFlags VkShaderInstrumentationValuesFlagsARM;
```

`VkShaderInstrumentationValuesFlagsARM` is a bitmask type for parameters to the retrieval, but is currently reserved for future use.

The shader instrumentation metrics block header is defined as:

```
// Provided by VK_ARM_shader_instrumentation
typedef struct VkShaderInstrumentationMetricDataHeaderARM {
    uint32_t              resultIndex;
    uint32_t              resultSubIndex;
    VkShaderStageFlags    stages;
    uint32_t              basicBlockIndex;
} VkShaderInstrumentationMetricDataHeaderARM;
```

- `resultIndex` is the result index of the metric block, as captured when the command was recorded.
- `resultSubIndex` is a secondary index with the result index, explained further below.
- `stages` is a bitfield of VkShaderStageFlagBits describing the shader stages that the metric block is for.
- `basicBlockIndex` is the index of the basic block within the shader that the metric block is for.

Valid Usage (Implicit)

- VUID-VkShaderInstrumentationMetricDataHeaderARM-stages-parameter
  `stages` **must** be a valid combination of VkShaderStageFlagBits values

The `resultIndex` is the index captured during command buffer recording, and identifies the draw, dispatch, or ray tracing command that the metrics are captured for.

Metrics are returned in ascending order of `resultIndex` values. Metrics with the same value of `resultIndex` are returned in ascending order of `resultSubIndex` values. Metrics with the same value of `resultIndex` and `resultSubIndex` are grouped by the value of `stages`. Metrics with the same value of `resultIndex`, `resultSubIndex`, and `stages` are returned in ascending order of `basicBlockIndex` values.

All metrics for commands that record multiple draws (such as indirect drawing commands with `drawCount` greater than one), dispatches, or involve groups of shaders (such as ray tracing pipelines), are returned using the same `resultIndex`.

Implementations **may** use a non-zero `resultSubIndex` to report more fine-grained metrics (such as per draw) for such commands, or aggregate all metrics for the command using `resultSubIndex` zero.

Metrics for commands recorded while multiview is enabled are returned as aggregated values across all views.

Implementations **may** aggregate metrics for multiple shader stages. The value of `stages` describes which shader stages have been aggregated.

`basicBlockIndex` describes the index of the basic block of the shader that metrics are captured for. If `VkPhysicalDeviceShaderInstrumentationPropertiesARM::perBasicBlockGranularity` is VK_FALSE, results are aggregated for the entire shader and reported as basic block zero.

9.36.5. Shader Instrumentation Clearing

To clear the value of all metric blocks in an instrumentation object to zero, call:

```
// Provided by VK_ARM_shader_instrumentation
void vkClearShaderInstrumentationMetricsARM(
    VkDevice                                    device,
    VkShaderInstrumentationARM                  instrumentation);
```

- `device` is the logical device that owns the shader instrumentation object.
- `instrumentation` is the shader instrumentation object to clear.

Valid Usage (Implicit)

- VUID-vkClearShaderInstrumentationMetricsARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkClearShaderInstrumentationMetricsARM-instrumentation-parameter
  `instrumentation` **must** be a valid VkShaderInstrumentationARM handle
- VUID-vkClearShaderInstrumentationMetricsARM-instrumentation-parent
  `instrumentation` **must** have been created, allocated, or retrieved from `device`

Chapter 10. Pipelines

The following figure shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, such as a *graphics pipeline*, a *ray tracing pipeline*, or a *compute pipeline*.

The graphics pipeline can be operated in two modes, as either *primitive shading* or *mesh shading* pipeline.

Primitive Shading

The first stage of the graphics pipeline (Input Assembler) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage (Vertex Shader) vertices **can** be transformed, computing positions and attributes for each vertex. If tessellation and/or geometry shaders are supported, they **can** then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

Cluster Culling Shading

When using the Cluster Culling Shader, a compute-like shader will perform cluster-based culling, a set of new built-in output variables are used to express visible cluster, in addition, a new built-in function is used to emit these variables from the cluster culling shader to the Input Assembler (IA) stage, then IA can use these variables to fetch vertices of visible cluster and drive vertex shader to work.

Mesh Shading

When using the *mesh shading* pipeline input primitives are not assembled implicitly, but explicitly through the (Mesh Shader). The work on the mesh pipeline is initiated by the application drawing a set of mesh tasks.

If an optional (Task Shader) is active, each task triggers the execution of a task shader workgroup that will generate a new set of tasks upon completion. Each of these spawned tasks, or each of the original dispatched tasks if no task shader is present, triggers the execution of a mesh shader workgroup that produces an output mesh with a variable-sized number of primitives assembled from vertices stored in the output mesh.

Common

The final resulting primitives are clipped to a clip volume in preparation for the next stage, Rasterization. The rasterizer produces a series of *fragments* associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by fragment operations to determine whether generated values will be written to the framebuffer. Fragment shading determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a render pass instance. The attachments **can**

be used as input attachments in the fragment shader in a later subpass of the same render pass.

The compute pipeline is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which **can** read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the synchronization chapter.

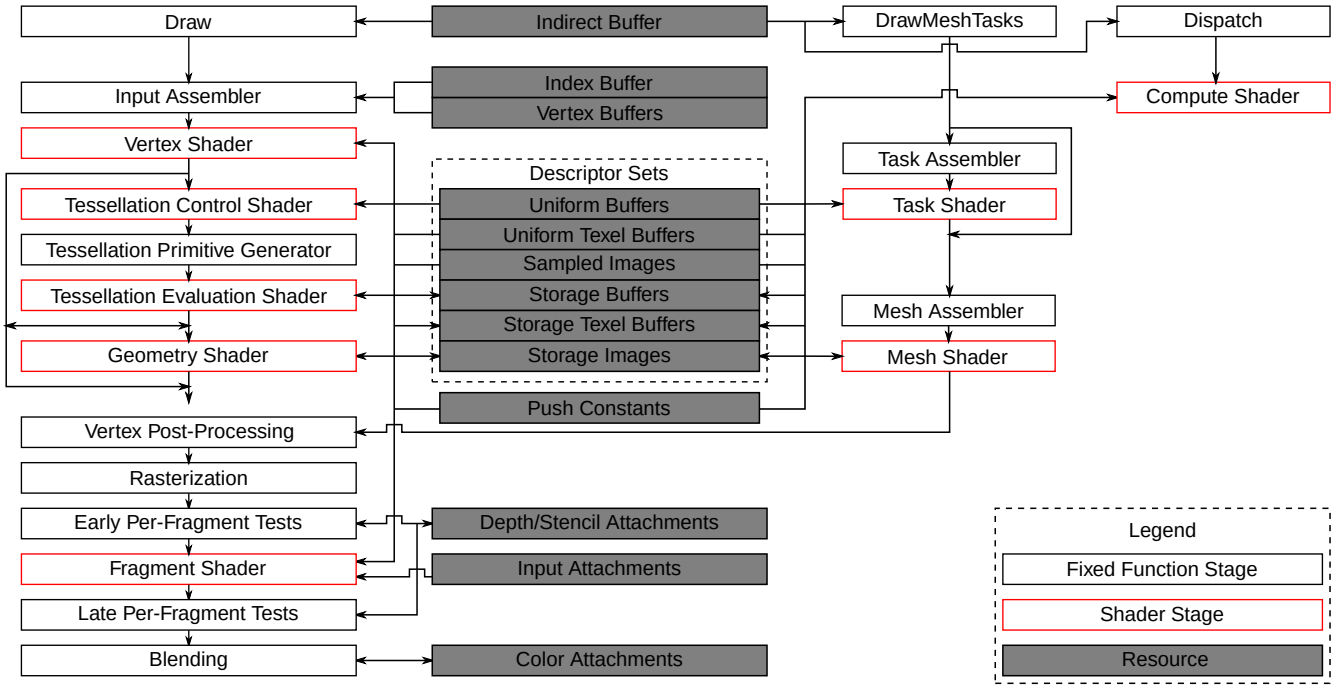

Figure 2. Block diagram of the Vulkan pipeline

Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. Linking the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using vkCmdBindPipeline. Any pipeline object state that is specified as dynamic is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

If the `commandBufferInheritance` feature is not enabled, then no state, including dynamic state, is inherited from one command buffer to another.

If the `commandBufferInheritance` feature is enabled, then all graphics and compute state that is valid at the end of the command buffer executed in a queue is inherited and valid at beginning of the command buffer next executed in the same queue. This applies to both primary and secondary command buffers, where a primary command buffer submitted to a queue will inherit state from the previously submitted command buffer to that queue, secondary command buffers will inherit state from the primary or secondary command buffer they are executed in, and after a secondary command buffer is executed, its state is inherited by the primary or secondary command buffer that executed it. Command buffers executed in one queue do not inherit state from any command

buffers executed in another queue.

Compute, ray tracing, and graphics pipelines are each represented by VkPipeline handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

10.1. Multiple Pipeline Creation

Multiple pipelines **can** be created in a single call by commands such as:

- vkCreateExecutionGraphPipelinesAMDX,
- vkCreateRayTracingPipelinesKHR,
- vkCreateRayTracingPipelinesNV,
- vkCreateDataGraphPipelinesARM,
- vkCreateGraphicsPipelines,
- vkCreateComputePipelines.

The creation commands are passed an array pCreateInfos of Vk*PipelineCreateInfo structures specifying parameters of each pipeline to be created, and return a corresponding array of handles in pPipelines. Each element index *i* of pPipelines is created based on the corresponding element *i* of pCreateInfos.

Applications **can** group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities when creating a group.

When attempting to create many pipelines in a single command, it is possible that creation **may** fail for a subset of them. In this case, the corresponding elements of pPipelines will be VK_NULL_HANDLE. If creation fails for a pipeline despite valid arguments (for example, due to out of memory errors), the VkResult code returned by the pipeline creation command will indicate why. The implementation will attempt to create all pipelines, and only return VK_NULL_HANDLE values for those that actually failed.

If creation fails for a pipeline that has the VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT set in its Vk*PipelineCreateInfo, pipelines at an index in the pPipelines array greater than or equal to that of the failing pipeline will be VK_NULL_HANDLE.

If creation fails for multiple pipelines, the returned VkResult **must** be the return value of any one of the pipelines which did not succeed. An application **can** reliably clean up from a failed call by iterating over the pPipelines array and destroying every element that is not VK_NULL_HANDLE.

If the entire command fails and no pipelines are created, all elements of pPipelines will be VK_NULL_HANDLE.

10.2. Pipeline Creation Flags

When creating a pipeline, the application **can** specify a set of flags that control how the pipeline is created and certain aspects of its behavior and capabilities. These flags are specified by chaining the VkPipelineCreateFlags2CreateInfo structure to the pipeline creation structure with a bitmask of VkPipelineCreateFlagBits2, or by setting the `flags` member of the pipeline creation structure to a bitmask of VkPipelineCreateFlagBits.

The `VkPipelineCreateFlags2CreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkPipelineCreateFlags2CreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineCreateFlags2    flags;
} VkPipelineCreateFlags2CreateInfo;
```

```
// Provided by VK_KHR_extended_flags, VK_KHR_maintenance5
// Equivalent to VkPipelineCreateFlags2CreateInfo
typedef VkPipelineCreateFlags2CreateInfo VkPipelineCreateFlags2CreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineCreateFlagBits2 specifying how a pipeline will be generated.

If this structure is included in the `pNext` chain of a pipeline creation structure, `flags` is used instead of the corresponding `flags` value passed in that creation structure, allowing additional creation flags to be specified.

Valid Usage (Implicit)

- VUID-VkPipelineCreateFlags2CreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_CREATE_FLAGS_2_CREATE_INFO
- VUID-VkPipelineCreateFlags2CreateInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkPipelineCreateFlagBits2 values

Structure Chaining

Extends the structures

- VkComputePipelineCreateInfo
- VkGraphicsPipelineCreateInfo
- VkRayTracingPipelineCreateInfoKHR

- VkRayTracingPipelineCreateInfoNV

Bits which **can** be set in VkPipelineCreateFlags2CreateInfo::flags, specifying how a pipeline is created, are:

```
// Provided by VK_VERSION_1_4
// Flag bits for VkPipelineCreateFlagBits2
typedef VkFlags64 VkPipelineCreateFlagBits2;

static const VkPipelineCreateFlagBits2
VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR =
0x200000000000ULL;
// Provided by VK_EXT_shader_64bit_indexing
static const VkPipelineCreateFlagBits2 VK_PIPELINE_CREATE_2_64_BIT_INDEXING_BIT_EXT =
```

```
0x80000000000ULL;
```

```
// Provided by VK_KHR_extended_flags, VK_KHR_maintenance5
// Equivalent to VkPipelineCreateFlagBits2
typedef VkPipelineCreateFlagBits2 VkPipelineCreateFlagBits2KHR;
```

- VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT specifies that the created pipeline will not be optimized. Using this flag **may** reduce the time taken to create the pipeline.
- VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.
- VK_PIPELINE_CREATE_2_DERIVATIVE_BIT specifies that the pipeline to be created will be a child of a previously created parent pipeline.
- VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.
- VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT specifies that a compute pipeline **can** be used with vkCmdDispatchBase with a non-zero base workgroup.
- VK_PIPELINE_CREATE_2_DEFER_COMPILE_BIT_NV specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application **must** call vkCompileDeferredNV exactly once on each shader in the pipeline before using the pipeline.
- VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which **can** later be retrieved by calling vkGetPipelineExecutableStatisticsKHR. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time.
- VK_PIPELINE_CREATE_2_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which **can** later be retrieved by calling vkGetPipelineExecutableInternalRepresentationsKHR. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries **can** be retrieved from the linked pipeline. Applications **should** retrieve IR from each library, and any linked pipelines, separately.
- VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR specifies that the pipeline **cannot** be used directly, and instead defines a *pipeline library* that **can** be combined with other pipelines using the VkPipelineLibraryCreateInfoKHR structure. This is available in ray tracing and graphics pipelines.
- VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.
- VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR specifies

that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

- VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.
- VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.
- VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR specifies that all built-in primitives including triangles, spheres, and LSS primitives will be skipped during traversal using pipeline trace ray instructions.
- VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_BUILT_IN_PRIMITIVES_BIT_KHR is an alias for VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR.
- VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBS_BIT_KHR specifies that AABB primitives will be skipped during traversal using pipeline trace ray instructions.
- VK_PIPELINE_CREATE_2_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR specifies that the shader group handles **can** be saved and reused on a subsequent run (e.g. for trace capture and replay).
- VK_PIPELINE_CREATE_2_RAY_TRACING_ALLOW_SPHERES_AND_LINEAR_SWEPT_SPHERES_BIT_NV specifies that the pipeline is allowed to use spheres or linear swept spheres as a geometry type in the acceleration structures. Using this flag **may** affect performance.
- VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_NV specifies that the pipeline can be used in combination with Device-Generated Commands.
- VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT specifies that the pipeline **can** be used in a `VkIndirectExecutionSetEXT`.
- VK_PIPELINE_CREATE_2_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT specifies that pipeline creation will fail if a compile is required for creation of a valid VkPipeline object; VK_PIPELINE_COMPILE_REQUIRED will be returned by pipeline creation, and the VkPipeline will be VK_NULL_HANDLE.
- When creating multiple pipelines, VK_PIPELINE_CREATE_2_EARLY_RETURN_ON_FAILURE_BIT specifies that control will be returned to the application if any individual pipeline returns a result which is not VK_SUCCESS rather than continuing to create additional pipelines.
- VK_PIPELINE_CREATE_2_RAY_TRACING_ALLOW_MOTION_BIT_NV specifies that the pipeline is allowed to use `OpTraceRayMotionNV`.
- VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that the pipeline will be used with a fragment shading rate attachment.
- VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT specifies that the pipeline will be used with a fragment density map attachment.
- VK_PIPELINE_CREATE_2_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE specifies that the

pipeline **can** be used with layered fragment density maps.

- VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT specifies that pipeline libraries being linked into this library **should** have link time optimizations applied. If this bit is omitted, implementations **should** instead perform linking as rapidly as possible.
- VK_PIPELINE_CREATE_2_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT specifies that pipeline libraries should retain any information necessary to later perform an optimal link with VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT.
- VK_PIPELINE_CREATE_2_DESCRIPTOR_BUFFER_BIT_EXT specifies that a pipeline will be used with descriptor buffers, rather than descriptor sets.
- VK_PIPELINE_CREATE_2_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT specifies that the pipeline **may** be used with an attachment feedback loop including color attachments.
- VK_PIPELINE_CREATE_2_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT specifies that the pipeline **may** be used with an attachment feedback loop including depth-stencil attachments.
- VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR specifies that the ray tracing pipeline **can** be used with acceleration structures which reference an opacity micromap array. This flag has no effect on using opacity micromaps with ray queries.
- VK_PIPELINE_CREATE_2_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV specifies that the ray tracing pipeline **can** be used with acceleration structures which reference a displacement micromap array.
- VK_PIPELINE_CREATE_2_NO_PROTECTED_ACCESS_BIT specifies that the pipeline **must** not be bound to a protected command buffer.
- VK_PIPELINE_CREATE_2_PROTECTED_ACCESS_ONLY_BIT specifies that the pipeline **must** not be bound to an unprotected command buffer.
- VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR specifies that `VkPipelineBinaryKHR` objects **can** be created from the pipeline. If VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR is used, implementations **should** not store pipeline data to an internal cache, if such a cache exists as stated by `pipelineBinaryInternalCache`. If `pipelineBinaryPrefersInternalCache` is VK_TRUE, applications **should** not use VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR.
- VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT specifies that the pipeline will be used in a render pass that is begun with VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT.
- VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMDX specifies that the pipeline will be used in an execution graph.
- VK_PIPELINE_CREATE_2_DISALLOW_OPACITY_MICROMAP_BIT_ARM specifies that the pipeline **must** not be used with acceleration structures which reference an opacity micromap.
- VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR specifies that the pipeline **cannot** be used with acceleration structures which are built with geometry that have an index buffer including both special indices and indices pointing to an associated micromap array. Geometry which has an index buffer using only special indices without an associated micromap array **can** be used with this flag.
- VK_PIPELINE_CREATE_2_64_BIT_INDEXING_BIT_EXT specifies that the pipeline enables 64-bit

indexing.

- VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT specifies that the pipeline will use descriptor heap mappings instead of descriptor set layouts.
- VK_PIPELINE_CREATE_2_INSTRUMENT_SHADERS_BIT_ARM specifies that the shaders in the pipeline will be instrumented.

It is valid to set both VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT and VK_PIPELINE_CREATE_2_DERIVATIVE_BIT. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

When an implementation is looking up a pipeline in a pipeline cache, if that pipeline is being created using linked libraries, implementations **should** always return an equivalent pipeline created with VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT if available, whether or not that bit was specified.

NOTE Using VK_PIPELINE_CREATE_2_LINK_TIME_OPTIMIZATION_BIT_EXT (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting the result for the suboptimally linked pipeline as soon as it is available.

```
// Provided by VK_VERSION_1_4
typedef VkFlags64 VkPipelineCreateFlags2;
```

```
// Provided by VK_KHR_extended_flags, VK_KHR_maintenance5
// Equivalent to VkPipelineCreateFlags2
typedef VkPipelineCreateFlags2 VkPipelineCreateFlags2KHR;
```

VkPipelineCreateFlags2 is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits2.

Bits which **can** be set in

- VkGraphicsPipelineCreateInfo::flags
- VkComputePipelineCreateInfo::flags
- VkRayTracingPipelineCreateInfoKHR::flags
- VkRayTracingPipelineCreateInfoNV::flags

specify how a pipeline is created, and are:

WARNING This functionality is superseded by VkPipelineCreateFlagBits2. See Legacy

> Functionality for more information.

  // VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
is a legacy alias
    VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR =
VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR,
  // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT =
VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT,
  // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT_EXT =
VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT,
  // Provided by VK_EXT_opacity_micromap
    VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT =
VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR,
```

```
  // Provided by VK_EXT_pipeline_protected_access
    VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT_EXT =
VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT,
  // Provided by VK_EXT_pipeline_protected_access
    VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT_EXT =
VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT,
} VkPipelineCreateFlagBits;
```

- VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT specifies that the created pipeline will not be optimized. Using this flag **may** reduce the time taken to create the pipeline.
- VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.
- VK_PIPELINE_CREATE_DERIVATIVE_BIT specifies that the pipeline to be created will be a child of a previously created parent pipeline.
- VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.
- VK_PIPELINE_CREATE_DISPATCH_BASE_BIT specifies that a compute pipeline **can** be used with vkCmdDispatchBase with a non-zero base workgroup.
- VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application **must** call vkCompileDeferredNV exactly once on each shader in the pipeline before using the pipeline.
- VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which **can** later be retrieved by calling vkGetPipelineExecutableStatisticsKHR. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time.
- VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which **can** later be retrieved by calling vkGetPipelineExecutableInternalRepresentationsKHR. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries **can** be retrieved from the linked pipeline. Applications **should** retrieve IR from each library, and any linked pipelines, separately.
- VK_PIPELINE_CREATE_LIBRARY_BIT_KHR specifies that the pipeline **cannot** be used directly, and instead defines a *pipeline library* that **can** be combined with other pipelines using the VkPipelineLibraryCreateInfoKHR structure. This is available in ray tracing and graphics pipelines.
- VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.
- VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR specifies

that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

- VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.
- VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.
- VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR specifies that sphere, LSS and triangle primitives will be skipped during traversal using pipeline trace ray instructions.
- VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR specifies that AABB primitives will be skipped during traversal using pipeline trace ray instructions.
- VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR specifies that the shader group handles **can** be saved and reused on a subsequent run (e.g. for trace capture and replay).
- VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV specifies that the pipeline **can** be used in combination with Device-Generated Commands.
- VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT specifies that pipeline creation will fail if a compile is required for creation of a valid VkPipeline object; VK_PIPELINE_COMPILE_REQUIRED will be returned by pipeline creation, and the VkPipeline will be VK_NULL_HANDLE.
- When creating multiple pipelines, VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT specifies that control will be returned to the application if any individual pipeline returns a result which is not VK_SUCCESS rather than continuing to create additional pipelines.
- VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV specifies that the pipeline is allowed to use `OpTraceRayMotionNV`.
- VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that the pipeline will be used with a fragment shading rate attachment and dynamic rendering.
- VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT specifies that the pipeline will be used with a fragment density map attachment and dynamic rendering.
- VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT specifies that pipeline libraries being linked into this library **should** have link time optimizations applied. If this bit is omitted, implementations **should** instead perform linking as rapidly as possible.
- VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT specifies that pipeline libraries should retain any information necessary to later perform an optimal link with VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT.
- VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT specifies that a pipeline will be used

with descriptor buffers, rather than descriptor sets.

- VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT specifies that the pipeline **may** be used with an attachment feedback loop including color attachments. It is ignored if VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT is set in pDynamicStates.
- VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT specifies that the pipeline **may** be used with an attachment feedback loop including depth-stencil attachments. It is ignored if VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT is set in pDynamicStates.
- VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR specifies that the ray tracing pipeline **can** be used with acceleration structures which reference an opacity micromap array. This flag has no effect on using opacity micromaps with ray queries.
- VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV specifies that the ray tracing pipeline **can** be used with acceleration structures which reference a displacement micromap array.
- VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT specifies that the pipeline **must** not be bound to a protected command buffer.
- VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT specifies that the pipeline **must** not be bound to an unprotected command buffer.

It is valid to set both VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT and VK_PIPELINE_CREATE_DERIVATIVE_BIT. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

When an implementation is looking up a pipeline in a pipeline cache, if that pipeline is being created using linked libraries, implementations **should** always return an equivalent pipeline created with VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT if available, whether or not that bit was specified.

NOTE Using VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT (or not) when linking pipeline libraries is intended as a performance tradeoff between host and device. If the bit is omitted, linking should be faster and produce a pipeline more rapidly, but performance of the pipeline on the target device may be reduced. If the bit is included, linking may be slower but should produce a pipeline with device performance comparable to a monolithically created pipeline. Using both options can allow latency-sensitive applications to generate a suboptimal but usable pipeline quickly, and then perform an optimal link in the background, substituting the result for the suboptimally linked pipeline as soon as it is available.

WARNING This functionality is superseded by VkPipelineCreateFlags2. See Legacy Functionality for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;
```

VkPipelineCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits.

10.3. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling vkCreateComputePipelines with module and pName selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the VkPipelineShaderStageCreateInfo structure contained within the VkComputePipelineCreateInfo structure.

To create compute pipelines, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(
    VkDevice                                    device,
    VkPipelineCache                             pipelineCache,
    uint32_t                                    createInfoCount,
    const VkComputePipelineCreateInfo*          pCreateInfos,
    const VkAllocationCallbacks*                pAllocator,
    VkPipeline*                                 pPipelines);
```

- device is the logical device that creates the compute pipelines.
- pipelineCache is either VK_NULL_HANDLE, indicating that pipeline caching is disabled, or to enable caching, the handle of a valid VkPipelineCache object. The implementation **must** not access this object outside of the duration of this command.
- createInfoCount is the length of the pCreateInfos and pPipelines arrays.
- pCreateInfos is a pointer to an array of VkComputePipelineCreateInfo structures.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pPipelines is a pointer to an array of VkPipeline handles in which the resulting compute pipeline objects are returned.

Pipelines are created and returned as described for Multiple Pipeline Creation.

Valid Usage

- VUID-vkCreateComputePipelines-device-09661
  device **must** support at least one queue family with the VK_QUEUE_COMPUTE_BIT capability
- VUID-vkCreateComputePipelines-flags-00695
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex **must** be less than the index into pCreateInfos that corresponds to that element

- VUID-vkCreateComputePipelines-flags-00696
  If the `flags` member of any element of `pCreateInfos` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline **must** have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set
- VUID-vkCreateComputePipelines-pipelineCache-02873
  If `pipelineCache` was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to `pipelineCache` **must** be externally synchronized
- VUID-vkCreateComputePipelines-pNext-09616
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, `pipelineCache` **must** be VK_NULL_HANDLE
- VUID-vkCreateComputePipelines-pNext-09617
  If a VkPipelineCreateFlags2CreateInfoKHR structure with the VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR flag set is included in the `pNext` chain of any element of `pCreateInfos`, `pipelineCache` **must** be VK_NULL_HANDLE
- VUID-vkCreateComputePipelines-binaryCount-09620
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT **must** not be set in the `flags` of that element
- VUID-vkCreateComputePipelines-binaryCount-09621
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT **must** not be set in the `flags` of that element
- VUID-vkCreateComputePipelines-binaryCount-09622
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT **must** not be set in the `flags` of that element
- VUID-vkCreateComputePipelines-pCreateInfos-11414
  If any element of `pCreateInfos` sets VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, there **must** be less than (`maxSamplerAllocationCount` - (`minSamplerHeapReservedRangeWithEmbedded` / `samplerDescriptorSize`)) VkSampler objects currently created on the device
- VUID-vkCreateComputePipelines-pCreateInfos-11429
  If any element of `pCreateInfos` sets VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, this command **must** not cause the total number of unique embedded samplers in pipelines and shaders on this device to exceed `maxDescriptorHeapEmbeddedSamplers`

Valid Usage (Implicit)

- VUID-vkCreateComputePipelines-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateComputePipelines-pipelineCache-parameter

If `pipelineCache` is not VK_NULL_HANDLE, `pipelineCache` **must** be a valid VkPipelineCache handle

- VUID-vkCreateComputePipelines-pCreateInfos-parameter
  `pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid VkComputePipelineCreateInfo structures
- VUID-vkCreateComputePipelines-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateComputePipelines-pPipelines-parameter
  `pPipelines` **must** be a valid pointer to an array of `createInfoCount` VkPipeline handles
- VUID-vkCreateComputePipelines-createInfoCount-arraylength
  `createInfoCount` **must** be greater than `0`
- VUID-vkCreateComputePipelines-pipelineCache-parent
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_PIPELINE_COMPILE_REQUIRED_EXT
- VK_SUCCESS

Failure

- VK_ERROR_INVALID_SHADER_NV
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkComputePipelineCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
    VkStructureType                    sType;
    const void*                        pNext;
    VkPipelineCreateFlags              flags;
    VkPipelineShaderStageCreateInfo    stage;
    VkPipelineLayout                   layout;
    VkPipeline                         basePipelineHandle;
    int32_t                            basePipelineIndex;
} VkComputePipelineCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineCreateFlagBits specifying how the pipeline will be generated.
- `stage` is a VkPipelineShaderStageCreateInfo structure describing the compute shader.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline. If VkPhysicalDeviceProperties::`apiVersion` is greater than or equal to Vulkan 1.3 or VK_KHR_maintenance4 is enabled `layout` **must** not be accessed by the implementation outside of the duration of the command this structure is passed to.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

If the `pNext` chain includes a VkPipelineCreateFlags2CreateInfo structure, VkPipelineCreateFlags2CreateInfo::`flags` from that structure is used instead of `flags` from this structure.

Valid Usage

- VUID-VkComputePipelineCreateInfo-None-09497
  If the `pNext` chain does not include a VkPipelineCreateFlags2CreateInfo structure, `flags` **must** be a valid combination of VkPipelineCreateFlagBits values
- VUID-VkComputePipelineCreateInfo-flags-07984
  If `flags` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid compute `VkPipeline` handle
- VUID-VkComputePipelineCreateInfo-flags-07985
  If `flags` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and `basePipelineHandle` is VK_NULL_HANDLE, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter
- VUID-VkComputePipelineCreateInfo-flags-07986
  If `flags` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, `basePipelineIndex` **must** be -1 or `basePipelineHandle` **must** be VK_NULL_HANDLE
- VUID-VkComputePipelineCreateInfo-layout-07987
  If a push constant block is declared in a shader and `layout` is not VK_NULL_HANDLE, a push constant range in `layout` **must** match the shader stage
- VUID-VkComputePipelineCreateInfo-layout-10069
  If a push constant block is declared in a shader and `layout` is not VK_NULL_HANDLE, the block must be contained inside the push constant range in `layout` that matches the stage
- VUID-VkComputePipelineCreateInfo-layout-07988
  If a resource variable is declared in a shader and `layout` is not VK_NULL_HANDLE, the corresponding descriptor set in `layout` **must** match the shader stage

- VUID-VkComputePipelineCreateInfo-layout-07990
  If a resource variable is declared in a shader, `layout` is not VK_NULL_HANDLE, and the descriptor type is not VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the corresponding descriptor set in `layout` **must** match the descriptor type
- VUID-VkComputePipelineCreateInfo-layout-07991
  If a resource variable is declared in a shader as an array and `layout` is not VK_NULL_HANDLE, the corresponding descriptor binding used to create `layout` **must** have a `descriptorCount` that is greater than or equal to the length of the array
- VUID-VkComputePipelineCreateInfo-None-10391
  If a resource variable is declared in a shader as an array of descriptors, then the descriptor type of that variable **must** not be VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK
- VUID-VkComputePipelineCreateInfo-flags-11798
  If the shader64BitIndexing feature is not enabled, `flags` **must** not contain VK_PIPELINE_CREATE_2_64_BIT_INDEXING_BIT_EXT
- VUID-VkComputePipelineCreateInfo-pipelineCreationCacheControl-02878
  If the `pipelineCreationCacheControl` feature is not enabled, `flags` **must** not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT nor VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT
- VUID-VkComputePipelineCreateInfo-pipelineProtectedAccess-07368
  If the `pipelineProtectedAccess` feature is not enabled, `flags` **must** not include VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT nor VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-VkComputePipelineCreateInfo-flags-07369
  `flags` **must** not include both VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT and VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-VkComputePipelineCreateInfo-flags-11311
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, `layout` **must** be VK_NULL_HANDLE
- VUID-VkComputePipelineCreateInfo-flags-11312
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, all shader variables in the shader resource interface with a `DescriptorSet` and `Binding` decoration **must** have a mapping declared in VkShaderDescriptorSetAndBindingMappingInfoEXT::`pMappings`
- VUID-VkComputePipelineCreateInfo-flags-03365
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-03366
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-03367
  `flags` **must** not include

VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR

- VUID-VkComputePipelineCreateInfo-flags-03368
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-03369
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-03370
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-03576
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-04945
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV
- VUID-VkComputePipelineCreateInfo-flags-09007
  If the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature is not enabled, `flags` **must** not include VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV
- VUID-VkComputePipelineCreateInfo-flags-09008
  If `flags` includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the `pNext` chain **must** include a pointer to a valid instance of VkComputePipelineIndirectBufferInfoNV specifying the address where the pipeline's metadata will be saved
- VUID-VkComputePipelineCreateInfo-flags-11007
  If `flags` includes VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT, then the `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled
- VUID-VkComputePipelineCreateInfo-stage-00701
  The `stage` member of `stage` **must** be VK_SHADER_STAGE_COMPUTE_BIT
- VUID-VkComputePipelineCreateInfo-stage-00702
  The shader code for the entry point identified by `stage` and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the Shader Interfaces chapter
- VUID-VkComputePipelineCreateInfo-layout-01687
  If `layout` is not VK_NULL_HANDLE, the number of resources in `layout` accessible to the compute shader stage **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`
- VUID-VkComputePipelineCreateInfo-shaderEnqueue-09177
  If the `shaderEnqueue` feature is not enabled, `flags` **must** not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-09178
  If `flags` does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the shader specified by `stage` **must** not declare the `ShaderEnqueueAMDX` capability

- VUID-VkComputePipelineCreateInfo-pipelineStageCreationFeedbackCount-06566
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it **must** be 1
- VUID-VkComputePipelineCreateInfo-flags-07367
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-11593
  If the VkPhysicalDeviceOpacityMicromapFeaturesKHR::micromap feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR
- VUID-VkComputePipelineCreateInfo-flags-07996
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV
- VUID-VkComputePipelineCreateInfo-layout-12396
  If layout is not VK_NULL_HANDLE, it **must** not have been created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT
- VUID-VkComputePipelineCreateInfo-None-11367
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, layout **must** not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkComputePipelineCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO
- VUID-VkComputePipelineCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkComputePipelineIndirectBufferInfoNV, VkPipelineBinaryInfoKHR, VkPipelineCompilerControlCreateInfoAMD, VkPipelineCreateFlags2CreateInfo, VkPipelineCreationFeedbackCreateInfo, VkPipelineRobustnessCreateInfo, VkSubpassShadingPipelineCreateInfoHUAWEI, or VkValidationFeaturesEXT
- VUID-VkComputePipelineCreateInfo-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkComputePipelineCreateInfo-stage-parameter
  stage **must** be a valid VkPipelineShaderStageCreateInfo structure
- VUID-VkComputePipelineCreateInfo-layout-parameter
  If layout is not VK_NULL_HANDLE, layout **must** be a valid VkPipelineLayout handle
- VUID-VkComputePipelineCreateInfo-commonparent
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Structure Chaining

Extends the structure

- VkPipelineCreateInfoKHR

The `VkPipelineShaderStageCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType                     sType;
    const void*                         pNext;
    VkPipelineShaderStageCreateFlags    flags;
    VkShaderStageFlagBits               stage;
    VkShaderModule                      module;
    const char*                         pName;
    const VkSpecializationInfo*         pSpecializationInfo;
} VkPipelineShaderStageCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineShaderStageCreateFlagBits specifying how the pipeline shader stage will be generated.
- `stage` is a VkShaderStageFlagBits value specifying a single pipeline stage.
- `module` is optionally a VkShaderModule object containing the shader code for this stage. The implementation **must** not access this object outside of the duration of the command this structure is passed to.
- `pName` is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- `pSpecializationInfo` is a pointer to a VkSpecializationInfo structure, as described in Specialization Constants, or `NULL`.

If `module` is not VK_NULL_HANDLE, the shader code used by the pipeline is defined by `module`. If `module` is VK_NULL_HANDLE, the shader code is defined by the chained VkShaderModuleCreateInfo if present.

If the `shaderModuleIdentifier` feature is enabled, applications **can** omit shader code for `stage` and instead provide a module identifier. This is done by including a VkPipelineShaderStageModuleIdentifierCreateInfoEXT structure with `identifierSize` not equal to 0 in the `pNext` chain. A shader stage created in this way is equivalent to one created using a shader module with the same identifier. The identifier allows an implementation to look up a pipeline without consuming a valid SPIR-V module. If a pipeline is not found, pipeline compilation is not possible and the implementation **must** fail as specified by VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT.

When an identifier is used in lieu of a shader module, implementations **may** fail pipeline compilation with VK_PIPELINE_COMPILE_REQUIRED for any reason.

NOTE The rationale for the relaxed requirement on implementations to return a pipeline with VkPipelineShaderStageModuleIdentifierCreateInfoEXT is that layers or tools may intercept pipeline creation calls and require the full SPIR-V context to operate correctly. ICDs are not expected to fail pipeline compilation if the pipeline exists in a cache somewhere.

Applications **can** use identifiers when creating pipelines with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR. When creating such pipelines, VK_SUCCESS **may** be returned, but subsequently fail when referencing the pipeline in a VkPipelineLibraryCreateInfoKHR struct. Applications **must** allow pipeline compilation to fail during link steps with VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT as it **may** not be possible to determine if a pipeline **can** be created from identifiers until the link step.

Valid Usage

- VUID-VkPipelineShaderStageCreateInfo-descriptorHeap-11314
  If the `descriptorHeap` feature is not enabled, VkShaderDescriptorSetAndBindingMappingInfoEXT::`mappingCount` **must** be 0
- VUID-VkPipelineShaderStageCreateInfo-pNext-11315
  If the `pNext` chain specifies a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT, the mapped resource in the shader **must** be a variable with a structure type decorated with `Block` in the `Uniform Storage Class`
- VUID-VkPipelineShaderStageCreateInfo-pNext-11316
  If the `pNext` chain specifies a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, the mapped structure **must** not be larger than `maxPushDataSize` minus the `pushDataOffset` used in the mapping
- VUID-VkPipelineShaderStageCreateInfo-pNext-12454
  If the `pNext` chain specifies a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, and there is a variable in the shader that matches the mapping, the `stage` **must** be a ray tracing stage
- VUID-VkPipelineShaderStageCreateInfo-pNext-11317
  If the `pNext` chain specifies a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT, the sum of mapped structure size and `shaderRecordDataOffset` used in the mapping **must** not be larger than `maxShaderGroupStride`
- VUID-VkPipelineShaderStageCreateInfo-pNext-11318
  If the `pNext` chain specifies a descriptor mapping using

VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, the mapped resource in the shader **must** be one of:

  - A variable with a structure type decorated with `Block` in the `Uniform Storage Class`
  - A variable with a structure type decorated with `BufferBlock` in the `Uniform Storage Class`
  - A variable with a structure type decorated with `Block` in the `StorageBuffer Storage Class`
  - A `OpTypeAccelerationStructureKHR` variable
  - A `OpTypeAccelerationStructureNV` variable

- VUID-VkPipelineShaderStageCreateInfo-pNext-11378
  If the `pNext` chain specifies a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, the `OpArrayLength` or `OpUntypedArrayLengthKHR` instruction **must** not be used on that resource
- VUID-VkPipelineShaderStageCreateInfo-pNext-11399
  If the `pNext` chain specifies a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, and the mapped resource declaration is an array, the `pEmbeddedSampler` member of the corresponding mapping structure **must** be `NULL`
- VUID-VkPipelineShaderStageCreateInfo-stage-00704
  If the `geometryShader` feature is not enabled, `stage` **must** not be VK_SHADER_STAGE_GEOMETRY_BIT
- VUID-VkPipelineShaderStageCreateInfo-stage-00705
  If the `tessellationShader` feature is not enabled, `stage` **must** not be VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT
- VUID-VkPipelineShaderStageCreateInfo-stage-02091
  If the `meshShader` feature is not enabled, `stage` **must** not be VK_SHADER_STAGE_MESH_BIT_EXT
- VUID-VkPipelineShaderStageCreateInfo-stage-02092
  If the `taskShader` feature is not enabled, `stage` **must** not be VK_SHADER_STAGE_TASK_BIT_EXT
- VUID-VkPipelineShaderStageCreateInfo-clustercullingShader-07813
  If the `clustercullingShader` feature is not enabled, `stage` **must** not be VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI

- VUID-VkPipelineShaderStageCreateInfo-stage-00706
  `stage` **must** not be VK_SHADER_STAGE_ALL_GRAPHICS, or VK_SHADER_STAGE_ALL
- VUID-VkPipelineShaderStageCreateInfo-pName-00707
  `pName` **must** be the name of an `OpEntryPoint` in `module` with an execution model that matches `stage`
- VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711
  If the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits`::`maxSampleMaskWords`
- VUID-VkPipelineShaderStageCreateInfo-stage-00713
  If `stage` is VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size **must** be greater than `0` and less than or equal to `VkPhysicalDeviceLimits`::`maxTessellationPatchSize`
- VUID-VkPipelineShaderStageCreateInfo-stage-00714
  If `stage` is VK_SHADER_STAGE_GEOMETRY_BIT, the identified entry point **must** have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits`::`maxGeometryOutputVertices`
- VUID-VkPipelineShaderStageCreateInfo-stage-00715
  If `stage` is VK_SHADER_STAGE_GEOMETRY_BIT, the identified entry point **must** have an `OpExecutionMode` instruction specifying an invocation count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits`::`maxGeometryShaderInvocations`
- VUID-VkPipelineShaderStageCreateInfo-stage-02596
  If `stage` is either VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, or VK_SHADER_STAGE_GEOMETRY_BIT, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive
- VUID-VkPipelineShaderStageCreateInfo-stage-02597
  If `stage` is either VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, or VK_SHADER_STAGE_GEOMETRY_BIT, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive
- VUID-VkPipelineShaderStageCreateInfo-stage-06685
  If `stage` is VK_SHADER_STAGE_FRAGMENT_BIT, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragDepth`
- VUID-VkPipelineShaderStageCreateInfo-stage-06686
  If `stage` is VK_SHADER_STAGE_FRAGMENT_BIT, and the identified entry point writes to `FragStencilRefEXT` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of

FragStencilRefEXT

- VUID-VkPipelineShaderStageCreateInfo-flags-02784
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set, the subgroupSizeControl feature **must** be enabled
- VUID-VkPipelineShaderStageCreateInfo-flags-02785
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set, the computeFullSubgroups feature **must** be enabled
- VUID-VkPipelineShaderStageCreateInfo-flags-08988
  If flags includes VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT, stage **must** be one of VK_SHADER_STAGE_MESH_BIT_EXT, VK_SHADER_STAGE_TASK_BIT_EXT, or VK_SHADER_STAGE_COMPUTE_BIT
- VUID-VkPipelineShaderStageCreateInfo-pNext-02754
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, flags **must** not have the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set
- VUID-VkPipelineShaderStageCreateInfo-pNext-02755
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, the subgroupSizeControl feature **must** be enabled, and stage **must** be a valid bit specified in requiredSubgroupSizeStages
- VUID-VkPipelineShaderStageCreateInfo-pNext-02756
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain and stage is VK_SHADER_STAGE_COMPUTE_BIT, VK_SHADER_STAGE_MESH_BIT_EXT, or VK_SHADER_STAGE_TASK_BIT_EXT, the local workgroup size of the shader **must** be less than or equal to the product of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize and maxComputeWorkgroupSubgroups
- VUID-VkPipelineShaderStageCreateInfo-pNext-02757
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, and flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize
- VUID-VkPipelineShaderStageCreateInfo-flags-02758
  If flags has both the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT and VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flags set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of maxSubgroupSize
- VUID-VkPipelineShaderStageCreateInfo-flags-02759
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set and flags does not have the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set

and no VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, the local workgroup size in the X dimension of the pipeline **must** be a multiple of subgroupSize

- VUID-VkPipelineShaderStageCreateInfo-module-08987
  If module uses the OpTypeCooperativeMatrixKHR instruction with a Scope equal to Subgroup, then the local workgroup size in the X dimension of the pipeline **must** be a multiple of the effective subgroup size
- VUID-VkPipelineShaderStageCreateInfo-module-10169
  If module uses the OpTypeCooperativeMatrixKHR instruction with a Scope equal to Workgroup, then the local workgroup size in the X dimension of the pipeline **must** be a multiple of the effective subgroup size and the total local workgroup size **must** be a power of two multiple of the effective subgroup size and **must** be less than or equal to cooperativeMatrixWorkgroupScopeMaxWorkgroupSize
- VUID-VkPipelineShaderStageCreateInfo-stage-08771
  If a shader module identifier is not specified for this stage, module **must** be a valid VkShaderModule , or the pNext chain of the parent Vk*CreateInfo structure **must** set VkPipelineBinaryInfoKHR::binaryCount to a value greater than 0, if none of the following features are enabled:
  - graphicsPipelineLibrary
  - maintenance5
- VUID-VkPipelineShaderStageCreateInfo-stage-06845
  If a shader module identifier is not specified for this stage, module **must** be a valid VkShaderModule, or there **must** be a valid VkShaderModuleCreateInfo structure in the pNext chain , or the pNext chain of the parent Vk*CreateInfo structure **must** set VkPipelineBinaryInfoKHR::binaryCount to a value greater than 0,
- VUID-VkPipelineShaderStageCreateInfo-stage-06844
  If a shader module identifier is specified for this stage, the pNext chain **must** not include a VkShaderModuleCreateInfo structure
- VUID-VkPipelineShaderStageCreateInfo-stage-06848
  If a shader module identifier is specified for this stage, module **must** be VK_NULL_HANDLE
- VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-06849
  If a shader module identifier is not specified, the shader code used by the pipeline **must** be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in pSpecializationInfo, if any, and then converting all specialization constants into fixed constants

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO
- VUID-VkPipelineShaderStageCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkDebugUtilsObjectNameInfoEXT,

VkPipelineRobustnessCreateInfo, VkPipelineShaderStageModuleIdentifierCreateInfoEXT, VkPipelineShaderStageNodeCreateInfoAMDX, VkPipelineShaderStageRequiredSubgroupSizeCreateInfo, VkShaderDescriptorSetAndBindingMappingInfoEXT, VkShaderModuleCreateInfo, VkShaderModuleValidationCacheCreateInfoEXT, or VkValidationFeaturesEXT

- VUID-VkPipelineShaderStageCreateInfo-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineShaderStageCreateInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkPipelineShaderStageCreateFlagBits values
- VUID-VkPipelineShaderStageCreateInfo-stage-parameter
  `stage` **must** be a valid VkShaderStageFlagBits value
- VUID-VkPipelineShaderStageCreateInfo-module-parameter
  If `module` is not VK_NULL_HANDLE, `module` **must** be a valid VkShaderModule handle
- VUID-VkPipelineShaderStageCreateInfo-pName-parameter
  `pName` **must** be a null-terminated UTF-8 string
- VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-parameter
  If `pSpecializationInfo` is not `NULL`, `pSpecializationInfo` **must** be a valid pointer to a valid VkSpecializationInfo structure

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;
```

VkPipelineShaderStageCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineShaderStageCreateFlagBits.

Possible values of the `flags` member of VkPipelineShaderStageCreateInfo specifying how a pipeline shader stage is created, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {
  // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
  // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT = 0x00000002,
  // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT =
VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT,
  // Provided by VK_EXT_subgroup_size_control
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT =
VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT,
} VkPipelineShaderStageCreateFlagBits;
```

- VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT specifies that

the SubgroupSize **may** vary in the shader stage.

- VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT specifies that the subgroup sizes **must** be launched with all invocations active in the task, mesh, or compute stage.

> **NOTE** If VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT and VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT are specified and minSubgroupSize does not equal maxSubgroupSize and no required subgroup size is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of SubgroupSize is to make it a multiple of maxSubgroupSize. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which **can** be set by commands and structures, specifying one or more shader stages, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
  // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_RAYGEN_BIT_KHR = 0x00000100,
  // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_ANY_HIT_BIT_KHR = 0x00000200,
  // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR = 0x00000400,
  // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_MISS_BIT_KHR = 0x00000800,
  // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_INTERSECTION_BIT_KHR = 0x00001000,
  // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CALLABLE_BIT_KHR = 0x00002000,
  // Provided by VK_EXT_mesh_shader
    VK_SHADER_STAGE_TASK_BIT_EXT = 0x00000040,
  // Provided by VK_EXT_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_EXT = 0x00000080,
  // Provided by VK_HUAWEI_subpass_shading
    VK_SHADER_STAGE_SUBPASS_SHADING_BIT_HUAWEI = 0x00004000,
  // Provided by VK_HUAWEI_cluster_culling_shader
    VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI = 0x00080000,
  // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_RAYGEN_BIT_NV = VK_SHADER_STAGE_RAYGEN_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_ANY_HIT_BIT_NV = VK_SHADER_STAGE_ANY_HIT_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV = VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_MISS_BIT_NV = VK_SHADER_STAGE_MISS_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_INTERSECTION_BIT_NV = VK_SHADER_STAGE_INTERSECTION_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_SHADER_STAGE_CALLABLE_BIT_NV = VK_SHADER_STAGE_CALLABLE_BIT_KHR,
  // Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_TASK_BIT_NV = VK_SHADER_STAGE_TASK_BIT_EXT,
  // Provided by VK_NV_mesh_shader
    VK_SHADER_STAGE_MESH_BIT_NV = VK_SHADER_STAGE_MESH_BIT_EXT,
} VkShaderStageFlagBits;
```

- VK_SHADER_STAGE_VERTEX_BIT specifies the vertex stage.

- VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT specifies the tessellation control stage.
- VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT specifies the tessellation evaluation stage.
- VK_SHADER_STAGE_GEOMETRY_BIT specifies the geometry stage.
- VK_SHADER_STAGE_FRAGMENT_BIT specifies the fragment stage.
- VK_SHADER_STAGE_COMPUTE_BIT specifies the compute stage.
- VK_SHADER_STAGE_ALL_GRAPHICS is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).
- VK_SHADER_STAGE_ALL is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.
- VK_SHADER_STAGE_TASK_BIT_EXT specifies the task stage.
- VK_SHADER_STAGE_MESH_BIT_EXT specifies the mesh stage.
- VK_SHADER_STAGE_CLUSTER_CULLING_BIT_HUAWEI specifies the cluster culling stage.
- VK_SHADER_STAGE_RAYGEN_BIT_KHR specifies the ray generation stage.
- VK_SHADER_STAGE_ANY_HIT_BIT_KHR specifies the any-hit stage.
- VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR specifies the closest hit stage.
- VK_SHADER_STAGE_MISS_BIT_KHR specifies the miss stage.
- VK_SHADER_STAGE_INTERSECTION_BIT_KHR specifies the intersection stage.
- VK_SHADER_STAGE_CALLABLE_BIT_KHR specifies the callable stage.

NOTE VK_SHADER_STAGE_ALL_GRAPHICS only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;
```

VkShaderStageFlags is a bitmask type for setting a mask of zero or more VkShaderStageFlagBits.

The VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;
```

```
// Provided by VK_EXT_subgroup_size_control
// Equivalent to VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT;
```

```
// Provided by VK_EXT_shader_object
// Equivalent to VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
VkShaderRequiredSubgroupSizeCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `requiredSubgroupSize` is an unsigned integer value specifying the required subgroup size for the newly created pipeline shader stage.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain of VkPipelineShaderStageCreateInfo, it specifies that the pipeline shader stage being compiled has a required subgroup size.

If a `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain of VkShaderCreateInfoEXT, it specifies that the shader being compiled has a required subgroup size.

Valid Usage

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760
  `requiredSubgroupSize` **must** be a power-of-two integer
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02761
  `requiredSubgroupSize` **must** be greater than or equal to `minSubgroupSize`
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02762
  `requiredSubgroupSize` **must** be less than or equal to `maxSubgroupSize`

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO

Structure Chaining

Extends the structures

- VkPipelineShaderStageCreateInfo
- VkShaderCreateInfoEXT

A subpass shading pipeline is a compute pipeline which **must** be called only in a subpass of a render pass with work dimensions specified by render area size. The subpass shading pipeline shader is a compute shader allowed to access input attachments specified in the calling subpass. To create a subpass shading pipeline, call vkCreateComputePipelines with VkSubpassShadingPipelineCreateInfoHUAWEI in the `pNext` chain of VkComputePipelineCreateInfo.

The `VkSubpassShadingPipelineCreateInfoHUAWEI` structure is defined as:

```
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkSubpassShadingPipelineCreateInfoHUAWEI {
    VkStructureType    sType;
    void*              pNext;
    VkRenderPass       renderPass;
    uint32_t           subpass;
} VkSubpassShadingPipelineCreateInfoHUAWEI;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information. The implementation **must** not access this object outside of the duration of the command this structure is passed to.
- `subpass` is the index of the subpass in the render pass where this pipeline will be used.

Valid Usage

- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-subpass-04946
  `subpass` **must** be created with VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI bind point

Valid Usage (Implicit)

- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SUBPASS_SHADING_PIPELINE_CREATE_INFO_HUAWEI
- VUID-VkSubpassShadingPipelineCreateInfoHUAWEI-renderPass-parameter
  `renderPass` **must** be a valid VkRenderPass handle

Structure Chaining

Extends the structure

- VkComputePipelineCreateInfo

A subpass shading pipeline's workgroup size is a 2D vector with number of power-of-two in width and height. The maximum number of width and height is implementation-dependent, and **may** vary for different formats and sample counts of attachments in a render pass.

To query the maximum workgroup size, call:

```
// Provided by VK_HUAWEI_subpass_shading
VkResult vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI(
    VkDevice                                    device,
    VkRenderPass                                renderpass,
    VkExtent2D*                                 pMaxWorkgroupSize);
```

- `device` is a handle to a local device object that was used to create the given render pass.
- `renderpass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
- `pMaxWorkgroupSize` is a pointer to a VkExtent2D structure.

Valid Usage (Implicit)

- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-renderpass-parameter
  `renderpass` **must** be a valid VkRenderPass handle
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-pMaxWorkgroupSize-parameter
  `pMaxWorkgroupSize` **must** be a valid pointer to a VkExtent2D structure
- VUID-vkGetDeviceSubpassShadingMaxWorkgroupSizeHUAWEI-renderpass-parent
  `renderpass` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkPipelineRobustnessCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkPipelineRobustnessCreateInfo {
    VkStructureType                       sType;
    const void*                           pNext;
    VkPipelineRobustnessBufferBehavior    storageBuffers;
    VkPipelineRobustnessBufferBehavior    uniformBuffers;
    VkPipelineRobustnessBufferBehavior    vertexInputs;
    VkPipelineRobustnessImageBehavior     images;
} VkPipelineRobustnessCreateInfo;
```

```
// Provided by VK_EXT_pipeline_robustness
// Equivalent to VkPipelineRobustnessCreateInfo
typedef VkPipelineRobustnessCreateInfo VkPipelineRobustnessCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- storageBuffers sets the behavior of out of bounds accesses made to resources bound as:
  - VK_DESCRIPTOR_TYPE_STORAGE_BUFFER
  - VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER
  - VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
- uniformBuffers describes the behavior of out of bounds accesses made to resources bound as:
  - VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER
  - VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER
  - VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC
  - VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK
- vertexInputs describes the behavior of out of bounds accesses made to vertex input attributes
- images describes the behavior of out of bounds accesses made to resources bound as:
  - VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE
  - VK_DESCRIPTOR_TYPE_STORAGE_IMAGE

Resources bound as VK_DESCRIPTOR_TYPE_MUTABLE_EXT will have the robustness behavior that covers its active descriptor type.

The scope of the effect of VkPipelineRobustnessCreateInfo depends on which structure's pNext chain it is included in.

- VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, VkComputePipelineCreateInfo:
  The robustness behavior described by VkPipelineRobustnessCreateInfo applies to all accesses through this pipeline
- VkPipelineShaderStageCreateInfo:
  The robustness behavior described by VkPipelineRobustnessCreateInfo applies to all accesses emanating from the shader code of this shader stage

If VkPipelineRobustnessCreateInfo is specified for both a pipeline and a pipeline stage, the VkPipelineRobustnessCreateInfo specified for the pipeline stage will take precedence.

When VkPipelineRobustnessCreateInfo is specified for a pipeline, it only affects the subset of the pipeline that is specified by the create info, as opposed to subsets linked from pipeline libraries. For VkGraphicsPipelineCreateInfo, that subset is specified by VkGraphicsPipelineLibraryCreateInfoEXT::flags. For VkRayTracingPipelineCreateInfoKHR, that subset is specified by the specific stages in VkRayTracingPipelineCreateInfoKHR::pStages.

Valid Usage

- VUID-VkPipelineRobustnessCreateInfo-pipelineRobustness-06926
  If the pipelineRobustness feature is not enabled, storageBuffers **must** be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT
- VUID-VkPipelineRobustnessCreateInfo-pipelineRobustness-06927
  If the pipelineRobustness feature is not enabled, uniformBuffers **must** be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT
- VUID-VkPipelineRobustnessCreateInfo-pipelineRobustness-06928
  If the pipelineRobustness feature is not enabled, vertexInputs **must** be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT
- VUID-VkPipelineRobustnessCreateInfo-pipelineRobustness-06929
  If the pipelineRobustness feature is not enabled, images **must** be VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT
- VUID-VkPipelineRobustnessCreateInfo-robustImageAccess-06930
  If the robustImageAccess feature is not supported, images **must** not be VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS
- VUID-VkPipelineRobustnessCreateInfo-robustBufferAccess2-06931
  If the robustBufferAccess2 feature is not supported, storageBuffers **must** not be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2
- VUID-VkPipelineRobustnessCreateInfo-robustBufferAccess2-06932
  If the robustBufferAccess2 feature is not supported, uniformBuffers **must** not be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2
- VUID-VkPipelineRobustnessCreateInfo-robustBufferAccess2-06933
  If the robustBufferAccess2 feature is not supported, vertexInputs **must** not be VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2

- VUID-VkPipelineRobustnessCreateInfo-robustImageAccess2-06934
  If the `robustImageAccess2` feature is not supported, `images` **must** not be VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2
- VUID-VkPipelineRobustnessCreateInfo-storageBuffers-10636
  If `storageBuffers` is VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2, and either the `descriptorBindingStorageBufferUpdateAfterBind` feature or the `descriptorBindingStorageTexelBufferUpdateAfterBind` feature is enabled on the device, `robustBufferAccessUpdateAfterBind` **must** be VK_TRUE
- VUID-VkPipelineRobustnessCreateInfo-uniformBuffers-10637
  If `uniformBuffers` is VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2, and either the `descriptorBindingInlineUniformBlockUpdateAfterBind` feature, the `descriptorBindingUniformBufferUpdateAfterBind` feature, or the `descriptorBindingUniformTexelBufferUpdateAfterBind` feature is enabled on the device, `robustBufferAccessUpdateAfterBind` **must** be VK_TRUE
- VUID-VkPipelineRobustnessCreateInfo-images-10638
  If `images` is VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS or VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2, and either the `descriptorBindingStorageImageUpdateAfterBind` feature or the `descriptorBindingSampledImageUpdateAfterBind` feature is enabled on the device, `robustBufferAccessUpdateAfterBind` **must** be VK_TRUE

Valid Usage (Implicit)

- VUID-VkPipelineRobustnessCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_ROBUSTNESS_CREATE_INFO
- VUID-VkPipelineRobustnessCreateInfo-storageBuffers-parameter
  `storageBuffers` **must** be a valid VkPipelineRobustnessBufferBehavior value
- VUID-VkPipelineRobustnessCreateInfo-uniformBuffers-parameter
  `uniformBuffers` **must** be a valid VkPipelineRobustnessBufferBehavior value
- VUID-VkPipelineRobustnessCreateInfo-vertexInputs-parameter
  `vertexInputs` **must** be a valid VkPipelineRobustnessBufferBehavior value
- VUID-VkPipelineRobustnessCreateInfo-images-parameter
  `images` **must** be a valid VkPipelineRobustnessImageBehavior value

Structure Chaining

Extends the structures

- VkComputePipelineCreateInfo

- VkGraphicsPipelineCreateInfo
- VkPipelineShaderStageCreateInfo
- VkRayTracingPipelineCreateInfoKHR

Possible values of the `storageBuffers`, `uniformBuffers`, and `vertexInputs` members of VkPipelineRobustnessCreateInfo are:

```
// Provided by VK_VERSION_1_4
typedef enum VkPipelineRobustnessBufferBehavior {
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT = 0,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED = 1,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS = 2,
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2 = 3,
  // Provided by VK_EXT_pipeline_robustness
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT_EXT =
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT,
  // Provided by VK_EXT_pipeline_robustness
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED_EXT =
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED,
  // Provided by VK_EXT_pipeline_robustness
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT =
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS,
  // Provided by VK_EXT_pipeline_robustness
    VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT =
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2,
} VkPipelineRobustnessBufferBehavior;
```

```
// Provided by VK_EXT_pipeline_robustness
// Equivalent to VkPipelineRobustnessBufferBehavior
typedef VkPipelineRobustnessBufferBehavior VkPipelineRobustnessBufferBehaviorEXT;
```

- VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DEVICE_DEFAULT specifies that out of bounds buffer accesses follow the behavior of robust buffer access features enabled for the device.
- VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_DISABLED specifies that buffer accesses **must** not be out of bounds.
- VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS specifies that buffer accesses conform to Robust Buffer Access guarantees.
- VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2 specifies that buffer accesses conform to Robust Buffer Access 2 guarantees.

Possible values of the `images` member of VkPipelineRobustnessCreateInfo are:

```
// Provided by VK_VERSION_1_4
typedef enum VkPipelineRobustnessImageBehavior {
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT = 0,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED = 1,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS = 2,
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2 = 3,
  // Provided by VK_EXT_pipeline_robustness
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT_EXT =
VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT,
  // Provided by VK_EXT_pipeline_robustness
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED_EXT =
VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED,
  // Provided by VK_EXT_pipeline_robustness
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_EXT =
VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS,
  // Provided by VK_EXT_pipeline_robustness
    VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2_EXT =
VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2,
} VkPipelineRobustnessImageBehavior;
```

```
// Provided by VK_EXT_pipeline_robustness
// Equivalent to VkPipelineRobustnessImageBehavior
typedef VkPipelineRobustnessImageBehavior VkPipelineRobustnessImageBehaviorEXT;
```

- VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DEVICE_DEFAULT specifies that out of bounds image accesses follow the behavior of robust image access features enabled for the device.
- VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_DISABLED specifies that image accesses **must** not be out of bounds.
- VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS specifies that image accesses conform to Robust Image Access guarantees.
- VK_PIPELINE_ROBUSTNESS_IMAGE_BEHAVIOR_ROBUST_IMAGE_ACCESS_2 specifies that image accesses conform to Robust Image Access 2 guarantees.

An identifier **can** be provided instead of shader code in an attempt to compile pipelines without providing complete SPIR-V to the implementation.

The VkPipelineShaderStageModuleIdentifierCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_shader_module_identifier
typedef struct VkPipelineShaderStageModuleIdentifierCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           identifierSize;
    const uint8_t*     pIdentifier;
} VkPipelineShaderStageModuleIdentifierCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `identifierSize` is the size, in bytes, of the buffer pointed to by `pIdentifier`.
- `pIdentifier` is a pointer to a buffer of opaque data specifying an identifier.

Any identifier **can** be used. If the pipeline being created with identifier requires compilation to complete the pipeline creation call, pipeline compilation **must** fail as defined by VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT.

`pIdentifier` and `identifierSize` **can** be obtained from an VkShaderModuleIdentifierEXT queried earlier.

Valid Usage

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06850
  If this structure is included in a `pNext` chain and `identifierSize` is not equal to 0, the `shaderModuleIdentifier` feature **must** be enabled
- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pNext-06851
  If this structure is included in a `pNext` chain of VkPipelineShaderStageCreateInfo and `identifierSize` is not equal to 0, the pipeline **must** be created with the VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT flag set
- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-identifierSize-06852
  `identifierSize` **must** be less-or-equal to VK_MAX_SHADER_MODULE_IDENTIFIER_SIZE_EXT

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_MODULE_IDENTIFIER_CREATE_INFO_EXT
- VUID-VkPipelineShaderStageModuleIdentifierCreateInfoEXT-pIdentifier-parameter
  If `identifierSize` is not `0`, `pIdentifier` **must** be a valid pointer to an array of `identifierSize` `uint8_t` values

Structure Chaining

Extends the structure

- VkPipelineShaderStageCreateInfo

If a compute pipeline is going to be used in Device-Generated Commands by specifying its pipeline token with VkBindPipelineIndirectCommandNV, then that pipeline's associated metadata **must** be saved at a specified buffer device address for later use in indirect command generation. The buffer

device address **must** be specified at the time of compute pipeline creation with VkComputePipelineIndirectBufferInfoNV structure in the pNext chain of VkComputePipelineCreateInfo.

The VkComputePipelineIndirectBufferInfoNV structure is defined as:

```
// Provided by VK_NV_device_generated_commands_compute
typedef struct VkComputePipelineIndirectBufferInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceAddress    deviceAddress;
    VkDeviceSize       size;
    VkDeviceAddress    pipelineDeviceAddressCaptureReplay;
} VkComputePipelineIndirectBufferInfoNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- deviceAddress is the address where the pipeline's metadata will be stored.
- size is the size of pipeline's metadata that was queried using vkGetPipelineIndirectMemoryRequirementsNV.
- pipelineDeviceAddressCaptureReplay is the device address where pipeline's metadata was originally saved and can now be used to re-populate deviceAddress for replay.

If pipelineDeviceAddressCaptureReplay is zero, no specific address is requested. If pipelineDeviceAddressCaptureReplay is not zero, then it **must** be an address retrieved from an identically created pipeline on the same implementation. The pipeline metadata **must** also be placed on an identically created buffer and at the same offset using the vkCmdUpdatePipelineIndirectBufferNV command.

Valid Usage

- VUID-VkComputePipelineIndirectBufferInfoNV-deviceGeneratedComputePipelines-09009
  The VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines feature **must** be enabled
- VUID-VkComputePipelineIndirectBufferInfoNV-flags-09010
  The pipeline creation flags in VkComputePipelineCreateInfo::flags **must** include VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV
- VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-09011
  deviceAddress **must** be aligned to the VkMemoryRequirements2::memoryRequirements.alignment, as returned by vkGetPipelineIndirectMemoryRequirementsNV
- VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-09012
  deviceAddress **must** have been allocated from a buffer that was created with both the VK_BUFFER_USAGE_TRANSFER_DST_BIT and VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT usage flags set

- VUID-VkComputePipelineIndirectBufferInfoNV-size-09013
  `size` **must** be greater than or equal to the VkMemoryRequirements2 ::`memoryRequirements.size`, as returned by vkGetPipelineIndirectMemoryRequirementsNV
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09014
  If `pipelineDeviceAddressCaptureReplay` is non-zero then the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputeCaptureReplay` feature **must** be enabled
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09015
  If `pipelineDeviceAddressCaptureReplay` is non-zero then that address **must** have been allocated with flag VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT set
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09016
  If `pipelineDeviceAddressCaptureReplay` is non-zero, the `pipeline` **must** have been recreated for replay
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-09017
  `pipelineDeviceAddressCaptureReplay` **must** satisfy the `alignment` and `size` requirements similar to `deviceAddress`

Valid Usage (Implicit)

- VUID-VkComputePipelineIndirectBufferInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_INDIRECT_BUFFER_INFO_NV
- VUID-VkComputePipelineIndirectBufferInfoNV-deviceAddress-parameter
  `deviceAddress` **must** be a valid VkDeviceAddress value
- VUID-VkComputePipelineIndirectBufferInfoNV-pipelineDeviceAddressCaptureReplay-parameter
  If `pipelineDeviceAddressCaptureReplay` is not `0`, `pipelineDeviceAddressCaptureReplay` **must** be a valid VkDeviceAddress value

Structure Chaining

Extends the structure

- VkComputePipelineCreateInfo

To save a compute pipeline's metadata at a device address call:

```
// Provided by VK_NV_device_generated_commands_compute
void vkCmdUpdatePipelineIndirectBufferNV(
    VkCommandBuffer                             commandBuffer,
    VkPipelineBindPoint                         pipelineBindPoint,
    VkPipeline                                  pipeline);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineBindPoint` is a VkPipelineBindPoint value specifying the type of pipeline whose metadata will be saved.
- `pipeline` is the pipeline whose metadata will be saved.

`vkCmdUpdatePipelineIndirectBufferNV` is only allowed outside of a render pass. This command is treated as a "transfer" operation for the purposes of synchronization barriers. The writes to the address **must** be synchronized using stages VK_PIPELINE_STAGE_2_COPY_BIT and VK_PIPELINE_STAGE_COMMAND_PREPROCESS_BIT_NV and with access masks VK_ACCESS_MEMORY_WRITE_BIT and VK_ACCESS_COMMAND_PREPROCESS_READ_BIT_NV respectively before using the results in preprocessing.

Valid Usage

- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipelineBindPoint-09018
  `pipelineBindPoint` **must** be VK_PIPELINE_BIND_POINT_COMPUTE
- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-09019
  `pipeline` **must** have been created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV flag set
- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-09020
  `pipeline` **must** have been created with VkComputePipelineIndirectBufferInfoNV structure specifying a valid address where its metadata will be saved
- VUID-vkCmdUpdatePipelineIndirectBufferNV-deviceGeneratedComputePipelines-09021
  The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipelineBindPoint-parameter
  `pipelineBindPoint` **must** be a valid VkPipelineBindPoint value
- VUID-vkCmdUpdatePipelineIndirectBufferNV-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle
- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdUpdatePipelineIndirectBufferNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support VK_QUEUE_COMPUTE_BIT, VK_QUEUE_GRAPHICS_BIT, or VK_QUEUE_TRANSFER_BIT operations
- VUID-vkCmdUpdatePipelineIndirectBufferNV-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdUpdatePipelineIndirectBufferNV-suspended
  This command **must** not be called between suspended render pass instances
- VUID-vkCmdUpdatePipelineIndirectBufferNV-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdUpdatePipelineIndirectBufferNV-commonparent
  Both of `commandBuffer`, and `pipeline` **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_TRANSFER_BIT	Action

Conditional Rendering

vkCmdUpdatePipelineIndirectBufferNV is not affected by conditional rendering

10.4. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(
    VkDevice                                    device,
    VkPipelineCache                             pipelineCache,
    uint32_t                                    createInfoCount,
    const VkGraphicsPipelineCreateInfo*         pCreateInfos,
    const VkAllocationCallbacks*                pAllocator,
    VkPipeline*                                 pPipelines);
```

- `device` is the logical device that creates the graphics pipelines.
- `pipelineCache` is either VK_NULL_HANDLE, indicating that pipeline caching is disabled, or to enable caching, the handle of a valid VkPipelineCache object. The implementation **must** not access this object outside of the duration of this command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of VkGraphicsPipelineCreateInfo structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array of VkPipeline handles in which the resulting graphics pipeline objects are returned.

The VkGraphicsPipelineCreateInfo structure includes an array of VkPipelineShaderStageCreateInfo structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.

Pipelines are created and returned as described for Multiple Pipeline Creation.

Valid Usage

- VUID-vkCreateGraphicsPipelines-device-09662
  `device` **must** support at least one queue family with the VK_QUEUE_GRAPHICS_BIT capability
- VUID-vkCreateGraphicsPipelines-flags-00720
  If the `flags` member of any element of `pCreateInfos` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` **must** be less than the index into `pCreateInfos` that corresponds to that element
- VUID-vkCreateGraphicsPipelines-flags-00721
  If the `flags` member of any element of `pCreateInfos` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline **must** have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set
- VUID-vkCreateGraphicsPipelines-pipelineCache-02876
  If `pipelineCache` was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to `pipelineCache` **must** be externally synchronized

- VUID-vkCreateGraphicsPipelines-pNext-09616
  If VkPipelineBinaryInfoKHR::binaryCount is not 0 for any element of pCreateInfos, pipelineCache **must** be VK_NULL_HANDLE
- VUID-vkCreateGraphicsPipelines-pNext-09617
  If a VkPipelineCreateFlags2CreateInfoKHR structure with the VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR flag set is included in the pNext chain of any element of pCreateInfos, pipelineCache **must** be VK_NULL_HANDLE
- VUID-vkCreateGraphicsPipelines-binaryCount-09620
  If VkPipelineBinaryInfoKHR::binaryCount is not 0 for any element of pCreateInfos, VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT **must** not be set in the flags of that element
- VUID-vkCreateGraphicsPipelines-binaryCount-09621
  If VkPipelineBinaryInfoKHR::binaryCount is not 0 for any element of pCreateInfos, VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT **must** not be set in the flags of that element
- VUID-vkCreateGraphicsPipelines-binaryCount-09622
  If VkPipelineBinaryInfoKHR::binaryCount is not 0 for any element of pCreateInfos, VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT **must** not be set in the flags of that element
- VUID-vkCreateGraphicsPipelines-pCreateInfos-11414
  If any element of pCreateInfos sets VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, there **must** be less than (maxSamplerAllocationCount - (minSamplerHeapReservedRangeWithEmbedded / samplerDescriptorSize)) VkSampler objects currently created on the device
- VUID-vkCreateGraphicsPipelines-pCreateInfos-11429
  If any element of pCreateInfos sets VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, this command **must** not cause the total number of unique embedded samplers in pipelines and shaders on this device to exceed maxDescriptorHeapEmbeddedSamplers

NOTE

An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT on flags for any element of pCreateInfos while passing VK_NULL_HANDLE for pipelineCache.

Valid Usage (Implicit)

- VUID-vkCreateGraphicsPipelines-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkCreateGraphicsPipelines-pipelineCache-parameter
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache **must** be a valid VkPipelineCache handle
- VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter

`pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid VkGraphicsPipelineCreateInfo structures

- VUID-vkCreateGraphicsPipelines-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateGraphicsPipelines-pPipelines-parameter
  `pPipelines` **must** be a valid pointer to an array of `createInfoCount` VkPipeline handles
- VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength
  `createInfoCount` **must** be greater than `0`
- VUID-vkCreateGraphicsPipelines-pipelineCache-parent
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_PIPELINE_COMPILE_REQUIRED_EXT
- VK_SUCCESS

Failure

- VK_ERROR_INVALID_SHADER_NV
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkGraphicsPipelineCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType                                 sType;
    const void*                                     pNext;
    VkPipelineCreateFlags                           flags;
    uint32_t                                        stageCount;
    const VkPipelineShaderStageCreateInfo*          pStages;
    const VkPipelineVertexInputStateCreateInfo*     pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo*   pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo*    pTessellationState;
    const VkPipelineViewportStateCreateInfo*        pViewportState;
    const VkPipelineRasterizationStateCreateInfo*   pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo*     pMultisampleState;
    const VkPipelineDepthStencilStateCreateInfo*    pDepthStencilState;
    const VkPipelineColorBlendStateCreateInfo*      pColorBlendState;
    const VkPipelineDynamicStateCreateInfo*         pDynamicState;
    VkPipelineLayout                                layout;
    VkRenderPass                                    renderPass;
    uint32_t                                        subpass;
    VkPipeline                                      basePipelineHandle;
    int32_t                                         basePipelineIndex;
} VkGraphicsPipelineCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineCreateFlagBits specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `stageCount` VkPipelineShaderStageCreateInfo structures describing the set of the shader stages to be included in the graphics pipeline.
- `pVertexInputState` is a pointer to a VkPipelineVertexInputStateCreateInfo structure. It is ignored if the pipeline includes a mesh shader stage. It **can** be `NULL` if the pipeline is created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state set.
- `pInputAssemblyState` is a pointer to a VkPipelineInputAssemblyStateCreateInfo structure which determines input assembly behavior for vertex shading, as described in Drawing Commands. If the `VK_EXT_extended_dynamic_state3` extension is enabled, it **can** be `NULL` if the pipeline is created with both VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, and VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic states set and `dynamicPrimitiveTopologyUnrestricted` is VK_TRUE. It is ignored if the pipeline includes a mesh shader stage.
- `pTessellationState` is a pointer to a VkPipelineTessellationStateCreateInfo structure defining tessellation state used by tessellation shaders. It **can** be `NULL` if the pipeline is created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state set.
- `pViewportState` is a pointer to a VkPipelineViewportStateCreateInfo structure defining viewport state used when rasterization is enabled. If the `VK_EXT_extended_dynamic_state3` extension is enabled, it **can** be `NULL` if the pipeline is created with both

VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic states set.

- pRasterizationState is a pointer to a VkPipelineRasterizationStateCreateInfo structure defining rasterization state. If the VK_EXT_extended_dynamic_state3 extension is enabled, it **can** be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT, VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE, VK_DYNAMIC_STATE_POLYGON_MODE_EXT, VK_DYNAMIC_STATE_CULL_MODE, VK_DYNAMIC_STATE_FRONT_FACE, VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE, VK_DYNAMIC_STATE_DEPTH_BIAS, and VK_DYNAMIC_STATE_LINE_WIDTH dynamic states set.
- pMultisampleState is a pointer to a VkPipelineMultisampleStateCreateInfo structure defining multisample state used when rasterization is enabled. If the VK_EXT_extended_dynamic_state3 extension is enabled, it **can** be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, and VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states set, and either the alphaToOne feature is not enabled or VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is set, in which case VkPipelineMultisampleStateCreateInfo::sampleShadingEnable is assumed to be VK_FALSE.
- pDepthStencilState is a pointer to a VkPipelineDepthStencilStateCreateInfo structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it **can** be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_COMPARE_OP, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_OP, and VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic states set.
- pColorBlendState is a pointer to a VkPipelineColorBlendStateCreateInfo structure defining color blend state used when rasterization is enabled for any color attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it **can** be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT, VK_DYNAMIC_STATE_LOGIC_OP_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic states set.
- pDynamicState is a pointer to a VkPipelineDynamicStateCreateInfo structure defining which properties of the pipeline state object are dynamic and **can** be changed independently of the pipeline state. This **can** be NULL, which means no state in the pipeline is considered dynamic.
- layout is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline. If VkPhysicalDeviceProperties::apiVersion is greater than or equal to Vulkan 1.3 or VK_KHR_maintenance4 is enabled layout **must** not be accessed by the implementation outside of the duration of the command this structure is passed to.
- renderPass is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline **must** only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information. The implementation **must** not access this object outside of the duration of the command this structure is passed to.

- `subpass` is the index of the subpass in the render pass where this pipeline will be used.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

If any shader stage fails to compile, the compile log will be reported back to the application, and VK_ERROR_INVALID_SHADER_NV will be generated.

NOTE	With `VK_EXT_extended_dynamic_state3`, it is possible that many of the `VkGraphicsPipelineCreateInfo` members above **can** be `NULL` because all their state is dynamic and therefore ignored. This is optional so the application **can** still use a valid pointer if it needs to set the `pNext` or `flags` fields to specify state for other extensions.

The state required for a graphics pipeline is divided into vertex input state, pre-rasterization shader state, fragment shader state, and fragment output state.

Vertex Input State

Vertex input state is defined by:

- VkPipelineVertexInputStateCreateInfo
- VkPipelineInputAssemblyStateCreateInfo

If this pipeline specifies pre-rasterization state either directly or by including it as a pipeline library and its `pStages` includes a vertex shader, this state **must** be specified to create a complete graphics pipeline.

If a pipeline includes VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT in VkGraphicsPipelineLibraryCreateInfoEXT::`flags` either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify pre-rasterization state in any way, that pipeline **must** specify this state directly.

Pre-Rasterization Shader State

Pre-rasterization shader state is defined by:

- VkPipelineShaderStageCreateInfo entries for:
  - Vertex shaders
  - Tessellation control shaders
  - Tessellation evaluation shaders
  - Geometry shaders
  - Task shaders

    - Mesh shaders
- Within the VkPipelineLayout, all descriptor sets with pre-rasterization shader bindings if VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT was specified.
    - If VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT was not specified, the full pipeline layout **must** be specified.
- VkPipelineViewportStateCreateInfo
- VkPipelineRasterizationStateCreateInfo
- VkPipelineTessellationStateCreateInfo
- VkRenderPass and `subpass` parameter
- The `viewMask` parameter of VkPipelineRenderingCreateInfo (formats are ignored)
- VkPipelineDiscardRectangleStateCreateInfoEXT
- VkPipelineFragmentShadingRateStateCreateInfoKHR
- Inclusion/omission of the VK_PIPELINE_CREATE_2_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE flag

This state **must** be specified to create a complete graphics pipeline.

If either the `pNext` chain includes a VkGraphicsPipelineLibraryCreateInfoEXT structure with VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT included in `flags`, or it is not specified and would default to include that value, this state **must** be specified in the pipeline.

Fragment Shader State

Fragment shader state is defined by:

- A VkPipelineShaderStageCreateInfo entry for the fragment shader
- Within the VkPipelineLayout, all descriptor sets with fragment shader bindings if VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT was specified.
    - If VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT was not specified, the full pipeline layout **must** be specified.
- VkPipelineMultisampleStateCreateInfo if sample shading is enabled or `renderpass` is not VK_NULL_HANDLE
- VkPipelineDepthStencilStateCreateInfo
- VkRenderPass and `subpass` parameter
- The `viewMask` parameter of VkPipelineRenderingCreateInfo (formats are ignored)
- VkPipelineFragmentShadingRateStateCreateInfoKHR
- VkPipelineFragmentShadingRateEnumStateCreateInfoNV
- VkPipelineRepresentativeFragmentTestStateCreateInfoNV
- Inclusion/omission of the VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BI

T_KHR flag

- Inclusion/omission of the VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT flag
- VkRenderingInputAttachmentIndexInfo
- Inclusion/omission of the VK_PIPELINE_CREATE_2_PER_LAYER_FRAGMENT_DENSITY_BIT_VALVE flag
- The `customResolve` parameter of VkCustomResolveCreateInfoEXT. Formats are ignored, and not including the structure behaves identically to setting `customResolve` to VK_FALSE, unlike in fragment output interface state.

If a pipeline specifies pre-rasterization state either directly or by including it as a pipeline library and `rasterizerDiscardEnable` is VK_FALSE or VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE is used, this state **must** be specified to create a complete graphics pipeline.

If a pipeline includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT in VkGraphicsPipelineLibraryCreateInfoEXT::`flags` either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify pre-rasterization state in any way, that pipeline **must** specify this state directly.

Fragment Output State

Fragment output state is defined by:

- VkPipelineColorBlendStateCreateInfo
- VkRenderPass and `subpass` parameter
- VkPipelineMultisampleStateCreateInfo
- The format parameters of VkPipelineRenderingCreateInfo (`viewMask` is ignored)
- VkAttachmentSampleCountInfoAMD
- VkAttachmentSampleCountInfoNV
- VkExternalFormatANDROID
- VkCustomResolveCreateInfoEXT
- Inclusion/omission of the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT and VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT flags
- Inclusion/omission of the VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT flag
- VkRenderingAttachmentLocationInfo

If a pipeline specifies pre-rasterization state either directly or by including it as a pipeline library and `rasterizerDiscardEnable` is VK_FALSE or VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE is used, this state **must** be specified to create a complete graphics pipeline.

If a pipeline includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT in

VkGraphicsPipelineLibraryCreateInfoEXT::flags either explicitly or as a default, and either the conditions requiring this state for a complete graphics pipeline are met or this pipeline does not specify pre-rasterization state in any way, that pipeline **must** specify this state directly.

Dynamic State

Dynamic state values set via pDynamicState **must** be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. Additionally, setting dynamic state values **must** not modify whether state in a linked library is static or dynamic; this is set and unchangeable when the library is created. For example, if a pipeline only included pre-rasterization shader state, then any dynamic state value corresponding to depth or stencil testing has no effect. Any linked library that has dynamic state enabled that same dynamic state **must** also be enabled in all the other linked libraries to which that dynamic state applies.

Complete Graphics Pipelines

A complete graphics pipeline always includes pre-rasterization shader state, with other subsets included depending on that state as specified in the above sections.

Graphics Pipeline Library Layouts

If different subsets are linked together with pipeline layouts created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, the final effective pipeline layout is effectively the union of the linked pipeline layouts. When binding descriptor sets for this pipeline, the pipeline layout used **must** be compatible with this union. This pipeline layout **can** be overridden when linking with VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT by providing a VkPipelineLayout that is compatible with this union other than VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, or when linking without VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT by providing a VkPipelineLayout that is fully compatible with this union.

If the pNext chain includes a VkPipelineCreateFlags2CreateInfo structure, VkPipelineCreateFlags2CreateInfo::flags from that structure is used instead of flags from this structure.

Valid Usage

- VUID-VkGraphicsPipelineCreateInfo-None-09497
  If the pNext chain does not include a VkPipelineCreateFlags2CreateInfo structure, flags **must** be a valid combination of VkPipelineCreateFlagBits values
- VUID-VkGraphicsPipelineCreateInfo-flags-07984
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is -1, basePipelineHandle **must** be a valid graphics VkPipeline handle
- VUID-VkGraphicsPipelineCreateInfo-flags-07985
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex **must** be a valid index into the calling command's pCreateInfos parameter

- VUID-VkGraphicsPipelineCreateInfo-flags-07986
  If `flags` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, `basePipelineIndex` **must** be -1 or `basePipelineHandle` **must** be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-layout-07987
  If a push constant block is declared in a shader and `layout` is not VK_NULL_HANDLE, a push constant range in `layout` **must** match the shader stage
- VUID-VkGraphicsPipelineCreateInfo-layout-10069
  If a push constant block is declared in a shader and `layout` is not VK_NULL_HANDLE, the block must be contained inside the push constant range in `layout` that matches the stage
- VUID-VkGraphicsPipelineCreateInfo-layout-07988
  If a resource variable is declared in a shader and `layout` is not VK_NULL_HANDLE, the corresponding descriptor set in `layout` **must** match the shader stage
- VUID-VkGraphicsPipelineCreateInfo-layout-07990
  If a resource variable is declared in a shader, `layout` is not VK_NULL_HANDLE, and the descriptor type is not VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the corresponding descriptor set in `layout` **must** match the descriptor type
- VUID-VkGraphicsPipelineCreateInfo-layout-07991
  If a resource variable is declared in a shader as an array and `layout` is not VK_NULL_HANDLE, the corresponding descriptor binding used to create `layout` **must** have a `descriptorCount` that is greater than or equal to the length of the array
- VUID-VkGraphicsPipelineCreateInfo-None-10391
  If a resource variable is declared in a shader as an array of descriptors, then the descriptor type of that variable **must** not be VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK
- VUID-VkGraphicsPipelineCreateInfo-flags-11798
  If the shader64BitIndexing feature is not enabled, `flags` **must** not contain VK_PIPELINE_CREATE_2_64_BIT_INDEXING_BIT_EXT
- VUID-VkGraphicsPipelineCreateInfo-pipelineCreationCacheControl-02878
  If the `pipelineCreationCacheControl` feature is not enabled, `flags` **must** not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT nor VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT
- VUID-VkGraphicsPipelineCreateInfo-pipelineProtectedAccess-07368
  If the `pipelineProtectedAccess` feature is not enabled, `flags` **must** not include VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT nor VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-VkGraphicsPipelineCreateInfo-flags-07369
  `flags` **must** not include both VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT and VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-VkGraphicsPipelineCreateInfo-flags-11311
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, `layout` **must** be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-flags-11312

If VkPipelineCreateFlags2CreateInfoKHR::flags includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, all shader variables in the shader resource interface with a DescriptorSet and Binding decoration **must** have a mapping declared in VkShaderDescriptorSetAndBindingMappingInfoEXT::pMappings

- VUID-VkGraphicsPipelineCreateInfo-stage-02096
  If the pipeline requires pre-rasterization shader state the stage member of one element of pStages **must** be VK_SHADER_STAGE_VERTEX_BIT or VK_SHADER_STAGE_MESH_BIT_EXT
- VUID-VkGraphicsPipelineCreateInfo-pStages-02095
  If the pipeline requires pre-rasterization shader state the geometric shader stages provided in pStages **must** be either from the mesh shading pipeline (stage is VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT) or from the primitive shading pipeline (stage is VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, or VK_SHADER_STAGE_GEOMETRY_BIT)
- VUID-VkGraphicsPipelineCreateInfo-pStages-09631
  If the pipeline requires pre-rasterization shader state and pStages contains both VK_SHADER_STAGE_TASK_BIT_EXT and VK_SHADER_STAGE_MESH_BIT_EXT, then the mesh shader's entry point **must** not declare a variable with a DrawIndex BuiltIn decoration
- VUID-VkGraphicsPipelineCreateInfo-TaskNV-07063
  The shader stages for VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT **must** use either the TaskNV and MeshNV Execution Model or the TaskEXT and MeshEXT Execution Model, but **must** not use both
- VUID-VkGraphicsPipelineCreateInfo-pStages-00729
  If the pipeline requires pre-rasterization shader state and pStages includes a tessellation control shader stage, it **must** include a tessellation evaluation shader stage
- VUID-VkGraphicsPipelineCreateInfo-pStages-00730
  If the pipeline requires pre-rasterization shader state and pStages includes a tessellation evaluation shader stage, it **must** include a tessellation control shader stage
- VUID-VkGraphicsPipelineCreateInfo-pStages-09022
  If the pipeline requires pre-rasterization shader state and pStages includes a tessellation control shader stage, and the VK_EXT_extended_dynamic_state3 extension is not enabled or the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state is not set, pTessellationState **must** be a valid pointer to a valid VkPipelineTessellationStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pTessellationState-09023
  If pTessellationState is not NULL it **must** be a pointer to a valid VkPipelineTessellationStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pStages-00732
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, the shader code of at least one stage **must** contain an OpExecutionMode instruction specifying the type of subdivision in the pipeline
- VUID-VkGraphicsPipelineCreateInfo-pStages-00733

If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, and the shader code of both stages contain an OpExecutionMode instruction specifying the type of subdivision in the pipeline, they **must** both specify the same subdivision mode

- VUID-VkGraphicsPipelineCreateInfo-pStages-00734
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, the shader code of at least one stage **must** contain an OpExecutionMode instruction specifying the output patch size in the pipeline
- VUID-VkGraphicsPipelineCreateInfo-pStages-00735
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, and the shader code of both contain an OpExecutionMode instruction specifying the output patch size in the pipeline, they **must** both specify the same patch size
- VUID-VkGraphicsPipelineCreateInfo-pStages-08888
  If the pipeline is being created with pre-rasterization shader state and vertex input state and pStages includes tessellation shader stages, and either VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or dynamicPrimitiveTopologyUnrestricted is VK_FALSE, the topology member of pInputAssemblyState **must** be VK_PRIMITIVE_TOPOLOGY_PATCH_LIST
- VUID-VkGraphicsPipelineCreateInfo-topology-08889
  If the pipeline is being created with pre-rasterization shader state and vertex input state and the topology member of pInputAssemblyState is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, and either VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then pStages **must** include tessellation shader stages
- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07723
  If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry Execution Model, uses the PointMode Execution Mode, and the shaderTessellationAndGeometryPointSize feature is enabled, a PointSize decorated variable **must** be written to if the maintenance5 feature is not enabled
- VUID-VkGraphicsPipelineCreateInfo-topology-08773
  If the pipeline is being created with a Vertex Execution Model and no TessellationEvaluation or Geometry Execution Model, and the topology member of pInputAssemblyState is VK_PRIMITIVE_TOPOLOGY_POINT_LIST, and either VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or dynamicPrimitiveTopologyUnrestricted is VK_FALSE, a PointSize decorated variable **must** be written to if the maintenance5 feature is not enabled
- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07724
  If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry Execution Model, uses the PointMode Execution Mode, and the shaderTessellationAndGeometryPointSize feature is not enabled, a PointSize decorated variable **must** not be written to
- VUID-VkGraphicsPipelineCreateInfo-shaderTessellationAndGeometryPointSize-08776
  If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints

Execution Mode, and the shaderTessellationAndGeometryPointSize feature is enabled, a PointSize decorated variable **must** be written to for every vertex emitted if the maintenance5 feature is not enabled

- VUID-VkGraphicsPipelineCreateInfo-Geometry-07726
  If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints Execution Mode, and the shaderTessellationAndGeometryPointSize feature is not enabled, a PointSize decorated variable **must** not be written to
- VUID-VkGraphicsPipelineCreateInfo-pStages-00738
  If the pipeline requires pre-rasterization shader state and pStages includes a geometry shader stage, and does not include any tessellation shader stages, its shader code **must** contain an OpExecutionMode instruction specifying an input primitive type that is compatible with the primitive topology specified in pInputAssembly
- VUID-VkGraphicsPipelineCreateInfo-pStages-00739
  If the pipeline requires pre-rasterization shader state and pStages includes a geometry shader stage, and also includes tessellation shader stages, its shader code **must** contain an OpExecutionMode instruction specifying an input primitive type that is compatible with the primitive topology that is output by the tessellation stages
- VUID-VkGraphicsPipelineCreateInfo-pStages-00740
  If the pipeline requires pre-rasterization shader state and fragment shader state, it includes both a fragment shader and a geometry shader, and the fragment shader code reads from an input variable that is decorated with PrimitiveId, then the geometry shader code **must** write to a matching output variable, decorated with PrimitiveId, in all execution paths
- VUID-VkGraphicsPipelineCreateInfo-PrimitiveId-06264
  If the pipeline requires pre-rasterization shader state, it includes a mesh shader and the fragment shader code reads from an input variable that is decorated with PrimitiveId, then the mesh shader code **must** write to a matching output variable, decorated with PrimitiveId, in all execution paths
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06038
  If renderPass is not VK_NULL_HANDLE and the pipeline is being created with fragment shader state the fragment shader **must** not read from any input attachment that is defined as VK_ATTACHMENT_UNUSED in subpass
- VUID-VkGraphicsPipelineCreateInfo-pStages-00742
  If the pipeline requires pre-rasterization shader state and multiple pre-rasterization shader stages are included in pStages, the shader code for the entry points identified by those pStages and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the Shader Interfaces chapter
- VUID-VkGraphicsPipelineCreateInfo-None-04889
  If the pipeline requires pre-rasterization shader state and fragment shader state, the fragment shader and last pre-rasterization shader stage and any relevant state **must** adhere to the pipeline linking rules described in the Shader Interfaces chapter
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06041
  If renderPass is not VK_NULL_HANDLE, and the pipeline is being created with fragment output interface state, then for each color attachment in the subpass, if the potential

format features of the format of the corresponding attachment description do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` **must** be VK_FALSE

- VUID-VkGraphicsPipelineCreateInfo-renderPass-07609
  If `renderPass` is not VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, the `pColorBlendState` pointer is not `NULL`, the `attachmentCount` member of `pColorBlendState` is not ignored, and the subpass uses color attachments, the `attachmentCount` member of `pColorBlendState` **must** be equal to the `colorAttachmentCount` used to create `subpass`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130
  If the pipeline requires pre-rasterization shader state, and `pViewportState->pViewports` is not dynamic, then `pViewportState->pViewports` **must** be a valid pointer to an array of `pViewportState->viewportCount` valid `VkViewport` structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131
  If the pipeline requires pre-rasterization shader state, and `pViewportState->pScissors` is not dynamic, then `pViewportState->pScissors` **must** be a valid pointer to an array of `pViewportState->scissorCount` `VkRect2D` structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749
  If the pipeline requires pre-rasterization shader state, and the `wideLines` feature is not enabled, and no element of the `pDynamicStates` member of `pDynamicState` is VK_DYNAMIC_STATE_LINE_WIDTH, the `lineWidth` member of `pRasterizationState` **must** be `1.0`
- VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-09024
  If the pipeline requires pre-rasterization shader state, and the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state is enabled or the `rasterizerDiscardEnable` member of `pRasterizationState` is VK_FALSE, and related dynamic state is not set, `pViewportState` **must** be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pViewportState-09025
  If `pViewportState` is not `NULL` it **must** be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09026
  If the pipeline requires fragment output interface state, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states is not set, or the alphaToOne feature is enabled and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, `pMultisampleState` **must** be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09027
  If `pMultisampleState` is not `NULL` it **must** be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-alphaToCoverageEnable-08891
  If the pipeline is being created with fragment shader state, the VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable is not ignored and is VK_TRUE, then the Fragment Output Interface **must** contain a variable for the alpha Component word in Location 0 at Index 0
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09028
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment shader state, and subpass uses a depth/stencil attachment, and related dynamic state is not set, pDepthStencilState **must** be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09029
  If pDepthStencilState is not NULL it **must** be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09030
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, and subpass uses color attachments, and related dynamic state is not set, pColorBlendState **must** be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00754
  If the pipeline requires pre-rasterization shader state, the depthBiasClamp feature is not enabled, no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BIAS, and the depthBiasEnable member of pRasterizationState is VK_TRUE, the depthBiasClamp member of pRasterizationState **must** be 0.0
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-02510
  If the pipeline requires fragment shader state, the VK_EXT_depth_range_unrestricted extension is not enabled and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BOUNDS, and the depthBoundsTestEnable member of pDepthStencilState is VK_TRUE, the minDepthBounds and maxDepthBounds members of pDepthStencilState **must** be between 0.0 and 1.0, inclusive
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-10913
  If the pipeline requires fragment shader state, no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BOUNDS, and pDynamicStates includes VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE or the depthBoundsTestEnable member of pDepthStencilState is VK_TRUE, minDepthBounds **must** be less than or equal to maxDepthBounds
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07610
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE, sampleLocationsInfo.sampleLocationGridSize.width **must** evenly divide VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07611
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT is used, sampleLocationsInfo.sampleLocationGridSize.height **must** evenly divide VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07612
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT is used, sampleLocationsInfo.sampleLocationsPerPixel **must** equal rasterizationSamples
- VUID-VkGraphicsPipelineCreateInfo-sampleLocationsEnable-01524
  If the pipeline requires fragment shader state, and the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT structure included in the pNext chain of pMultisampleState is VK_TRUE, the fragment shader code **must** not statically use the extended instruction InterpolateAtSample
- VUID-VkGraphicsPipelineCreateInfo-multisampledRenderToSingleSampled-06853
  If the pipeline requires fragment output interface state, the multisampledRenderToSingleSampled feature is not enabled, the VK_AMD_mixed_attachment_samples extension is not enabled, the VK_NV_framebuffer_mixed_samples extension is not enabled, rasterizationSamples is not dynamic, and subpass uses color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState **must** be the same as the sample count for those subpass attachments
- VUID-VkGraphicsPipelineCreateInfo-subpass-01505
  If the pipeline requires fragment output interface state, and the VK_AMD_mixed_attachment_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass uses color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState **must** equal the maximum of the sample counts of those subpass attachments
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06854
  If renderPass is not VK_NULL_HANDLE, the multisampledRenderToSingleSampled feature is not enabled, rasterizationSamples is not dynamic, and subpass has a VkMultisampledRenderToSingleSampledInfoEXT structure included in the VkSubpassDescription2::pNext chain with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the rasterizationSamples member of pMultisampleState **must** be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples
- VUID-VkGraphicsPipelineCreateInfo-subpass-01411
  If the pipeline requires fragment output interface state, the

VK_NV_framebuffer_mixed_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled, then the rasterizationSamples member of pMultisampleState **must** be the same as the sample count of the depth/stencil attachment

- VUID-VkGraphicsPipelineCreateInfo-subpass-01412
  If the pipeline requires fragment output interface state, the VK_NV_framebuffer_mixed_samples extension is enabled, rasterizationSamples is not dynamic, and if subpass has any color attachments, then the rasterizationSamples member of pMultisampleState **must** be greater than or equal to the sample count for those subpass attachments
- VUID-VkGraphicsPipelineCreateInfo-coverageReductionMode-02722
  If the pipeline requires fragment output interface state, the coverageReductionMode feature is enabled, and rasterizationSamples is not dynamic, the coverage reduction mode specified by VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, the rasterizationSamples member of pMultisampleState and the sample counts for the color and depth/stencil attachments (if the subpass has them) **must** be a valid combination returned by vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV
- VUID-VkGraphicsPipelineCreateInfo-subpass-00758
  If the pipeline requires fragment output interface state, rasterizationSamples is not dynamic, and subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState **must** follow the rules for a zero-attachment subpass
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06046
  If renderPass is not VK_NULL_HANDLE, subpass **must** be a valid subpass within renderPass
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06047
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, subpass viewMask is not 0, and multiviewTessellationShader is not enabled, then pStages **must** not include tessellation shaders
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06048
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, subpass viewMask is not 0, and multiviewGeometryShader is not enabled, then pStages **must** not include a geometry shader
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06050
  If renderPass is not VK_NULL_HANDLE and the pipeline is being created with pre-rasterization shader state, and subpass viewMask is not 0, then all of the shaders in the pipeline **must** not include variables decorated with the Layer built-in decoration in their interfaces
- VUID-VkGraphicsPipelineCreateInfo-renderPass-07064
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, subpass viewMask is not 0, and multiviewMeshShader is not enabled, then pStages **must** not include a mesh shader
- VUID-VkGraphicsPipelineCreateInfo-renderPass-12325
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, pStages includes a mesh shader, and subpass viewMask is not 0,

then the index of the most significant bit in viewMask **must** be less than maxMeshMultiviewViewCount

- VUID-VkGraphicsPipelineCreateInfo-flags-00764
  flags **must** not contain the VK_PIPELINE_CREATE_DISPATCH_BASE_BIT flag
- VUID-VkGraphicsPipelineCreateInfo-pStages-01565
  If the pipeline requires fragment shader state and an input attachment was referenced by an aspectMask at renderPass creation time, the fragment shader **must** only read from the aspects that were specified for that input attachment
- VUID-VkGraphicsPipelineCreateInfo-layout-01688
  The number of resources in layout accessible to each shader stage that is used by the pipeline **must** be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-01715
  If the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV, and the viewportWScalingEnable member of a VkPipelineViewportWScalingStateCreateInfoNV structure, included in the pNext chain of pViewportState, is VK_TRUE, the pViewportWScalings member of the VkPipelineViewportWScalingStateCreateInfoNV **must** be a pointer to an array of VkPipelineViewportWScalingStateCreateInfoNV::viewportCount valid VkViewportWScalingNV structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04056
  If the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV, and if pViewportState->pNext chain includes a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure, and if its exclusiveScissorCount member is not 0, then its pExclusiveScissors member **must** be a valid pointer to an array of exclusiveScissorCount VkRect2D structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07854
  If VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV is included in the pDynamicStates array then the implementation **must** support at least specVersion 2 of the VK_NV_scissor_exclusive extension
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04057
  If the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV, and if pViewportState->pNext chain includes a VkPipelineViewportShadingRateImageStateCreateInfoNV structure, then its pShadingRatePalettes member **must** be a valid pointer to an array of viewportCount valid VkShadingRatePaletteNV structures
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04058
  If the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT, and if pNext chain includes a VkPipelineDiscardRectangleStateCreateInfoEXT structure, and if its discardRectangleCount member is not 0, then its pDiscardRectangles member **must** be a valid pointer to an array of discardRectangleCount VkRect2D structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07855
  If VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT is included in the pDynamicStates array then the implementation **must** support at least specVersion 2 of the VK_EXT_discard_rectangles extension
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07856
  If VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT is included in the pDynamicStates array then the implementation **must** support at least specVersion 2 of the VK_EXT_discard_rectangles extension
- VUID-VkGraphicsPipelineCreateInfo-pStages-02097
  If the pipeline requires vertex input state, and pVertexInputState is not dynamic, then pVertexInputState **must** be a valid pointer to a valid VkPipelineVertexInputStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-Input-07904
  If the vertexAttributeRobustness feature is not enabled, and the maintenance9 feature is not enabled, and the pipeline is being created with vertex input state and pVertexInputState is not dynamic, then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint **must** contain a location in VkVertexInputAttributeDescription::location
- VUID-VkGraphicsPipelineCreateInfo-Input-08733
  If the pipeline requires vertex input state and pVertexInputState is not dynamic, then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint **must** be the same as VkVertexInputAttributeDescription::format
- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08929
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and VkVertexInputAttributeDescription::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint **must** be 64-bit
- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08930
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription::format **must** have a 64-bit component
- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-09198
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and VkVertexInputAttributeDescription::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint **must** not use components that are not present in the format
- VUID-VkGraphicsPipelineCreateInfo-dynamicPrimitiveTopologyUnrestricted-09031
  If the pipeline requires vertex input state, and related dynamic state is not set, pInputAssemblyState **must** be a valid pointer to a valid VkPipelineInputAssemblyStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pInputAssemblyState-09032
  If pInputAssemblyState is not NULL it **must** be a valid pointer to a valid

VkPipelineInputAssemblyStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-pStages-02317
  If the pipeline requires pre-rasterization shader state, the Xfb execution mode **can** be specified by no more than one shader stage in pStages
- VUID-VkGraphicsPipelineCreateInfo-pStages-02318
  If the pipeline requires pre-rasterization shader state, and any shader stage in pStages specifies Xfb execution mode it **must** be the last pre-rasterization shader stage
- VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02319
  If the pipeline requires pre-rasterization shader state, and a VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream value other than zero is specified, all variables in the output interface of the entry point being compiled decorated with Position, PointSize, ClipDistance, or CullDistance **must** be decorated with identical Stream values that match the rasterizationStream
- VUID-VkGraphicsPipelineCreateInfo-rasterizationStream-02320
  If the pipeline requires pre-rasterization shader state, and VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream is zero, or not specified, all variables in the output interface of the entry point being compiled decorated with Position, PointSize, ClipDistance, or CullDistance **must** be decorated with a Stream value of zero, or **must** not specify the Stream decoration
- VUID-VkGraphicsPipelineCreateInfo-geometryStreams-02321
  If the pipeline requires pre-rasterization shader state, and the last pre-rasterization shader stage is a geometry shader, and that geometry shader uses the GeometryStreams capability, then VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams feature **must** be enabled
- VUID-VkGraphicsPipelineCreateInfo-None-02322
  If the pipeline requires pre-rasterization shader state, and there are any mesh shader stages in the pipeline there **must** not be any shader stage in the pipeline with a Xfb execution mode
- VUID-VkGraphicsPipelineCreateInfo-lineRasterizationMode-02766
  If the pipeline requires pre-rasterization shader state and at least one of fragment output interface state or fragment shader state, and pMultisampleState is not NULL, the lineRasterizationMode member of a VkPipelineRasterizationLineStateCreateInfo structure included in the pNext chain of pRasterizationState is VK_LINE_RASTERIZATION_MODE_BRESENHAM or VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH, then the alphaToCoverageEnable, alphaToOneEnable, and sampleShadingEnable members of pMultisampleState **must** all be VK_FALSE
- VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767
  If the pipeline requires pre-rasterization shader state, the stippledLineEnable member of VkPipelineRasterizationLineStateCreateInfo is VK_TRUE, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_LINE_STIPPLE, then the lineStippleFactor member of VkPipelineRasterizationLineStateCreateInfo **must** be in the range [1,256]
- VUID-VkGraphicsPipelineCreateInfo-shaderMeshEnqueue-10187

If the shaderMeshEnqueue feature is not enabled, shaders specified by pStages **must** not declare the ShaderEnqueueAMDX capability

- VUID-VkGraphicsPipelineCreateInfo-flags-10188
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, shaders specified by pStages **must** not declare the ShaderEnqueueAMDX capability
- VUID-VkGraphicsPipelineCreateInfo-pStages-10189
  If any shader stages in pStages declare the ShaderEnqueueAMDX capability, VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMDX and VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR **must** be included in flags
- VUID-VkGraphicsPipelineCreateInfo-flags-10190
  If VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMDX is included in flags, and the pipeline requires pre-rasterization shader state, there **must** not be a task or vertex shader specified in pStages
- VUID-VkGraphicsPipelineCreateInfo-flags-10191
  If VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMDX is included in flags, all elements of VkPipelineLibraryCreateInfoKHR::pLibraries **must** have been created with VK_PIPELINE_CREATE_2_EXECUTION_GRAPH_BIT_AMDX
- VUID-VkGraphicsPipelineCreateInfo-flags-03372
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-03373
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-03374
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-03375
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-03376
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-03377
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-03577
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-04947
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03378
  If the extendedDynamicState feature is not enabled, and the minimum value of VkApplicationInfo::apiVersion used to create the VkInstance and apiVersion supported by the physical device is less than Version 1.3 there **must** be no element of the pDynamicStates

member of pDynamicState set to VK_DYNAMIC_STATE_CULL_MODE, VK_DYNAMIC_STATE_FRONT_FACE, VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY, VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT, VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE, VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_COMPARE_OP, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, or VK_DYNAMIC_STATE_STENCIL_OP

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03379
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is included in the pDynamicStates array then viewportCount **must** be zero
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03380
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT is included in the pDynamicStates array then scissorCount **must** be zero
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is included in the pDynamicStates array then VK_DYNAMIC_STATE_VIEWPORT **must** not be present
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133
  If the pipeline requires pre-rasterization shader state, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT is included in the pDynamicStates array then VK_DYNAMIC_STATE_SCISSOR **must** not be present
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07065
  If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY, or VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868
  If the extendedDynamicState2 feature is not enabled, and the minimum value of VkApplicationInfo::apiVersion used to create the VkInstance and apiVersion supported by the physical device is less than Version 1.3 there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE, VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, or VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869
  If the extendedDynamicState2LogicOp feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LOGIC_OP_EXT
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04870
  If the extendedDynamicState2PatchControlPoints feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07066
  If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, or VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT
- VUID-VkGraphicsPipelineCreateInfo-flags-02877
  If `flags` includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then the `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature **must** be enabled
- VUID-VkGraphicsPipelineCreateInfo-flags-02966
  If the pipeline requires pre-rasterization shader state and `flags` includes VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV, then all stages **must** not specify `Xfb` execution mode
- VUID-VkGraphicsPipelineCreateInfo-libraryCount-06648
  If the pipeline is not created with a complete set of state, or VkPipelineLibraryCreateInfoKHR::`libraryCount` is not `0`, VkGraphicsPipelineShaderGroupsCreateInfoNV::`groupCount` and VkGraphicsPipelineShaderGroupsCreateInfoNV::`pipelineCount` **must** be `0`
- VUID-VkGraphicsPipelineCreateInfo-libraryCount-06649
  If the pipeline is created with a complete set of state, and VkPipelineLibraryCreateInfoKHR::`libraryCount` is `0`, and the `pNext` chain includes an instance of VkGraphicsPipelineShaderGroupsCreateInfoNV, VkGraphicsPipelineShaderGroupsCreateInfoNV::`groupCount` **must** be greater than `0`
- VUID-VkGraphicsPipelineCreateInfo-flags-11000
  If `flags` includes VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT, then the `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled
- VUID-VkGraphicsPipelineCreateInfo-flags-11001
  If the pipeline requires pre-rasterization shader state and `flags` includes VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT, then all stages **must** not specify `Xfb` execution mode
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04494
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in `pDynamicState->pDynamicStates`, VkPipelineFragmentShadingRateStateCreateInfoKHR::`fragmentSize.width` **must** be greater than or equal to `1`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04495
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in `pDynamicState->pDynamicStates`, VkPipelineFragmentShadingRateStateCreateInfoKHR::`fragmentSize.height` **must** be greater than or equal to `1`
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04496
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in `pDynamicState-`

>pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width **must** be a power-of-two value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04497
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height **must** be a power-of-two value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04498
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width **must** be less than or equal to 4
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04499
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height **must** be less than or equal to 4
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04500
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the pipelineFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width and VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height **must** both be equal to 1
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06567
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] **must** be a valid VkFragmentShadingRateCombinerOpKHR value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06568
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] **must** be a valid VkFragmentShadingRateCombinerOpKHR value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04501
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] **must** be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04502
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the attachmentFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] **must** be

VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04503
  If the pipeline requires pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is not included in pDynamicState->pDynamicStates, and VkPipelineViewportStateCreateInfo::viewportCount is greater than 1, entry points specified in pStages **must** not write to the PrimitiveShadingRateKHR built-in
- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04504
  If the pipeline requires pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and entry points specified in pStages write to the ViewportIndex built-in, they **must** not also write to the PrimitiveShadingRateKHR built-in
- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04505
  If the pipeline requires pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and entry points specified in pStages write to the ViewportMaskNV built-in, they **must** not also write to the PrimitiveShadingRateKHR built-in
- VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04506
  If the pipeline requires pre-rasterization shader state or fragment shader state, the fragmentShadingRateNonTrivialCombinerOps limit is not supported, and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, elements of VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps **must** be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR
- VUID-VkGraphicsPipelineCreateInfo-None-06569
  If the pipeline requires fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRateType **must** be a valid VkFragmentShadingRateTypeNV value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06570
  If the pipeline requires fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate **must** be a valid VkFragmentShadingRateNV value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06571
  If the pipeline requires fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0] **must** be a valid VkFragmentShadingRateCombinerOpKHR value
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06572
  If the pipeline requires fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState-

>pDynamicStates, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1] **must** be a valid VkFragmentShadingRateCombinerOpKHR value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04569
  If the pipeline requires fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the fragmentShadingRateEnums feature is not enabled, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRateType **must** be equal to VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04570
  If the pipeline requires fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the pipelineFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate **must** be equal to VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04571
  If the pipeline requires fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[0] **must** be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04572
  If the pipeline requires fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the attachmentFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps[1] **must** be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR
- VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04573
  If the pipeline requires fragment shader state, and the fragmentShadingRateNonTrivialCombinerOps limit is not supported and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, elements of VkPipelineFragmentShadingRateEnumStateCreateInfoNV::combinerOps **must** be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR
- VUID-VkGraphicsPipelineCreateInfo-None-04574
  If the pipeline requires fragment shader state, and the supersampleFragmentShadingRates feature is not enabled, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate **must** not be equal to VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV, VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV, VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV, or VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV
- VUID-VkGraphicsPipelineCreateInfo-None-04575
  If the pipeline requires fragment shader state, and the noInvocationFragmentShadingRates feature is not enabled, VkPipelineFragmentShadingRateEnumStateCreateInfoNV::shadingRate **must** not be equal to

VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03578
  All elements of the pDynamicStates member of pDynamicState **must** not be VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04807
  If the pipeline requires pre-rasterization shader state and the vertexInputDynamicState feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VERTEX_INPUT_EXT
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07067
  If the pipeline requires pre-rasterization shader state, and includes a mesh shader, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VERTEX_INPUT_EXT
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04800
  If the colorWriteEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-rasterizationSamples-04899
  If the pipeline requires fragment shader state, and the VK_QCOM_render_pass_shader_resolve extension or the customResolve feature is enabled, rasterizationSamples is not dynamic, and if subpass has any input attachments, and if the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_EXT, then the sample count of the input attachments **must** equal rasterizationSamples
- VUID-VkGraphicsPipelineCreateInfo-sampleShadingEnable-04900
  If the pipeline requires fragment shader state, and the VK_QCOM_render_pass_shader_resolve extension or the customResolve feature is enabled, and if the subpass description contains VK_SUBPASS_DESCRIPTION_FRAGMENT_REGION_BIT_EXT, then sampleShadingEnable **must** be false
- VUID-VkGraphicsPipelineCreateInfo-dynamicRendering-06576
  If the dynamicRendering feature is not enabled and the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, renderPass **must** not be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-pNext-12427
  If VkPipelineRenderingCreateInfo is included in the pNext chain, then renderPass **must** be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-multiview-06577
  If the multiview feature is not enabled, the pipeline requires pre-rasterization shader state or fragment shader state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::viewMask **must** be 0
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06578
  If the pipeline requires pre-rasterization shader state or fragment shader state, and renderPass is VK_NULL_HANDLE, the index of the most significant bit in VkPipelineRenderingCreateInfo::viewMask **must** be less than maxMultiviewViewCount

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06579
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::colorAttachmentCount is not 0, VkPipelineRenderingCreateInfo::pColorAttachmentFormats **must** be a valid pointer to an array of colorAttachmentCount valid VkFormat values
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06580
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, each element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats **must** be a valid VkFormat value
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06582
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and any element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, that format **must** be a format with potential format features that include VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06583
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::depthAttachmentFormat **must** be a valid VkFormat value
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06584
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::stencilAttachmentFormat **must** be a valid VkFormat value
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06585
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it **must** be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06586
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it **must** be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06587
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it **must** be a format that includes a depth component
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06588
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it **must** be a format that includes a stencil component
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06589
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED,

and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, depthAttachmentFormat **must** equal stencilAttachmentFormat

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09033
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with fragment shader state and fragment output interface state, and either of VkPipelineRenderingCreateInfo ::depthAttachmentFormat or VkPipelineRenderingCreateInfo::stencilAttachmentFormat are not VK_FORMAT_UNDEFINED, and the VK_EXT_extended_dynamic_state3 extension is not enabled or any of the VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_COMPARE_OP, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_OP, or VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic states are not set, pDepthStencilState **must** be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09034
  If pDepthStencilState is not NULL it **must** be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09035
  If renderPass is VK_NULL_HANDLE and the pipeline is being created with fragment shader state but not fragment output interface state, and the VK_EXT_extended_dynamic_state3 extension is not enabled, or any of the VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_COMPARE_OP, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_OP, or VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic states are not set, pDepthStencilState **must** be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09036
  If pDepthStencilState is not NULL it **must** be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09037
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, and any element of VkPipelineRenderingCreateInfo ::pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, and the VK_EXT_extended_dynamic_state3 extension is not enabled, or any of the VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT, VK_DYNAMIC_STATE_LOGIC_OP_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, or VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic states are not set, pColorBlendState **must** be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pColorBlendState-09038
  If pColorBlendState is not NULL it **must** be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06055

If renderPass is VK_NULL_HANDLE, the attachmentCount member of pColorBlendState is not ignored, and the pipeline is being created with fragment output interface state, pColorBlendState->attachmentCount **must** be equal to VkPipelineRenderingCreateInfo::colorAttachmentCount

- VUID-VkGraphicsPipelineCreateInfo-renderPass-11504
  If renderPass is VK_NULL_HANDLE, a VkCustomResolveCreateInfoEXT structure is in the pNext chain, and the pipeline is being created with fragment output interface state, VkPipelineRenderingCreateInfo::colorAttachmentCount **must** be equal to VkCustomResolveCreateInfoEXT::colorAttachmentCount
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06057
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, VkPipelineRenderingCreateInfo::viewMask is not 0, and the multiviewTessellationShader feature is not enabled, then pStages **must** not include tessellation shaders
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06058
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, VkPipelineRenderingCreateInfo::viewMask is not 0, and the multiviewGeometryShader feature is not enabled, then pStages **must** not include a geometry shader
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06059
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, all of the shaders in the pipeline **must** not include variables decorated with the Layer built-in decoration in their interfaces
- VUID-VkGraphicsPipelineCreateInfo-renderPass-07720
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, and VkPipelineRenderingCreateInfo::viewMask is not 0, and multiviewMeshShader is not enabled, then pStages **must** not include a mesh shader
- VUID-VkGraphicsPipelineCreateInfo-renderPass-12326
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, pStages includes a mesh shader, and VkPipelineRenderingCreateInfo::viewMask is not 0, then the index of the most significant bit in viewMask **must** be less than maxMeshMultiviewViewCount
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06061
  If the dynamicRenderingLocalRead feature is not enabled, the pipeline requires fragment shader state, and renderPass is VK_NULL_HANDLE, fragment shaders in pStages **must** not include the InputAttachment capability
- VUID-VkGraphicsPipelineCreateInfo-renderPass-08710
  If the pipeline requires fragment shader state and renderPass is not VK_NULL_HANDLE, fragment shaders in pStages **must** not include any of the TileImageColorReadAccessEXT, TileImageDepthReadAccessEXT, or TileImageStencilReadAccessEXT capabilities
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06062
  If the pipeline requires fragment output interface state and renderPass is VK_NULL_HANDLE, for each color attachment format defined by the

pColorAttachmentFormats member of VkPipelineRenderingCreateInfo, if its potential format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState **must** be VK_FALSE

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06063
  If the pipeline requires fragment output interface state and renderPass is VK_NULL_HANDLE, if the pNext chain includes VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV, the colorAttachmentCount member of that structure **must** be equal to the value of VkPipelineRenderingCreateInfo::colorAttachmentCount
- VUID-VkGraphicsPipelineCreateInfo-flags-06591
  If pStages includes a fragment shader stage, and the fragment shader declares the EarlyFragmentTests execution mode, the flags member of VkPipelineDepthStencilStateCreateInfo **must** not include VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT
- VUID-VkGraphicsPipelineCreateInfo-flags-06482
  If the dynamicRenderingLocalRead feature is not enabled, the pipeline requires fragment output interface state, and the flags member of VkPipelineColorBlendStateCreateInfo includes VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT, renderPass **must** not be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-None-09526
  If the dynamicRenderingLocalRead feature is not enabled, the pipeline requires fragment output interface state, and the flags member of VkPipelineDepthStencilStateCreateInfo includes VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT or VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT, renderPass **must** not be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-pColorAttachmentSamples-06592
  If the fragment output interface state, elements of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV **must** be valid VkSampleCountFlagBits values
- VUID-VkGraphicsPipelineCreateInfo-depthStencilAttachmentSamples-06593
  If the fragment output interface state and the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV is not 0, it **must** be a valid VkSampleCountFlagBits value
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09527
  If the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineColorBlendStateCreateInfo includes VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_A

CCESS_BIT_EXT subpass **must** have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_COLOR_ACCESS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09528
  If the pipeline requires fragment shader state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineDepthStencilStateCreateInfo includes VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT, subpass **must** have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09529
  If the pipeline requires fragment shader state, renderPass is not VK_NULL_HANDLE, and the flags member of VkPipelineDepthStencilStateCreateInfo includes VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT, subpass **must** have been created with VK_SUBPASS_DESCRIPTION_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT
- VUID-VkGraphicsPipelineCreateInfo-pipelineStageCreationFeedbackCount-06594
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it **must** be equal to stageCount
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06595
  If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state or fragment shader state, and VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly is VK_TRUE then VkMultiviewPerViewAttributesInfoNVX::perViewAttributes **must** also be VK_TRUE
- VUID-VkGraphicsPipelineCreateInfo-flags-06596
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributes specified in both this pipeline and the library **must** be equal
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06597
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributes specified in both libraries **must** be equal
- VUID-VkGraphicsPipelineCreateInfo-flags-06598
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly specified in both this pipeline and the library **must** be equal

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06599
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the value of VkMultiviewPerViewAttributesInfoNVX::perViewAttributesPositionXOnly specified in both libraries **must** be equal
- VUID-VkGraphicsPipelineCreateInfo-pStages-06600
  If the pipeline requires pre-rasterization shader state or fragment shader state, pStages **must** be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures
- VUID-VkGraphicsPipelineCreateInfo-stageCount-09587
  If the pipeline does not require pre-rasterization shader state or fragment shader state, stageCount **must** be zero
- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-06601
  If the pipeline requires pre-rasterization shader state, and related dynamic state is not set, pRasterizationState **must** be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09039
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and related dynamic state is not set, then pMultisampleState **must** be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09040
  If pRasterizationState is not NULL it **must** be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-layout-06602
  If the pipeline requires fragment shader state or pre-rasterization shader state, and VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, layout **must** be a valid VkPipelineLayout handle
- VUID-VkGraphicsPipelineCreateInfo-renderPass-06603
  If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output state, and renderPass is not VK_NULL_HANDLE, renderPass **must** be a valid VkRenderPass handle
- VUID-VkGraphicsPipelineCreateInfo-stageCount-09530
  If the pipeline requires pre-rasterization shader state, stageCount **must** be greater than 0
- VUID-VkGraphicsPipelineCreateInfo-graphicsPipelineLibrary-06606
  If the graphicsPipelineLibrary feature is not enabled, and if the shaderMeshEnqueue feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-06608
  If the shaderMeshEnqueue feature is not enabled, and the pipeline is being created with all possible state subsets, flags **must** not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-06609

If `flags` includes VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT, pipeline libraries included via VkPipelineLibraryCreateInfoKHR **must** have been created with VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-flags-09245
  If `flags` includes VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT, `flags` **must** also include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-06610
  If `flags` includes VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT, pipeline libraries included via VkPipelineLibraryCreateInfoKHR **must** have been created with VK_PIPELINE_CREATE_RETAIN_LINK_TIME_OPTIMIZATION_INFO_BIT_EXT
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06611
  Any pipeline libraries included via VkPipelineLibraryCreateInfoKHR::`pLibraries` **must** not include any state subset already defined by this structure or defined by any other pipeline library in VkPipelineLibraryCreateInfoKHR::`pLibraries`
- VUID-VkGraphicsPipelineCreateInfo-flags-06612
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::`flags` includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::`pLibraries` includes the other flag, and `layout` was not created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the `layout` used by this pipeline and the library **must** be *identically defined*
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06613
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, one element of VkPipelineLibraryCreateInfoKHR::`pLibraries` includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the `layout` specified by either library was not created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the `layout` used by each library **must** be identically defined
- VUID-VkGraphicsPipelineCreateInfo-flags-06614
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::`flags` includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::`pLibraries` includes the other subset, and `layout` was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the `layout` used by the library **must** also have been created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06615

If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the layout specified by either library was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then the layout used by both libraries **must** have been created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT

- VUID-VkGraphicsPipelineCreateInfo-flags-06616
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and layout was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, elements of the pSetLayouts array which layout was created with that are not VK_NULL_HANDLE **must** be identically defined to the element at the same index of pSetLayouts used to create the library's layout
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06617
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the layout specified by either library was created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, elements of the pSetLayouts array which either layout was created with that are not VK_NULL_HANDLE **must** be identically defined to the element at the same index of pSetLayouts used to create the other library's layout
- VUID-VkGraphicsPipelineCreateInfo-flags-06618
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, any descriptor set layout *N* specified by layout in both this pipeline and the library which include bindings accessed by shader stages in each **must** be *identically defined*
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06619
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, any

descriptor set layout *N* specified by `layout` in both libraries which include bindings accessed by shader stages in each **must** be identically defined

- VUID-VkGraphicsPipelineCreateInfo-flags-06620
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::`flags` includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::`pLibraries` includes the other flag, push constants specified in `layout` in both this pipeline and the library which are available to shader stages in each **must** be identically defined
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06621
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, and one element of VkPipelineLibraryCreateInfoKHR::`pLibraries` includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, push constants specified in `layout` in both this pipeline and the library which are available to shader stages in each **must** be identically defined
- VUID-VkGraphicsPipelineCreateInfo-flags-06679
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, and VkGraphicsPipelineLibraryCreateInfoEXT::`flags` includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::`pLibraries` includes the other subset, VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT was not used, and any element of the `pSetLayouts` array when `layout` was created and the corresponding element of the `pSetLayouts` array used to create the library's `layout` **must** not both be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06681
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, one element of VkPipelineLibraryCreateInfoKHR::`pLibraries` includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT was not used, and any element of the `pSetLayouts` array used to create each library's `layout` was VK_NULL_HANDLE, then the corresponding element of the `pSetLayouts` array used to create the other library's `layout` **must** not be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-flags-06756
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::`flags` includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of

VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element of the pSetLayouts array which layout was created with was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the library's layout **must** not have shader bindings for shaders in the other subset

- VUID-VkGraphicsPipelineCreateInfo-flags-06757
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other subset, and any element of the pSetLayouts array used to create the library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create this pipeline's layout **must** not have shader bindings for shaders in the other subset
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06758
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and any element of the pSetLayouts array used to create each library's layout was VK_NULL_HANDLE, then the corresponding element of the pSetLayouts array used to create the other library's layout **must** not have shader bindings for shaders in the other subset
- VUID-VkGraphicsPipelineCreateInfo-flags-06682
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, and VkGraphicsPipelineLibraryCreateInfoEXT::flags includes both VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, layout **must** have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-flags-06683
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and pRasterizationState->rasterizerDiscardEnable is VK_TRUE, layout **must** have been created with no elements of the pSetLayouts array set to VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-flags-06684
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of subpass **must** be equal to that used to create the library

- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06623
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and another element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of subpass used to create each library **must** be identical
- VUID-VkGraphicsPipelineCreateInfo-renderpass-06624
  If renderpass is not VK_NULL_HANDLE, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, renderPass **must** be compatible with that used to create the library
- VUID-VkGraphicsPipelineCreateInfo-renderpass-06625
  If renderpass is VK_NULL_HANDLE, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the value of renderPass used to create that library **must** also be VK_NULL_HANDLE
- VUID-VkGraphicsPipelineCreateInfo-flags-06626
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes either VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and the other element is included in VkPipelineLibraryCreateInfoKHR::pLibraries, and renderPass is VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::viewMask used by this pipeline and that specified by the library **must** be identical
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06627
  If VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT are included in two elements of VkPipelineLibraryCreateInfoKHR::pLibraries, and renderPass was VK_NULL_HANDLE for both libraries, the value of VkPipelineRenderingCreateInfo::viewMask set by each library **must** be identical
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06628
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes at least one of and no more than two of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and another element of VkPipelineLibraryCreateInfoKHR::pLibraries includes one of the other flags, the renderPass objects used to create each library **must** be compatible or all equal to VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-renderpass-06631
  If `renderPass` is not VK_NULL_HANDLE, the pipeline requires fragment shader state, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states is not set, or the alphaToOne feature is enabled and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, then `pMultisampleState` **must** be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-Input-06632
  If the pipeline requires fragment shader state with a fragment shader that either enables sample shading or decorates any variable in the `Input` storage class with `Sample`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states is not set, or the alphaToOne feature is enabled and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set, then `pMultisampleState` **must** be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-flags-11856
  If VkGraphicsPipelineLibraryCreateInfoEXT::`flags` includes either VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, VkCustomResolveCreateInfoEXT is included and VkCustomResolveCreateInfoEXT::`customResolve` is VK_TRUE, and an element of VkPipelineLibraryCreateInfoKHR::`pLibraries` also includes either VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the library **must** also include VkCustomResolveCreateInfoEXT and the VkCustomResolveCreateInfoEXT::`customResolve` specified by the library **must** be VK_TRUE
- VUID-VkGraphicsPipelineCreateInfo-flags-11857
  If VkGraphicsPipelineLibraryCreateInfoEXT::`flags` includes either VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, VkCustomResolveCreateInfoEXT is not included or VkCustomResolveCreateInfoEXT::`customResolve` is VK_FALSE, and an element of VkPipelineLibraryCreateInfoKHR::`pLibraries` also includes either VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, either the library **must** not include VkCustomResolveCreateInfoEXT or the VkCustomResolveCreateInfoEXT::`customResolve` specified by the library **must** be VK_FALSE
- VUID-VkGraphicsPipelineCreateInfo-customResolve-11858
  If one element of VkPipelineLibraryCreateInfoKHR includes either VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT,

VkCustomResolveCreateInfoEXT is included and VkCustomResolveCreateInfoEXT ::customResolve is VK_TRUE, and another element of VkPipelineLibraryCreateInfoKHR ::pLibraries also includes either VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the other library **must** also include VkCustomResolveCreateInfoEXT and the VkCustomResolveCreateInfoEXT ::customResolve specified by the library **must** be VK_TRUE

- VUID-VkGraphicsPipelineCreateInfo-customResolve-11859
  If one element of VkPipelineLibraryCreateInfoKHR includes either VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, VkCustomResolveCreateInfoEXT is not included or VkCustomResolveCreateInfoEXT ::customResolve is VK_FALSE, and another element of VkPipelineLibraryCreateInfoKHR ::pLibraries also includes either VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, either the other library **must** not include VkCustomResolveCreateInfoEXT or the VkCustomResolveCreateInfoEXT::customResolve specified by the library **must** be VK_FALSE
- VUID-VkGraphicsPipelineCreateInfo-flags-06633
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT with a pMultisampleState that was not NULL, and an element of VkPipelineLibraryCreateInfoKHR ::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, pMultisampleState **must** be identically defined to that used to create the library
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06634
  If an element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT with a pMultisampleState that was not NULL, and if VkGraphicsPipelineLibraryCreateInfoEXT ::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, pMultisampleState **must** be identically defined to that used to create the library
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06635
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT with a pMultisampleState that was not NULL, and if a different element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, the pMultisampleState used to create each library **must** be identically defined
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06636
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT and a value of pMultisampleState->sampleShadingEnable equal to VK_TRUE, and if a different element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, the pMultisampleState

used to create each library **must** be identically defined

- VUID-VkGraphicsPipelineCreateInfo-flags-06637
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, pMultisampleState->sampleShadingEnable is VK_TRUE, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pMultisampleState **must** be identically defined to that used to create the library
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-09567
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries was created with VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT and a value of pMultisampleState->sampleShadingEnable equal to VK_TRUE, and if VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pMultisampleState **must** be identically defined to that used to create the library
- VUID-VkGraphicsPipelineCreateInfo-flags-06638
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes only one of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and an element of VkPipelineLibraryCreateInfoKHR::pLibraries includes the other flag, values specified in VkPipelineFragmentShadingRateStateCreateInfoKHR for both this pipeline and that library **must** be identical
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06639
  If one element of VkPipelineLibraryCreateInfoKHR::pLibraries includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT and another element includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, values specified in VkPipelineFragmentShadingRateStateCreateInfoKHR for both this pipeline and that library **must** be identical
- VUID-VkGraphicsPipelineCreateInfo-flags-06640
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pStages **must** be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures
- VUID-VkGraphicsPipelineCreateInfo-flags-06642
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, layout **must** be a valid VkPipelineLayout handle
- VUID-VkGraphicsPipelineCreateInfo-flags-06643
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and

`renderPass` is not VK_NULL_HANDLE, `renderPass` **must** be a valid VkRenderPass handle

- VUID-VkGraphicsPipelineCreateInfo-flags-06644
  If VkGraphicsPipelineLibraryCreateInfoEXT::`flags` includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT or VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, `stageCount` **must** be greater than `0`
- VUID-VkGraphicsPipelineCreateInfo-flags-06645
  If VkGraphicsPipelineLibraryCreateInfoEXT::`flags` is non-zero, if `flags` includes VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR, any libraries **must** have also been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06646
  If VkPipelineLibraryCreateInfoKHR::`pLibraries` includes more than one library, and any library was created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR, all libraries **must** have also been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-06647
  If VkPipelineLibraryCreateInfoKHR::`pLibraries` includes at least one library, VkGraphicsPipelineLibraryCreateInfoEXT::`flags` is non-zero, and any library was created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR, `flags` **must** include VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-None-07826
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, the pipeline includes a complete set of state, and there are no libraries included in VkPipelineLibraryCreateInfoKHR::`pLibraries`, then VkPipelineLayout **must** be a valid pipeline layout
- VUID-VkGraphicsPipelineCreateInfo-layout-07827
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, the pipeline includes a complete set of state specified entirely by libraries, and each library was created with a VkPipelineLayout created without VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then `layout` **must** be compatible with the layouts in those libraries
- VUID-VkGraphicsPipelineCreateInfo-flags-06729
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, `flags` includes VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT, the pipeline includes a complete set of state specified entirely by libraries, and each library was created with a VkPipelineLayout created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then `layout` **must** be compatible with the union of the libraries' pipeline layouts other than the inclusion/exclusion of VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT
- VUID-VkGraphicsPipelineCreateInfo-flags-06730
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include

VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, flags does not include VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT, the pipeline includes a complete set of state specified entirely by libraries, and each library was created with a VkPipelineLayout created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, then layout **must** be compatible with the union of the libraries' pipeline layouts

- VUID-VkGraphicsPipelineCreateInfo-conservativePointAndLineRasterization-08892
  If conservativePointAndLineRasterization is not supported and the effective rasterization input topology is in line or point topology class, then VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode **must** be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT
- VUID-VkGraphicsPipelineCreateInfo-pStages-06894
  If the pipeline requires pre-rasterization shader state but not fragment shader state, elements of pStages **must** not have stage set to VK_SHADER_STAGE_FRAGMENT_BIT
- VUID-VkGraphicsPipelineCreateInfo-pStages-06895
  If the pipeline requires fragment shader state but not pre-rasterization shader state, elements of pStages **must** not have stage set to a shader stage which participates in pre-rasterization
- VUID-VkGraphicsPipelineCreateInfo-pStages-06896
  If the pipeline requires pre-rasterization shader state, all elements of pStages **must** have a stage set to a shader stage which participates in fragment shader state or pre-rasterization shader state
- VUID-VkGraphicsPipelineCreateInfo-stage-06897
  If the pipeline requires fragment shader state and/or pre-rasterization shader state, any value of stage **must** not be set in more than one element of pStages
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3TessellationDomainOrigin-07370
  If the extendedDynamicState3TessellationDomainOrigin feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClampEnable-07371
  If the extendedDynamicState3DepthClampEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3PolygonMode-07372
  If the extendedDynamicState3PolygonMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_POLYGON_MODE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationSamples-07373
  If the extendedDynamicState3RasterizationSamples feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleMask-07374
  If the extendedDynamicState3SampleMask feature is not enabled, there **must** be no element

of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SAMPLE_MASK_EXT

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToCoverageEnable-07375
  If the extendedDynamicState3AlphaToCoverageEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToOneEnable-07376
  If the extendedDynamicState3AlphaToOneEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LogicOpEnable-07377
  If the extendedDynamicState3LogicOpEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEnable-07378
  If the extendedDynamicState3ColorBlendEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEquation-07379
  If the extendedDynamicState3ColorBlendEquation feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorWriteMask-07380
  If the extendedDynamicState3ColorWriteMask feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationStream-07381
  If the extendedDynamicState3RasterizationStream feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ConservativeRasterizationMode-07382
  If the extendedDynamicState3ConservativeRasterizationMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ExtraPrimitiveOverestimationSize-07383
  If the extendedDynamicState3ExtraPrimitiveOverestimationSize feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-09639
  If the pipeline requires pre-rasterization shader state, pDynamicState includes VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT, and pDynamicState

does not include VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT, pRasterizationState **must** include a VkPipelineRasterizationConservativeStateCreateInfoEXT in its pNext chain

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipEnable-07384
  If the extendedDynamicState3DepthClipEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleLocationsEnable-07385
  If the extendedDynamicState3SampleLocationsEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendAdvanced-07386
  If the extendedDynamicState3ColorBlendAdvanced feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ProvokingVertexMode-07387
  If the extendedDynamicState3ProvokingVertexMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineRasterizationMode-07388
  If the extendedDynamicState3LineRasterizationMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LineStippleEnable-07389
  If the extendedDynamicState3LineStippleEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClipNegativeOneToOne-07390
  If the extendedDynamicState3DepthClipNegativeOneToOne feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportWScalingEnable-07391
  If the extendedDynamicState3ViewportWScalingEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ViewportSwizzle-07392
  If the extendedDynamicState3ViewportSwizzle feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorEnable-

07393
If the extendedDynamicState3CoverageToColorEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV

- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageToColorLocation-07394
If the extendedDynamicState3CoverageToColorLocation feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationMode-07395
If the extendedDynamicState3CoverageModulationMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTableEnable-07396
If the extendedDynamicState3CoverageModulationTableEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageModulationTable-07397
If the extendedDynamicState3CoverageModulationTable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3CoverageReductionMode-07398
If the extendedDynamicState3CoverageReductionMode feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RepresentativeFragmentTestEnable-07399
If the extendedDynamicState3RepresentativeFragmentTestEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV
- VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ShadingRateImageEnable-07400
If the extendedDynamicState3ShadingRateImageEnable feature is not enabled, there **must** be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV
- VUID-VkGraphicsPipelineCreateInfo-flags-07401
flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-pLibraries-11594
If flags includes

VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR, each element of VkPipelineLibraryCreateInfoKHR::pLibraries **must** have been created with the VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR bit set

- VUID-VkGraphicsPipelineCreateInfo-flags-11595
  If the VkPhysicalDeviceOpacityMicromapFeaturesKHR::micromap feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR
- VUID-VkGraphicsPipelineCreateInfo-flags-07997
  flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07730
  If the multiviewPerViewViewports feature is enabled, renderpass is not VK_NULL_HANDLE, the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, then the index of the most significant bit in each element of VkRenderPassMultiviewCreateInfo::pViewMasks **must** be less than pViewportState->viewportCount
- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07731
  If the multiviewPerViewViewports feature is enabled, renderpass is not VK_NULL_HANDLE, the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT, then the index of the most significant bit in each element of VkRenderPassMultiviewCreateInfo::pViewMasks **must** be less than pViewportState->scissorCount
- VUID-VkGraphicsPipelineCreateInfo-multiviewPerViewViewports-12249
  If the multiviewPerViewViewports feature is enabled, renderpass is VK_NULL_HANDLE, the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, then the index of the most significant bit in VkPipelineRenderingCreateInfo::viewMask **must** be less than pViewportState->viewportCount
- VUID-VkGraphicsPipelineCreateInfo-multiviewPerViewViewports-12250
  If the multiviewPerViewViewports feature is enabled, renderpass is VK_NULL_HANDLE, the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT, then the index of the most significant bit in VkPipelineRenderingCreateInfo::viewMask **must** be less than pViewportState->scissorCount
- VUID-VkGraphicsPipelineCreateInfo-pStages-08711
  If pStages includes a fragment shader stage, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE is not set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable member of VkPipelineDepthStencilStateCreateInfo **must** be VK_FALSE
- VUID-VkGraphicsPipelineCreateInfo-pStages-08712
  If pStages includes a fragment shader stage, VK_DYNAMIC_STATE_STENCIL_WRITE_MASK

is not set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the value of VkStencilOpState::writeMask for both front and back in VkPipelineDepthStencilStateCreateInfo **must** be 0

- VUID-VkGraphicsPipelineCreateInfo-flags-08897
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state includes a vertex shader stage in pStages, the pipeline **must** define vertex input state
- VUID-VkGraphicsPipelineCreateInfo-flags-08898
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT, and pre-rasterization shader state is not specified, the pipeline **must** define vertex input state
- VUID-VkGraphicsPipelineCreateInfo-flags-08899
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state includes a vertex shader stage in pStages, the pipeline **must** either define vertex input state or include that state in a linked pipeline library
- VUID-VkGraphicsPipelineCreateInfo-flags-08900
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT the pipeline **must** define pre-rasterization shader state
- VUID-VkGraphicsPipelineCreateInfo-flags-08901
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the pipeline **must** either define pre-rasterization shader state or include that state in a linked pipeline library
- VUID-VkGraphicsPipelineCreateInfo-flags-08903
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state either includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE or has pRasterizationState->rasterizerDiscardEnable set to VK_FALSE, the pipeline **must** define fragment shader state
- VUID-VkGraphicsPipelineCreateInfo-flags-08904
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT, and pre-rasterization shader state is not specified, the pipeline **must** define fragment shader state
- VUID-VkGraphicsPipelineCreateInfo-flags-08906
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that

state either includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE or has pRasterizationState->rasterizerDiscardEnable set to VK_FALSE, the pipeline **must** define fragment output interface state

- VUID-VkGraphicsPipelineCreateInfo-flags-08907
  If VkGraphicsPipelineLibraryCreateInfoEXT::flags includes VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT, and pre-rasterization shader state is not specified, the pipeline **must** define fragment output interface state
- VUID-VkGraphicsPipelineCreateInfo-flags-08909
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pre-rasterization shader state is specified either in a library or by the inclusion of VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT, and that state either includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE or has pRasterizationState->rasterizerDiscardEnable set to VK_FALSE, the pipeline **must** define fragment output interface state and fragment shader state or include those states in linked pipeline libraries
- VUID-VkGraphicsPipelineCreateInfo-None-09043
  If pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the colorWriteMask member of the corresponding element of pColorBlendState->pAttachments **must** either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, VK_COLOR_COMPONENT_B_BIT, and VK_COLOR_COMPONENT_A_BIT, or none of them
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09301
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, VkPipelineRenderingCreateInfo::viewMask **must** be 0
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09304
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, VkExternalFormatANDROID::externalFormat is not 0, and rasterizationSamples is not dynamic, VkPipelineMultisampleStateCreateInfo::rasterizationSamples **must** be 1
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09305
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, and blendEnable is not dynamic, the blendEnable member of each element of pColorBlendState->pAttachments **must** be VK_FALSE
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09306
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, and pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width **must** be 1
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09307
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output

interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, and pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height **must** be 1

- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09308
  If the externalFormatResolve feature is enabled, the pipeline requires pre-rasterization shader state and fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, the last pre-rasterization shader stage **must** not statically use a variable with the PrimitiveShadingRateKHR built-in
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09309
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, VkPipelineRenderingCreateInfo::colorAttachmentCount **must** be 1
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09310
  If the externalFormatResolve feature is enabled, the pipeline requires fragment shader state and fragment output interface state, renderPass is VK_NULL_HANDLE, and VkExternalFormatANDROID::externalFormat is not 0, the fragment shader **must** not declare the DepthReplacing or StencilRefReplacingEXT execution modes
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09313
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and rasterizationSamples is not dynamic, VkPipelineMultisampleStateCreateInfo::rasterizationSamples **must** be VK_SAMPLE_COUNT_1_BIT
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09314
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and blendEnable is not dynamic, the blendEnable member of each element of pColorBlendState->pAttachments **must** be VK_FALSE
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09315
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width **must** be 1
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09316
  If the externalFormatResolve feature is enabled, the pipeline requires fragment output interface state, renderPass is not VK_NULL_HANDLE, subpass includes an external format resolve attachment, and pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height **must** be 1
- VUID-VkGraphicsPipelineCreateInfo-externalFormatResolve-09317
  If the externalFormatResolve feature is enabled, the pipeline requires pre-rasterization shader state and fragment output interface state, renderPass is not VK_NULL_HANDLE, and subpass includes an external format resolve attachment, the last pre-rasterization

shader stage **must** not statically use a variable with the PrimitiveShadingRateKHR built-in

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09531
  If the pipeline is being created with fragment shader state and fragment output state, the value of renderPass is VK_NULL_HANDLE, and VkRenderingInputAttachmentIndexInfo is included, VkRenderingInputAttachmentIndexInfo::colorAttachmentCount **must** be equal to VkPipelineRenderingCreateInfo::colorAttachmentCount
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09652
  If the pipeline is being created with fragment shader state and fragment output state, the value of renderPass is VK_NULL_HANDLE, and VkRenderingInputAttachmentIndexInfo is not included, the fragment shader **must** not contain any input attachments with a InputAttachmentIndex greater than or equal to VkPipelineRenderingCreateInfo::colorAttachmentCount
- VUID-VkGraphicsPipelineCreateInfo-renderPass-09532
  If the pipeline is being created with fragment output state, and the value of renderPass is VK_NULL_HANDLE, VkRenderingAttachmentLocationInfo::colorAttachmentCount **must** be equal to VkPipelineRenderingCreateInfo::colorAttachmentCount
- VUID-VkGraphicsPipelineCreateInfo-flags-11273
  If VkPipelineCreateFlags2CreateInfoKHR::flags includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, all libraries linked to this pipeline **must** also have that flag set
- VUID-VkGraphicsPipelineCreateInfo-flags-11274
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, all libraries linked to this pipeline **must** also not have that flag set
- VUID-VkGraphicsPipelineCreateInfo-flags-12355
  If flags includes VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, all libraries linked to this pipeline **must** also have that flag set
- VUID-VkGraphicsPipelineCreateInfo-flags-12356
  If flags does not include VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, all libraries linked to this pipeline **must** also not have that flag set
- VUID-VkGraphicsPipelineCreateInfo-flags-12357
  If flags includes VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT, all libraries linked to this pipeline **must** also have that flag set
- VUID-VkGraphicsPipelineCreateInfo-flags-12358
  If flags does not include VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT, all libraries linked to this pipeline **must** also not have that flag set
- VUID-VkGraphicsPipelineCreateInfo-flags-12359
  If flags includes VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT, all libraries linked to this pipeline **must** also have that flag set
- VUID-VkGraphicsPipelineCreateInfo-flags-12360
  If flags does not include VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT, all libraries linked to this pipeline **must** also not have that flag set

Valid Usage (Implicit)

- VUID-VkGraphicsPipelineCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO
- VUID-VkGraphicsPipelineCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkAttachmentSampleCountInfoAMD, VkCustomResolveCreateInfoEXT, VkExternalFormatANDROID, VkExternalFormatOHOS, VkGraphicsPipelineLibraryCreateInfoEXT, VkGraphicsPipelineShaderGroupsCreateInfoNV, VkMultiviewPerViewAttributesInfoNVX, VkPipelineBinaryInfoKHR, VkPipelineCompilerControlCreateInfoAMD, VkPipelineCreateFlags2CreateInfo, VkPipelineCreationFeedbackCreateInfo, VkPipelineDiscardRectangleStateCreateInfoEXT, VkPipelineFragmentDensityMapLayeredCreateInfoVALVE, VkPipelineFragmentShadingRateEnumStateCreateInfoNV, VkPipelineFragmentShadingRateStateCreateInfoKHR, VkPipelineLibraryCreateInfoKHR, VkPipelineRenderingCreateInfo, VkPipelineRepresentativeFragmentTestStateCreateInfoNV, VkPipelineRobustnessCreateInfo, VkRenderingAttachmentLocationInfo, VkRenderingInputAttachmentIndexInfo, or VkValidationFeaturesEXT
- VUID-VkGraphicsPipelineCreateInfo-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-parameter
  If `pDynamicState` is not `NULL`, `pDynamicState` **must** be a valid pointer to a valid VkPipelineDynamicStateCreateInfo structure
- VUID-VkGraphicsPipelineCreateInfo-commonparent
  Each of `basePipelineHandle`, `layout`, and `renderPass` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Structure Chaining

Extends the structure

- VkPipelineCreateInfoKHR

The `VkPipelineFragmentDensityMapLayeredCreateInfoVALVE` structure is defined as:

```
// Provided by VK_VALVE_fragment_density_map_layered
typedef struct VkPipelineFragmentDensityMapLayeredCreateInfoVALVE {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           maxFragmentDensityMapLayers;
} VkPipelineFragmentDensityMapLayeredCreateInfoVALVE;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxFragmentDensityMapLayers` is the maximum number of layers which can be used with a fragment density map.

Valid Usage

- VUID-VkPipelineFragmentDensityMapLayeredCreateInfoVALVE-maxFragmentDensityMapLayers-10825
  `maxFragmentDensityMapLayers` **must** be less than or equal to `maxFragmentDensityMapLayers`

Valid Usage (Implicit)

- VUID-VkPipelineFragmentDensityMapLayeredCreateInfoVALVE-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_DENSITY_MAP_LAYERED_CREATE_INFO_VALVE

Structure Chaining

Extends the structure

- VkGraphicsPipelineCreateInfo

The `VkPipelineRenderingCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPipelineRenderingCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           viewMask;
    uint32_t           colorAttachmentCount;
    const VkFormat*    pColorAttachmentFormats;
    VkFormat           depthAttachmentFormat;
    VkFormat           stencilAttachmentFormat;
} VkPipelineRenderingCreateInfo;
```

```
// Provided by VK_KHR_dynamic_rendering
// Equivalent to VkPipelineRenderingCreateInfo
typedef VkPipelineRenderingCreateInfo VkPipelineRenderingCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `viewMask` is a bitfield of view indices describing which views are active during rendering. It **must** match VkRenderingInfo::`viewMask` when rendering.
- `colorAttachmentCount` is the number of entries in `pColorAttachmentFormats`.
- `pColorAttachmentFormats` is a pointer to an array of VkFormat values defining the format of color attachments used in this pipeline.
- `depthAttachmentFormat` is a VkFormat value defining the format of the depth attachment used in this pipeline.
- `stencilAttachmentFormat` is a VkFormat value defining the format of the stencil attachment used in this pipeline.

When a pipeline is created without a VkRenderPass, if the `pNext` chain of VkGraphicsPipelineCreateInfo includes this structure, it specifies the view mask and format of attachments used for rendering. If this structure is not specified, and the pipeline does not include a VkRenderPass, `viewMask` and `colorAttachmentCount` are `0`, and `depthAttachmentFormat` and `stencilAttachmentFormat` are VK_FORMAT_UNDEFINED. If a graphics pipeline is created with a valid VkRenderPass, parameters of this structure are ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is VK_FORMAT_UNDEFINED, it indicates that the corresponding attachment is unused within the render pass. Valid formats indicate that an attachment **can** be used - but it is still valid to set the attachment to `NULL` when beginning rendering.

If the render pass is going to be used with an external format resolve attachment, a VkExternalFormatANDROID structure **must** also be included in the `pNext` chain of VkGraphicsPipelineCreateInfo, defining the external format of the resolve attachment that will be used.

Valid Usage

- VUID-VkPipelineRenderingCreateInfo-colorAttachmentCount-09533
  `colorAttachmentCount` **must** be less than or equal to `maxColorAttachments`

Valid Usage (Implicit)

- VUID-VkPipelineRenderingCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_RENDERING_CREATE_INFO

Structure Chaining

Extends the structure

- VkGraphicsPipelineCreateInfo

The `VkCustomResolveCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_custom_resolve with VK_KHR_dynamic_rendering or VK_VERSION_1_3
typedef struct VkCustomResolveCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           customResolve;
    uint32_t           colorAttachmentCount;
    const VkFormat*    pColorAttachmentFormats;
    VkFormat           depthAttachmentFormat;
    VkFormat           stencilAttachmentFormat;
} VkCustomResolveCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `customResolve` indicates whether this pipeline will be used for a resolve operation.
- `colorAttachmentCount` is the number of entries in `pColorAttachmentFormats`.
- `pColorAttachmentFormats` is a pointer to an array of VkFormat values defining the format of color resolve attachments used in custom resolves in the same render pass.
- `depthAttachmentFormat` is a VkFormat value defining the format of the depth resolve attachment used in custom resolves in the same render pass.
- `stencilAttachmentFormat` is a VkFormat value defining the format of the stencil resolve attachment used in custom resolves in the same render pass.

If the `pNext` chain includes this structure for one of:

- a VkGraphicsPipelineCreateInfo for a pipeline created without a VkRenderPass
- a VkCommandBufferInheritanceInfo for a secondary command buffer within a render pass instance begun with vkCmdBeginRendering.

it specifies the formats used in custom resolves within the same render pass. It also specifies that the corresponding object will be used in a render pass which contains a custom resolve operation.

If the `pNext` chain includes this structure for a VkShaderCreateInfoEXT for a fragment shader object, it only specifies that the fragment shader will be used in a custom resolve operation.

If a graphics pipeline is created with a valid VkRenderPass, parameters of this structure are ignored.

If `customResolve` is VK_FALSE, the pipeline **can** only be used outside the custom resolve section. If `customResolve` is VK_TRUE, the pipeline **can** only be used inside the custom resolve section.

When a dynamic render pass instance contains a custom resolve operation and the `dynamicRenderingUnusedAttachments` feature is not enabled , all pipelines used to draw in such a render pass **must** include this structure and have identical format information in it. When a dynamic render pass does not contain a custom resolve operation and the `dynamicRenderingUnusedAttachments` feature is not enabled , all pipelines used to draw in such a render pass **must** not include this structure.

If the dynamicRenderingUnusedAttachments feature is enabled, then when this structure is not included in the pNext chain for VkGraphicsPipelineCreateInfo, customResolve is VK_FALSE, colorAttachmentCount is 0, and depthAttachmentFormat and stencilAttachmentFormat are VK_FORMAT_UNDEFINED.

If depthAttachmentFormat, stencilAttachmentFormat, or any element of pColorAttachmentFormats is VK_FORMAT_UNDEFINED, it indicates that the corresponding attachment is unused within the resolve portion of the render pass. Valid formats indicate that an attachment **can** be used - but it is still valid to set the attachment to NULL when beginning rendering.

When passed as a pNext member to a VkShaderCreateInfoEXT struct for use with fragment density maps, the colorAttachmentCount, pColorAttachmentFormats, depthAttachmentFormat, and stencilAttachmentFormat members of this struct are ignored. When not passed as a pNext member, customResolve is VK_FALSE.

Valid Usage

- VUID-VkCustomResolveCreateInfoEXT-colorAttachmentCount-11507
  colorAttachmentCount **must** be less than or equal to maxColorAttachments
- VUID-VkCustomResolveCreateInfoEXT-depthAttachmentFormat-11508
  If depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it **must** be a format that includes a depth component
- VUID-VkCustomResolveCreateInfoEXT-depthAttachmentFormat-11509
  If depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it **must** be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkCustomResolveCreateInfoEXT-pColorAttachmentFormats-11510
  If any element of pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, it **must** be a format with potential format features that include VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT , or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV if the linearColorAttachment feature is enabled
- VUID-VkCustomResolveCreateInfoEXT-stencilAttachmentFormat-11511
  If stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it **must** be a format that includes a stencil aspect
- VUID-VkCustomResolveCreateInfoEXT-stencilAttachmentFormat-11512
  If stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it **must** be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkCustomResolveCreateInfoEXT-depthAttachmentFormat-11513
  If depthAttachmentFormat is not VK_FORMAT_UNDEFINED and stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, depthAttachmentFormat **must** equal stencilAttachmentFormat

Valid Usage (Implicit)

- VUID-VkCustomResolveCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_CUSTOM_RESOLVE_CREATE_INFO_EXT

Structure Chaining

Extends the structures

- VkCommandBufferInheritanceInfo
- VkGraphicsPipelineCreateInfo
- VkShaderCreateInfoEXT

The `VkPipelineBinaryInfoKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineBinaryInfoKHR {
    VkStructureType               sType;
    const void*                   pNext;
    uint32_t                      binaryCount;
    const VkPipelineBinaryKHR*    pPipelineBinaries;
} VkPipelineBinaryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `binaryCount` is the number of elements in the `pPipelineBinaries` array.
- `pPipelineBinaries` is a pointer to an array of VkPipelineBinaryKHR handles.

If a `VkPipelineBinaryInfoKHR` structure with a `binaryCount` greater than 0 is included in the `pNext` chain of any `Vk*PipelineCreateInfo` structure when creating a pipeline, implementations **must** use the data in `pPipelineBinaries` instead of recalculating it. Any shader module identifiers, shader modules, or chained VkShaderModuleCreateInfo structures declared in VkPipelineShaderStageCreateInfo instances are ignored. Any VkShaderDescriptorSetAndBindingMappingInfoEXT in the `pNext` chains of VkPipelineShaderStageCreateInfo instances are ignored.

If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `binaryCount` of `0`.

Valid Usage

- VUID-VkPipelineBinaryInfoKHR-binaryCount-09603
  `binaryCount` and the order of the elements in `pPipelineBinaries` **must** exactly match that returned by vkCreatePipelineBinariesKHR for the matching `Vk*PipelineCreateInfo`

structure and its pNext chain, ignoring the presence of the VkPipelineBinaryInfoKHR structure, the presence of the VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR flag, and absence of any shader module identifiers, shader modules, or VkShaderModuleCreateInfo structures, for the same global pipeline key, from either:

- VkPipelineBinaryCreateInfoKHR::pPipelineCreateInfo, or
- VkPipelineBinaryCreateInfoKHR::pipeline

Valid Usage (Implicit)

- VUID-VkPipelineBinaryInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_BINARY_INFO_KHR
- VUID-VkPipelineBinaryInfoKHR-pPipelineBinaries-parameter
  If binaryCount is not 0, pPipelineBinaries **must** be a valid pointer to an array of binaryCount valid VkPipelineBinaryKHR handles

Structure Chaining

Extends the structures

- VkComputePipelineCreateInfo
- VkGraphicsPipelineCreateInfo
- VkRayTracingPipelineCreateInfoKHR

The VkGraphicsPipelineLibraryCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_graphics_pipeline_library
typedef struct VkGraphicsPipelineLibraryCreateInfoEXT {
    VkStructureType                       sType;
    const void*                           pNext;
    VkGraphicsPipelineLibraryFlagsEXT     flags;
} VkGraphicsPipelineLibraryCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkGraphicsPipelineLibraryFlagBitsEXT specifying the subsets of the graphics pipeline that are being compiled.

If a VkGraphicsPipelineLibraryCreateInfoEXT structure is included in the pNext chain of VkGraphicsPipelineCreateInfo, it specifies the subsets of the graphics pipeline being created, excluding any subsets from linked pipeline libraries. If the pipeline is created with pipeline libraries, state from those libraries is aggregated with said subset.

If this structure is omitted, and either VkGraphicsPipelineCreateInfo::flags includes

VK_PIPELINE_CREATE_LIBRARY_BIT_KHR or the VkGraphicsPipelineCreateInfo::pNext chain includes a VkPipelineLibraryCreateInfoKHR structure with a libraryCount greater than 0, it is as if flags is 0. Otherwise if this structure is omitted, it is as if flags includes all possible subsets of the graphics pipeline (i.e. a complete graphics pipeline).

Valid Usage (Implicit)

- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_LIBRARY_CREATE_INFO_EXT
- VUID-VkGraphicsPipelineLibraryCreateInfoEXT-flags-parameter
  flags **must** be a valid combination of VkGraphicsPipelineLibraryFlagBitsEXT values

Structure Chaining

Extends the structure

- VkGraphicsPipelineCreateInfo

```
// Provided by VK_EXT_graphics_pipeline_library
typedef VkFlags VkGraphicsPipelineLibraryFlagsEXT;
```

VkGraphicsPipelineLibraryFlagsEXT is a bitmask type for setting a mask of zero or more VkGraphicsPipelineLibraryFlagBitsEXT.

Possible values of the flags member of VkGraphicsPipelineLibraryCreateInfoEXT, specifying the subsets of a graphics pipeline to compile are:

```
// Provided by VK_EXT_graphics_pipeline_library
typedef enum VkGraphicsPipelineLibraryFlagBitsEXT {
    VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT = 0x00000001,
    VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT = 0x00000002,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT = 0x00000004,
    VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT = 0x00000008,
} VkGraphicsPipelineLibraryFlagBitsEXT;
```

- VK_GRAPHICS_PIPELINE_LIBRARY_VERTEX_INPUT_INTERFACE_BIT_EXT specifies that a pipeline will include vertex input interface state.
- VK_GRAPHICS_PIPELINE_LIBRARY_PRE_RASTERIZATION_SHADERS_BIT_EXT specifies that a pipeline will include pre-rasterization shader state.
- VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_SHADER_BIT_EXT specifies that a pipeline will include fragment shader state.
- VK_GRAPHICS_PIPELINE_LIBRARY_FRAGMENT_OUTPUT_INTERFACE_BIT_EXT specifies that a pipeline will include fragment output interface state.

The VkPipelineDynamicStateCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType                      sType;
    const void*                          pNext;
    VkPipelineDynamicStateCreateFlags    flags;
    uint32_t                             dynamicStateCount;
    const VkDynamicState*                pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- dynamicStateCount is the number of elements in the pDynamicStates array.
- pDynamicStates is a pointer to an array of VkDynamicState values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.

Valid Usage

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
  Each element of pDynamicStates **must** be unique

Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO
- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
  pNext **must** be NULL
- VUID-VkPipelineDynamicStateCreateInfo-flags-zerobitmask
  flags **must** be 0
- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
  If dynamicStateCount is not 0, pDynamicStates **must** be a valid pointer to an array of dynamicStateCount valid VkDynamicState values

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDynamicStateCreateFlags;
```

VkPipelineDynamicStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The source of different pieces of dynamic state is specified by the VkPipelineDynamicStateCreateInfo::pDynamicStates property of the currently active pipeline, each of whose elements **must** be one of the values:

```
// Provided by VK_VERSION_1_0
typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
    VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
    VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
  // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_CULL_MODE = 1000267000,
  // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_FRONT_FACE = 1000267001,
  // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY = 1000267002,
  // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT = 1000267003,
  // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT = 1000267004,
  // Provided by VK_VERSION_1_3

    VK_DYNAMIC_STATE_STENCIL_OP_EXT = VK_DYNAMIC_STATE_STENCIL_OP,
  // Provided by VK_EXT_extended_dynamic_state2
    VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE_EXT =
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE,
  // Provided by VK_EXT_extended_dynamic_state2
    VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE_EXT = VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE,
  // Provided by VK_EXT_extended_dynamic_state2
    VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT =
VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE,
  // Provided by VK_KHR_line_rasterization
    VK_DYNAMIC_STATE_LINE_STIPPLE_KHR = VK_DYNAMIC_STATE_LINE_STIPPLE,
} VkDynamicState;
```

- VK_DYNAMIC_STATE_VIEWPORT specifies that the `pViewports` state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetViewport before any drawing commands. The number of viewports used by a pipeline is still specified by the `viewportCount` member of VkPipelineViewportStateCreateInfo.
- VK_DYNAMIC_STATE_SCISSOR specifies that the `pScissors` state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetScissor before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the `scissorCount` member of VkPipelineViewportStateCreateInfo.
- VK_DYNAMIC_STATE_LINE_WIDTH specifies that the `lineWidth` state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLineWidth before any drawing commands that generate line primitives for the rasterizer.
- VK_DYNAMIC_STATE_DEPTH_BIAS specifies that any instance of

VkDepthBiasRepresentationInfoEXT included in the pNext chain of VkPipelineRasterizationStateCreateInfo as well as the depthBiasConstantFactor, depthBiasClamp and depthBiasSlopeFactor states in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBias or vkCmdSetDepthBias2EXT before any draws are performed with depth bias enabled.

- VK_DYNAMIC_STATE_BLEND_CONSTANTS specifies that the blendConstants state in VkPipelineColorBlendStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetBlendConstants before any draws are performed with a pipeline state with VkPipelineColorBlendAttachmentState member blendEnable set to VK_TRUE and any of the blend functions using a constant blend color.
- VK_DYNAMIC_STATE_DEPTH_BOUNDS specifies that the minDepthBounds and maxDepthBounds states of VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBounds before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member depthBoundsTestEnable set to VK_TRUE.
- VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK specifies that the compareMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilCompareMask before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.
- VK_DYNAMIC_STATE_STENCIL_WRITE_MASK specifies that the writeMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilWriteMask before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.
- VK_DYNAMIC_STATE_STENCIL_REFERENCE specifies that the reference state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilReference before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.
- VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV specifies that the pViewportWScalings state in VkPipelineViewportWScalingStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetViewportWScalingNV before any draws are performed with a pipeline state with VkPipelineViewportWScalingStateCreateInfoNV member viewportWScalingEnable set to VK_TRUE
- VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT specifies that the pDiscardRectangles state in VkPipelineDiscardRectangleStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDiscardRectangleEXT before any draw or clear commands.
- VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT specifies that the presence of the VkPipelineDiscardRectangleStateCreateInfoEXT structure in the VkGraphicsPipelineCreateInfo chain with a discardRectangleCount greater than zero does not implicitly enable discard rectangles and they **must** be enabled dynamically with vkCmdSetDiscardRectangleEnableEXT before any draw commands. This is available on implementations that support at least specVersion 2 of the VK_EXT_discard_rectangles extension.
- VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT specifies that the discardRectangleMode state in VkPipelineDiscardRectangleStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDiscardRectangleModeEXT before any draw commands. This is

available on implementations that support at least specVersion 2 of the VK_EXT_discard_rectangles extension.

- VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT specifies that the sampleLocationsInfo state in VkPipelineSampleLocationsStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetSampleLocationsEXT before any draw or clear commands. Enabling custom sample locations is still indicated by the sampleLocationsEnable member of VkPipelineSampleLocationsStateCreateInfoEXT.
- VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV specifies that the pExclusiveScissors state in VkPipelineViewportExclusiveScissorStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetExclusiveScissorNV before any drawing commands.
- VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV specifies that the exclusive scissors **must** be explicitly enabled with vkCmdSetExclusiveScissorEnableNV and the exclusiveScissorCount value in VkPipelineViewportExclusiveScissorStateCreateInfoNV will not implicitly enable them. This is available on implementations that support at least specVersion 2 of the VK_NV_scissor_exclusive extension.
- VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV specifies that the pShadingRatePalettes state in VkPipelineViewportShadingRateImageStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetViewportShadingRatePaletteNV before any drawing commands.
- VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV specifies that the coarse sample order state in VkPipelineViewportCoarseSampleOrderStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoarseSampleOrderNV before any drawing commands.
- VK_DYNAMIC_STATE_LINE_STIPPLE specifies that the lineStippleFactor and lineStipplePattern state in VkPipelineRasterizationLineStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLineStipple before any draws are performed with a pipeline state with VkPipelineRasterizationLineStateCreateInfo member stippledLineEnable set to VK_TRUE.
- VK_DYNAMIC_STATE_CULL_MODE specifies that the cullMode state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetCullMode before any drawing commands.
- VK_DYNAMIC_STATE_FRONT_FACE specifies that the frontFace state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetFrontFace before any drawing commands.
- VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY specifies that the topology state in VkPipelineInputAssemblyStateCreateInfo only specifies the topology class, and the specific topology order and adjacency **must** be set dynamically with vkCmdSetPrimitiveTopology before any drawing commands.
- VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT specifies that the viewportCount and pViewports state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetViewportWithCount before any draw call.
- VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT specifies that the scissorCount and pScissors state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetScissorWithCount before any draw call.
- VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE specifies that the stride state in

VkVertexInputBindingDescription will be ignored and **must** be set dynamically with vkCmdBindVertexBuffers2 before any draw call.

- VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE specifies that the `depthTestEnable` state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthTestEnable before any draw call.
- VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE specifies that the `depthWriteEnable` state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthWriteEnable before any draw call.
- VK_DYNAMIC_STATE_DEPTH_COMPARE_OP specifies that the `depthCompareOp` state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthCompareOp before any draw call.
- VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE specifies that the `depthBoundsTestEnable` state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBoundsTestEnable before any draw call.
- VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE specifies that the `stencilTestEnable` state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetStencilTestEnable before any draw call.
- VK_DYNAMIC_STATE_STENCIL_OP specifies that the `failOp`, `passOp`, `depthFailOp`, and `compareOp` states in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with vkCmdSetStencilOp before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to VK_TRUE.
- VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT specifies that the `patchControlPoints` state in VkPipelineTessellationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetPatchControlPointsEXT before any drawing commands.
- VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE specifies that the `rasterizerDiscardEnable` state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetRasterizerDiscardEnable before any drawing commands.
- VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE specifies that the `depthBiasEnable` state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBiasEnable before any drawing commands.
- VK_DYNAMIC_STATE_LOGIC_OP_EXT specifies that the `logicOp` state in VkPipelineColorBlendStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLogicOpEXT before any drawing commands.
- VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE specifies that the `primitiveRestartEnable` state in VkPipelineInputAssemblyStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetPrimitiveRestartEnable before any drawing commands.
- VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR specifies that state in VkPipelineFragmentShadingRateStateCreateInfoKHR and VkPipelineFragmentShadingRateEnumStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetFragmentShadingRateKHR or vkCmdSetFragmentShadingRateEnumNV before any drawing commands.
- VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR specifies that the default stack

size computation for the pipeline will be ignored and **must** be set dynamically with vkCmdSetRayTracingPipelineStackSizeKHR before any ray tracing calls are performed.

- VK_DYNAMIC_STATE_VERTEX_INPUT_EXT specifies that the `pVertexInputState` state will be ignored and **must** be set dynamically with vkCmdSetVertexInputEXT before any drawing commands.
- VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT specifies that the `pColorWriteEnables` state in VkPipelineColorWriteCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetColorWriteEnableEXT before any draw call.
- VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT specifies that the `domainOrigin` state in VkPipelineTessellationDomainOriginStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetTessellationDomainOriginEXT before any draw call.
- VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT specifies that the `depthClampEnable` state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthClampEnableEXT before any draw call.
- VK_DYNAMIC_STATE_POLYGON_MODE_EXT specifies that the `polygonMode` state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetPolygonModeEXT before any draw call.
- VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT specifies that the `rasterizationSamples` state in VkPipelineMultisampleStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetRasterizationSamplesEXT before any draw call.
- VK_DYNAMIC_STATE_SAMPLE_MASK_EXT specifies that the `pSampleMask` state in VkPipelineMultisampleStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetSampleMaskEXT before any draw call.
- VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT specifies that the `alphaToCoverageEnable` state in VkPipelineMultisampleStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetAlphaToCoverageEnableEXT before any draw call.
- VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT specifies that the `alphaToOneEnable` state in VkPipelineMultisampleStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetAlphaToOneEnableEXT before any draw call.
- VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT specifies that the `logicOpEnable` state in VkPipelineColorBlendStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLogicOpEnableEXT before any draw call.
- VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT specifies that the `blendEnable` state in VkPipelineColorBlendAttachmentState will be ignored and **must** be set dynamically with vkCmdSetColorBlendEnableEXT before any draw call.
- VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT specifies that the `srcColorBlendFactor`, `dstColorBlendFactor`, `colorBlendOp`, `srcAlphaBlendFactor`, `dstAlphaBlendFactor`, and `alphaBlendOp` states in VkPipelineColorBlendAttachmentState will be ignored and **must** be set dynamically with vkCmdSetColorBlendEquationEXT before any draw call.
- VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT specifies that the `colorWriteMask` state in VkPipelineColorBlendAttachmentState will be ignored and **must** be set dynamically with vkCmdSetColorWriteMaskEXT before any draw call.

- VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT specifies that the `rasterizationStream` state in VkPipelineRasterizationStateStreamCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetRasterizationStreamEXT before any draw call.
- VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT specifies that the `conservativeRasterizationMode` state in VkPipelineRasterizationConservativeStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetConservativeRasterizationModeEXT before any draw call.
- VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT specifies that the `extraPrimitiveOverestimationSize` state in VkPipelineRasterizationConservativeStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetExtraPrimitiveOverestimationSizeEXT before any draw call.
- VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT specifies that the `depthClipEnable` state in VkPipelineRasterizationDepthClipStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDepthClipEnableEXT before any draw call.
- VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT specifies that the `sampleLocationsEnable` state in VkPipelineSampleLocationsStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetSampleLocationsEnableEXT before any draw call.
- VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT specifies that the `colorBlendOp` state in VkPipelineColorBlendAttachmentState, and `srcPremultiplied`, `dstPremultiplied`, and `blendOverlap` states in VkPipelineColorBlendAdvancedStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetColorBlendAdvancedEXT before any draw call.
- VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT specifies that the `provokingVertexMode` state in VkPipelineRasterizationProvokingVertexStateCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetProvokingVertexModeEXT before any draw call.
- VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT specifies that the `lineRasterizationMode` state in VkPipelineRasterizationLineStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLineRasterizationModeEXT before any draw call.
- VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT specifies that the `stippledLineEnable` state in VkPipelineRasterizationLineStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetLineStippleEnableEXT before any draw call.
- VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT specifies that the `negativeOneToOne` state in VkPipelineViewportDepthClipControlCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDepthClipNegativeOneToOneEXT before any draw call.
- VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT specifies that the `depthClampMode` and `pDepthClampRange` state in VkPipelineViewportDepthClampControlCreateInfoEXT will be ignored and **must** be set dynamically with vkCmdSetDepthClampRangeEXT before any draw call.
- VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV specifies that the `viewportWScalingEnable` state in VkPipelineViewportWScalingStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetViewportWScalingEnableNV before any draw call.
- VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV specifies that the `viewportCount`, and `pViewportSwizzles` states in VkPipelineViewportSwizzleStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetViewportSwizzleNV before any draw call.

- VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV specifies that the `coverageToColorEnable` state in VkPipelineCoverageToColorStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageToColorEnableNV before any draw call.
- VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV specifies that the `coverageToColorLocation` state in VkPipelineCoverageToColorStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageToColorLocationNV before any draw call.
- VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV specifies that the `coverageModulationMode` state in VkPipelineCoverageModulationStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageModulationModeNV before any draw call.
- VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV specifies that the `coverageModulationTableEnable` state in VkPipelineCoverageModulationStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageModulationTableEnableNV before any draw call.
- VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV specifies that the `coverageModulationTableCount`, and `pCoverageModulationTable` states in VkPipelineCoverageModulationStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageModulationTableNV before any draw call.
- VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV specifies that the `shadingRateImageEnable` state in VkPipelineViewportShadingRateImageStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetShadingRateImageEnableNV before any draw call.
- VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV specifies that the `representativeFragmentTestEnable` state in VkPipelineRepresentativeFragmentTestStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetRepresentativeFragmentTestEnableNV before any draw call.
- VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV specifies that the `coverageReductionMode` state in VkPipelineCoverageReductionStateCreateInfoNV will be ignored and **must** be set dynamically with vkCmdSetCoverageReductionModeNV before any draw call.
- VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT specifies that the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT and VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT flags will be ignored and **must** be set dynamically with vkCmdSetAttachmentFeedbackLoopEnableEXT before any draw call.

10.4.1. Valid Combinations of Stages for Graphics Pipelines

Primitive processing can be handled either on a per primitive basis by the vertex, tessellation, and geometry shader stages, or on a per mesh basis using task and mesh shader stages. If the pipeline includes a mesh shader stage, it uses the mesh pipeline, otherwise it uses the primitive pipeline.

If a task shader is omitted, the task shading stage is skipped.

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is determined by Fragment Operations state. This **can** be useful for depth-only rendering.

Presence of a shader stage in a pipeline is indicated by including a valid VkPipelineShaderStageCreateInfo with `module` and `pName` selecting an entry point from a shader module, where that entry point is valid for the stage specified by `stage`.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

For example:

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineDepthStencilStateCreateInfo
- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineColorBlendStateCreateInfo
- Rendering pipeline with tessellation and geometry shaders
  - Active Pipeline Shader Stages
    - Vertex Shader

        - Tessellation Control Shader
        - Tessellation Evaluation Shader
        - Geometry Shader
        - Fragment Shader
    - Required: Fixed-Function Pipeline Stages
        - VkPipelineVertexInputStateCreateInfo
        - VkPipelineInputAssemblyStateCreateInfo
        - VkPipelineTessellationStateCreateInfo
        - VkPipelineViewportStateCreateInfo
        - VkPipelineRasterizationStateCreateInfo
        - VkPipelineMultisampleStateCreateInfo
        - VkPipelineDepthStencilStateCreateInfo
        - VkPipelineColorBlendStateCreateInfo
- Rendering pipeline with task and mesh shaders
    - Active Pipeline Shader Stages
        - Task Shader
        - Mesh Shader
        - Fragment Shader
    - Required: Fixed-Function Pipeline Stages
        - VkPipelineViewportStateCreateInfo
        - VkPipelineRasterizationStateCreateInfo
        - VkPipelineMultisampleStateCreateInfo
        - VkPipelineDepthStencilStateCreateInfo
        - VkPipelineColorBlendStateCreateInfo

10.4.2. Graphics Pipeline Shader Groups

Graphics pipelines can contain multiple shader groups that can be bound individually. Each shader group behaves as if it was a pipeline using the shader group's state. When the pipeline is bound by regular means, it behaves as if the state of group `0` is active, use vkCmdBindPipelineShaderGroupNV to bind an individual shader group.

The primary purpose of shader groups is allowing the device to bind different pipeline state using Device-Generated Commands.

The `VkGraphicsPipelineShaderGroupsCreateInfoNV` structure is defined as:

```
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsPipelineShaderGroupsCreateInfoNV {
    VkStructureType                                 sType;
    const void*                                     pNext;
    uint32_t                                        groupCount;
    const VkGraphicsShaderGroupCreateInfoNV*        pGroups;
    uint32_t                                        pipelineCount;
    const VkPipeline*                               pPipelines;
} VkGraphicsPipelineShaderGroupsCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `groupCount` is the number of elements in the `pGroups` array.
- `pGroups` is a pointer to an array of VkGraphicsShaderGroupCreateInfoNV structures specifying which state of the original VkGraphicsPipelineCreateInfo each shader group overrides.
- `pipelineCount` is the number of elements in the `pPipelines` array.
- `pPipelines` is a pointer to an array of graphics `VkPipeline` structures which are referenced within the created pipeline, including all their shader groups.

When referencing shader groups by index, groups defined in the referenced pipelines are treated as if they were defined as additional entries in `pGroups`. They are appended in the order they appear in the `pPipelines` array and in the `pGroups` array when those pipelines were defined.

The application **must** maintain the lifetime of all such referenced pipelines based on the pipelines that make use of them.

Valid Usage

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02879
  `groupCount` **must** be at least `1` and as maximum `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount`
- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-groupCount-02880
  The sum of `groupCount` including those groups added from referenced `pPipelines` **must** also be as maximum `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxGraphicsShaderGroupCount`
- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02881
  The state of the first element of `pGroups` **must** match its equivalent within the parent's VkGraphicsPipelineCreateInfo
- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02882
  Each element of `pGroups` **must** in combination with the rest of the pipeline state yield a valid state configuration
- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02884
  All elements of `pGroups` **must** use the same shader stage combinations unless any mesh shader stage is used, then either combination of task and mesh or just mesh shader is

valid

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-02885
  Mesh and regular primitive shading stages cannot be mixed across `pGroups`
- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-02886
  Each element of `pPipelines` **must** have been created with identical state to the pipeline currently created except the state that can be overridden by VkGraphicsShaderGroupCreateInfoNV
- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-deviceGeneratedCommands-02887
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature **must** be enabled

Valid Usage (Implicit)

- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_SHADER_GROUPS_CREATE_INFO_NV
- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pGroups-parameter
  If `groupCount` is not `0`, `pGroups` **must** be a valid pointer to an array of `groupCount` valid VkGraphicsShaderGroupCreateInfoNV structures
- VUID-VkGraphicsPipelineShaderGroupsCreateInfoNV-pPipelines-parameter
  If `pipelineCount` is not `0`, `pPipelines` **must** be a valid pointer to an array of `pipelineCount` valid VkPipeline handles

Structure Chaining

Extends the structure

- VkGraphicsPipelineCreateInfo

The `VkGraphicsShaderGroupCreateInfoNV` structure provides the state overrides for each shader group. Each shader group behaves like a pipeline that was created from its state as well as the remaining parent's state. It is defined as:

```
// Provided by VK_NV_device_generated_commands
typedef struct VkGraphicsShaderGroupCreateInfoNV {
    VkStructureType                             sType;
    const void*                                 pNext;
    uint32_t                                    stageCount;
    const VkPipelineShaderStageCreateInfo*      pStages;
    const VkPipelineVertexInputStateCreateInfo*     pVertexInputState;
    const VkPipelineTessellationStateCreateInfo*    pTessellationState;
} VkGraphicsShaderGroupCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of VkPipelineShaderStageCreateInfo structures specifying the set of the shader stages to be included in this shader group.
- `pVertexInputState` is a pointer to a VkPipelineVertexInputStateCreateInfo structure.
- `pTessellationState` is a pointer to a VkPipelineTessellationStateCreateInfo structure, and is ignored if the shader group does not include a tessellation control shader stage and tessellation evaluation shader stage.

Valid Usage

- VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-02888
  For `stageCount`, the same restrictions as in VkGraphicsPipelineCreateInfo::`stageCount` apply
- VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-02889
  For `pStages`, the same restrictions as in VkGraphicsPipelineCreateInfo::`pStages` apply
- VUID-VkGraphicsShaderGroupCreateInfoNV-pVertexInputState-02890
  For `pVertexInputState`, the same restrictions as in VkGraphicsPipelineCreateInfo ::`pVertexInputState` apply
- VUID-VkGraphicsShaderGroupCreateInfoNV-pTessellationState-02891
  For `pTessellationState`, the same restrictions as in VkGraphicsPipelineCreateInfo ::`pTessellationState` apply

Valid Usage (Implicit)

- VUID-VkGraphicsShaderGroupCreateInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_GRAPHICS_SHADER_GROUP_CREATE_INFO_NV
- VUID-VkGraphicsShaderGroupCreateInfoNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkGraphicsShaderGroupCreateInfoNV-pStages-parameter
  `pStages` **must** be a valid pointer to an array of `stageCount` valid VkPipelineShaderStageCreateInfo structures
- VUID-VkGraphicsShaderGroupCreateInfoNV-stageCount-arraylength
  `stageCount` **must** be greater than `0`

10.5. Ray Tracing Pipelines

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

10.5.1. Ray Tracing Pipeline Enums and Types

VK_SHADER_UNUSED_KHR is a special shader index used to indicate that a ray generation, miss, or callable shader member is not used.

```
#define VK_SHADER_UNUSED_KHR              (~0U)
```

```
#define VK_SHADER_UNUSED_NV               VK_SHADER_UNUSED_KHR
```

The VkRayTracingShaderGroupTypeKHR enumeration is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkRayTracingShaderGroupTypeKHR {
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR = 0,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR = 1,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR = 2,
  // Provided by VK_NV_ray_tracing
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV =
VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR,
  // Provided by VK_NV_ray_tracing
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV =
VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR,
  // Provided by VK_NV_ray_tracing
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV =
VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR,
} VkRayTracingShaderGroupTypeKHR;
```

```
// Provided by VK_NV_ray_tracing
// Equivalent to VkRayTracingShaderGroupTypeKHR
typedef VkRayTracingShaderGroupTypeKHR VkRayTracingShaderGroupTypeNV;
```

- VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR specifies a shader group with a single VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR shader in it.
- VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR specifies a shader group that only hits triangles and **must** not contain an intersection shader, only closest hit and any-hit shaders.
- VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR specifies a shader group that only intersects with custom geometry and **must** contain an intersection shader and **may** contain closest hit and any-hit shaders.

NOTE For current group types, the hit group type could be inferred from the presence or absence of the intersection shader, but we provide the type explicitly for future hit groups that do not have that property.

10.5.2. Ray Tracing Pipeline Creation

To create ray tracing pipelines, call:

```
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkCreateRayTracingPipelinesKHR(
    VkDevice                                    device,
    VkDeferredOperationKHR                      deferredOperation,
    VkPipelineCache                             pipelineCache,
    uint32_t                                    createInfoCount,
    const VkRayTracingPipelineCreateInfoKHR*    pCreateInfos,
    const VkAllocationCallbacks*                pAllocator,
    VkPipeline*                                 pPipelines);
```

- `device` is the logical device that creates the ray tracing pipelines.
- `deferredOperation` is VK_NULL_HANDLE or the handle of a valid VkDeferredOperationKHR request deferral object for this command.
- `pipelineCache` is either VK_NULL_HANDLE, indicating that pipeline caching is disabled, or to enable caching, the handle of a valid VkPipelineCache object. The implementation **must** not access this object outside of the duration of this command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of VkRayTracingPipelineCreateInfoKHR structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

The VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS error is returned if the implementation is unable to reuse the shader group handles provided in VkRayTracingShaderGroupCreateInfoKHR::`pShaderGroupCaptureReplayHandle` when VkPhysicalDeviceRayTracingPipelineFeaturesKHR::`rayTracingPipelineShaderGroupHandleCaptureReplay` is enabled.

Pipelines are created and returned as described for Multiple Pipeline Creation.

Valid Usage

- VUID-vkCreateRayTracingPipelinesKHR-device-09677
  `device` **must** support at least one queue family with the VK_QUEUE_COMPUTE_BIT capability
- VUID-vkCreateRayTracingPipelinesKHR-flags-03415
  If the `flags` member of any element of `pCreateInfos` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` **must** be less than the index into `pCreateInfos` that corresponds to that element
- VUID-vkCreateRayTracingPipelinesKHR-flags-03416
  If the `flags` member of any element of `pCreateInfos` contains the

VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline **must** have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set

- VUID-vkCreateRayTracingPipelinesKHR-flags-03816
  `flags` **must** not contain the VK_PIPELINE_CREATE_DISPATCH_BASE_BIT flag
- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-02903
  If `pipelineCache` was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to `pipelineCache` **must** be externally synchronized
- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` **must** be complete
- VUID-vkCreateRayTracingPipelinesKHR-pNext-09616
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, `pipelineCache` **must** be VK_NULL_HANDLE
- VUID-vkCreateRayTracingPipelinesKHR-pNext-09617
  If a VkPipelineCreateFlags2CreateInfoKHR structure with the VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR flag set is included in the `pNext` chain of any element of `pCreateInfos`, `pipelineCache` **must** be VK_NULL_HANDLE
- VUID-vkCreateRayTracingPipelinesKHR-binaryCount-09620
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT **must** not be set in the `flags` of that element
- VUID-vkCreateRayTracingPipelinesKHR-binaryCount-09621
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT **must** not be set in the `flags` of that element
- VUID-vkCreateRayTracingPipelinesKHR-binaryCount-09622
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT **must** not be set in the `flags` of that element
- VUID-vkCreateRayTracingPipelinesKHR-pCreateInfos-11414
  If any element of `pCreateInfos` sets VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, there **must** be less than (`maxSamplerAllocationCount` - (`minSamplerHeapReservedRangeWithEmbedded` / `samplerDescriptorSize`)) VkSampler objects currently created on the device
- VUID-vkCreateRayTracingPipelinesKHR-pCreateInfos-11429
  If any element of `pCreateInfos` sets VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, this command **must** not cause the total number of unique embedded samplers in pipelines and shaders on this device to exceed `maxDescriptorHeapEmbeddedSamplers`
- VUID-vkCreateRayTracingPipelinesKHR-rayTracingPipeline-03586
  The `rayTracingPipeline` feature **must** be enabled

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03587
  If `deferredOperation` is not VK_NULL_HANDLE, the `flags` member of elements of `pCreateInfos` **must** not include VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

Valid Usage (Implicit)

- VUID-vkCreateRayTracingPipelinesKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parameter
  If `deferredOperation` is not VK_NULL_HANDLE, `deferredOperation` **must** be a valid VkDeferredOperationKHR handle
- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parameter
  If `pipelineCache` is not VK_NULL_HANDLE, `pipelineCache` **must** be a valid VkPipelineCache handle
- VUID-vkCreateRayTracingPipelinesKHR-pCreateInfos-parameter
  `pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid VkRayTracingPipelineCreateInfoKHR structures
- VUID-vkCreateRayTracingPipelinesKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateRayTracingPipelinesKHR-pPipelines-parameter
  `pPipelines` **must** be a valid pointer to an array of `createInfoCount` VkPipeline handles
- VUID-vkCreateRayTracingPipelinesKHR-createInfoCount-arraylength
  `createInfoCount` **must** be greater than `0`
- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`
- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parent
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR
- VK_PIPELINE_COMPILE_REQUIRED_EXT
- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkRayTracingPipelineCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineCreateInfoKHR {
    VkStructureType                                 sType;
    const void*                                     pNext;
    VkPipelineCreateFlags                           flags;
    uint32_t                                        stageCount;
    const VkPipelineShaderStageCreateInfo*          pStages;
    uint32_t                                        groupCount;
    const VkRayTracingShaderGroupCreateInfoKHR*     pGroups;
    uint32_t                                        maxPipelineRayRecursionDepth;
    const VkPipelineLibraryCreateInfoKHR*           pLibraryInfo;
    const VkRayTracingPipelineInterfaceCreateInfoKHR* pLibraryInterface;
    const VkPipelineDynamicStateCreateInfo*         pDynamicState;
    VkPipelineLayout                                layout;
    VkPipeline                                      basePipelineHandle;
    int32_t                                         basePipelineIndex;
} VkRayTracingPipelineCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkPipelineCreateFlagBits specifying how the pipeline will be generated.
- stageCount is the number of entries in the pStages array.
- pStages is a pointer to an array of stageCount VkPipelineShaderStageCreateInfo structures describing the set of the shader stages to be included in the ray tracing pipeline.
- groupCount is the number of entries in the pGroups array.
- pGroups is a pointer to an array of groupCount VkRayTracingShaderGroupCreateInfoKHR structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- maxPipelineRayRecursionDepth is the maximum recursion depth of shaders executed by this pipeline.
- pLibraryInfo is a pointer to a VkPipelineLibraryCreateInfoKHR structure defining pipeline libraries to include.
- pLibraryInterface is a pointer to a VkRayTracingPipelineInterfaceCreateInfoKHR structure defining additional information when using pipeline libraries.
- pDynamicState is a pointer to a VkPipelineDynamicStateCreateInfo structure, and is used to

indicate which properties of the pipeline state object are dynamic and **can** be changed independently of the pipeline state. This **can** be `NULL`, which means no state in the pipeline is considered dynamic.

- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline. If VkPhysicalDeviceProperties::`apiVersion` is greater than or equal to Vulkan 1.3 or VK_KHR_maintenance4 is enabled `layout` **must** not be accessed by the implementation outside of the duration of the command this structure is passed to.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

When VK_PIPELINE_CREATE_LIBRARY_BIT_KHR is specified, this pipeline defines a *pipeline library* which **cannot** be bound as a ray tracing pipeline directly. Instead, pipeline libraries define common shaders and shader groups which **can** be included in future pipeline creation.

If pipeline libraries are included in `pLibraryInfo`, shaders defined in those libraries are treated as if they were defined as additional entries in `pStages`, appended in the order they appear in the `pLibraries` array and in the `pStages` array when those libraries were defined.

When referencing shader groups in order to obtain a shader group handle, groups defined in those libraries are treated as if they were defined as additional entries in `pGroups`, appended in the order they appear in the `pLibraries` array and in the `pGroups` array when those libraries were defined. The shaders these groups reference are set when the pipeline library is created, referencing those specified in the pipeline library, not in the pipeline that includes it.

The default stack size for a pipeline if VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR is not provided is computed as described in Ray Tracing Pipeline Stack.

If the `pNext` chain includes a VkPipelineCreateFlags2CreateInfo structure, VkPipelineCreateFlags2CreateInfo::`flags` from that structure is used instead of `flags` from this structure.

If the `pNext` chain includes a VkRayTracingPipelineClusterAccelerationStructureCreateInfoNV structure, then that structure controls whether cluster acceleration structures are allowed in this ray tracing pipeline.

Valid Usage

- VUID-VkRayTracingPipelineCreateInfoKHR-None-09497
  If the `pNext` chain does not include a VkPipelineCreateFlags2CreateInfo structure, `flags` **must** be a valid combination of VkPipelineCreateFlagBits values
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-07984
  If `flags` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and `basePipelineIndex`

is -1, basePipelineHandle **must** be a valid ray tracing VkPipeline handle

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-07985
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex **must** be a valid index into the calling command's pCreateInfos parameter
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-07986
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, basePipelineIndex **must** be -1 or basePipelineHandle **must** be VK_NULL_HANDLE
- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07987
  If a push constant block is declared in a shader and layout is not VK_NULL_HANDLE, a push constant range in layout **must** match the shader stage
- VUID-VkRayTracingPipelineCreateInfoKHR-layout-10069
  If a push constant block is declared in a shader and layout is not VK_NULL_HANDLE, the block must be contained inside the push constant range in layout that matches the stage
- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07988
  If a resource variable is declared in a shader and layout is not VK_NULL_HANDLE, the corresponding descriptor set in layout **must** match the shader stage
- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07990
  If a resource variable is declared in a shader, layout is not VK_NULL_HANDLE, and the descriptor type is not VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the corresponding descriptor set in layout **must** match the descriptor type
- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07991
  If a resource variable is declared in a shader as an array and layout is not VK_NULL_HANDLE, the corresponding descriptor binding used to create layout **must** have a descriptorCount that is greater than or equal to the length of the array
- VUID-VkRayTracingPipelineCreateInfoKHR-None-10391
  If a resource variable is declared in a shader as an array of descriptors, then the descriptor type of that variable **must** not be VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-11798
  If the shader64BitIndexing feature is not enabled, flags **must** not contain VK_PIPELINE_CREATE_2_64_BIT_INDEXING_BIT_EXT
- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineCreationCacheControl-02878
  If the pipelineCreationCacheControl feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT nor VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT
- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineProtectedAccess-07368
  If the pipelineProtectedAccess feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT nor VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-07369
  flags **must** not include both VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT and VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-11311
  If VkPipelineCreateFlags2CreateInfoKHR::flags includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, layout **must** be VK_NULL_HANDLE
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-11312
  If VkPipelineCreateFlags2CreateInfoKHR::flags includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, all shader variables in the shader resource interface with a DescriptorSet and Binding decoration **must** have a mapping declared in VkShaderDescriptorSetAndBindingMappingInfoEXT::pMappings
- VUID-VkRayTracingPipelineCreateInfoKHR-pStages-03426
  The shader code for the entry points identified by pStages, and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the Shader Interfaces chapter
- VUID-VkRayTracingPipelineCreateInfoKHR-layout-03428
  The number of resources in layout accessible to each shader stage that is used by the pipeline **must** be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-02904
  flags **must** not include VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-12341
  flags **must** not include VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT nor VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-VkRayTracingPipelineCreateInfoKHR-layout-12402
  If layout is not VK_NULL_HANDLE, it **must** not have been created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT
- VUID-VkRayTracingPipelineCreateInfoKHR-stage-03425
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the stage member of at least one element of pStages, including those implicitly added by pLibraryInfo, **must** be VK_SHADER_STAGE_RAYGEN_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-maxPipelineRayRecursionDepth-03589
  maxPipelineRayRecursionDepth **must** be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayRecursionDepth
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03465
  If flags includes VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pLibraryInterface **must** not be NULL
- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03590
  If pLibraryInfo is not NULL and its libraryCount member is greater than 0, pLibraryInterface **must** not be NULL
- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraries-03591
  Each element of pLibraryInfo->pLibraries **must** have been created with the value of maxPipelineRayRecursionDepth equal to that in this pipeline
- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03592
  If pLibraryInfo is not NULL and layout is not VK_NULL_HANDLE, each element of pLibraryInfo->pLibraries **must** have been created with a layout that is compatible with

the layout in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03593
  If pLibraryInfo is not NULL, each element of its pLibraries member **must** have been created with values of the maxPipelineRayPayloadSize and maxPipelineRayHitAttributeSize members of pLibraryInterface equal to those in this pipeline
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03594
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04718
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04719
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04720
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04721
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04722
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04723
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03595
  If the VK_KHR_pipeline_library extension is not enabled, pLibraryInfo and pLibraryInterface **must** be NULL
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03470

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, for each element of pGroups with a type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the anyHitShader of that element **must** not be VK_SHADER_UNUSED_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03471
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, for each element of pGroups with a type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the closestHitShader of that element **must** not be VK_SHADER_UNUSED_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03596
  If the rayTraversalPrimitiveCulling feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03597
  If the rayTraversalPrimitiveCulling feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-06546
  flags **must** not include both VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR and VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03598
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, rayTracingPipelineShaderGroupHandleCaptureReplay **must** be enabled
- VUID-VkRayTracingPipelineCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03599
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is VK_TRUE and the pShaderGroupCaptureReplayHandle member of any element of pGroups is not NULL, flags **must** include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-07999
  If pLibraryInfo is NULL or its libraryCount is 0, stageCount **must** not be 0
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-08700
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and either pLibraryInfo is NULL or its libraryCount is 0, groupCount **must** not be 0
- VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicStates-03602
  Any element of the pDynamicStates member of pDynamicState **must** be VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineStageCreationFeedbackCount-06652

If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it **must** be equal to stageCount

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-06899
  The stage value in all pStages elements **must** be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-11597
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR, at least one of the following features **must** be enabled
  - VkPhysicalDeviceOpacityMicromapFeaturesKHR::micromap
  - VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromap
- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraries-11598
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-11599
  If the VkPhysicalDeviceOpacityMicromapFeaturesKHR::micromap feature is not enabled or flags does not include VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR, flags **must** not include VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-08701
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV, each element of pLibraryInfo->pLibraries **must** have been created with the VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV bit set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-10392
  If the pNext chain includes a VkPipelineCreateFlags2CreateInfo structure, flags **must** not include both VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR and VK_PIPELINE_CREATE_2_DISALLOW_OPACITY_MICROMAP_BIT_ARM
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-11275
  If VkPipelineCreateFlags2CreateInfoKHR::flags includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, all libraries linked to this pipeline **must** also have that flag set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-11276
  If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, all libraries linked to this pipeline **must** also not have that flag set
- VUID-VkRayTracingPipelineCreateInfoKHR-flags-12361
  If flags includes VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, all libraries

linked to this pipeline **must** also have that flag set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-12362
  If `flags` does not include VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, all libraries linked to this pipeline **must** also not have that flag set
- VUID-VkRayTracingPipelineCreateInfoKHR-None-11369
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, `layout` **must** not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkRayTracingPipelineCreateInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR
- VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkPipelineBinaryInfoKHR, VkPipelineCreateFlags2CreateInfo, VkPipelineCreationFeedbackCreateInfo, VkPipelineRobustnessCreateInfo, VkRayTracingPipelineClusterAccelerationStructureCreateInfoNV, or VkValidationFeaturesEXT
- VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkRayTracingPipelineCreateInfoKHR-pStages-parameter
  If `stageCount` is not `0`, `pStages` **must** be a valid pointer to an array of `stageCount` valid VkPipelineShaderStageCreateInfo structures
- VUID-VkRayTracingPipelineCreateInfoKHR-pGroups-parameter
  If `groupCount` is not `0`, `pGroups` **must** be a valid pointer to an array of `groupCount` valid VkRayTracingShaderGroupCreateInfoKHR structures
- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-parameter
  If `pLibraryInfo` is not `NULL`, `pLibraryInfo` **must** be a valid pointer to a valid VkPipelineLibraryCreateInfoKHR structure
- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInterface-parameter
  If `pLibraryInterface` is not `NULL`, `pLibraryInterface` **must** be a valid pointer to a valid VkRayTracingPipelineInterfaceCreateInfoKHR structure
- VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicState-parameter
  If `pDynamicState` is not `NULL`, `pDynamicState` **must** be a valid pointer to a valid VkPipelineDynamicStateCreateInfo structure
- VUID-VkRayTracingPipelineCreateInfoKHR-layout-parameter
  If `layout` is not VK_NULL_HANDLE, `layout` **must** be a valid VkPipelineLayout handle
- VUID-VkRayTracingPipelineCreateInfoKHR-commonparent
  Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Structure Chaining

Extends the structure

- VkPipelineCreateInfoKHR

The VkRayTracingPipelineClusterAccelerationStructureCreateInfoNV structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline with VK_NV_cluster_acceleration_structure
typedef struct VkRayTracingPipelineClusterAccelerationStructureCreateInfoNV {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           allowClusterAccelerationStructure;
} VkRayTracingPipelineClusterAccelerationStructureCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allowClusterAccelerationStructure` controls if cluster acceleration structures are allowed in the ray tracing pipeline.

If no cluster acceleration structures are present in the ray tracing pipeline, `allowClusterAccelerationStructure` **should** not be used to prevent traversal penalty on some implementations.

Valid Usage

- VUID-VkRayTracingPipelineClusterAccelerationStructureCreateInfoNV-clusterAccelerationStructure-10576
  The `VkPhysicalDeviceClusterAccelerationStructureFeaturesNV::clusterAccelerationStructure` feature **must** be enabled

Valid Usage (Implicit)

- VUID-VkRayTracingPipelineClusterAccelerationStructureCreateInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CLUSTER_ACCELERATION_STRUCTURE_CREATE_INFO_NV

Structure Chaining

Extends the structure

- VkRayTracingPipelineCreateInfoKHR

The VkRayTracingShaderGroupCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingShaderGroupCreateInfoKHR {
    VkStructureType                   sType;
    const void*                       pNext;
    VkRayTracingShaderGroupTypeKHR    type;
    uint32_t                          generalShader;
    uint32_t                          closestHitShader;
    uint32_t                          anyHitShader;
    uint32_t                          intersectionShader;
    const void*                       pShaderGroupCaptureReplayHandle;
} VkRayTracingShaderGroupCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- type is the type of hit group specified in this structure.
- generalShader is the index of the ray generation, miss, or callable shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR, and VK_SHADER_UNUSED_KHR otherwise.
- closestHitShader is the optional index of the closest hit shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK_SHADER_UNUSED_KHR otherwise.
- anyHitShader is the optional index of the any-hit shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK_SHADER_UNUSED_KHR otherwise.
- intersectionShader is the index of the intersection shader from VkRayTracingPipelineCreateInfoKHR::pStages in the group if the shader group has type of VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, and VK_SHADER_UNUSED_KHR otherwise.
- pShaderGroupCaptureReplayHandle is NULL or a pointer to replay information for this shader group queried from vkGetRayTracingCaptureReplayShaderGroupHandlesKHR, as described in Ray Tracing Capture Replay. Ignored if VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is VK_FALSE.

If the pipeline is created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and the pipelineLibraryGroupHandles feature is enabled, pShaderGroupCaptureReplayHandle is inherited by all pipelines which link against this pipeline and remains bitwise identical for any pipeline which references this pipeline library.

Valid Usage

- VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03474
  If `type` is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR then `generalShader` **must** be a valid index into the list of shaders, formed by shaders in VkRayTracingPipelineCreateInfoKHR::`pStages` and the shaders imported from pipeline libraries, referring to a shader of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR
- VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03475
  If `type` is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR then `closestHitShader`, `anyHitShader`, and `intersectionShader` **must** be VK_SHADER_UNUSED_KHR
- VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03476
  If `type` is VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR then `intersectionShader` **must** be a valid index into the list of shaders, formed by shaders in VkRayTracingPipelineCreateInfoKHR::`pStages` and the shaders imported from pipeline libraries, referring to a shader of VK_SHADER_STAGE_INTERSECTION_BIT_KHR
- VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03477
  If `type` is VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR then `intersectionShader` **must** be VK_SHADER_UNUSED_KHR
- VUID-VkRayTracingShaderGroupCreateInfoKHR-closestHitShader-03478
  `closestHitShader` **must** be either VK_SHADER_UNUSED_KHR or a valid index into the list of shaders, formed by shaders in VkRayTracingPipelineCreateInfoKHR::`pStages` and the shaders imported from pipeline libraries, referring to a shader of VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR
- VUID-VkRayTracingShaderGroupCreateInfoKHR-anyHitShader-03479
  `anyHitShader` **must** be either VK_SHADER_UNUSED_KHR or a valid index into the list of shaders, formed by shaders in VkRayTracingPipelineCreateInfoKHR::`pStages` and the shaders imported from pipeline libraries, referring to a shader of VK_SHADER_STAGE_ANY_HIT_BIT_KHR
- VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03603
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR::`rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is VK_FALSE then `pShaderGroupCaptureReplayHandle` **must** not be provided if it has not been provided on a previous call to ray tracing pipeline creation
- VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03604
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR::`rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is VK_FALSE then the caller **must** guarantee that no ray tracing pipeline creation commands with `pShaderGroupCaptureReplayHandle` provided execute simultaneously with ray tracing pipeline creation commands without `pShaderGroupCaptureReplayHandle` provided

Valid Usage (Implicit)

- VUID-VkRayTracingShaderGroupCreateInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR
- VUID-VkRayTracingShaderGroupCreateInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkRayTracingShaderGroupCreateInfoKHR-type-parameter
  `type` **must** be a valid VkRayTracingShaderGroupTypeKHR value

The `VkRayTracingPipelineInterfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineInterfaceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           maxPipelineRayPayloadSize;
    uint32_t           maxPipelineRayHitAttributeSize;
} VkRayTracingPipelineInterfaceCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxPipelineRayPayloadSize` is the maximum payload size in bytes used by any shader in the pipeline.
- `maxPipelineRayHitAttributeSize` is the maximum attribute structure size in bytes used by any shader in the pipeline.

`maxPipelineRayPayloadSize` is calculated as the maximum size of the block (in bytes) declared in the `RayPayloadKHR` or `IncomingRayPayloadKHR` storage classes. `maxPipelineRayHitAttributeSize` is calculated as the maximum size of any block (in bytes) declared in the `HitAttributeKHR` or `HitObjectAttributeEXT` storage class. As variables in these storage classes do not have explicit offsets, the size should be calculated as if each variable has a scalar alignment equal to the largest scalar alignment of any of the block's members.

NOTE There is no explicit upper limit for `maxPipelineRayPayloadSize`, but in practice it should be kept as small as possible. Similar to invocation local memory, it must be allocated for each shader invocation and for devices which support many simultaneous invocations, this storage can rapidly be exhausted, resulting in failure.

Valid Usage

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-maxPipelineRayHitAttributeSize-03605
  `maxPipelineRayHitAttributeSize` **must** be less than or equal to

VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayHitAttributeSize

Valid Usage (Implicit)

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR
- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-pNext-pNext
  pNext **must** be NULL

To create ray tracing pipelines, call:

```
// Provided by VK_NV_ray_tracing
VkResult vkCreateRayTracingPipelinesNV(
    VkDevice                                    device,
    VkPipelineCache                             pipelineCache,
    uint32_t                                    createInfoCount,
    const VkRayTracingPipelineCreateInfoNV*     pCreateInfos,
    const VkAllocationCallbacks*                pAllocator,
    VkPipeline*                                 pPipelines);
```

- device is the logical device that creates the ray tracing pipelines.
- pipelineCache is either VK_NULL_HANDLE, indicating that pipeline caching is disabled, or to enable caching, the handle of a valid VkPipelineCache object. The implementation **must** not access this object outside of the duration of this command.
- createInfoCount is the length of the pCreateInfos and pPipelines arrays.
- pCreateInfos is a pointer to an array of VkRayTracingPipelineCreateInfoNV structures.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pPipelines is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

Pipelines are created and returned as described for Multiple Pipeline Creation.

Valid Usage

- VUID-vkCreateRayTracingPipelinesNV-device-09677
  device **must** support at least one queue family with the VK_QUEUE_COMPUTE_BIT capability
- VUID-vkCreateRayTracingPipelinesNV-flags-03415
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex **must** be less than the index into pCreateInfos that corresponds to that element

- VUID-vkCreateRayTracingPipelinesNV-flags-03416
  If the `flags` member of any element of `pCreateInfos` contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline **must** have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set
- VUID-vkCreateRayTracingPipelinesNV-flags-03816
  `flags` **must** not contain the VK_PIPELINE_CREATE_DISPATCH_BASE_BIT flag
- VUID-vkCreateRayTracingPipelinesNV-pipelineCache-02903
  If `pipelineCache` was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to `pipelineCache` **must** be externally synchronized
- VUID-vkCreateRayTracingPipelinesNV-pNext-09616
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, `pipelineCache` **must** be VK_NULL_HANDLE
- VUID-vkCreateRayTracingPipelinesNV-pNext-09617
  If a VkPipelineCreateFlags2CreateInfoKHR structure with the VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR flag set is included in the `pNext` chain of any element of `pCreateInfos`, `pipelineCache` **must** be VK_NULL_HANDLE
- VUID-vkCreateRayTracingPipelinesNV-binaryCount-09620
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT **must** not be set in the `flags` of that element
- VUID-vkCreateRayTracingPipelinesNV-binaryCount-09621
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT **must** not be set in the `flags` of that element
- VUID-vkCreateRayTracingPipelinesNV-binaryCount-09622
  If VkPipelineBinaryInfoKHR::`binaryCount` is not `0` for any element of `pCreateInfos`, VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_EXT **must** not be set in the `flags` of that element
- VUID-vkCreateRayTracingPipelinesNV-pCreateInfos-11414
  If any element of `pCreateInfos` sets VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, there **must** be less than (`maxSamplerAllocationCount` - (`minSamplerHeapReservedRangeWithEmbedded` / `samplerDescriptorSize`)) VkSampler objects currently created on the device
- VUID-vkCreateRayTracingPipelinesNV-pCreateInfos-11429
  If any element of `pCreateInfos` sets VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and includes embedded sampler mappings, this command **must** not cause the total number of unique embedded samplers in pipelines and shaders on this device to exceed `maxDescriptorHeapEmbeddedSamplers`
- VUID-vkCreateRayTracingPipelinesNV-pNext-10150
  If a VkPipelineCreateFlags2CreateInfoKHR structure is included in the `pNext` chain of any element of `pCreateInfos`, VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR flag **must** not be set

Valid Usage (Implicit)

- VUID-vkCreateRayTracingPipelinesNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parameter
  If `pipelineCache` is not VK_NULL_HANDLE, `pipelineCache` **must** be a valid VkPipelineCache handle
- VUID-vkCreateRayTracingPipelinesNV-pCreateInfos-parameter
  `pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid VkRayTracingPipelineCreateInfoNV structures
- VUID-vkCreateRayTracingPipelinesNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateRayTracingPipelinesNV-pPipelines-parameter
  `pPipelines` **must** be a valid pointer to an array of `createInfoCount` VkPipeline handles
- VUID-vkCreateRayTracingPipelinesNV-createInfoCount-arraylength
  `createInfoCount` **must** be greater than `0`
- VUID-vkCreateRayTracingPipelinesNV-pipelineCache-parent
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_PIPELINE_COMPILE_REQUIRED_EXT
- VK_SUCCESS

Failure

- VK_ERROR_INVALID_SHADER_NV
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkRayTracingPipelineCreateInfoNV` structure is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkRayTracingPipelineCreateInfoNV {
    VkStructureType                              sType;
    const void*                                  pNext;
    VkPipelineCreateFlags                        flags;
    uint32_t                                     stageCount;
    const VkPipelineShaderStageCreateInfo*       pStages;
    uint32_t                                     groupCount;
    const VkRayTracingShaderGroupCreateInfoNV*   pGroups;
    uint32_t                                     maxRecursionDepth;
    VkPipelineLayout                             layout;
    VkPipeline                                   basePipelineHandle;
    int32_t                                      basePipelineIndex;
} VkRayTracingPipelineCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineCreateFlagBits specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of VkPipelineShaderStageCreateInfo structures specifying the set of the shader stages to be included in the ray tracing pipeline.
- `groupCount` is the number of entries in the `pGroups` array.
- `pGroups` is a pointer to an array of VkRayTracingShaderGroupCreateInfoNV structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- `maxRecursionDepth` is the maximum recursion depth of shaders executed by this pipeline.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline. If VkPhysicalDeviceProperties::`apiVersion` is greater than or equal to Vulkan 1.3 or VK_KHR_maintenance4 is enabled `layout` **must** not be accessed by the implementation outside of the duration of the command this structure is passed to.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

If the `pNext` chain includes a VkPipelineCreateFlags2CreateInfo structure, VkPipelineCreateFlags2CreateInfo::`flags` from that structure is used instead of `flags` from this structure.

Valid Usage

- VUID-VkRayTracingPipelineCreateInfoNV-None-09497

If the pNext chain does not include a VkPipelineCreateFlags2CreateInfo structure, flags **must** be a valid combination of VkPipelineCreateFlagBits values

- VUID-VkRayTracingPipelineCreateInfoNV-flags-07984
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is -1, basePipelineHandle **must** be a valid ray tracing VkPipeline handle
- VUID-VkRayTracingPipelineCreateInfoNV-flags-07985
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex **must** be a valid index into the calling command's pCreateInfos parameter
- VUID-VkRayTracingPipelineCreateInfoNV-flags-07986
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, basePipelineIndex **must** be -1 or basePipelineHandle **must** be VK_NULL_HANDLE
- VUID-VkRayTracingPipelineCreateInfoNV-layout-07987
  If a push constant block is declared in a shader and layout is not VK_NULL_HANDLE, a push constant range in layout **must** match the shader stage
- VUID-VkRayTracingPipelineCreateInfoNV-layout-10069
  If a push constant block is declared in a shader and layout is not VK_NULL_HANDLE, the block must be contained inside the push constant range in layout that matches the stage
- VUID-VkRayTracingPipelineCreateInfoNV-layout-07988
  If a resource variable is declared in a shader and layout is not VK_NULL_HANDLE, the corresponding descriptor set in layout **must** match the shader stage
- VUID-VkRayTracingPipelineCreateInfoNV-layout-07990
  If a resource variable is declared in a shader, layout is not VK_NULL_HANDLE, and the descriptor type is not VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the corresponding descriptor set in layout **must** match the descriptor type
- VUID-VkRayTracingPipelineCreateInfoNV-layout-07991
  If a resource variable is declared in a shader as an array and layout is not VK_NULL_HANDLE, the corresponding descriptor binding used to create layout **must** have a descriptorCount that is greater than or equal to the length of the array
- VUID-VkRayTracingPipelineCreateInfoNV-None-10391
  If a resource variable is declared in a shader as an array of descriptors, then the descriptor type of that variable **must** not be VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK
- VUID-VkRayTracingPipelineCreateInfoNV-flags-11798
  If the shader64BitIndexing feature is not enabled, flags **must** not contain VK_PIPELINE_CREATE_2_64_BIT_INDEXING_BIT_EXT
- VUID-VkRayTracingPipelineCreateInfoNV-pipelineCreationCacheControl-02878
  If the pipelineCreationCacheControl feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT nor VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT
- VUID-VkRayTracingPipelineCreateInfoNV-pipelineProtectedAccess-07368
  If the pipelineProtectedAccess feature is not enabled, flags **must** not include VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT nor

VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT

- VUID-VkRayTracingPipelineCreateInfoNV-flags-07369
  `flags` **must** not include both VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT and VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-VkRayTracingPipelineCreateInfoNV-flags-11311
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, `layout` **must** be VK_NULL_HANDLE
- VUID-VkRayTracingPipelineCreateInfoNV-flags-11312
  If VkPipelineCreateFlags2CreateInfoKHR::`flags` includes VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, all shader variables in the shader resource interface with a `DescriptorSet` and `Binding` decoration **must** have a mapping declared in VkShaderDescriptorSetAndBindingMappingInfoEXT::`pMappings`
- VUID-VkRayTracingPipelineCreateInfoNV-pStages-03426
  The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the Shader Interfaces chapter
- VUID-VkRayTracingPipelineCreateInfoNV-layout-03428
  The number of resources in `layout` accessible to each shader stage that is used by the pipeline **must** be less than or equal to VkPhysicalDeviceLimits::`maxPerStageResources`
- VUID-VkRayTracingPipelineCreateInfoNV-flags-02904
  `flags` **must** not include VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV
- VUID-VkRayTracingPipelineCreateInfoNV-flags-12341
  `flags` **must** not include VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT nor VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-VkRayTracingPipelineCreateInfoNV-layout-12402
  If `layout` is not VK_NULL_HANDLE, it **must** not have been created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT
- VUID-VkRayTracingPipelineCreateInfoNV-stage-06232
  The `stage` member of at least one element of `pStages` **must** be VK_SHADER_STAGE_RAYGEN_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-03456
  `flags` **must** not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-maxRecursionDepth-03457
  `maxRecursionDepth` **must** be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::`maxRecursionDepth`
- VUID-VkRayTracingPipelineCreateInfoNV-flags-03458
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-03459
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoNV-flags-03460
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-03461
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-03462
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-03463
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-03588
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-04948
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV
- VUID-VkRayTracingPipelineCreateInfoNV-flags-02957
  `flags` **must** not include both VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV and VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT at the same time
- VUID-VkRayTracingPipelineCreateInfoNV-pipelineStageCreationFeedbackCount-06651
  If VkPipelineCreationFeedbackCreateInfo::`pipelineStageCreationFeedbackCount` is not `0`, it **must** be equal to `stageCount`
- VUID-VkRayTracingPipelineCreateInfoNV-stage-06898
  The `stage` value in all `pStages` elements **must** be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-11596
  `flags` **must** not include any of the following bits
  - VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_KHR
  - VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR
- VUID-VkRayTracingPipelineCreateInfoNV-flags-07402
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT
- VUID-VkRayTracingPipelineCreateInfoNV-flags-07998
  `flags` **must** not include VK_PIPELINE_CREATE_RAY_TRACING_DISPLACEMENT_MICROMAP_BIT_NV
- VUID-VkRayTracingPipelineCreateInfoNV-flags-11008
  `flags` **must** not include VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT
- VUID-VkRayTracingPipelineCreateInfoNV-None-11368

If VkPipelineCreateFlags2CreateInfoKHR::flags does not include VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT, layout **must** not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkRayTracingPipelineCreateInfoNV-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_NV
- VUID-VkRayTracingPipelineCreateInfoNV-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkPipelineCreateFlags2CreateInfo or VkPipelineCreationFeedbackCreateInfo
- VUID-VkRayTracingPipelineCreateInfoNV-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkRayTracingPipelineCreateInfoNV-pStages-parameter
  pStages **must** be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures
- VUID-VkRayTracingPipelineCreateInfoNV-pGroups-parameter
  pGroups **must** be a valid pointer to an array of groupCount valid VkRayTracingShaderGroupCreateInfoNV structures
- VUID-VkRayTracingPipelineCreateInfoNV-layout-parameter
  If layout is not VK_NULL_HANDLE, layout **must** be a valid VkPipelineLayout handle
- VUID-VkRayTracingPipelineCreateInfoNV-stageCount-arraylength
  stageCount **must** be greater than 0
- VUID-VkRayTracingPipelineCreateInfoNV-groupCount-arraylength
  groupCount **must** be greater than 0
- VUID-VkRayTracingPipelineCreateInfoNV-commonparent
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

The VkRayTracingShaderGroupCreateInfoNV structure is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkRayTracingShaderGroupCreateInfoNV {
    VkStructureType                 sType;
    const void*                     pNext;
    VkRayTracingShaderGroupTypeKHR  type;
    uint32_t                        generalShader;
    uint32_t                        closestHitShader;
    uint32_t                        anyHitShader;
    uint32_t                        intersectionShader;
} VkRayTracingShaderGroupCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is the type of hit group specified in this structure.
- `generalShader` is the index of the ray generation, miss, or callable shader from VkRayTracingPipelineCreateInfoNV::`pStages` in the group if the shader group has `type` of VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV, and VK_SHADER_UNUSED_NV otherwise.
- `closestHitShader` is the optional index of the closest hit shader from VkRayTracingPipelineCreateInfoNV::`pStages` in the group if the shader group has `type` of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV, and VK_SHADER_UNUSED_NV otherwise.
- `anyHitShader` is the optional index of the any-hit shader from VkRayTracingPipelineCreateInfoNV::`pStages` in the group if the shader group has `type` of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV, and VK_SHADER_UNUSED_NV otherwise.
- `intersectionShader` is the index of the intersection shader from VkRayTracingPipelineCreateInfoNV::`pStages` in the group if the shader group has `type` of VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV, and VK_SHADER_UNUSED_NV otherwise.

Valid Usage

- VUID-VkRayTracingShaderGroupCreateInfoNV-type-02413
  If `type` is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV then `generalShader` **must** be a valid index into VkRayTracingPipelineCreateInfoNV::`pStages` referring to a shader of VK_SHADER_STAGE_RAYGEN_BIT_NV, VK_SHADER_STAGE_MISS_BIT_NV, or VK_SHADER_STAGE_CALLABLE_BIT_NV
- VUID-VkRayTracingShaderGroupCreateInfoNV-type-02414
  If `type` is VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV then `closestHitShader`, `anyHitShader`, and `intersectionShader` **must** be VK_SHADER_UNUSED_NV
- VUID-VkRayTracingShaderGroupCreateInfoNV-type-02415
  If `type` is VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV then `intersectionShader` **must** be a valid index into VkRayTracingPipelineCreateInfoNV::`pStages` referring to a shader of VK_SHADER_STAGE_INTERSECTION_BIT_NV
- VUID-VkRayTracingShaderGroupCreateInfoNV-type-02416
  If `type` is VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV then `intersectionShader` **must** be VK_SHADER_UNUSED_NV
- VUID-VkRayTracingShaderGroupCreateInfoNV-closestHitShader-02417
  `closestHitShader` **must** be either VK_SHADER_UNUSED_NV or a valid index into VkRayTracingPipelineCreateInfoNV::`pStages` referring to a shader of VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV

- VUID-VkRayTracingShaderGroupCreateInfoNV-anyHitShader-02418
  `anyHitShader` **must** be either VK_SHADER_UNUSED_NV or a valid index into VkRayTracingPipelineCreateInfoNV::`pStages` referring to a shader of VK_SHADER_STAGE_ANY_HIT_BIT_NV

Valid Usage (Implicit)

- VUID-VkRayTracingShaderGroupCreateInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_NV
- VUID-VkRayTracingShaderGroupCreateInfoNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkRayTracingShaderGroupCreateInfoNV-type-parameter
  `type` **must** be a valid VkRayTracingShaderGroupTypeKHR value

10.5.3. Ray Tracing Pipeline Queries and Commands

To query the opaque handles of shaders in the ray tracing pipeline, call:

```
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingShaderGroupHandlesKHR(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    firstGroup,
    uint32_t                                    groupCount,
    size_t                                      dataSize,
    void*                                       pData);
```

```
// Provided by VK_NV_ray_tracing
// Equivalent to vkGetRayTracingShaderGroupHandlesKHR
VkResult vkGetRayTracingShaderGroupHandlesNV(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    firstGroup,
    uint32_t                                    groupCount,
    size_t                                      dataSize,
    void*                                       pData);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `firstGroup` is the index of the first group to retrieve a handle for from the VkRayTracingPipelineCreateInfoKHR::`pGroups` or VkRayTracingPipelineCreateInfoNV::`pGroups` array.
- `groupCount` is the number of shader handles to retrieve.

- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to an application-allocated buffer where the results will be written.

On success, an array of `groupCount` shader handles will be written to `pData`, with each element being of size VkPhysicalDeviceRayTracingPipelinePropertiesKHR::`shaderGroupHandleSize`. The first handle written corresponds to the group identified by `firstGroup`, with subsequent handles corresponding to consecutive shader groups in the order they appear in the VkRayTracingPipelineCreateInfoKHR::`pGroups` or VkRayTracingPipelineCreateInfoNV::`pGroups` array.

If `pipeline` was created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and the pipelineLibraryGroupHandles feature is enabled applications **can** query group handles from that pipeline, even if the pipeline is a library and is never bound to a command buffer. These group handles remain bitwise identical for any `pipeline` which references the pipeline library. Group indices are assigned as-if the pipeline was created without VK_PIPELINE_CREATE_LIBRARY_BIT_KHR.

Valid Usage

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-04619
  `pipeline` **must** be a ray tracing pipeline
- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-04050
  `firstGroup` **must** be less than the number of shader groups in `pipeline`
- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-02419
  The sum of `firstGroup` and `groupCount` **must** be less than or equal to the number of shader groups in `pipeline`
- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-02420
  `dataSize` **must** be at least VkPhysicalDeviceRayTracingPipelinePropertiesKHR::`shaderGroupHandleSize` × `groupCount`
- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-07828
  If the pipelineLibraryGroupHandles feature is not enabled, `pipeline` **must** not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupHandlesKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle
- VUID-vkGetRayTracingShaderGroupHandlesKHR-pData-parameter
  `pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-arraylength
  `dataSize` **must** be greater than `0`
- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parent

`pipeline` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To query the opaque capture data of shader groups in a ray tracing pipeline, call:

```
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingCaptureReplayShaderGroupHandlesKHR(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    firstGroup,
    uint32_t                                    groupCount,
    size_t                                      dataSize,
    void*                                       pData);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `firstGroup` is the index of the first group to retrieve a handle for from the VkRayTracingPipelineCreateInfoKHR::`pGroups` array.
- `groupCount` is the number of shader handles to retrieve.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to an application-allocated buffer where the results will be written.

On success, an array of `groupCount` shader handles will be written to `pData`, with each element being of size VkPhysicalDeviceRayTracingPipelinePropertiesKHR::`shaderGroupHandleCaptureReplaySize`. The first handle written corresponds to the group identified by `firstGroup`, with subsequent handles corresponding to consecutive shader groups in the order they appear in the VkRayTracingPipelineCreateInfoKHR::`pGroups` array.

Once queried, this opaque data **can** be provided at pipeline creation time (in a subsequent execution), using VkRayTracingShaderGroupCreateInfoKHR::`pShaderGroupCaptureReplayHandle`, as described in Ray Tracing Capture Replay.

If `pipeline` was created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and the

pipelineLibraryGroupHandles feature is enabled applications **can** query capture replay group handles from that pipeline. The capture replay handle remains bitwise identical for any `pipeline` which references the pipeline library. Group indices are assigned as-if the pipeline was created without VK_PIPELINE_CREATE_LIBRARY_BIT_KHR.

Valid Usage

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-04620
  `pipeline` **must** be a ray tracing pipeline
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-04051
  `firstGroup` **must** be less than the number of shader groups in `pipeline`
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-03483
  The sum of `firstGroup` and `groupCount` **must** be less than or equal to the number of shader groups in `pipeline`
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-03484
  `dataSize` **must** be at least VkPhysicalDeviceRayTracingPipelinePropertiesKHR::`shaderGroupHandleCaptureReplaySize` × `groupCount`
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03606
  `VkPhysicalDeviceRayTracingPipelineFeaturesKHR`::`rayTracingPipelineShaderGroupHandleCaptureReplay` **must** be enabled to call this function
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-03607
  `pipeline` **must** have been created with a `flags` that included VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-07829
  If the pipelineLibraryGroupHandles feature is not enabled, `pipeline` **must** not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pData-parameter
  `pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-arraylength
  `dataSize` **must** be greater than `0`
- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parent
  `pipeline` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To query the pipeline stack size of shaders in a shader group in the ray tracing pipeline, call:

```
// Provided by VK_KHR_ray_tracing_pipeline
VkDeviceSize vkGetRayTracingShaderGroupStackSizeKHR(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    group,
    VkShaderGroupShaderKHR                      groupShader);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shader groups.
- `group` is the index of the shader group to query.
- `groupShader` is the type of shader from the group to query.

The return value is the ray tracing pipeline stack size in bytes for the specified shader as called from the specified shader group.

Valid Usage

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-04622
  `pipeline` **must** be a ray tracing pipeline
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-group-03608
  The value of `group` **must** be less than the number of shader groups in `pipeline`
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-03609
  The shader identified by `groupShader` in `group` **must** not be VK_SHADER_UNUSED_KHR

Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parameter

`pipeline` **must** be a valid VkPipeline handle

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-parameter
  `groupShader` **must** be a valid VkShaderGroupShaderKHR value
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parent
  `pipeline` **must** have been created, allocated, or retrieved from `device`

Possible values of `groupShader` in vkGetRayTracingShaderGroupStackSizeKHR are:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkShaderGroupShaderKHR {
    VK_SHADER_GROUP_SHADER_GENERAL_KHR = 0,
    VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR = 1,
    VK_SHADER_GROUP_SHADER_ANY_HIT_KHR = 2,
    VK_SHADER_GROUP_SHADER_INTERSECTION_KHR = 3,
} VkShaderGroupShaderKHR;
```

- VK_SHADER_GROUP_SHADER_GENERAL_KHR uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::`generalShader`
- VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::`closestHitShader`
- VK_SHADER_GROUP_SHADER_ANY_HIT_KHR uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::`anyHitShader`
- VK_SHADER_GROUP_SHADER_INTERSECTION_KHR uses the shader specified in the group with VkRayTracingShaderGroupCreateInfoKHR::`intersectionShader`

To dynamically set the stack size for a ray tracing pipeline, call:

```
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdSetRayTracingPipelineStackSizeKHR(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    pipelineStackSize);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStackSize` is the stack size to use for subsequent ray tracing trace commands.

This command sets the stack size for subsequent ray tracing commands when the ray tracing pipeline is created with VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR set in VkPipelineDynamicStateCreateInfo::`pDynamicStates`. Otherwise, the stack size is computed as described in Ray Tracing Pipeline Stack.

Valid Usage

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-pipelineStackSize-03610
  `pipelineStackSize` **must** be large enough for any dynamic execution through the shaders

in the ray tracing pipeline used by a subsequent trace call

Valid Usage (Implicit)

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support VK_QUEUE_COMPUTE_BIT operations
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	VK_QUEUE_COMPUTE_BIT	State

Conditional Rendering

vkCmdSetRayTracingPipelineStackSizeKHR is not affected by conditional rendering

Ray tracing pipelines **can** contain more shaders than a graphics or compute pipeline, so to allow parallel compilation of shaders within a pipeline, an application **can** choose to defer compilation until a later point in time.

To compile a deferred shader in a pipeline call:

```
// Provided by VK_NV_ray_tracing
VkResult vkCompileDeferredNV(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    uint32_t                                    shader);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `shader` is the index of the shader to compile.

Valid Usage

- VUID-vkCompileDeferredNV-pipeline-04621
  `pipeline` **must** be a ray tracing pipeline
- VUID-vkCompileDeferredNV-pipeline-02237
  `pipeline` **must** have been created with VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV
- VUID-vkCompileDeferredNV-shader-02238
  `shader` **must** not have been called as a deferred compile before

Valid Usage (Implicit)

- VUID-vkCompileDeferredNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCompileDeferredNV-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle
- VUID-vkCompileDeferredNV-pipeline-parent
  `pipeline` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

10.6. Pipeline Destruction

To destroy a pipeline, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyPipeline(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the pipeline.
- `pipeline` is the handle of the pipeline to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyPipeline-pipeline-00765
  All submitted commands that refer to `pipeline` **must** have completed execution
- VUID-vkDestroyPipeline-pipeline-00766
  If `VkAllocationCallbacks` were provided when `pipeline` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyPipeline-pipeline-00767
  If no `VkAllocationCallbacks` were provided when `pipeline` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyPipeline-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyPipeline-pipeline-parameter
  If `pipeline` is not VK_NULL_HANDLE, `pipeline` **must** be a valid VkPipeline handle
- VUID-vkDestroyPipeline-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyPipeline-pipeline-parent
  If `pipeline` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `pipeline` **must** be externally synchronized

10.7. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality.

The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.

A derivative pipeline is created by setting the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag in the Vk*PipelineCreateInfo structure. If this is set, then exactly one of basePipelineHandle or basePipelineIndex members of the structure **must** have a valid handle/index, and specifies the parent pipeline. If basePipelineHandle is used, the parent pipeline **must** have already been created. If basePipelineIndex is used, then the parent is being created in the same command. VK_NULL_HANDLE acts as the invalid handle for basePipelineHandle, and -1 is the invalid index for basePipelineIndex. If basePipelineIndex is used, the base pipeline **must** appear earlier in the array. The base pipeline **must** have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

10.8. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications **can** manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline cache object.

Pipeline cache objects are represented by VkPipelineCache handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)
```

10.8.1. Creating a Pipeline Cache

To create pipeline cache objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(
    VkDevice                                    device,
    const VkPipelineCacheCreateInfo*            pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkPipelineCache*                            pPipelineCache);
```

- `device` is the logical device that creates the pipeline cache object.
- `pCreateInfo` is a pointer to a VkPipelineCacheCreateInfo structure containing initial parameters for the pipeline cache object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineCache` is a pointer to a VkPipelineCache handle in which the resulting pipeline cache object is returned.

NOTE	Applications **can** track and manage the total host memory size of a pipeline cache object using the `pAllocator`. Applications **can** limit the amount of data retrieved from a pipeline cache object in `vkGetPipelineCacheData`. Implementations **should** not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache **can** be passed to the vkCreateGraphicsPipelines, vkCreateRayTracingPipelinesKHR, vkCreateRayTracingPipelinesNV, vkCreateDataGraphPipelinesARM, and vkCreateComputePipelines commands. If the pipeline cache passed into these commands is not VK_NULL_HANDLE, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object **can** be used in multiple threads simultaneously.

If `flags` of `pCreateInfo` includes VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, all commands that modify the returned pipeline cache object **must** be externally synchronized.

NOTE	Implementations **should** make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreate*Pipelines` commands.

Valid Usage (Implicit)

- VUID-vkCreatePipelineCache-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreatePipelineCache-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkPipelineCacheCreateInfo structure
- VUID-vkCreatePipelineCache-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreatePipelineCache-pPipelineCache-parameter
  `pPipelineCache` **must** be a valid pointer to a VkPipelineCache handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkPipelineCacheCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType              sType;
    const void*                  pNext;
    VkPipelineCacheCreateFlags   flags;
    size_t                       initialDataSize;
    const void*                  pInitialData;
} VkPipelineCacheCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkPipelineCacheCreateFlagBits specifying the behavior of the pipeline cache.
- initialDataSize is the number of bytes in pInitialData. If initialDataSize is zero, the pipeline cache will initially be empty.
- pInitialData is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If initialDataSize is zero, pInitialData is ignored.

Valid Usage

- VUID-VkPipelineCacheCreateInfo-initialDataSize-00768
  If initialDataSize is not 0, it **must** be equal to the size of pInitialData, as returned by vkGetPipelineCacheData when pInitialData was originally retrieved
- VUID-VkPipelineCacheCreateInfo-initialDataSize-00769
  If initialDataSize is not 0, pInitialData **must** have been retrieved from a previous call to vkGetPipelineCacheData
- VUID-VkPipelineCacheCreateInfo-pipelineCreationCacheControl-02892
  If the pipelineCreationCacheControl feature is not enabled, flags **must** not include VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT
- VUID-VkPipelineCacheCreateInfo-maintenance8-10200
  If the maintenance8 feature is not enabled, flags **must** not include VK_PIPELINE_CACHE_CREATE_INTERNALLY_SYNCHRONIZED_MERGE_BIT_KHR
- VUID-VkPipelineCacheCreateInfo-flags-10201

If `flags` includes VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, it **must** not include VK_PIPELINE_CACHE_CREATE_INTERNALLY_SYNCHRONIZED_MERGE_BIT_KHR

Valid Usage (Implicit)

- VUID-VkPipelineCacheCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO
- VUID-VkPipelineCacheCreateInfo-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPipelineCacheCreateInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkPipelineCacheCreateFlagBits values
- VUID-VkPipelineCacheCreateInfo-pInitialData-parameter
  If `initialDataSize` is not `0`, `pInitialData` **must** be a valid pointer to an array of `initialDataSize` bytes

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;
```

`VkPipelineCacheCreateFlags` is a bitmask type for setting a mask of zero or more VkPipelineCacheCreateFlagBits.

Bits which **can** be set in VkPipelineCacheCreateInfo::`flags`, specifying behavior of the pipeline cache, are:

```
// Provided by VK_VERSION_1_0, VK_KHR_maintenance8,
VK_EXT_pipeline_creation_cache_control
typedef enum VkPipelineCacheCreateFlagBits {
  // Provided by VK_VERSION_1_3
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT = 0x00000001,
  // Provided by VK_KHR_maintenance8
    VK_PIPELINE_CACHE_CREATE_INTERNALLY_SYNCHRONIZED_MERGE_BIT_KHR = 0x00000008,
  // Provided by VK_EXT_pipeline_creation_cache_control
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT_EXT =
VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT,
} VkPipelineCacheCreateFlagBits;
```

- VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT specifies that all commands that modify the created VkPipelineCache will be externally synchronized. When set, the implementation **may** skip any unnecessary processing needed to support simultaneous modification from multiple threads where allowed.
- VK_PIPELINE_CACHE_CREATE_INTERNALLY_SYNCHRONIZED_MERGE_BIT_KHR specifies that

when the created VkPipelineCache is used as the dstCache parameter of vkMergePipelineCaches, it does not need to be externally synchronized. This flag is mutually exclusive with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT.

10.8.2. Merging Pipeline Caches

Pipeline cache objects **can** be merged using the command:

```
// Provided by VK_VERSION_1_0
VkResult vkMergePipelineCaches(
    VkDevice                                    device,
    VkPipelineCache                             dstCache,
    uint32_t                                    srcCacheCount,
    const VkPipelineCache*                      pSrcCaches);
```

- device is the logical device that owns the pipeline cache objects.
- dstCache is the handle of the pipeline cache to merge results into.
- srcCacheCount is the length of the pSrcCaches array.
- pSrcCaches is a pointer to an array of pipeline cache handles, which will be merged into dstCache. The previous contents of dstCache are included after the merge.

NOTE	The details of the merge operation are implementation-dependent, but implementations **should** merge the contents of the specified pipelines and prune duplicate entries.

Valid Usage

- VUID-vkMergePipelineCaches-dstCache-00770
  dstCache **must** not appear in the list of source caches
- VUID-vkMergePipelineCaches-dstCache-10202
  Host access to dstCache **must** be externally synchronized if it was not created with VK_PIPELINE_CACHE_CREATE_INTERNALLY_SYNCHRONIZED_MERGE_BIT_KHR
- VUID-vkMergePipelineCaches-dstCache-11832
  dstCache **must** not have been created with the headerVersion member of VkPipelineCacheCreateInfo::pInitialData equal to VK_PIPELINE_CACHE_HEADER_VERSION_DATA_GRAPH_QCOM
- VUID-vkMergePipelineCaches-headerVersion-11833
  Each member of pSrcCaches **must** not have been created with the headerVersion member of VkPipelineCacheCreateInfo::pInitialData equal to VK_PIPELINE_CACHE_HEADER_VERSION_DATA_GRAPH_QCOM

Valid Usage (Implicit)

- VUID-vkMergePipelineCaches-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkMergePipelineCaches-dstCache-parameter
  `dstCache` **must** be a valid VkPipelineCache handle
- VUID-vkMergePipelineCaches-pSrcCaches-parameter
  `pSrcCaches` **must** be a valid pointer to an array of `srcCacheCount` valid VkPipelineCache handles
- VUID-vkMergePipelineCaches-srcCacheCount-arraylength
  `srcCacheCount` **must** be greater than `0`
- VUID-vkMergePipelineCaches-dstCache-parent
  `dstCache` **must** have been created, allocated, or retrieved from `device`
- VUID-vkMergePipelineCaches-pSrcCaches-parent
  Each element of `pSrcCaches` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

10.8.3. Retrieving Pipeline Cache Data

Data **can** be retrieved from a pipeline cache object using the command:

```
// Provided by VK_VERSION_1_0
VkResult vkGetPipelineCacheData(
    VkDevice                                    device,
    VkPipelineCache                             pipelineCache,
    size_t*                                     pDataSize,
    void*                                       pData);
```

- `device` is the logical device that owns the pipeline cache.
- `pipelineCache` is the pipeline cache to retrieve data from.
- `pDataSize` is a pointer to a `size_t` value related to the amount of data in the pipeline cache, as

described below.

- pData is either NULL or a pointer to a buffer.

If pData is NULL, then the maximum size of the data that **can** be retrieved from the pipeline cache, in bytes, is returned in pDataSize. Otherwise, pDataSize **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by pData, and on return the variable is overwritten with the amount of data actually written to pData. If pDataSize is less than the maximum size that **can** be retrieved by the pipeline cache, at most pDataSize bytes will be written to pData, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all of the pipeline cache was returned.

Any data written to pData is valid and **can** be provided as the pInitialData member of the VkPipelineCacheCreateInfo structure passed to vkCreatePipelineCache.

Two calls to vkGetPipelineCacheData with the same parameters **must** retrieve the same data unless a command that modifies the contents of the cache is called between them.

The initial bytes written to pData **must** be a header as described in the Pipeline Cache Header section.

If pDataSize is less than what is necessary to store this header, nothing will be written to pData and zero will be written to pDataSize.

NOTE

This query does not behave consistently with the behavior described in Opaque Binary Data Results, for historical reasons.

If the amount of data available is larger than the passed pDataSize, the query returns up to the size of the passed buffer, and signals overflow with a VK_INCOMPLETE success status instead of returning a VK_ERROR_NOT_ENOUGH_SPACE_KHR error status.

Valid Usage

- VUID-vkGetPipelineCacheData-pipelineCache-11834
  pipelineCache **must** not have been created with the headerVersion member of VkPipelineCacheCreateInfo::pInitialData equal to VK_PIPELINE_CACHE_HEADER_VERSION_DATA_GRAPH_QCOM

Valid Usage (Implicit)

- VUID-vkGetPipelineCacheData-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetPipelineCacheData-pipelineCache-parameter
  pipelineCache **must** be a valid VkPipelineCache handle
- VUID-vkGetPipelineCacheData-pDataSize-parameter
  pDataSize **must** be a valid pointer to a size_t value

- VUID-vkGetPipelineCacheData-pData-parameter
  If the value referenced by `pDataSize` is not `0`, and `pData` is not `NULL`, `pData` **must** be a valid pointer to an array of `pDataSize` bytes
- VUID-vkGetPipelineCacheData-pipelineCache-parent
  `pipelineCache` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

10.8.4. Pipeline Cache Header

Applications **can** store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline compiles, however, **may** depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the pipeline cache data **must** begin with a valid pipeline cache header.

NOTE Structures described in this section are not part of the Vulkan API and are only used to describe the representation of data elements in pipeline cache data. Accordingly, the valid usage clauses defined for structures defined in this section do not define valid usage conditions for APIs accepting pipeline cache data as input, as providing invalid pipeline cache data as input to any Vulkan API commands will result in the provided pipeline cache data being ignored.

Version one of the pipeline cache header is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheHeaderVersionOne {
    uint32_t                        headerSize;
    VkPipelineCacheHeaderVersion    headerVersion;
    uint32_t                        vendorID;
    uint32_t                        deviceID;
    uint8_t                         pipelineCacheUUID[VK_UUID_SIZE];
} VkPipelineCacheHeaderVersionOne;
```

- `headerSize` is the length in bytes of the pipeline cache header.
- `headerVersion` is a VkPipelineCacheHeaderVersion value specifying the version of the header. A consumer of the pipeline cache **should** use the cache version to interpret the remainder of the cache header. `headerVersion` **must** be written as exactly 4 bytes.
- `vendorID` is the `VkPhysicalDeviceProperties`::`vendorID` of the implementation.
- `deviceID` is the `VkPhysicalDeviceProperties`::`deviceID` of the implementation.
- `pipelineCacheUUID` is the `VkPhysicalDeviceProperties`::`pipelineCacheUUID` of the implementation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 32 bytes. If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-04967
  `headerSize` **must** be 32
- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-04968
  `headerVersion` **must** be VK_PIPELINE_CACHE_HEADER_VERSION_ONE
- VUID-VkPipelineCacheHeaderVersionOne-headerSize-08990
  `headerSize` **must** not exceed the size of the pipeline cache

Valid Usage (Implicit)

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-parameter
  `headerVersion` **must** be a valid VkPipelineCacheHeaderVersion value

Possible values of the `headerVersion` value of the pipeline cache header are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
  // Provided by VK_QCOM_data_graph_model
    VK_PIPELINE_CACHE_HEADER_VERSION_DATA_GRAPH_QCOM = 1000629000,
} VkPipelineCacheHeaderVersion;
```

- VK_PIPELINE_CACHE_HEADER_VERSION_ONE specifies version one of the pipeline cache, described by VkPipelineCacheHeaderVersionOne.
- VK_PIPELINE_CACHE_HEADER_VERSION_DATA_GRAPH_QCOM specifies a pipeline cache for offline built data graph models, described by VkPipelineCacheHeaderVersionDataGraphQCOM.

The data graph pipeline cache header is defined as:

```
// Provided by VK_QCOM_data_graph_model
typedef struct VkPipelineCacheHeaderVersionDataGraphQCOM {
    uint32_t                          headerSize;
    VkPipelineCacheHeaderVersion      headerVersion;
    VkDataGraphModelCacheTypeQCOM     cacheType;
    uint32_t                          cacheVersion;
    uint32_t                          toolchainVersion
[VK_DATA_GRAPH_MODEL_TOOLCHAIN_VERSION_LENGTH_QCOM];
} VkPipelineCacheHeaderVersionDataGraphQCOM;
```

- `headerSize` is the length in bytes of the pipeline cache header.
- `headerVersion` is a VkPipelineCacheHeaderVersion value specifying the version of the header. A consumer of the pipeline cache **should** use the cache version to interpret the remainder of the cache header. `headerVersion` **must** be written as exactly 4 bytes.
- `cacheType` is the VkDataGraphModelCacheTypeQCOM type of data graph cache encoded in the data.
- `cacheVersion` is the version of the encoding of the data graph cache.
- `toolchainVersion` is a null-terminated UTF-8 string specifying the version of the compiler that built the data graph cache.

The application **should** verify that the header info is compatible with the VkDataGraphProcessingEngineCreateInfoARM passed during pipeline creation. Implementations **may** return VK_PIPELINE_COMPILE_REQUIRED_EXT from vkCreateDataGraphPipelinesARM if the cache is not compatible.

NOTE	This cache type is built using offline compilation, therefore Vulkan does not define engine compatibility. The application should refer to the offline compiler used to create the cache for guidance on compatibility.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 28 bytes. If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkPipelineCacheHeaderVersionDataGraphQCOM-None-11835
  The dataGraphModel feature **must** be enabled
- VUID-VkPipelineCacheHeaderVersionDataGraphQCOM-headerSize-11836
  `headerSize` **must** be 28

- VUID-VkPipelineCacheHeaderVersionDataGraphQCOM-headerVersion-11837
  `headerVersion` **must** be VK_PIPELINE_CACHE_HEADER_VERSION_DATA_GRAPH_QCOM
- VUID-VkPipelineCacheHeaderVersionDataGraphQCOM-headerSize-11838
  `headerSize` **must** not exceed the size of the pipeline cache

Valid Usage (Implicit)

- VUID-VkPipelineCacheHeaderVersionDataGraphQCOM-headerVersion-parameter
  `headerVersion` **must** be a valid VkPipelineCacheHeaderVersion value
- VUID-VkPipelineCacheHeaderVersionDataGraphQCOM-cacheType-parameter
  `cacheType` **must** be a valid VkDataGraphModelCacheTypeQCOM value

The VkDataGraphModelCacheTypeQCOM enumeration determines the contents of the pipeline data graph cache.

Possible values are:

```
// Provided by VK_QCOM_data_graph_model
typedef enum VkDataGraphModelCacheTypeQCOM {
    VK_DATA_GRAPH_MODEL_CACHE_TYPE_GENERIC_BINARY_QCOM = 0,
} VkDataGraphModelCacheTypeQCOM;
```

- VK_DATA_GRAPH_MODEL_CACHE_TYPE_GENERIC_BINARY_QCOM specifies a general binary layout type.

VK_DATA_GRAPH_MODEL_TOOLCHAIN_VERSION_LENGTH_QCOM is the length in `char` values of an array containing the version of the compiler that built a data graph cache, as returned in VkPipelineCacheHeaderVersionDataGraphQCOM::`toolchainVersion`.

```
#define VK_DATA_GRAPH_MODEL_TOOLCHAIN_VERSION_LENGTH_QCOM 3U
```

10.8.5. Destroying a Pipeline Cache

To destroy a pipeline cache, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
    VkDevice                                    device,
    VkPipelineCache                             pipelineCache,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the pipeline cache object.
- `pipelineCache` is the handle of the pipeline cache to destroy.

- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyPipelineCache-pipelineCache-00771
  If `VkAllocationCallbacks` were provided when `pipelineCache` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyPipelineCache-pipelineCache-00772
  If no `VkAllocationCallbacks` were provided when `pipelineCache` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyPipelineCache-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyPipelineCache-pipelineCache-parameter
  If `pipelineCache` is not VK_NULL_HANDLE, `pipelineCache` **must** be a valid VkPipelineCache handle
- VUID-vkDestroyPipelineCache-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyPipelineCache-pipelineCache-parent
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `pipelineCache` **must** be externally synchronized

10.9. Pipeline Binaries

Pipeline binary objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse is achieved by extracting pipeline binaries from a VkPipeline object, associating them with a corresponding VkPipelineBinaryKeyKHR and then adding a VkPipelineBinaryInfoKHR to the `pNext` chain of any `Vk*PipelineCreateInfo` when creating a pipeline. Pipeline binaries can be reused between runs by extracting `VkPipelineBinaryDataKHR` from `VkPipelineBinaryKHR` objects, saving the contents, and then using them to create a `VkPipelineBinaryKHR` object on subsequent runs.

When creating a pipeline that includes VkPipelineBinaryInfoKHR in the `pNext` chain, or has the VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR flag set, the use of VkPipelineCache objects is not allowed.

Pipeline binary objects are represented by VkPipelineBinaryKHR handles:

```
// Provided by VK_KHR_pipeline_binary
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineBinaryKHR)
```

10.9.1. Generating the Pipeline Key

To generate the key for a particular pipeline creation info, call:

```
// Provided by VK_KHR_pipeline_binary
VkResult vkGetPipelineKeyKHR(
    VkDevice                                    device,
    const VkPipelineCreateInfoKHR*              pPipelineCreateInfo,
    VkPipelineBinaryKeyKHR*                     pPipelineKey);
```

- device is the logical device that creates the pipeline object.
- pPipelineCreateInfo is NULL or a pointer to a VkPipelineCreateInfoKHR structure.
- pPipelineKey is a pointer to a VkPipelineBinaryKeyKHR structure in which the resulting key is returned.

If pPipelineCreateInfo is NULL, then the implementation **must** return the global key that applies to all pipelines. If the key obtained in this way changes between saving and restoring data obtained from vkGetPipelineBinaryDataKHR in a different VkDevice, then the application **must** assume that the restored data is invalid and cannot be passed to vkCreatePipelineBinariesKHR. Otherwise the application **can** assume the data is still valid.

If pPipelineCreateInfo is not NULL, the key obtained functions as a method to compare two pipeline creation info structures. Implementations **may** not compare parts of a pipeline creation info which would not contribute to the final binary output. If a shader module identifier is used instead of a shader module, the pPipelineKey generated **must** be equal to the key generated when using the shader module from which the identifier was queried. If the content of two pPipelineKey are equal, pipelines created with the two pPipelineCreateInfo->pNext create infos **must** produce the same VkPipelineBinaryKHR contents.

The pipeline key is distinct from pipeline binary key. Pipeline binary keys **can** only be obtained after compilation. The pipeline key is intended to optionally allow associating pipeline create info with multiple pipeline binary keys.

Valid Usage

- VUID-vkGetPipelineKeyKHR-pNext-09605
  The pNext chain of pPipelineCreateInfo **must** not set VkPipelineBinaryInfoKHR::binaryCount to a value greater than 0

Valid Usage (Implicit)

- VUID-vkGetPipelineKeyKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetPipelineKeyKHR-pPipelineCreateInfo-parameter
  If `pPipelineCreateInfo` is not `NULL`, `pPipelineCreateInfo` **must** be a valid pointer to a valid VkPipelineCreateInfoKHR structure
- VUID-vkGetPipelineKeyKHR-pPipelineKey-parameter
  `pPipelineKey` **must** be a valid pointer to a VkPipelineBinaryKeyKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkPipelineCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineCreateInfoKHR {
    VkStructureType    sType;
    void*              pNext;
} VkPipelineCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is a pointer to a structure extending this structure.

Valid Usage

- VUID-VkPipelineCreateInfoKHR-pNext-09604
  `pNext` **must** be a pointer to a valid instance of VkGraphicsPipelineCreateInfo, VkExecutionGraphPipelineCreateInfoAMDX, VkRayTracingPipelineCreateInfoKHR, or VkComputePipelineCreateInfo

Valid Usage (Implicit)

- VUID-VkPipelineCreateInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_CREATE_INFO_KHR

The `VkPipelineBinaryKeyKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineBinaryKeyKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           keySize;
    uint8_t            key[VK_MAX_PIPELINE_BINARY_KEY_SIZE_KHR];
} VkPipelineBinaryKeyKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `keySize` is the size, in bytes, of valid data returned in `key`.
- `key` is a buffer of opaque data specifying a pipeline binary key.

Any returned values beyond the first `keySize` bytes are undefined. Implementations **must** return a `keySize` greater than 0, and less-or-equal to VK_MAX_PIPELINE_BINARY_KEY_SIZE_KHR.

Two keys are considered equal if `keySize` is equal and the first `keySize` bytes of `key` compare equal.

Implementations **may** return a different `keySize` for different binaries.

Implementations **should** ensure that `keySize` is large enough to uniquely identify a pipeline binary.

Valid Usage (Implicit)

- VUID-VkPipelineBinaryKeyKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_BINARY_KEY_KHR
- VUID-VkPipelineBinaryKeyKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPipelineBinaryKeyKHR-key-parameter
  Each element of `key` **must** be a valid pointer to an array of `keySize` `uint8_t` values
- VUID-VkPipelineBinaryKeyKHR-keySize-arraylength
  `keySize` **must** be greater than `0`

VK_MAX_PIPELINE_BINARY_KEY_SIZE_KHR is the length in bytes of a binary key, as returned in VkPipelineBinaryKeyKHR::`keySize`.

```
#define VK_MAX_PIPELINE_BINARY_KEY_SIZE_KHR 32U
```

10.9.2. Creating Pipeline Binaries

To create pipeline binary objects, call:

```
// Provided by VK_KHR_pipeline_binary
VkResult vkCreatePipelineBinariesKHR(
    VkDevice                                    device,
    const VkPipelineBinaryCreateInfoKHR*        pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkPipelineBinaryHandlesInfoKHR*             pBinaries);
```

- `device` is the logical device that creates the pipeline binary objects.
- `pCreateInfo` is a pointer to a VkPipelineBinaryCreateInfoKHR structure that contains the data to create the pipeline binaries from.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pBinaries` is a pointer to a VkPipelineBinaryHandlesInfoKHR structure in which the resulting pipeline binaries are returned.

The implementation will attempt to create all pipeline binaries. If creation fails for any pipeline binary, then:

- The corresponding entry in the `pPipelineBinaries` output array will be filled with VK_NULL_HANDLE.
- The VkResult returned by vkCreatePipelineBinariesKHR will contain the error value for the first entry in the output array in `pBinaries` containing VK_NULL_HANDLE.

Valid Usage (Implicit)

- VUID-vkCreatePipelineBinariesKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreatePipelineBinariesKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkPipelineBinaryCreateInfoKHR structure
- VUID-vkCreatePipelineBinariesKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreatePipelineBinariesKHR-pBinaries-parameter
  `pBinaries` **must** be a valid pointer to a VkPipelineBinaryHandlesInfoKHR structure

Return Codes

Success

- VK_INCOMPLETE
- VK_PIPELINE_BINARY_MISSING_KHR
- VK_SUCCESS

Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkPipelineBinaryHandlesInfoKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineBinaryHandlesInfoKHR {
    VkStructureType         sType;
    const void*             pNext;
    uint32_t                pipelineBinaryCount;
    VkPipelineBinaryKHR*    pPipelineBinaries;
} VkPipelineBinaryHandlesInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBinaryCount` is the number of binaries associated with this pipeline or the number of entries in the `pPipelineBinaries` array.
- `pPipelineBinaries` is `NULL` or a pointer to an array of VkPipelineBinaryKHR handles in which the resulting pipeline binaries are returned.

If `pPipelineBinaries` is `NULL`, the number of binaries that would be created is returned in `pipelineBinaryCount`. Otherwise, `pipelineBinaryCount` **must** be the number of entries in the `pPipelineBinaries` array, and on return from vkCreatePipelineBinariesKHR `pipelineBinaryCount` is overwritten with the number of handles actually written to `pPipelineBinaries`. If the value of `pipelineBinaryCount` is less than the number of binaries that would have been created, at most `pipelineBinaryCount` handles will be written to `pPipelineBinaries` and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that `pPipelineBinaries` was not large enough to create all the binaries.

Valid Usage (Implicit)

- VUID-VkPipelineBinaryHandlesInfoKHR-sType-sType

sType **must** be VK_STRUCTURE_TYPE_PIPELINE_BINARY_HANDLES_INFO_KHR

- VUID-VkPipelineBinaryHandlesInfoKHR-pNext-pNext
  pNext **must** be NULL
- VUID-VkPipelineBinaryHandlesInfoKHR-pPipelineBinaries-parameter
  If pipelineBinaryCount is not 0, and pPipelineBinaries is not NULL, pPipelineBinaries **must** be a valid pointer to an array of pipelineBinaryCount VkPipelineBinaryKHR handles

The VkPipelineBinaryCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineBinaryCreateInfoKHR {
    VkStructureType                           sType;
    const void*                               pNext;
    const VkPipelineBinaryKeysAndDataKHR*     pKeysAndDataInfo;
    VkPipeline                                pipeline;
    const VkPipelineCreateInfoKHR*            pPipelineCreateInfo;
} VkPipelineBinaryCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pKeysAndDataInfo is NULL or a pointer to a VkPipelineBinaryKeysAndDataKHR structure that contains keys and data to create the pipeline binaries from.
- pipeline is VK_NULL_HANDLE or a VkPipeline that contains data to create the pipeline binaries from.
- pPipelineCreateInfo is NULL or a pointer to a VkPipelineCreateInfoKHR structure with the pipeline creation info. This is used to probe the implementation's internal cache for pipeline binaries.

When pPipelineCreateInfo is not NULL, an implementation will attempt to retrieve pipeline binary data from an internal cache external to the application if pipelineBinaryInternalCache is VK_TRUE. Applications **can** use this to determine if a pipeline **can** be created without compilation. If the implementation fails to create a pipeline binary due to missing an internal cache entry, VK_PIPELINE_BINARY_MISSING_KHR is returned. If creation succeeds, the resulting binary **can** be used to create a pipeline. VK_PIPELINE_BINARY_MISSING_KHR **may** be returned for any reason in this situation, even if creating a pipeline binary with the same parameters that succeeded earlier.

If pipelineBinaryPrecompiledInternalCache is VK_TRUE, the implementation **may** be able to create pipeline binaries even when pPipelineCreateInfo has not been used to create binaries before by the application.

NOTE	On some platforms, internal pipeline caches may be pre-populated before running the application.

Valid Usage

- VUID-VkPipelineBinaryCreateInfoKHR-pipeline-09607
  If `pipeline` is not VK_NULL_HANDLE, `pipeline` **must** have been created with VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR
- VUID-VkPipelineBinaryCreateInfoKHR-pipeline-09608
  If `pipeline` is not VK_NULL_HANDLE, vkReleaseCapturedPipelineDataKHR **must** not have been called on `pipeline` prior to this command
- VUID-VkPipelineBinaryCreateInfoKHR-pipelineBinaryInternalCache-09609
  If `pipelineBinaryInternalCache` is VK_FALSE pPipelineCreateInfo **must** be `NULL`
- VUID-VkPipelineBinaryCreateInfoKHR-device-09610
  If `device` was created with VkDevicePipelineBinaryInternalCacheControlKHR ::`disableInternalCache` set to VK_TRUE, `pPipelineCreateInfo` **must** be `NULL`
- VUID-VkPipelineBinaryCreateInfoKHR-pKeysAndDataInfo-09619
  One and only one of `pKeysAndDataInfo`, `pipeline`, or `pPipelineCreateInfo` **must** be non-`NULL`
- VUID-VkPipelineBinaryCreateInfoKHR-pPipelineCreateInfo-09606
  If `pPipelineCreateInfo` is not `NULL`, the `pNext` chain of `pPipelineCreateInfo` **must** not set VkPipelineBinaryInfoKHR::`binaryCount` to a value greater than `0`

Valid Usage (Implicit)

- VUID-VkPipelineBinaryCreateInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_BINARY_CREATE_INFO_KHR
- VUID-VkPipelineBinaryCreateInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPipelineBinaryCreateInfoKHR-pKeysAndDataInfo-parameter
  If `pKeysAndDataInfo` is not `NULL`, `pKeysAndDataInfo` **must** be a valid pointer to a valid VkPipelineBinaryKeysAndDataKHR structure
- VUID-VkPipelineBinaryCreateInfoKHR-pipeline-parameter
  If `pipeline` is not VK_NULL_HANDLE, `pipeline` **must** be a valid VkPipeline handle
- VUID-VkPipelineBinaryCreateInfoKHR-pPipelineCreateInfo-parameter
  If `pPipelineCreateInfo` is not `NULL`, `pPipelineCreateInfo` **must** be a valid pointer to a valid VkPipelineCreateInfoKHR structure

The `VkPipelineBinaryKeysAndDataKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineBinaryKeysAndDataKHR {
    uint32_t                            binaryCount;
    const VkPipelineBinaryKeyKHR*       pPipelineBinaryKeys;
    const VkPipelineBinaryDataKHR*      pPipelineBinaryData;
} VkPipelineBinaryKeysAndDataKHR;
```

- `binaryCount` is the size of the `pPipelineBinaryKeys` and `pPipelineBinaryData` arrays.
- `pPipelineBinaryKeys` is a pointer to an array of VkPipelineBinaryKeyKHR structures containing the pipeline binary keys.
- `pPipelineBinaryData` is a pointer to an array of VkPipelineBinaryDataKHR structures containing the pipeline binary data.

Valid Usage (Implicit)

- VUID-VkPipelineBinaryKeysAndDataKHR-pPipelineBinaryKeys-parameter
  `pPipelineBinaryKeys` **must** be a valid pointer to an array of `binaryCount` valid VkPipelineBinaryKeyKHR structures
- VUID-VkPipelineBinaryKeysAndDataKHR-pPipelineBinaryData-parameter
  `pPipelineBinaryData` **must** be a valid pointer to an array of `binaryCount` valid VkPipelineBinaryDataKHR structures
- VUID-VkPipelineBinaryKeysAndDataKHR-binaryCount-arraylength
  `binaryCount` **must** be greater than `0`

The `VkPipelineBinaryDataKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineBinaryDataKHR {
    size_t    dataSize;
    void*     pData;
} VkPipelineBinaryDataKHR;
```

- `dataSize` is the size of the `pData` buffer in bytes.
- `pData` is a pointer to a buffer of `dataSize` bytes that contains pipeline binary data obtained from `vkGetPipelineBinaryDataKHR`.

Valid Usage (Implicit)

- VUID-VkPipelineBinaryDataKHR-pData-parameter
  `pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-VkPipelineBinaryDataKHR-dataSize-arraylength
  `dataSize` **must** be greater than `0`

10.9.3. Retrieving Pipeline Binary Data

Data **can** be retrieved from a pipeline binary object using the command:

```
// Provided by VK_KHR_pipeline_binary
VkResult vkGetPipelineBinaryDataKHR(
    VkDevice                                    device,
    const VkPipelineBinaryDataInfoKHR*          pInfo,
    VkPipelineBinaryKeyKHR*                     pPipelineBinaryKey,
    size_t*                                     pPipelineBinaryDataSize,
    void*                                       pPipelineBinaryData);
```

- `device` is the logical device that created the pipeline binary.
- `pInfo` is a pointer to a VkPipelineBinaryDataInfoKHR structure which describes the pipeline binary to get data from.
- `pPipelineBinaryKey` is a pointer to a VkPipelineBinaryKeyKHR structure where the key for this binary will be written.
- `pPipelineBinaryDataSize` is a pointer to a `size_t` value related to the amount of data in the pipeline binary, as described below.
- `pPipelineBinaryData` is either `NULL` or a pointer to a buffer.

If `pPipelineBinaryData` is `NULL`, then the size of the data, in bytes, that is required to store the binary is returned in `pPipelineBinaryDataSize`. Otherwise, `pPipelineBinaryDataSize` **must** contain the size of the buffer, in bytes, pointed to by `pPipelineBinaryData`, and on return `pPipelineBinaryDataSize` is overwritten with the size of the data, in bytes, that is required to store the binary. If `pPipelineBinaryDataSize` is less than the size that is required to store the binary, nothing is written to `pPipelineBinaryData` and VK_ERROR_NOT_ENOUGH_SPACE_KHR will be returned, instead of VK_SUCCESS.

If the call returns one of the success return codes, the pipeline binary key is written to `pPipelineBinaryKey`, regardless of whether `pPipelineBinaryData` is `NULL` or not.

If pipelineBinaryCompressedData is VK_FALSE, implementations **should** not return compressed pipeline binary data to the application.

Valid Usage (Implicit)

- VUID-vkGetPipelineBinaryDataKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetPipelineBinaryDataKHR-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkPipelineBinaryDataInfoKHR structure
- VUID-vkGetPipelineBinaryDataKHR-pPipelineBinaryKey-parameter
  `pPipelineBinaryKey` **must** be a valid pointer to a VkPipelineBinaryKeyKHR structure
- VUID-vkGetPipelineBinaryDataKHR-pPipelineBinaryDataSize-parameter
  `pPipelineBinaryDataSize` **must** be a valid pointer to a `size_t` value

- VUID-vkGetPipelineBinaryDataKHR-pPipelineBinaryData-parameter
  If the value referenced by `pPipelineBinaryDataSize` is not `0`, and `pPipelineBinaryData` is not `NULL`, `pPipelineBinaryData` **must** be a valid pointer to an array of `pPipelineBinaryDataSize` bytes

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_NOT_ENOUGH_SPACE_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkPipelineBinaryDataInfoKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkPipelineBinaryDataInfoKHR {
    VkStructureType        sType;
    void*                  pNext;
    VkPipelineBinaryKHR    pipelineBinary;
} VkPipelineBinaryDataInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBinary` is the pipeline binary to get data from.

Valid Usage (Implicit)

- VUID-VkPipelineBinaryDataInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_BINARY_DATA_INFO_KHR
- VUID-VkPipelineBinaryDataInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPipelineBinaryDataInfoKHR-pipelineBinary-parameter
  `pipelineBinary` **must** be a valid VkPipelineBinaryKHR handle

10.9.4. Releasing Captured Pipeline Binary Data

To release pipeline resources captured with VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR, call:

```
// Provided by VK_KHR_pipeline_binary
VkResult vkReleaseCapturedPipelineDataKHR(
    VkDevice                                    device,
    const VkReleaseCapturedPipelineDataInfoKHR* pInfo,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that created the pipeline object.
- `pInfo` is a pointer to a VkReleaseCapturedPipelineDataInfoKHR structure which describes the pipeline to release the data from.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

The implementation **may** free any resources captured as a result of creating the pipeline with VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR and put the pipeline into a state as if VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR had not been provided at pipeline creation time.

NOTE	Any resources captured as a result of creating the pipeline with VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR are implicitly freed by vkDestroyPipeline.

Valid Usage

- VUID-vkReleaseCapturedPipelineDataKHR-pipeline-09611
  If `VkAllocationCallbacks` were provided when `pipeline` was created, a compatible set of callbacks **must** be provided in `pAllocator`
- VUID-vkReleaseCapturedPipelineDataKHR-pipeline-09612
  If no VkAllocationCallbacks were provided when `pipeline` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkReleaseCapturedPipelineDataKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkReleaseCapturedPipelineDataKHR-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkReleaseCapturedPipelineDataInfoKHR structure
- VUID-vkReleaseCapturedPipelineDataKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkReleaseCapturedPipelineDataInfoKHR structure is defined as:

```
// Provided by VK_KHR_pipeline_binary
typedef struct VkReleaseCapturedPipelineDataInfoKHR {
    VkStructureType    sType;
    void*              pNext;
    VkPipeline         pipeline;
} VkReleaseCapturedPipelineDataInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pipeline is the handle of the pipeline object to release the data from.

Valid Usage

- VUID-VkReleaseCapturedPipelineDataInfoKHR-pipeline-09613
  pipeline **must** have been created with VK_PIPELINE_CREATE_2_CAPTURE_DATA_BIT_KHR
- VUID-VkReleaseCapturedPipelineDataInfoKHR-pipeline-09618
  pipeline **must** not have been used in a previous call to vkReleaseCapturedPipelineDataKHR

Valid Usage (Implicit)

- VUID-VkReleaseCapturedPipelineDataInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_RELEASE_CAPTURED_PIPELINE_DATA_INFO_KHR
- VUID-VkReleaseCapturedPipelineDataInfoKHR-pNext-pNext
  pNext **must** be NULL
- VUID-VkReleaseCapturedPipelineDataInfoKHR-pipeline-parameter
  pipeline **must** be a valid VkPipeline handle

Host Synchronization

- Host access to pipeline **must** be externally synchronized

10.9.5. Destroying Pipeline Binaries

To destroy a VkPipelineBinaryKHR, call:

```
// Provided by VK_KHR_pipeline_binary
void vkDestroyPipelineBinaryKHR(
    VkDevice                                    device,
    VkPipelineBinaryKHR                         pipelineBinary,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that created the pipeline binary object.
- `pipelineBinary` is the handle of the pipeline binary object to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyPipelineBinaryKHR-pipelineBinary-09614
  If `VkAllocationCallbacks` were provided when `pipelineBinary` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyPipelineBinaryKHR-pipelineBinary-09615
  If no VkAllocationCallbacks were provided when `pipelineBinary` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyPipelineBinaryKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyPipelineBinaryKHR-pipelineBinary-parameter
  If `pipelineBinary` is not VK_NULL_HANDLE, `pipelineBinary` **must** be a valid VkPipelineBinaryKHR handle
- VUID-vkDestroyPipelineBinaryKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyPipelineBinaryKHR-pipelineBinary-parent
  If `pipelineBinary` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `pipelineBinary` **must** be externally synchronized

10.10. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module **can** have their constant value specified at the time the VkPipeline is created. This allows a SPIR-V module to have constants that **can** be modified while executing an application that uses the Vulkan API.

NOTE	Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each VkPipelineShaderStageCreateInfo structure contains a pSpecializationInfo member, which **can** be NULL to indicate no specialization constants, or point to a VkSpecializationInfo structure.

The VkSpecializationInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t                           mapEntryCount;
    const VkSpecializationMapEntry*    pMapEntries;
    size_t                             dataSize;
    const void*                        pData;
} VkSpecializationInfo;
```

- mapEntryCount is the number of entries in the pMapEntries array.
- pMapEntries is a pointer to an array of VkSpecializationMapEntry structures, which map constant IDs to offsets in pData.
- dataSize is the byte size of the pData buffer.
- pData contains the actual constant values to specialize with.

Valid Usage

- VUID-VkSpecializationInfo-offset-00773
  The offset member of each element of pMapEntries **must** be less than dataSize
- VUID-VkSpecializationInfo-pMapEntries-00774
  The size member of each element of pMapEntries **must** be less than or equal to dataSize minus offset
- VUID-VkSpecializationInfo-constantID-04911
  The constantID value of each element of pMapEntries **must** be unique within pMapEntries

Valid Usage (Implicit)

- VUID-VkSpecializationInfo-pMapEntries-parameter
  If mapEntryCount is not 0, pMapEntries **must** be a valid pointer to an array of mapEntryCount valid VkSpecializationMapEntry structures

- VUID-VkSpecializationInfo-pData-parameter
  If `dataSize` is not `0`, `pData` **must** be a valid pointer to an array of `dataSize` bytes

The `VkSpecializationMapEntry` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
    uint32_t    constantID;
    uint32_t    offset;
    size_t      size;
} VkSpecializationMapEntry;
```

- `constantID` is the ID of the specialization constant in SPIR-V.
- `offset` is the byte offset of the specialization constant value within the supplied data buffer.
- `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.

Valid Usage

- VUID-VkSpecializationMapEntry-constantID-00776
  For a `constantID` specialization constant declared in a shader, `size` **must** match the byte size of the `constantID`. If the specialization constant is of type `boolean`, `size` **must** be the byte size of VkBool32

In human readable SPIR-V:

```
OpDecorate %x SpecId 13 ; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId 42 ; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId 3  ; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wgsize BuiltIn WorkgroupSize ; decorate WorkgroupSize onto constant
%i32 = OpTypeInt 32 0 ; declare an unsigned 32-bit type
%uvec3 = OpTypeVector %i32 3 ; declare a 3 element vector type of unsigned 32-bit
%x = OpSpecConstant %i32 1 ; declare the .x component of WorkgroupSize
%y = OpSpecConstant %i32 1 ; declare the .y component of WorkgroupSize
%z = OpSpecConstant %i32 1 ; declare the .z component of WorkgroupSize
%wgsize = OpSpecConstantComposite %uvec3 %x %y %z ; declare WorkgroupSize
```

From the above we have three specialization constants, one for each of the x, y, and z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```
const VkSpecializationMapEntry entries[] =
```

```
{
    {
        .constantID = 13,
        .offset = 0 * sizeof(uint32_t),
        .size = sizeof(uint32_t)
    },
    {
        .constantID = 42,
        .offset = 1 * sizeof(uint32_t),
        .size = sizeof(uint32_t)
    },
    {
        .constantID = 3,
        .offset = 2 * sizeof(uint32_t),
        .size = sizeof(uint32_t)
    }
};

const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4

const VkSpecializationInfo info =
{
    .mapEntryCount = 3,
    .pMapEntries  = entries,
    .dataSize = 3 * sizeof(uint32_t),
    .pData = data,
};
```

Then when calling vkCreateComputePipelines, and passing the VkSpecializationInfo we defined as the pSpecializationInfo parameter of VkPipelineShaderStageCreateInfo, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```
OpDecorate %1 SpecId 0  ; decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12 ; decorate our 32-bit floating-point constant
%i32 = OpTypeInt 32 1   ; declare a signed 32-bit type
%float = OpTypeFloat 32 ; declare a 32-bit floating-point type
%1 = OpSpecConstant %i32 -1 ; some signed 32-bit integer constant
%2 = OpSpecConstant %float 0.5 ; some 32-bit floating-point constant
```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.

Now to specialize the above via the specialization constants mechanism:

```
struct SpecializationData {
    int32_t data0;
    float data1;
};

const VkSpecializationMapEntry entries[] =
{
    {
        .constantID = 0,
        .offset = offsetof(SpecializationData, data0),
        .size = sizeof(SpecializationData::data0)
    },
    {
        .constantID = 12,
        .offset = offsetof(SpecializationData, data1),
        .size = sizeof(SpecializationData::data1)
    }
};

SpecializationData data;
data.data0 = -42;    // set the data for the 32-bit integer
data.data1 = 42.0f;  // set the data for the 32-bit floating-point

const VkSpecializationInfo info =
{
    .mapEntryCount = 2,
    .pMapEntries = entries,
    .dataSize = sizeof(data),
    .pData = &data,
};
```

It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization information was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

10.11. Pipeline Libraries

A pipeline library is a special pipeline that was created using the VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and cannot be bound, instead it defines a set of pipeline state which can be linked into other pipelines. For ray tracing pipelines this includes shaders and shader groups. For graphics pipelines this includes distinct library types defined by VkGraphicsPipelineLibraryFlagBitsEXT. The application **must** maintain the lifetime of a pipeline library based on the pipelines that link with it.

This linkage is achieved by using the following structure within the appropriate creation

mechanisms:

The VkPipelineLibraryCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_pipeline_library
typedef struct VkPipelineLibraryCreateInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             libraryCount;
    const VkPipeline*    pLibraries;
} VkPipelineLibraryCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- libraryCount is the number of pipeline libraries in pLibraries.
- pLibraries is a pointer to an array of VkPipeline structures specifying pipeline libraries to use when creating a pipeline.

Valid Usage

- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-03381
  Each element of pLibraries **must** have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR
- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-06855
  If any library in pLibraries was created with a shader stage with VkPipelineShaderStageModuleIdentifierCreateInfoEXT and identifierSize not equal to 0, the pipeline **must** be created with the VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT flag set

Valid Usage (Implicit)

- VUID-VkPipelineLibraryCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_LIBRARY_CREATE_INFO_KHR
- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-parameter
  If libraryCount is not 0, pLibraries **must** be a valid pointer to an array of libraryCount valid VkPipeline handles

Structure Chaining

Extends the structure

- VkGraphicsPipelineCreateInfo

Pipelines created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR libraries **can** depend on other pipeline libraries in VkPipelineLibraryCreateInfoKHR.

A pipeline library is considered in-use, as long as one of the linking pipelines is in-use. This applies recursively if a pipeline library includes other pipeline libraries.

10.12. Pipeline Binding

Once a pipeline has been created, it **can** be bound to the command buffer using the command:

```
// Provided by VK_VERSION_1_0
void vkCmdBindPipeline(
    VkCommandBuffer                             commandBuffer,
    VkPipelineBindPoint                         pipelineBindPoint,
    VkPipeline                                  pipeline);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a VkPipelineBindPoint value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.
- `pipeline` is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point, or until the pipeline bind point is disturbed by binding a shader object as described in Interaction with Pipelines. Commands that do not interact with the given pipeline type **must** not be affected by the pipeline state.

Valid Usage

- VUID-vkCmdBindPipeline-pipelineBindPoint-00777
  If `pipelineBindPoint` is VK_PIPELINE_BIND_POINT_COMPUTE, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdBindPipeline-pipelineBindPoint-00778
  If `pipelineBindPoint` is VK_PIPELINE_BIND_POINT_GRAPHICS, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdBindPipeline-pipelineBindPoint-00779
  If `pipelineBindPoint` is VK_PIPELINE_BIND_POINT_COMPUTE, `pipeline` **must** be a compute pipeline
- VUID-vkCmdBindPipeline-pipelineBindPoint-00780
  If `pipelineBindPoint` is VK_PIPELINE_BIND_POINT_GRAPHICS, `pipeline` **must** be a graphics pipeline
- VUID-vkCmdBindPipeline-pipeline-00781
  If the `variableMultisampleRate` feature is not supported, `pipeline` is a graphics pipeline, the current subpass uses no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count

specified by this pipeline **must** match that set in the previous pipeline

- VUID-vkCmdBindPipeline-variableSampleLocations-01525
  If VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations is VK_FALSE, and pipeline is a graphics pipeline created with a renderPass that is not VK_NULL_HANDLE and with a VkPipelineSampleLocationsStateCreateInfoEXT structure having its sampleLocationsEnable member set to VK_TRUE but without VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT enabled then the current render pass instance **must** have been begun by specifying a VkRenderPassSampleLocationsBeginInfoEXT structure whose pPostSubpassSampleLocations member contains an element with a subpassIndex matching the current subpass index and the sampleLocationsInfo member of that element **must** match the sampleLocationsInfo specified in VkPipelineSampleLocationsStateCreateInfoEXT when the pipeline was created
- VUID-vkCmdBindPipeline-None-02323
  This command **must** not be recorded when transform feedback is active
- VUID-vkCmdBindPipeline-pipelineBindPoint-02391
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR, the VkCommandPool that commandBuffer was allocated from **must** support compute operations
- VUID-vkCmdBindPipeline-pipelineBindPoint-02392
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR, pipeline **must** be a ray tracing pipeline
- VUID-vkCmdBindPipeline-pipelineBindPoint-06721
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR, commandBuffer **must** not be a protected command buffer
- VUID-vkCmdBindPipeline-pipelineProtectedAccess-07408
  If the pipelineProtectedAccess feature is enabled, and commandBuffer is a protected command buffer, pipeline **must** have been created without VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT
- VUID-vkCmdBindPipeline-pipelineProtectedAccess-07409
  If the pipelineProtectedAccess feature is enabled, and commandBuffer is not a protected command buffer, pipeline **must** have been created without VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT
- VUID-vkCmdBindPipeline-pipeline-03382
  pipeline **must** not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR set
- VUID-vkCmdBindPipeline-commandBuffer-04808
  If commandBuffer is a secondary command buffer with VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled and pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS, then the pipeline **must** have been created with VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT or VK_DYNAMIC_STATE_VIEWPORT, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT or VK_DYNAMIC_STATE_SCISSOR enabled
- VUID-vkCmdBindPipeline-commandBuffer-04809
  If commandBuffer is a secondary command buffer with VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled and

pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS and pipeline was created with VkPipelineDiscardRectangleStateCreateInfoEXT structure and its discardRectangleCount member is not 0, or the pipeline was created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT enabled, then the pipeline **must** have been created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT enabled

- VUID-vkCmdBindPipeline-pipelineBindPoint-04881
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_GRAPHICS and the provokingVertexModePerPipeline limit is VK_FALSE, then the pipeline's VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode **must** be the same as that of any other pipelines previously bound to this bind point within the current render pass instance, including any pipeline already bound when beginning the render pass instance
- VUID-vkCmdBindPipeline-pipelineBindPoint-04949
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI, the VkCommandPool that commandBuffer was allocated from **must** support compute operations
- VUID-vkCmdBindPipeline-pipelineBindPoint-04950
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI, pipeline **must** be a subpass shading pipeline
- VUID-vkCmdBindPipeline-pipelineBindPoint-09910
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_DATA_GRAPH_ARM, the VkCommandPool that commandBuffer was allocated from **must** have been created for a queue family that supports VK_QUEUE_DATA_GRAPH_BIT_ARM
- VUID-vkCmdBindPipeline-pipelineBindPoint-09911
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_DATA_GRAPH_ARM, pipeline **must** be a data graph pipeline
- VUID-vkCmdBindPipeline-pipeline-09912
  If pipeline is a data graph pipeline and the VkDataGraphPipelineCreateInfoARM structure used to create it had a VkDataGraphProcessingEngineCreateInfoARM structure in its pNext chain that specified any foreign data processing engines, then the command pool from which commandBuffer was allocated **must** have been created with a VkCommandPoolCreateInfo structure that had a VkDataGraphProcessingEngineCreateInfoARM structure specifying a superset of the foreign data graph processing engines specified at pipeline creation time in its pNext chain
- VUID-vkCmdBindPipeline-pipeline-09913
  If pipeline is a data graph pipeline and the VkDataGraphPipelineCreateInfoARM structure used to create it did not have a VkDataGraphProcessingEngineCreateInfoARM structure in its pNext chain, then the command pool from which commandBuffer was allocated **must** not have been created with a VkCommandPoolCreateInfo that had a VkDataGraphProcessingEngineCreateInfoARM structure in its pNext chain

Valid Usage (Implicit)

- VUID-vkCmdBindPipeline-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle

- VUID-vkCmdBindPipeline-pipelineBindPoint-parameter
  `pipelineBindPoint` **must** be a valid VkPipelineBindPoint value
- VUID-vkCmdBindPipeline-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle
- VUID-vkCmdBindPipeline-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBindPipeline-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support VK_QUEUE_COMPUTE_BIT, VK_QUEUE_DATA_GRAPH_BIT_ARM, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdBindPipeline-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindPipeline-commonparent
  Both of `commandBuffer`, and `pipeline` **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_DATA_GRAPH_BIT_ARM VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdBindPipeline is not affected by conditional rendering

Possible values of vkCmdBindPipeline::`pipelineBindPoint`, specifying the bind point of a pipeline object, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
#ifdef VK_ENABLE_BETA_EXTENSIONS
  // Provided by VK_AMDX_shader_enqueue
    VK_PIPELINE_BIND_POINT_EXECUTION_GRAPH_AMDX = 1000134000,
#endif
  // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR = 1000165000,
  // Provided by VK_HUAWEI_subpass_shading
    VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI = 1000369003,
  // Provided by VK_ARM_data_graph
    VK_PIPELINE_BIND_POINT_DATA_GRAPH_ARM = 1000507000,
  // Provided by VK_NV_ray_tracing
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV = VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR,
} VkPipelineBindPoint;
```

- VK_PIPELINE_BIND_POINT_COMPUTE specifies binding as a compute pipeline.
- VK_PIPELINE_BIND_POINT_GRAPHICS specifies binding as a graphics pipeline.
- VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR specifies binding as a ray tracing pipeline.
- VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI specifies binding as a subpass shading pipeline.
- VK_PIPELINE_BIND_POINT_EXECUTION_GRAPH_AMDX specifies binding as an execution graph pipeline.

For pipelines that were created with the support of multiple shader groups (see Graphics Pipeline Shader Groups), the regular `vkCmdBindPipeline` command will bind Shader Group `0`. To explicitly bind a shader group use:

```
// Provided by VK_NV_device_generated_commands
void vkCmdBindPipelineShaderGroupNV(
    VkCommandBuffer                             commandBuffer,
    VkPipelineBindPoint                         pipelineBindPoint,
    VkPipeline                                  pipeline,
    uint32_t                                    groupIndex);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a VkPipelineBindPoint value specifying the bind point to which the pipeline will be bound.
- `pipeline` is the pipeline to be bound.
- `groupIndex` is the shader group to be bound.

Valid Usage

- VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02893
  `groupIndex` **must** be `0` or less than the effective VkGraphicsPipelineShaderGroupsCreateInfoNV::`groupCount` including the referenced pipelines
- VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-02894
  The `pipelineBindPoint` **must** be VK_PIPELINE_BIND_POINT_GRAPHICS
- VUID-vkCmdBindPipelineShaderGroupNV-groupIndex-02895
  The same restrictions as vkCmdBindPipeline apply as if the bound pipeline was created only with the Shader Group from the `groupIndex` information
- VUID-vkCmdBindPipelineShaderGroupNV-deviceGeneratedCommands-02896
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBindPipelineShaderGroupNV-pipelineBindPoint-parameter
  `pipelineBindPoint` **must** be a valid VkPipelineBindPoint value
- VUID-vkCmdBindPipelineShaderGroupNV-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle
- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBindPipelineShaderGroupNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdBindPipelineShaderGroupNV-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindPipelineShaderGroupNV-commonparent
  Both of `commandBuffer`, and `pipeline` **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdBindPipelineShaderGroupNV is not affected by conditional rendering

10.12.1. Interaction With Shader Objects

If the `shaderObject` feature is enabled, applications **can** use both pipelines and shader objects at the same time. The interaction between pipelines and shader objects is described in Interaction with Pipelines.

10.13. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time.

Instead, dynamic state **can** be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command, or made invalid by binding a pipeline in which that state is statically specified.

If the `commandBufferInheritance` feature is enabled, all valid state from the previously executed command buffer in the queue is inherited into the next command buffer executed in the same queue. This inherited state does not need to be set again before draw or dispatch commands.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object. Before any draw or dispatch call with this pipeline there **must** not have been any calls to any of the corresponding dynamic state setting commands after this pipeline was bound.
- If the state is specified as dynamic in the new pipeline object, then that command buffer state is not disturbed. Before any draw or dispatch call with this pipeline there **must** have been at least one call to each of the corresponding dynamic state setting commands. The state-setting commands **must** be recorded after command buffer recording was begun, or after the last command binding a pipeline object with that state specified as static, whichever was the latter.

- If the state is not included (corresponding pointer in VkGraphicsPipelineCreateInfo was `NULL` or was ignored) in the new pipeline object, then that command buffer state is not disturbed. For example, mesh shading pipelines do not include vertex input state and therefore do not disturb any such command buffer state.

Dynamic state that does not affect the result of operations **can** be left undefined.

NOTE	For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.

NOTE	Applications running on Vulkan implementations advertising a VkPhysicalDeviceDriverProperties::`conformanceVersion` less than 1.3.8.0 should be aware that rebinding the bound pipeline object may not reapply static state.

The following lists all the dynamic state with their logical state name.

Some dynamic state is tied to a single shader stage and can be ignored if that stage is not being used.

Some dynamic state is tied to certain graphics pipeline state. The dynamic state in VkPipelineDynamicStateCreateInfo::`pDynamicStates` is ignored if the pipeline is being created without the corresponding pipeline state.

Some dynamic state is ignored if there is no rasterization stage. The `rasterizerDiscardEnable` state is used to control if the rasterization stage occurs.

Some dynamic state is ignored if other dynamic state is not enabled. Some conditions involve special conditions to be met.

Each dynamic state has at least one command that can be set while recording the command buffer. If using a pipeline, there is a VkDynamicState associated for each of these commands.

When using vkCreateShadersEXT to create a shader object, all dynamic state is dynamic, with no static equivalent.

Table 13. Dynamic State Table

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
`viewport`	Any	Pre-Rasterization	No	None
	• vkCmdSetViewport (VK_DYNAMIC_STATE_VIEWPORT) - pipelines only • vkCmdSetViewportWithCount (VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT)			

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
`scissor`	Any	Pre-Rasterization	No	None
	• vkCmdSetScissor (VK_DYNAMIC_STATE_SCISSOR) - pipelines only • vkCmdSetScissorWithCount (VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT)			
`rasterizerDiscardEnable`	Any	Pre-Rasterization	No	None
	• vkCmdSetRasterizerDiscardEnable (VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE)			
`vertexInput`	Vertex	Vertex Input	No	None
	• vkCmdSetVertexInputEXT (VK_DYNAMIC_STATE_VERTEX_INPUT_EXT) • vkCmdBindVertexBuffers2 (VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE) - pipelines only			
`primitiveTopology`	Vertex	Vertex Input	No	None
	• vkCmdSetPrimitiveTopology (VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY)			
`primitiveRestartEnable`	Vertex	Vertex Input	No	None
	• vkCmdSetPrimitiveRestartEnable (VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE)			
`provokingVertexMode`	Vertex	Pre-Rasterization	Yes	None
	• vkCmdSetProvokingVertexModeEXT (VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT) • Requires the `VK_EXT_provoking_vertex` extension			
`blendConstants`	Fragment	Fragment Output	Yes	colorBlendFactor
	• vkCmdSetBlendConstants (VK_DYNAMIC_STATE_BLEND_CONSTANTS)			
`logicOpEnable`	Fragment	Fragment Output	Yes	None
	• vkCmdSetLogicOpEnableEXT (VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT) • Requires the `logicOp` feature			
`logicOp`	Fragment	Fragment Output	Yes	`logicOpEnable`
	• vkCmdSetLogicOpEXT (VK_DYNAMIC_STATE_LOGIC_OP_EXT)			

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
colorWriteEnable	Fragment	Fragment Output	Yes	boundColorAttachment
	• vkCmdSetColorWriteEnableEXT (VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT) • Requires the colorWriteEnable feature			
colorBlendEnable	Fragment	Fragment Output	Yes	boundColorAttachment
	• vkCmdSetColorBlendEnableEXT (VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT)			
colorWriteMask	Fragment	Fragment Output	Yes	boundColorAttachment
	• vkCmdSetColorWriteMaskEXT (VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT)			
colorBlendEquation	Fragment	Fragment Output	Yes	colorBlendEnableIndex
	• vkCmdSetColorBlendEquationEXT (VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT)			
colorBlendAdvanced	Fragment	Fragment Output	Yes	colorBlendEnableIndex
	• vkCmdSetColorBlendAdvancedEXT (VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT)			
attachmentFeedbackLoopEnable	Fragment	Pre-Rasterization, Fragment Shader, Fragment Output	Yes	None
	• vkCmdSetAttachmentFeedbackLoopEnableEXT (VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT) • Requires the attachmentFeedbackLoopDynamicState feature			
depthBiasEnable	Any	Pre-Rasterization	Yes	None
	• vkCmdSetDepthBiasEnable (VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE)			

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
depthBias	Any	Pre-Rasterization	Yes	depthBiasEnable
	• vkCmdSetDepthBias (VK_DYNAMIC_STATE_DEPTH_BIAS) • vkCmdSetDepthBias2EXT (VK_DYNAMIC_STATE_DEPTH_BIAS)			
depthBoundsTestEnable	Any	Fragment Shader	Yes	None
	• vkCmdSetDepthBoundsTestEnable (VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE) • Requires the depthBounds feature			
depthBounds	Any	Fragment Shader	Yes	depthBoundsTestEnable
	• vkCmdSetDepthBounds (VK_DYNAMIC_STATE_DEPTH_BOUNDS)			
depthTestEnable	Any	Fragment Shader	Yes	None
	• vkCmdSetDepthTestEnable (VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE)			
depthWriteEnable	Any	Fragment Shader	Yes	depthTestEnable
	• vkCmdSetDepthWriteEnable (VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE)			
depthCompareOp	Any	Fragment Shader	Yes	depthTestEnable
	• vkCmdSetDepthCompareOp (VK_DYNAMIC_STATE_DEPTH_COMPARE_OP)			
depthClipEnable	Any	Pre-Rasterization	No	None
	• vkCmdSetDepthClipEnableEXT (VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT) • Requires the depthClipEnable feature			
depthClipNegativeOneToOne	Any	Pre-Rasterization	No	None
	• vkCmdSetDepthClipNegativeOneToOneEXT (VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT) • Requires the depthClipControl feature			

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
`depthClampEnable`	Any	Pre-Rasterization	Yes	None
	• vkCmdSetDepthClampEnableEXT (VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT) • Requires the `depthClamp` feature			
`depthClampRange`	Any	Pre-Rasterization	No	`depthClampEnable`
	• vkCmdSetDepthClampRangeEXT (VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT) • Requires the `depthClampControl` feature			
`stencilTestEnable`	Any	Fragment Shader	Yes	None
	• vkCmdSetStencilTestEnable (VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE)			
`stencilCompareMask`	Any	Fragment Shader	Yes	`stencilTestEnable`
	• vkCmdSetStencilCompareMask (VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK)			
`stencilWriteMask`	Any	Fragment Shader	Yes	`stencilTestEnable`
	• vkCmdSetStencilWriteMask (VK_DYNAMIC_STATE_STENCIL_WRITE_MASK)			
`stencilReference`	Any	Fragment Shader	Yes	`stencilTestEnable`
	• vkCmdSetStencilReference (VK_DYNAMIC_STATE_STENCIL_REFERENCE)			
`stencilOp`	Any	Fragment Shader	Yes	`stencilTestEnable`
	• vkCmdSetStencilOp (VK_DYNAMIC_STATE_STENCIL_OP)			
`cullMode`	Any	Pre-Rasterization	Yes	None
	• vkCmdSetCullMode (VK_DYNAMIC_STATE_CULL_MODE)			
`frontFace`	Any	Pre-Rasterization	Yes	None
	• vkCmdSetFrontFace (VK_DYNAMIC_STATE_FRONT_FACE)			

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
discardRectangleEnable	Any	Pre-Rasterization	Yes	None
	• vkCmdSetDiscardRectangleEnableEXT (VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT) • Requires the VK_EXT_discard_rectangles extension			
discardRectangle	Any	Pre-Rasterization	Yes	discardRectangleEnable
	• vkCmdSetDiscardRectangleEXT (VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT) • Requires the VK_EXT_discard_rectangles extension			
discardRectangleMode	Any	Pre-Rasterization	Yes	discardRectangleEnable
	• vkCmdSetDiscardRectangleModeEXT (VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT) • Requires the VK_EXT_discard_rectangles extension			
sampleLocationsEnable	Any	Fragment Shader, Fragment Output	Yes	None
	• vkCmdSetSampleLocationsEnableEXT (VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT) • Requires the VK_EXT_sample_locations extension			
sampleLocations	Any	Fragment Shader, Fragment Output	Yes	sampleLocationsEnable
	• vkCmdSetSampleLocationsEXT (VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT) • Requires the VK_EXT_sample_locations extension			
fragmentShadingRate	Any	Pre-Rasterization, Fragment Shader	Yes	None
	• vkCmdSetFragmentShadingRateKHR (VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR) • Requires the pipelineFragmentShadingRate feature			

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
lineWidth	Any	Pre-Rasterization	Yes	lineTopology
	• vkCmdSetLineWidth (VK_DYNAMIC_STATE_LINE_WIDTH)			
lineStippleEnable	Vertex	Pre-Rasterization	Yes	stippledLineTopology
	• vkCmdSetLineStippleEnableEXT (VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT) • Requires any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features			
lineStipple	Any	Pre-Rasterization	Yes	lineStippleEnable and stippledLineTopology
	• vkCmdSetLineStipple (VK_DYNAMIC_STATE_LINE_STIPPLE) • Requires any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features			
lineRasterizationMode	Vertex	Pre-Rasterization	Yes	stippledLineTopology
	• vkCmdSetLineRasterizationModeEXT (VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT) • Requires any of the stippledRectangularLines, stippledBresenhamLines or stippledSmoothLines features			
rasterizationStream	Geometry	Pre-Rasterization	No	None
	• vkCmdSetRasterizationStreamEXT (VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT) • Requires the geometryStreams feature			
patchControlPoints	Tessellation Control	Pre-Rasterization	No	patchListPrimitiveTopology
	• vkCmdSetPatchControlPointsEXT (VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT)			
tessellationDomainOrigin	Tessellation Evaluation	Pre-Rasterization	No	None
	• vkCmdSetTessellationDomainOriginEXT (VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT)			
polygonMode	Any	Pre-Rasterization	Yes	None
	• vkCmdSetPolygonModeEXT (VK_DYNAMIC_STATE_POLYGON_MODE_EXT)			

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
rasterizationSamples	Any	Fragment Shader, Fragment Output	Yes	None
	• vkCmdSetRasterizationSamplesEXT (VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT)			
sampleMask	Any	Fragment Shader, Fragment Output	Yes	None
	• vkCmdSetSampleMaskEXT (VK_DYNAMIC_STATE_SAMPLE_MASK_EXT)			
alphaToCoverageEnable	Any	Fragment Shader, Fragment Output	Yes	None
	• vkCmdSetAlphaToCoverageEnableEXT (VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT)			
alphaToOneEnable	Any	Fragment Shader, Fragment Output	Yes	None
	• vkCmdSetAlphaToOneEnableEXT (VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT) • Requires the alphaToOne feature			
conservativeRasterizationMode	Any	Pre-Rasterization	Yes	None
	• vkCmdSetConservativeRasterizationModeEXT (VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT) • Requires the VK_EXT_conservative_rasterization extension			
extraPrimitiveOverestimationSize	Any	Pre-Rasterization	Yes	conservativeRasterizationMode
	• vkCmdSetExtraPrimitiveOverestimationSizeEXT (VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT) • Requires the VK_EXT_conservative_rasterization extension			

Dynamic State	Shader Stage	Pipeline State	Requires Rasterization	Depends On
viewportWScalingEnable	Any	Pre-Rasterization	No	None
	• vkCmdSetViewportWScalingEnableNV (VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV) • Requires the VK_NV_clip_space_w_scaling extension			
viewportWScaling	Any	Pre-Rasterization	No	viewportWScalingEnable
	• vkCmdSetViewportWScalingNV (VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV) • Requires the VK_NV_clip_space_w_scaling extension			
shadingRateImageEnable	Any	Pre-Rasterization	Yes	None
	• vkCmdSetShadingRateImageEnableNV (VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV) • Requires the shadingRateImage feature			
viewportShadingRatePalette	Any	Pre-Rasterization	Yes	shadingRateImageEnable
	• vkCmdSetViewportShadingRatePaletteNV (VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV) • Requires the shadingRateImage feature			
coarseSampleOrder	Any	Pre-Rasterization	Yes	None
	• vkCmdSetCoarseSampleOrderNV (VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV) • Requires the shadingRateImage feature			
exclusiveScissorEnable	Any	Pre-Rasterization	No	None

	• vkCmdSetRayTracingPipelineStackSizeKHR (VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR) • Requires the VK_KHR_ray_tracing_pipeline extension			

10.14. Pipeline Properties and Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these pipeline executables, call:

```
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutablePropertiesKHR(
    VkDevice                                    device,
    const VkPipelineInfoKHR*                    pPipelineInfo,
    uint32_t*                                   pExecutableCount,
    VkPipelineExecutablePropertiesKHR*          pProperties);
```

- device is the device that created the pipeline.

- pPipelineInfo describes the pipeline being queried.
- pExecutableCount is a pointer to an integer related to the number of pipeline executables available or queried, as described below.
- pProperties is either NULL or a pointer to an array of VkPipelineExecutablePropertiesKHR structures.

If pProperties is NULL, then the number of pipeline executables associated with the pipeline is returned in pExecutableCount. Otherwise, pExecutableCount **must** point to a variable set by the application to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pExecutableCount is less than the number of pipeline executables associated with the pipeline, at most pExecutableCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

Valid Usage

- VUID-vkGetPipelineExecutablePropertiesKHR-pipelineExecutableInfo-03270
  The pipelineExecutableInfo feature **must** be enabled
- VUID-vkGetPipelineExecutablePropertiesKHR-pipeline-03271
  The pipeline member of pPipelineInfo **must** have been created with device

Valid Usage (Implicit)

- VUID-vkGetPipelineExecutablePropertiesKHR-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetPipelineExecutablePropertiesKHR-pPipelineInfo-parameter
  pPipelineInfo **must** be a valid pointer to a valid VkPipelineInfoKHR structure
- VUID-vkGetPipelineExecutablePropertiesKHR-pExecutableCount-parameter
  pExecutableCount **must** be a valid pointer to a uint32_t value
- VUID-vkGetPipelineExecutablePropertiesKHR-pProperties-parameter
  If the value referenced by pExecutableCount is not 0, and pProperties is not NULL, pProperties **must** be a valid pointer to an array of pExecutableCount VkPipelineExecutablePropertiesKHR structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkPipelineExecutablePropertiesKHR structure is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType       sType;
    void*                 pNext;
    VkShaderStageFlags    stages;
    char                  name[VK_MAX_DESCRIPTION_SIZE];
    char                  description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t              subgroupSize;
} VkPipelineExecutablePropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stages is a bitmask of zero or more VkShaderStageFlagBits indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.
- name is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a short human readable name for this pipeline executable.
- description is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description for this pipeline executable.
- subgroupSize is the subgroup size with which this pipeline executable is dispatched.

Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations **may** reduce a given shader stage to fixed function hardware programming such that no pipeline executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and stages **should** be considered a best effort hint. Because the application **cannot** rely on the stages field to provide an exact description, name and description provide a human readable name and description which more accurately describes the given pipeline executable.

Valid Usage (Implicit)

- VUID-VkPipelineExecutablePropertiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR
- VUID-VkPipelineExecutablePropertiesKHR-pNext-pNext
  pNext **must** be NULL

To query the pipeline properties call:

```
// Provided by VK_EXT_pipeline_properties
VkResult vkGetPipelinePropertiesEXT(
    VkDevice                                    device,
    const VkPipelineInfoKHR*                    pPipelineInfo,
    VkBaseOutStructure*                         pPipelineProperties);
```

- `device` is the logical device that created the pipeline.
- `pPipelineInfo` is a pointer to a VkPipelineInfoEXT structure which describes the pipeline being queried.
- `pPipelineProperties` is a pointer to a VkBaseOutStructure structure in which the pipeline properties will be written.

To query a pipeline's `pipelineIdentifier` pass a VkPipelinePropertiesIdentifierEXT structure in `pPipelineProperties`. Each pipeline is associated with a `pipelineIdentifier` and the identifier is implementation specific.

Valid Usage

- VUID-vkGetPipelinePropertiesEXT-pipeline-06738
  The `pipeline` member of `pPipelineInfo` **must** have been created with `device`
- VUID-vkGetPipelinePropertiesEXT-pPipelineProperties-06739
  `pPipelineProperties` **must** be a valid pointer to a VkPipelinePropertiesIdentifierEXT structure
- VUID-vkGetPipelinePropertiesEXT-None-06766
  The `pipelinePropertiesIdentifier` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetPipelinePropertiesEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetPipelinePropertiesEXT-pPipelineInfo-parameter
  `pPipelineInfo` **must** be a valid pointer to a valid VkPipelineInfoKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkPipelinePropertiesIdentifierEXT structure is defined as:

```
// Provided by VK_EXT_pipeline_properties
typedef struct VkPipelinePropertiesIdentifierEXT {
    VkStructureType    sType;
    void*              pNext;
    uint8_t            pipelineIdentifier[VK_UUID_SIZE];
} VkPipelinePropertiesIdentifierEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pipelineIdentifier is an array of VK_UUID_SIZE uint8_t values into which the pipeline identifier will be written.

Valid Usage (Implicit)

- VUID-VkPipelinePropertiesIdentifierEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_PROPERTIES_IDENTIFIER_EXT
- VUID-VkPipelinePropertiesIdentifierEXT-pNext-pNext
  pNext **must** be NULL

The VkPipelineInfoKHR structure is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkPipeline         pipeline;
} VkPipelineInfoKHR;
```

```
// Provided by VK_EXT_pipeline_properties
// Equivalent to VkPipelineInfoKHR
typedef VkPipelineInfoKHR VkPipelineInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pipeline is a VkPipeline handle.

Valid Usage (Implicit)

- VUID-VkPipelineInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR

- VUID-VkPipelineInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPipelineInfoKHR-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle

Each pipeline executable **may** have a set of statistics associated with it that are generated by the pipeline compilation process. These statistics **may** include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which **may** aid developers in evaluating the expected performance of a shader. To query the compile time statistics associated with a pipeline executable, call:

```
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableStatisticsKHR(
    VkDevice                                    device,
    const VkPipelineExecutableInfoKHR*          pExecutableInfo,
    uint32_t*                                   pStatisticCount,
    VkPipelineExecutableStatisticKHR*           pStatistics);
```

- `device` is the device that created the pipeline.
- `pExecutableInfo` describes the pipeline executable being queried.
- `pStatisticCount` is a pointer to an integer related to the number of statistics available or queried, as described below.
- `pStatistics` is either `NULL` or a pointer to an array of VkPipelineExecutableStatisticKHR structures.

If `pStatistics` is `NULL`, then the number of statistics associated with the pipeline executable is returned in `pStatisticCount`. Otherwise, `pStatisticCount` **must** point to a variable set by the application to the number of elements in the `pStatistics` array, and on return the variable is overwritten with the number of structures actually written to `pStatistics`. If `pStatisticCount` is less than the number of statistics associated with the pipeline executable, at most `pStatisticCount` structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available statistics were returned.

Valid Usage

- VUID-vkGetPipelineExecutableStatisticsKHR-pipelineExecutableInfo-03272
  The `pipelineExecutableInfo` feature **must** be enabled
- VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03273
  The `pipeline` member of `pExecutableInfo` **must** have been created with `device`
- VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03274
  The `pipeline` member of `pExecutableInfo` **must** have been created with VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetPipelineExecutableStatisticsKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetPipelineExecutableStatisticsKHR-pExecutableInfo-parameter
  `pExecutableInfo` **must** be a valid pointer to a valid VkPipelineExecutableInfoKHR structure
- VUID-vkGetPipelineExecutableStatisticsKHR-pStatisticCount-parameter
  `pStatisticCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPipelineExecutableStatisticsKHR-pStatistics-parameter
  If the value referenced by `pStatisticCount` is not `0`, and `pStatistics` is not `NULL`, `pStatistics` **must** be a valid pointer to an array of `pStatisticCount` VkPipelineExecutableStatisticKHR structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkPipelineExecutableInfoKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkPipeline         pipeline;
    uint32_t           executableIndex;
} VkPipelineExecutableInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipeline` is the pipeline to query.
- `executableIndex` is the index of the pipeline executable to query in the array of executable properties returned by vkGetPipelineExecutablePropertiesKHR.

Valid Usage

- VUID-VkPipelineExecutableInfoKHR-executableIndex-03275
  `executableIndex` **must** be less than the number of pipeline executables associated with `pipeline` as returned in the `pExecutableCount` parameter of `vkGetPipelineExecutablePropertiesKHR`

Valid Usage (Implicit)

- VUID-VkPipelineExecutableInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR
- VUID-VkPipelineExecutableInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkPipelineExecutableInfoKHR-pipeline-parameter
  `pipeline` **must** be a valid VkPipeline handle

The `VkPipelineExecutableStatisticKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableStatisticKHR {
    VkStructureType                           sType;
    void*                                     pNext;
    char                                      name[VK_MAX_DESCRIPTION_SIZE];
    char                                      description[VK_MAX_DESCRIPTION_SIZE];
    VkPipelineExecutableStatisticFormatKHR    format;
    VkPipelineExecutableStatisticValueKHR     value;
} VkPipelineExecutableStatisticKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `name` is an array of VK_MAX_DESCRIPTION_SIZE `char` containing a null-terminated UTF-8 string which is a short human readable name for this statistic.
- `description` is an array of VK_MAX_DESCRIPTION_SIZE `char` containing a null-terminated UTF-8 string which is a human readable description for this statistic.
- `format` is a VkPipelineExecutableStatisticFormatKHR value specifying the format of the data found in `value`.
- `value` is the value of this statistic.

Valid Usage (Implicit)

- VUID-VkPipelineExecutableStatisticKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR

- VUID-VkPipelineExecutableStatisticKHR-pNext-pNext
  `pNext` **must** be `NULL`

The VkPipelineExecutableStatisticFormatKHR enum is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef enum VkPipelineExecutableStatisticFormatKHR {
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR = 0,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR = 1,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR = 2,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR = 3,
} VkPipelineExecutableStatisticFormatKHR;
```

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR specifies that the statistic is returned as a 32-bit boolean value which **must** be either VK_TRUE or VK_FALSE and **should** be read from the `b32` field of `VkPipelineExecutableStatisticValueKHR`.
- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR specifies that the statistic is returned as a signed 64-bit integer and **should** be read from the `i64` field of `VkPipelineExecutableStatisticValueKHR`.
- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR specifies that the statistic is returned as an unsigned 64-bit integer and **should** be read from the `u64` field of `VkPipelineExecutableStatisticValueKHR`.
- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR specifies that the statistic is returned as a 64-bit floating-point value and **should** be read from the `f64` field of `VkPipelineExecutableStatisticValueKHR`.

The `VkPipelineExecutableStatisticValueKHR` union is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef union VkPipelineExecutableStatisticValueKHR {
    VkBool32    b32;
    int64_t     i64;
    uint64_t    u64;
    double      f64;
} VkPipelineExecutableStatisticValueKHR;
```

- `b32` is the 32-bit boolean value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR.
- `i64` is the signed 64-bit integer value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR.
- `u64` is the unsigned 64-bit integer value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR.
- `f64` is the 64-bit floating-point value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR.

Each pipeline executable **may** have one or more text or binary internal representations associated with it which are generated as part of the compile process. These **may** include the final shader assembly, a binary form of the compiled shader, or the shader compiler's internal representation at any number of intermediate compile steps. To query the internal representations associated with a pipeline executable, call:

```
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableInternalRepresentationsKHR(
    VkDevice                                    device,
    const VkPipelineExecutableInfoKHR*          pExecutableInfo,
    uint32_t*                                   pInternalRepresentationCount,
    VkPipelineExecutableInternalRepresentationKHR* pInternalRepresentations);
```

- `device` is the device that created the pipeline.
- `pExecutableInfo` describes the pipeline executable being queried.
- `pInternalRepresentationCount` is a pointer to an integer related to the number of internal representations available or queried, as described below.
- `pInternalRepresentations` is either `NULL` or a pointer to an array of VkPipelineExecutableInternalRepresentationKHR structures.

If `pInternalRepresentations` is `NULL`, then the number of internal representations associated with the pipeline executable is returned in `pInternalRepresentationCount`. Otherwise, `pInternalRepresentationCount` **must** point to a variable set by the application to the number of elements in the `pInternalRepresentations` array, and on return the variable is overwritten with the number of structures actually written to `pInternalRepresentations`. If `pInternalRepresentationCount` is less than the number of internal representations associated with the pipeline executable, at most `pInternalRepresentationCount` structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available representations were returned.

While the details of the internal representations remain implementation-dependent, the implementation **should** order the internal representations in the order in which they occur in the compiled pipeline with the final shader assembly (if any) last.

Valid Usage

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipelineExecutableInfo-03276
  The `pipelineExecutableInfo` feature **must** be enabled
- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03277
  The `pipeline` member of `pExecutableInfo` **must** have been created with `device`
- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03278
  The `pipeline` member of `pExecutableInfo` **must** have been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pExecutableInfo-parameter
  `pExecutableInfo` **must** be a valid pointer to a valid VkPipelineExecutableInfoKHR structure
- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentationCount-parameter
  `pInternalRepresentationCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentations-parameter
  If the value referenced by `pInternalRepresentationCount` is not `0`, and `pInternalRepresentations` is not `NULL`, `pInternalRepresentations` **must** be a valid pointer to an array of `pInternalRepresentationCount` VkPipelineExecutableInternalRepresentationKHR structures

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkPipelineExecutableInternalRepresentationKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInternalRepresentationKHR {
    VkStructureType    sType;
    void*              pNext;
    char               name[VK_MAX_DESCRIPTION_SIZE];
    char               description[VK_MAX_DESCRIPTION_SIZE];
    VkBool32           isText;
    size_t             dataSize;
    void*              pData;
} VkPipelineExecutableInternalRepresentationKHR;
```

- `sType` is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.
- name is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a short human readable name for this internal representation.
- description is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description for this internal representation.
- isText specifies whether the returned data is text or opaque data. If isText is VK_TRUE then the data returned in pData is text and is guaranteed to be a null-terminated UTF-8 string.
- dataSize is an integer related to the size, in bytes, of the internal representation's data, as described below.
- pData is either NULL or a pointer to a block of data into which the implementation will write the internal representation.

If pData is NULL, then the size, in bytes, of the internal representation data is returned in dataSize. Otherwise, dataSize **must** be the size of the buffer, in bytes, pointed to by pData and on return dataSize is overwritten with the number of bytes of data actually written to pData including any trailing null character. If dataSize is less than the size, in bytes, of the internal representation's data, at most dataSize bytes of data will be written to pData, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available representation was returned.

If isText is VK_TRUE and pData is not NULL and dataSize is not zero, the last byte written to pData will be a null character.

Valid Usage (Implicit)

- VUID-VkPipelineExecutableInternalRepresentationKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR
- VUID-VkPipelineExecutableInternalRepresentationKHR-pNext-pNext
  pNext **must** be NULL

Information about a particular shader that has been compiled as part of a pipeline object can be extracted by calling:

```
// Provided by VK_AMD_shader_info
VkResult vkGetShaderInfoAMD(
    VkDevice                                    device,
    VkPipeline                                  pipeline,
    VkShaderStageFlagBits                       shaderStage,
    VkShaderInfoTypeAMD                         infoType,
    size_t*                                     pInfoSize,
    void*                                       pInfo);
```

- device is the device that created pipeline.
- pipeline is the target of the query.

- `shaderStage` is a VkShaderStageFlagBits specifying the particular shader within the pipeline about which information is being queried.
- `infoType` describes what kind of information is being queried.
- `pInfoSize` is a pointer to a value related to the amount of data the query returns, as described below.
- `pInfo` is either `NULL` or a pointer to a buffer.

If `pInfo` is `NULL`, then the maximum size of the information that **can** be retrieved about the shader, in bytes, is returned in `pInfoSize`. Otherwise, `pInfoSize` **must** point to a variable set by the application to the size of the buffer, in bytes, pointed to by `pInfo`, and on return the variable is overwritten with the amount of data actually written to `pInfo`. If `pInfoSize` is less than the maximum size that **can** be retrieved by the pipeline cache, then at most `pInfoSize` bytes will be written to `pInfo`, and VK_INCOMPLETE will be returned, instead of VK_SUCCESS, to indicate that not all required of the pipeline cache was returned.

Not all information is available for every shader and implementations may not support all kinds of information for any shader. When a certain type of information is unavailable, the function returns VK_ERROR_FEATURE_NOT_PRESENT.

If information is successfully and fully queried, the function will return VK_SUCCESS.

For `infoType` VK_SHADER_INFO_TYPE_STATISTICS_AMD, a `VkShaderStatisticsInfoAMD` structure will be written to the buffer pointed to by `pInfo`. This structure will be populated with statistics regarding the physical device resources used by that shader along with other miscellaneous information and is described in further detail below.

For `infoType` VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD, `pInfo` is a pointer to a null-terminated UTF-8 string containing human-readable disassembly. The exact formatting and contents of the disassembly string are vendor-specific.

The formatting and contents of all other types of information, including `infoType` VK_SHADER_INFO_TYPE_BINARY_AMD, are left to the vendor and are not further specified by this extension.

NOTE

This query does not behave consistently with the behavior described in Opaque Binary Data Results, for historical reasons.

If the amount of data available is larger than the passed `pInfoSize`, the query returns up to the size of the passed buffer, and signals overflow with a VK_INCOMPLETE success status instead of returning a VK_ERROR_NOT_ENOUGH_SPACE_KHR error status.

Valid Usage (Implicit)

- VUID-vkGetShaderInfoAMD-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetShaderInfoAMD-pipeline-parameter

`pipeline` **must** be a valid VkPipeline handle

- VUID-vkGetShaderInfoAMD-shaderStage-parameter
  `shaderStage` **must** be a valid VkShaderStageFlagBits value
- VUID-vkGetShaderInfoAMD-infoType-parameter
  `infoType` **must** be a valid VkShaderInfoTypeAMD value
- VUID-vkGetShaderInfoAMD-pInfoSize-parameter
  `pInfoSize` **must** be a valid pointer to a `size_t` value
- VUID-vkGetShaderInfoAMD-pInfo-parameter
  If the value referenced by `pInfoSize` is not `0`, and `pInfo` is not `NULL`, `pInfo` **must** be a valid pointer to an array of `pInfoSize` bytes
- VUID-vkGetShaderInfoAMD-pipeline-parent
  `pipeline` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_INCOMPLETE
- VK_SUCCESS

Failure

- VK_ERROR_FEATURE_NOT_PRESENT
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Possible values of vkGetShaderInfoAMD::`infoType`, specifying the information being queried from a shader, are:

```
// Provided by VK_AMD_shader_info
typedef enum VkShaderInfoTypeAMD {
    VK_SHADER_INFO_TYPE_STATISTICS_AMD = 0,
    VK_SHADER_INFO_TYPE_BINARY_AMD = 1,
    VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD = 2,
} VkShaderInfoTypeAMD;
```

- VK_SHADER_INFO_TYPE_STATISTICS_AMD specifies that device resources used by a shader will be queried.
- VK_SHADER_INFO_TYPE_BINARY_AMD specifies that implementation-specific information will be queried.
- VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD specifies that human-readable disassembly of a shader will be queried.

The VkShaderStatisticsInfoAMD structure is defined as:

```
// Provided by VK_AMD_shader_info
typedef struct VkShaderStatisticsInfoAMD {
    VkShaderStageFlags          shaderStageMask;
    VkShaderResourceUsageAMD    resourceUsage;
    uint32_t                    numPhysicalVgprs;
    uint32_t                    numPhysicalSgprs;
    uint32_t                    numAvailableVgprs;
    uint32_t                    numAvailableSgprs;
    uint32_t                    computeWorkGroupSize[3];
} VkShaderStatisticsInfoAMD;
```

- shaderStageMask is the combination of logical shader stages contained within this shader.
- resourceUsage is a VkShaderResourceUsageAMD structure describing internal physical device resources used by this shader.
- numPhysicalVgprs is the maximum number of vector instruction general-purpose registers (VGPRs) available to the physical device.
- numPhysicalSgprs is the maximum number of scalar instruction general-purpose registers (SGPRs) available to the physical device.
- numAvailableVgprs is the maximum limit of VGPRs made available to the shader compiler.
- numAvailableSgprs is the maximum limit of SGPRs made available to the shader compiler.
- computeWorkGroupSize is the local workgroup size of this shader in { X, Y, Z } dimensions.

Some implementations may merge multiple logical shader stages together in a single shader. In such cases, shaderStageMask will contain a bitmask of all of the stages that are active within that shader. Consequently, if specifying those stages as input to vkGetShaderInfoAMD, the same output information **may** be returned for all such shader stage queries.

The number of available VGPRs and SGPRs (numAvailableVgprs and numAvailableSgprs respectively) are the shader-addressable subset of physical registers that is given as a limit to the compiler for register assignment. These values **may** further be limited by implementations due to performance optimizations where register pressure is a bottleneck.

The VkShaderResourceUsageAMD structure is defined as:

```
// Provided by VK_AMD_shader_info
typedef struct VkShaderResourceUsageAMD {
    uint32_t    numUsedVgprs;
    uint32_t    numUsedSgprs;
    uint32_t    ldsSizePerLocalWorkGroup;
    size_t      ldsUsageSizeInBytes;
    size_t      scratchMemUsageInBytes;
} VkShaderResourceUsageAMD;
```

- `numUsedVgprs` is the number of vector instruction general-purpose registers used by this shader.
- `numUsedSgprs` is the number of scalar instruction general-purpose registers used by this shader.
- `ldsSizePerLocalWorkGroup` is the maximum local data store size per work group in bytes.
- `ldsUsageSizeInBytes` is the LDS usage size in bytes per work group by this shader.
- `scratchMemUsageInBytes` is the scratch memory usage in bytes by this shader.

10.15. Pipeline Compiler Control

The compilation of a pipeline **can** be tuned by adding a `VkPipelineCompilerControlCreateInfoAMD` structure to the `pNext` chain of VkGraphicsPipelineCreateInfo or VkComputePipelineCreateInfo.

```
// Provided by VK_AMD_pipeline_compiler_control
typedef struct VkPipelineCompilerControlCreateInfoAMD {
    VkStructureType                      sType;
    const void*                          pNext;
    VkPipelineCompilerControlFlagsAMD    compilerControlFlags;
} VkPipelineCompilerControlCreateInfoAMD;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `compilerControlFlags` is a bitmask of VkPipelineCompilerControlFlagBitsAMD affecting how the pipeline will be compiled.

Valid Usage (Implicit)

- VUID-VkPipelineCompilerControlCreateInfoAMD-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PIPELINE_COMPILER_CONTROL_CREATE_INFO_AMD
- VUID-VkPipelineCompilerControlCreateInfoAMD-compilerControlFlags-zerobitmask
  `compilerControlFlags` **must** be `0`

Structure Chaining

Extends the structures

- VkComputePipelineCreateInfo
- VkExecutionGraphPipelineCreateInfoAMDX
- VkGraphicsPipelineCreateInfo

There are currently no available flags for this extension; flags will be added by future versions of this extension.

```
// Provided by VK_AMD_pipeline_compiler_control
typedef enum VkPipelineCompilerControlFlagBitsAMD {
} VkPipelineCompilerControlFlagBitsAMD;
```

```
// Provided by VK_AMD_pipeline_compiler_control
typedef VkFlags VkPipelineCompilerControlFlagsAMD;
```

VkPipelineCompilerControlFlagsAMD is a bitmask type for setting a mask of zero or more VkPipelineCompilerControlFlagBitsAMD.

10.16. Pipeline Creation Feedback

Feedback about the creation of a particular pipeline object **can** be obtained by adding a VkPipelineCreationFeedbackCreateInfo structure to the pNext chain of VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, VkDataGraphPipelineCreateInfoARM, or VkComputePipelineCreateInfo. The VkPipelineCreationFeedbackCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedbackCreateInfo {
    VkStructureType                 sType;
    const void*                     pNext;
    VkPipelineCreationFeedback*     pPipelineCreationFeedback;
    uint32_t                        pipelineStageCreationFeedbackCount;
    VkPipelineCreationFeedback*     pPipelineStageCreationFeedbacks;
} VkPipelineCreationFeedbackCreateInfo;
```

```
// Provided by VK_EXT_pipeline_creation_feedback
// Equivalent to VkPipelineCreationFeedbackCreateInfo
typedef VkPipelineCreationFeedbackCreateInfo VkPipelineCreationFeedbackCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pPipelineCreationFeedback is a pointer to a VkPipelineCreationFeedback structure.
- pipelineStageCreationFeedbackCount is the number of elements in pPipelineStageCreationFeedbacks.
- pPipelineStageCreationFeedbacks is a pointer to an array of pipelineStageCreationFeedbackCount VkPipelineCreationFeedback structures.

An implementation **should** write pipeline creation feedback to pPipelineCreationFeedback and **may** write pipeline stage creation feedback to pPipelineStageCreationFeedbacks. An implementation **must** set or clear the VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT in VkPipelineCreationFeedback::flags for pPipelineCreationFeedback and every element of

pPipelineStageCreationFeedbacks.

NOTE	One common scenario for an implementation to skip per-stage feedback is when VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT is set in pPipelineCreationFeedback.

When chained to VkRayTracingPipelineCreateInfoKHR, VkRayTracingPipelineCreateInfoNV, or VkGraphicsPipelineCreateInfo, the i element of pPipelineStageCreationFeedbacks corresponds to the i element of VkRayTracingPipelineCreateInfoKHR::pStages, VkRayTracingPipelineCreateInfoNV::pStages, or VkGraphicsPipelineCreateInfo::pStages. When chained to VkComputePipelineCreateInfo, the first element of pPipelineStageCreationFeedbacks corresponds to VkComputePipelineCreateInfo::stage.

Valid Usage (Implicit)

- VUID-VkPipelineCreationFeedbackCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_CREATION_FEEDBACK_CREATE_INFO
- VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineCreationFeedback-parameter
  pPipelineCreationFeedback **must** be a valid pointer to a VkPipelineCreationFeedback structure
- VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineStageCreationFeedbacks-parameter
  If pipelineStageCreationFeedbackCount is not 0, pPipelineStageCreationFeedbacks **must** be a valid pointer to an array of pipelineStageCreationFeedbackCount VkPipelineCreationFeedback structures

Structure Chaining

Extends the structures

- VkComputePipelineCreateInfo
- VkDataGraphPipelineCreateInfoARM
- VkExecutionGraphPipelineCreateInfoAMDX
- VkGraphicsPipelineCreateInfo
- VkRayTracingPipelineCreateInfoKHR
- VkRayTracingPipelineCreateInfoNV

The VkPipelineCreationFeedback structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedback {
    VkPipelineCreationFeedbackFlags    flags;
    uint64_t                           duration;
} VkPipelineCreationFeedback;
```

```
// Provided by VK_EXT_pipeline_creation_feedback
// Equivalent to VkPipelineCreationFeedback
typedef VkPipelineCreationFeedback VkPipelineCreationFeedbackEXT;
```

- `flags` is a bitmask of VkPipelineCreationFeedbackFlagBits providing feedback about the creation of a pipeline or of a pipeline stage.
- `duration` is the duration spent creating a pipeline or pipeline stage in nanoseconds.

If the VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT is not set in `flags`, an implementation **must** not set any other bits in `flags`, and the values of all other `VkPipelineCreationFeedback` data members are undefined.

Possible values of the `flags` member of VkPipelineCreationFeedback are:

```
// Provided by VK_VERSION_1_3
typedef enum VkPipelineCreationFeedbackFlagBits {
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT = 0x00000001,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT = 0x00000002,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT = 0x00000004,
  // Provided by VK_EXT_pipeline_creation_feedback
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT =
VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT,
  // Provided by VK_EXT_pipeline_creation_feedback
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT =
VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT,
  // Provided by VK_EXT_pipeline_creation_feedback
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT =
VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT,
} VkPipelineCreationFeedbackFlagBits;
```

```
// Provided by VK_EXT_pipeline_creation_feedback
// Equivalent to VkPipelineCreationFeedbackFlagBits
typedef VkPipelineCreationFeedbackFlagBits VkPipelineCreationFeedbackFlagBitsEXT;
```

- VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT specifies that the feedback information is valid.
- VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT specifies that a readily usable pipeline or pipeline stage was found in the `pipelineCache` specified by the application in the pipeline creation command.

An implementation **should** set the VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT bit if it was able to avoid the large majority of pipeline or pipeline stage creation work by using the `pipelineCache` parameter of vkCreateGraphicsPipelines, vkCreateRayTracingPipelinesKHR, vkCreateRayTracingPipelinesNV, vkCreateDataGraphPipelinesARM, or vkCreateComputePipelines. When an implementation sets this bit for the entire pipeline, it **may** leave it unset for any stage.

> **NOTE** Implementations are encouraged to provide a meaningful signal to applications using this bit. The intention is to communicate to the application that the pipeline or pipeline stage was created "as fast as it gets" using the pipeline cache provided by the application. If an implementation uses an internal cache, it is discouraged from setting this bit as the feedback would be unactionable.

- VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT specifies that the base pipeline specified by the `basePipelineHandle` or `basePipelineIndex` member of the `Vk*PipelineCreateInfo` structure was used to accelerate the creation of the pipeline.

  An implementation **should** set the VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT bit if it was able to avoid a significant amount of work by using the base pipeline.

  > **NOTE** While "significant amount of work" is subjective, implementations are encouraged to provide a meaningful signal to applications using this bit. For example, a 1% reduction in duration may not warrant setting this bit, while a 50% reduction would.

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkPipelineCreationFeedbackFlags;
```

```
// Provided by VK_EXT_pipeline_creation_feedback
// Equivalent to VkPipelineCreationFeedbackFlags
typedef VkPipelineCreationFeedbackFlags VkPipelineCreationFeedbackFlagsEXT;
```

`VkPipelineCreationFeedbackFlags` is a bitmask type for providing zero or more VkPipelineCreationFeedbackFlagBits.

Chapter 11. Memory Allocation

Vulkan memory is broken up into two categories, *host memory* and *device memory*.

11.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

> **NOTE** This memory **may** be used to store the implementation's representation and state of Vulkan objects.

Vulkan provides applications the opportunity to perform host memory allocations on behalf of the Vulkan implementation. If this feature is not used, the implementation will perform its own memory allocations. Since most memory allocations are off the critical path, this is not meant as a performance feature. Rather, this **can** be useful for certain embedded systems, for debugging purposes (e.g. putting a guard page after all host allocations), or for memory allocation logging.

Allocators are provided by the application as a pointer to a `VkAllocationCallbacks` structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkAllocationCallbacks {
    void*                                   pUserData;
    PFN_vkAllocationFunction                pfnAllocation;
    PFN_vkReallocationFunction              pfnReallocation;
    PFN_vkFreeFunction                      pfnFree;
    PFN_vkInternalAllocationNotification    pfnInternalAllocation;
    PFN_vkInternalFreeNotification          pfnInternalFree;
} VkAllocationCallbacks;
```

- `pUserData` is `NULL` or an application-defined user data pointer to be interpreted by the implementation of the callbacks. When any of the callbacks in `VkAllocationCallbacks` are called, the Vulkan implementation will pass this value as the first parameter to the callback. This value **can** vary each time an allocator is passed into a command, even when the same object takes an allocator in multiple commands.
- `pfnAllocation` is a PFN_vkAllocationFunction pointer to an application-defined memory allocation function.
- `pfnReallocation` is a PFN_vkReallocationFunction pointer to an application-defined memory reallocation function.
- `pfnFree` is a PFN_vkFreeFunction pointer to an application-defined memory free function.
- `pfnInternalAllocation` is a PFN_vkInternalAllocationNotification pointer to an application-defined function that is called by the implementation when the implementation makes internal allocations.
- `pfnInternalFree` is a PFN_vkInternalFreeNotification pointer to an application-defined function that is called by the implementation when the implementation frees internal allocations.

Valid Usage

- VUID-VkAllocationCallbacks-pfnAllocation-00632
  `pfnAllocation` **must** be a valid pointer to a valid application-defined PFN_vkAllocationFunction
- VUID-VkAllocationCallbacks-pfnReallocation-00633
  `pfnReallocation` **must** be a valid pointer to a valid application-defined PFN_vkReallocationFunction
- VUID-VkAllocationCallbacks-pfnFree-00634
  `pfnFree` **must** be a valid pointer to a valid application-defined PFN_vkFreeFunction
- VUID-VkAllocationCallbacks-pfnInternalAllocation-00635
  If either of `pfnInternalAllocation` or `pfnInternalFree` is not `NULL`, both **must** be valid callbacks

The type of `pfnAllocation` is:

```
// Provided by VK_VERSION_1_0
typedef void* (*PFN_vkAllocationFunction)(
    void*                                       pUserData,
    size_t                                      size,
    size_t                                      alignment,
    VkSystemAllocationScope                     allocationScope);
```

- `pUserData` is the value specified for VkAllocationCallbacks::`pUserData` in the allocator specified by the application.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and **must** be a power of two.
- `allocationScope` is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

If `pfnAllocation` is unable to allocate the requested memory, it **must** return `NULL`. If the allocation was successful, it **must** return a valid pointer to memory allocation containing at least `size` bytes, and with the pointer value being a multiple of `alignment`.

NOTE

Correct Vulkan operation **cannot** be assumed if the application does not follow these rules.

For example, `pfnAllocation` (or `pfnReallocation`) could cause termination of running Vulkan instance(s) on a failed allocation for debugging purposes, either directly or indirectly. In these circumstances, it **cannot** be assumed that any part of any affected VkInstance objects are going to operate correctly (even vkDestroyInstance), and the application **must** ensure it cleans up properly via other means (e.g. process termination).

If pfnAllocation returns NULL, and if the implementation is unable to continue correct processing of the current command without the requested allocation, it **must** treat this as a runtime error, and generate VK_ERROR_OUT_OF_HOST_MEMORY at the appropriate time for the command in which the condition was detected, as described in Return Codes.

If the implementation is able to continue correct processing of the current command without the requested allocation, then it **may** do so, and **must** not generate VK_ERROR_OUT_OF_HOST_MEMORY as a result of this failed allocation.

The type of pfnReallocation is:

```
// Provided by VK_VERSION_1_0
typedef void* (*PFN_vkReallocationFunction)(
    void*                                       pUserData,
    void*                                       pOriginal,
    size_t                                      size,
    size_t                                      alignment,
    VkSystemAllocationScope                     allocationScope);
```

- pUserData is the value specified for VkAllocationCallbacks::pUserData in the allocator specified by the application.
- pOriginal **must** be either NULL or a pointer previously returned by pfnReallocation or pfnAllocation of a compatible allocator.
- size is the size in bytes of the requested allocation.
- alignment is the requested alignment of the allocation in bytes and **must** be a power of two.
- allocationScope is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

If the reallocation was successful, pfnReallocation **must** return an allocation with enough space for size bytes, and the contents of the original allocation from bytes zero to min(original size, new size) - 1 **must** be preserved in the returned allocation. If size is larger than the old size, the contents of the additional space are undefined. If satisfying these requirements involves creating a new allocation, then the old allocation **should** be freed.

If pOriginal is NULL, then pfnReallocation **must** behave equivalently to a call to PFN_vkAllocationFunction with the same parameter values (without pOriginal).

If size is zero, then pfnReallocation **must** behave equivalently to a call to PFN_vkFreeFunction with the same pUserData parameter value, and pMemory equal to pOriginal.

If pOriginal is non-NULL, the implementation **must** ensure that alignment is equal to the alignment used to originally allocate pOriginal.

If this function fails and pOriginal is non-NULL the application **must** not free the old allocation.

pfnReallocation **must** follow the same rules for return values as PFN_vkAllocationFunction.

The type of pfnFree is:

```
// Provided by VK_VERSION_1_0
typedef void (*PFN_vkFreeFunction)(
    void*                                       pUserData,
    void*                                       pMemory);
```

- `pUserData` is the value specified for VkAllocationCallbacks::`pUserData` in the allocator specified by the application.
- `pMemory` is the allocation to be freed.

`pMemory` **may** be `NULL`, which the callback **must** handle safely. If `pMemory` is non-`NULL`, it **must** be a pointer previously allocated by `pfnAllocation` or `pfnReallocation`. The application **should** free this memory.

The type of `pfnInternalAllocation` is:

```
// Provided by VK_VERSION_1_0
typedef void (*PFN_vkInternalAllocationNotification)(
    void*                                       pUserData,
    size_t                                      size,
    VkInternalAllocationType                    allocationType,
    VkSystemAllocationScope                     allocationScope);
```

- `pUserData` is the value specified for VkAllocationCallbacks::`pUserData` in the allocator specified by the application.
- `size` is the requested size of an allocation.
- `allocationType` is a VkInternalAllocationType value specifying the requested type of an allocation.
- `allocationScope` is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

This is a purely informational callback.

The type of `pfnInternalFree` is:

```
// Provided by VK_VERSION_1_0
typedef void (*PFN_vkInternalFreeNotification)(
    void*                                       pUserData,
    size_t                                      size,
    VkInternalAllocationType                    allocationType,
    VkSystemAllocationScope                     allocationScope);
```

- `pUserData` is the value specified for VkAllocationCallbacks::`pUserData` in the allocator specified by the application.
- `size` is the requested size of an allocation.

- `allocationType` is a VkInternalAllocationType value specifying the requested type of an allocation.
- `allocationScope` is a VkSystemAllocationScope value specifying the allocation scope of the lifetime of the allocation, as described here.

Each allocation has an *allocation scope* defining its lifetime and which object it is associated with. Possible values passed to the `allocationScope` parameter of the callback functions specified by VkAllocationCallbacks, indicating the allocation scope, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSystemAllocationScope {
    VK_SYSTEM_ALLOCATION_SCOPE_COMMAND = 0,
    VK_SYSTEM_ALLOCATION_SCOPE_OBJECT = 1,
    VK_SYSTEM_ALLOCATION_SCOPE_CACHE = 2,
    VK_SYSTEM_ALLOCATION_SCOPE_DEVICE = 3,
    VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE = 4,
} VkSystemAllocationScope;
```

- VK_SYSTEM_ALLOCATION_SCOPE_COMMAND specifies that the allocation is scoped to the duration of the Vulkan command.
- VK_SYSTEM_ALLOCATION_SCOPE_OBJECT specifies that the allocation is scoped to the lifetime of the Vulkan object that is being created or used.
- VK_SYSTEM_ALLOCATION_SCOPE_CACHE specifies that the allocation is scoped to the lifetime of a `VkPipelineCache` or `VkValidationCacheEXT` object.
- VK_SYSTEM_ALLOCATION_SCOPE_DEVICE specifies that the allocation is scoped to the lifetime of the Vulkan device.
- VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE specifies that the allocation is scoped to the lifetime of the Vulkan instance.

Most Vulkan commands operate on a single object, or there is a sole object that is being created or manipulated. When an allocation uses an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT or VK_SYSTEM_ALLOCATION_SCOPE_CACHE, the allocation is scoped to the object being created or manipulated.

When an implementation requires host memory, it will make callbacks to the application using the most specific allocator and allocation scope available:

- If an allocation is scoped to the duration of a command, the allocator will use the VK_SYSTEM_ALLOCATION_SCOPE_COMMAND allocation scope. The most specific allocator available is used: if the object being created or manipulated has an allocator, that object's allocator will be used, else if the parent `VkDevice` has an allocator it will be used, else if the parent `VkInstance` has an allocator it will be used. Else,
- If an allocation is associated with a `VkValidationCacheEXT` or `VkPipelineCache` object, the allocator will use the VK_SYSTEM_ALLOCATION_SCOPE_CACHE allocation scope. The most specific allocator available is used (cache, else device, else instance). Else,

- If an allocation is scoped to the lifetime of an object, that object is being created or manipulated by the command, and that object's type is not `VkDevice` or `VkInstance`, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT. The most specific allocator available is used (object, else device, else instance). Else,
- If an allocation is scoped to the lifetime of a device, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_DEVICE. The most specific allocator available is used (device, else instance). Else,
- If the allocation is scoped to the lifetime of an instance and the instance has an allocator, its allocator will be used with an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE.
- Otherwise an implementation will allocate memory through an alternative mechanism that is unspecified.

Objects that are allocated from pools do not specify their own allocator. When an implementation requires host memory for such an object, that memory is sourced from the object's parent pool's allocator.

The application is not expected to handle allocating memory that is intended for execution by the host due to the complexities of differing security implementations across multiple platforms. The implementation will allocate such memory internally and invoke an application provided informational callback when these *internal allocations* are allocated and freed. Upon allocation of executable memory, `pfnInternalAllocation` will be called. Upon freeing executable memory, `pfnInternalFree` will be called. An implementation will only call an informational callback for executable memory allocations and frees.

The `allocationType` parameter to the `pfnInternalAllocation` and `pfnInternalFree` functions **may** be one of the following values:

```
// Provided by VK_VERSION_1_0
typedef enum VkInternalAllocationType {
    VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE = 0,
} VkInternalAllocationType;
```

- VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE specifies that the allocation is intended for execution by the host.

An implementation **must** only make calls into an application-provided allocator during the execution of an API command. An implementation **must** only make calls into an application-provided allocator from the same thread that called the provoking API command. The implementation **should** not synchronize calls to any of the callbacks. If synchronization is needed, the callbacks **must** provide it themselves. The informational callbacks are subject to the same restrictions as the allocation callbacks.

If an implementation intends to make calls through a `VkAllocationCallbacks` structure between the time a `vkCreate*` command returns and the time a corresponding `vkDestroy*` command begins, that implementation **must** save a copy of the allocator before the `vkCreate*` command returns. The callback functions and any data structures they rely upon **must** remain valid for the lifetime of the object they are associated with.

If an allocator is provided to a vkCreate* command, a *compatible* allocator **must** be provided to the corresponding vkDestroy* command. Two VkAllocationCallbacks structures are compatible if memory allocated with pfnAllocation or pfnReallocation in each **can** be freed with pfnReallocation or pfnFree in the other. An allocator **must** not be provided to a vkDestroy* command if an allocator was not provided to the corresponding vkCreate* command.

If a non-NULL allocator is used, the pfnAllocation, pfnReallocation and pfnFree members **must** be non-NULL and point to valid implementations of the callbacks. An application **can** choose to not provide informational callbacks by setting both pfnInternalAllocation and pfnInternalFree to NULL. pfnInternalAllocation and pfnInternalFree **must** either both be NULL or both be non-NULL.

If pfnAllocation or pfnReallocation fail, the implementation **may** fail object creation and/or generate a VK_ERROR_OUT_OF_HOST_MEMORY error, as appropriate.

Allocation callbacks **must** not call any Vulkan commands.

The following sets of rules define when an implementation is permitted to call the allocator callbacks.

pfnAllocation or pfnReallocation **may** be called in the following situations:

- Allocations scoped to a VkDevice or VkInstance **may** be allocated from any API command.
- Allocations scoped to a command **may** be allocated from any API command.
- Allocations scoped to a VkPipelineCache **may** only be allocated from:
  - vkCreatePipelineCache
  - vkMergePipelineCaches for dstCache
  - vkCreateGraphicsPipelines for pipelineCache
  - vkCreateComputePipelines for pipelineCache
- Allocations scoped to a VkValidationCacheEXT **may** only be allocated from:
  - vkCreateValidationCacheEXT
  - vkMergeValidationCachesEXT for dstCache
  - vkCreateShaderModule for validationCache in VkShaderModuleValidationCacheCreateInfoEXT
- Allocations scoped to a VkDescriptorPool **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - vkAllocateDescriptorSets for the descriptorPool member of its pAllocateInfo parameter
  - vkCreateDescriptorPool
- Allocations scoped to a VkCommandPool **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - vkCreateCommandPool
  - vkAllocateCommandBuffers for the commandPool member of its pAllocateInfo parameter
  - any vkCmd* command whose commandBuffer was allocated from that VkCommandPool

- Allocations scoped to any other object **may** only be allocated in that object's `vkCreate*` command.

`pfnFree`, or `pfnReallocation` with zero `size`, **may** be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` **may** be freed from any API command.
- Allocations scoped to a command **must** be freed by any API command which allocates such memory.
- Allocations scoped to a `VkPipelineCache` **may** be freed from `vkDestroyPipelineCache`.
- Allocations scoped to a `VkValidationCacheEXT` **may** be freed from `vkDestroyValidationCacheEXT`.
- Allocations scoped to a `VkDescriptorPool` **may** be freed from:
  - any command that takes the pool as a direct argument
- Allocations scoped to a `VkCommandPool` **may** be freed from:
  - any command that takes the pool as a direct argument
  - `vkResetCommandBuffer` whose `commandBuffer` was allocated from that `VkCommandPool`
- Allocations scoped to any other object **may** be freed in that object's `vkDestroy*` command.
- Any command that allocates host memory **may** also free host memory of the same scope.

11.2. Device Memory

Device memory is memory that is visible to the device — for example the contents of the image or buffer objects, which **can** be natively used by the device.

11.2.1. Device Memory Properties

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

WARNING	This functionality is superseded by vkGetPhysicalDeviceMemoryProperties2. See Legacy Functionality for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceMemoryProperties(
    VkPhysicalDevice                            physicalDevice,
    VkPhysicalDeviceMemoryProperties*           pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a VkPhysicalDeviceMemoryProperties structure in which the properties are returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMemoryProperties-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceMemoryProperties-pMemoryProperties-parameter
  `pMemoryProperties` **must** be a valid pointer to a VkPhysicalDeviceMemoryProperties structure

The `VkPhysicalDeviceMemoryProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t        memoryTypeCount;
    VkMemoryType    memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t        memoryHeapCount;
    VkMemoryHeap    memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;
```

- `memoryTypeCount` is the number of valid elements in the `memoryTypes` array.
- `memoryTypes` is an array of VK_MAX_MEMORY_TYPES VkMemoryType structures describing the *memory types* that **can** be used to access memory allocated from the heaps specified by `memoryHeaps`.
- `memoryHeapCount` is the number of valid elements in the `memoryHeaps` array.
- `memoryHeaps` is an array of VK_MAX_MEMORY_HEAPS VkMemoryHeap structures describing the *memory heaps* from which memory **can** be allocated.

The `VkPhysicalDeviceMemoryProperties` structure describes a number of *memory heaps* as well as a number of *memory types* that **can** be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs. uncached) that **can** be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type's heap index. More than one memory type **may** share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by `memoryHeapCount` and is less than or equal to VK_MAX_MEMORY_HEAPS. Each heap is described by an element of the `memoryHeaps` array as a VkMemoryHeap structure. The number of memory types available across all memory heaps is given by `memoryTypeCount` and is less than or equal to VK_MAX_MEMORY_TYPES. Each memory type is described by an element of the `memoryTypes` array as a VkMemoryType structure.

At least one heap **must** include VK_MEMORY_HEAP_DEVICE_LOCAL_BIT in VkMemoryHeap::`flags`. If there are multiple heaps that all have similar performance characteristics, they **may** all include VK_MEMORY_HEAP_DEVICE_LOCAL_BIT. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally "local" to the host and to the

device, and such an implementation **must** advertise the heap as device-local.

Memory contents within a tile memory heap, denoted by VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM, are only visible across the command buffers executed in a single command buffer submission batch within a vkQueueSubmit or vkQueueSubmit2 call. If the VkPhysicalDeviceTileMemoryHeapPropertiesQCOM ::`queueSubmitBoundary` property is set, the visibility is extended across all batches in the submit call. Memory contents are discarded and made undefined after the respective submission batch or submit call. Tile memory **may** have different performance characteristics than non tile memory. Tile memory **can** be used simultaneously by command buffers in other queues without invalidating each other's contents. Collectively, these rules define the *tile memory scope*.

NOTE

Tile memory heaps work differently than most heaps as it is allowing addressing on device cache memory. Therefore, the heap's address space is aliased across the different queues, with each queue retaining its individual copy of the heap. The implementation takes care of any required saving and restoring of the tile memory contents.

Effectively, this means that the same address in the heap in different queues has simultaneously different defined contents and the contents have a lifespan scoped to the submit or batch for that specific queue.

Each memory type returned by vkGetPhysicalDeviceMemoryProperties **must** have its `propertyFlags` set to one of the following values:

- 0
- VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
- VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT
- VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT |

VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT

- VK_MEMORY_PROPERTY_PROTECTED_BIT
- VK_MEMORY_PROPERTY_PROTECTED_BIT | VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT
- VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD
- VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD
- VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD
- VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD | VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD
- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT | VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD |

VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD

- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV

There **must** be at least one memory type with both the VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT and VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bits set in its `propertyFlags`. There **must** be at least one memory type with the VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit set in its `propertyFlags`. If the `deviceCoherentMemory` feature is enabled, there **must** be at least one memory type with the VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD bit set in its `propertyFlags`.

For each pair of elements **X** and **Y** returned in `memoryTypes`, **X must** be placed at a lower index position than **Y** if:

- the set of bit flags returned in the `propertyFlags` member of **X** is a strict subset of the set of bit flags returned in the `propertyFlags` member of **Y**; or
- the `propertyFlags` members of **X** and **Y** are equal, and **X** belongs to a memory heap with greater performance (as determined in an implementation-specific manner) ; or
- the `propertyFlags` member of **Y** includes VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD or VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD and **X** does not

NOTE

There is no ordering requirement between **X** and **Y** elements for the case their `propertyFlags` members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the list of all allowed memory property flag combinations is written in a valid order. But if instead VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT was before VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT, the list would still be in a valid order.

There may be a performance penalty for using device coherent or uncached device memory types, and using these accidentally is undesirable. In order to avoid this, memory types with these properties always appear at the end of the list; but are subject to the same rules otherwise.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```
// Find a memory in `memoryTypeBitsRequirement` that includes all of
`requiredProperties`
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                       uint32_t memoryTypeBitsRequirement,
                       VkMemoryPropertyFlags requiredProperties) {
    const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
    for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
        const uint32_t memoryTypeBits = (1 << memoryIndex);
        const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;
```

```
        const VkMemoryPropertyFlags properties =
            pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
        const bool hasRequiredProperties =
            (properties & requiredProperties) == requiredProperties;

        if (isRequiredMemoryType && hasRequiredProperties)
            return static_cast<int32_t>(memoryIndex);
    }

    // failed to find memory type
    return -1;
}

// Try to find an optimal memory type, or if it does not exist try fallback memory
type
// `device` is the VkDevice
// `image` is the VkImage that requires memory to be bound
// `memoryProperties` properties as returned by vkGetPhysicalDeviceMemoryProperties
// `requiredProperties` are the property flags that must be present
// `optimalProperties` are the property flags that are preferred by the application
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType =
    findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
optimalProperties);
if (memoryType == -1) // not found; try fallback properties
    memoryType =
        findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
requiredProperties);
```

VK_MAX_MEMORY_TYPES is the length of an array of VkMemoryType structures describing memory types, as returned in VkPhysicalDeviceMemoryProperties::memoryTypes.

```
#define VK_MAX_MEMORY_TYPES             32U
```

VK_MAX_MEMORY_HEAPS is the length of an array of VkMemoryHeap structures describing memory heaps, as returned in VkPhysicalDeviceMemoryProperties::memoryHeaps.

```
#define VK_MAX_MEMORY_HEAPS             16U
```

To query memory properties, call:

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceMemoryProperties2(
    VkPhysicalDevice                            physicalDevice,
    VkPhysicalDeviceMemoryProperties2*          pMemoryProperties);
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to vkGetPhysicalDeviceMemoryProperties2
void vkGetPhysicalDeviceMemoryProperties2KHR(
    VkPhysicalDevice                            physicalDevice,
    VkPhysicalDeviceMemoryProperties2*          pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a VkPhysicalDeviceMemoryProperties2 structure in which the properties are returned.

`vkGetPhysicalDeviceMemoryProperties2` behaves similarly to vkGetPhysicalDeviceMemoryProperties, with the ability to return extended information in a `pNext` chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter
  `pMemoryProperties` **must** be a valid pointer to a VkPhysicalDeviceMemoryProperties2 structure

The `VkPhysicalDeviceMemoryProperties2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMemoryProperties2 {
    VkStructureType                     sType;
    void*                               pNext;
    VkPhysicalDeviceMemoryProperties    memoryProperties;
} VkPhysicalDeviceMemoryProperties2;
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to VkPhysicalDeviceMemoryProperties2
typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryProperties` is a VkPhysicalDeviceMemoryProperties structure which is populated with the

same values as in vkGetPhysicalDeviceMemoryProperties.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryProperties2-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2
- VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkPhysicalDeviceMemoryBudgetPropertiesEXT
- VUID-VkPhysicalDeviceMemoryProperties2-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique

The `VkMemoryHeap` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryHeap {
    VkDeviceSize         size;
    VkMemoryHeapFlags    flags;
} VkMemoryHeap;
```

- `size` is the total memory size in bytes in the heap.
- `flags` is a bitmask of VkMemoryHeapFlagBits specifying attribute flags for the heap.

Bits which **may** be set in VkMemoryHeap::`flags`, indicating attribute flags for the heap, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
  // Provided by VK_VERSION_1_1
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT = 0x00000002,
  // Provided by VK_QCOM_tile_memory_heap
    VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM = 0x00000008,
  // Provided by VK_KHR_device_group_creation
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT_KHR = VK_MEMORY_HEAP_MULTI_INSTANCE_BIT,
} VkMemoryHeapFlagBits;
```

- VK_MEMORY_HEAP_DEVICE_LOCAL_BIT specifies that the heap corresponds to device-local memory. Device-local memory **may** have different performance characteristics than host-local memory, and **may** support different memory property flags.
- VK_MEMORY_HEAP_MULTI_INSTANCE_BIT specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.
- VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM bit specifies that the heap corresponds to tile memory.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryHeapFlags;
```

VkMemoryHeapFlags is a bitmask type for setting a mask of zero or more VkMemoryHeapFlagBits.

The VkMemoryType structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags    propertyFlags;
    uint32_t                 heapIndex;
} VkMemoryType;
```

- heapIndex describes which memory heap this memory type corresponds to, and **must** be less than memoryHeapCount from the VkPhysicalDeviceMemoryProperties structure.
- propertyFlags is a bitmask of VkMemoryPropertyFlagBits of properties for this memory type.

Bits which **may** be set in VkMemoryType::propertyFlags, indicating properties of a memory type, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
  // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
  // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD = 0x00000040,
  // Provided by VK_AMD_device_coherent_memory
    VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD = 0x00000080,
  // Provided by VK_NV_external_memory_rdma
    VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV = 0x00000100,
} VkMemoryPropertyFlagBits;
```

- VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the VK_MEMORY_HEAP_DEVICE_LOCAL_BIT set.
- VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT bit specifies that memory allocated with this type **can** be mapped for host access using vkMapMemory.
- VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bit specifies that the host cache management commands vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges are not needed to manage availability and visibility on the host.

- VK_MEMORY_PROPERTY_HOST_CACHED_BIT bit specifies that memory allocated with this type is cached on the host. Host memory read accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.
- VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit specifies that the memory type only allows device access to the memory. Memory types **must** not have both VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT and VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT set. Additionally, the object's backing memory **may** be provided by the implementation lazily as specified in Lazily Allocated Memory.
- VK_MEMORY_PROPERTY_PROTECTED_BIT bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types **must** not have VK_MEMORY_PROPERTY_PROTECTED_BIT set and any of VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT set, or VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, or VK_MEMORY_PROPERTY_HOST_CACHED_BIT set.
- VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD bit specifies that device accesses to allocations of this memory type are automatically made available and visible on the device. If paired with VK_MEMORY_PROPERTY_HOST_COHERENT_BIT, memory domain operations are also performed automatically between host and device.
- VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD bit specifies that memory allocated with this type is not cached on the device. Uncached device memory is always device coherent.
- VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV bit specifies that external devices can access this memory directly.

For any memory allocated with both the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT and the VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD, host or device accesses also perform automatic memory domain transfer operations, such that writes are always automatically available and visible to both host and device memory domains.

NOTE

Device coherence is a useful property for certain debugging use cases (e.g. crash analysis, where performing separate coherence actions could mean values are not reported correctly). However, device coherent accesses may be slower than equivalent accesses without device coherence, particularly if they are also device uncached. For device uncached memory in particular, repeated accesses to the same or neighboring memory locations over a short time period (e.g. within a frame) may be slower than it would be for the equivalent cached memory type. As such, it is generally inadvisable to use device coherent or device uncached memory except when really needed.

NOTE

Between the memory types which support VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT on any particular implementation, there may be different properties which cater to different memory access patterns.

VK_MEMORY_PROPERTY_HOST_CACHED_BIT is expected to be used when the host performs any read or read-modify-write operations on the memory. The typical scenario for this is when data flows from device to host. A typical implementation of this is normal `malloc`-like memory.

VK_MEMORY_PROPERTY_HOST_COHERENT_BIT without VK_MEMORY_PROPERTY_HOST_CACHED_BIT is expected for upload operations where data flows from host to device, for purposes of initializing resources or similar. A typical implementation of this memory type is write-combined memory which avoids polluting caches on the host, but has severe performance penalties if it is read from. The host is also expected to write complete cache lines for maximum performance.

Some implementations may not support uncached memory types. The expectation is that applications will end up using a memory type that supports VK_MEMORY_PROPERTY_HOST_COHERENT_BIT and VK_MEMORY_PROPERTY_HOST_CACHED_BIT together. Either way, applications are expected to look for the first memory type which supports VK_MEMORY_PROPERTY_HOST_COHERENT_BIT and use that. On VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU with a unified memory architecture, VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT is less of a concern since all memory is effectively device-local, but on VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU, there may be a distinction between a VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT memory type which is additionally VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT or not.

On discrete GPUs, using VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT, VK_MEMORY_PROPERTY_HOST_COHERENT_BIT, and VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT together is intended for small uploads to device memory which is optimized for fast device access without the need to go through a separate copy operation. Also known as BAR on PCI-e platforms. Peak write performance may be lower than system memory, and is not recommended for large uploads to the device. Common use cases for this type may be updating descriptors in a descriptor heap with vkWriteResourceDescriptorsEXT and vkWriteSamplerDescriptorsEXT, updating descriptors in a descriptor buffer with vkGetDescriptorEXT, or writing uniform buffer data.

Some implementations may support host visible types which are VK_MEMORY_PROPERTY_HOST_CACHED_BIT, where some types support VK_MEMORY_PROPERTY_HOST_COHERENT_BIT alongside CACHED, and some types which do not support VK_MEMORY_PROPERTY_HOST_COHERENT_BIT in combination with CACHED. Unless coherency is required by the application's usage patterns, the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT supporting type is likely to be less optimal. If an application only looks for the CACHED property, it must come before the CACHED | COHERENT memory type in the memory types list, so this suggestion will be followed by default.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryPropertyFlags;
```

VkMemoryPropertyFlags is a bitmask type for setting a mask of zero or more VkMemoryPropertyFlagBits.

If the VkPhysicalDeviceMemoryBudgetPropertiesEXT structure is included in the pNext chain of VkPhysicalDeviceMemoryProperties2, it is filled with the current memory budgets and usages.

The VkPhysicalDeviceMemoryBudgetPropertiesEXT structure is defined as:

```
// Provided by VK_EXT_memory_budget
typedef struct VkPhysicalDeviceMemoryBudgetPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       heapBudget[VK_MAX_MEMORY_HEAPS];
    VkDeviceSize       heapUsage[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryBudgetPropertiesEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- heapBudget is an array of VK_MAX_MEMORY_HEAPS VkDeviceSize values in which memory budgets are returned, with one element for each memory heap. A heap's budget provides a guideline for how much total memory the current process **can** use at any given time before allocations **may** start failing or causing performance degradation. The values **may** change based on other activity in the system that is outside the scope and control of the Vulkan implementation.
- heapUsage is an array of VK_MAX_MEMORY_HEAPS VkDeviceSize values in which memory usages are returned, with one element for each memory heap. A heap's usage is an estimate of how much memory the current process has allocated from that heap.

The values returned in this structure are not invariant. The heapBudget and heapUsage values **must** be zero for array elements greater than or equal to VkPhysicalDeviceMemoryProperties::memoryHeapCount. The heapBudget value **must** be non-zero for array elements less than VkPhysicalDeviceMemoryProperties::memoryHeapCount. The heapBudget value **must** be less than or equal to VkMemoryHeap::size for each heap.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryBudgetPropertiesEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT

Structure Chaining

Extends the structure

- VkPhysicalDeviceMemoryProperties2

11.2.2. Device Memory Objects

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a `VkDeviceMemory` handle:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

11.2.3. Device Memory Allocation

To allocate memory objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(
    VkDevice                                    device,
    const VkMemoryAllocateInfo*                 pAllocateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDeviceMemory*                             pMemory);
```

- `device` is the logical device that owns the memory.
- `pAllocateInfo` is a pointer to a VkMemoryAllocateInfo structure describing parameters of the allocation. A successfully returned allocation **must** use the requested parameters — no substitution is permitted by the implementation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pMemory` is a pointer to a VkDeviceMemory handle in which information about the allocated memory is returned.

Allocations returned by `vkAllocateMemory` are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-byte aligned. This ensures that applications **can** correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object. If VkBufferDeviceAddressAlignmentAllocateInfoVALVE is included in the `pNext` chain of `pAllocateInfo`, the allocation requirements **can** be further increased to meet alignment requirements which are beyond the requirements imposed by the implementation. This increased alignment **can** only be observed through addresses returned by vkGetBufferDeviceAddress. Acceleration structure alignment is outside the scope of this alignment. Such alignment **can** be enforced by vkCreateAccelerationStructure2KHR which inherits the device address verbatim. If the parameters define an import operation, and the same memory object is imported into multiple VkDeviceMemory handles, VkBufferDeviceAddressAlignmentAllocateInfoVALVE::`alignment` **may** be ignored, and the implementation **may** use the alignment of an existing import of the same handle.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory **must** not be a function of the contents of data protected memory objects, even if those memory objects were previously freed.

NOTE	The contents of memory allocated by one application **should** not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.

The maximum number of valid memory allocations that **can** exist simultaneously within a VkDevice **may** be restricted by implementation- or platform-dependent limits. The `maxMemoryAllocationCount` feature describes the number of allocations that **can** exist simultaneously before encountering these internal limits.

NOTE	For historical reasons, if `maxMemoryAllocationCount` is exceeded, some implementations may return VK_ERROR_TOO_MANY_OBJECTS. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

NOTE	Many protected memory implementations involve complex hardware and system software support, and often have additional and much lower limits on the number of simultaneous protected memory allocations (from memory types with the VK_MEMORY_PROPERTY_PROTECTED_BIT property) than for non-protected memory allocations. These limits can be system-wide, and depend on a variety of factors outside of the Vulkan implementation, so they cannot be queried in Vulkan. Applications **should** use as few allocations as possible from such memory types by suballocating aggressively, and be prepared for allocation failure even when there is apparently plenty of capacity remaining in the memory heap. As a guideline, the Vulkan conformance test suite requires that at least 80 minimum-size allocations can exist concurrently when no other uses of protected memory are active in the system.

Some platforms **may** have a limit on the maximum size of a single allocation. For example, certain systems **may** fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error VK_ERROR_OUT_OF_DEVICE_MEMORY **must** be returned. This limit is advertised in VkPhysicalDeviceMaintenance3Properties::`maxMemoryAllocationSize`.

The cumulative memory size allocated to a heap **can** be limited by the size of the specified heap. In such cases, allocated memory is tracked on a per-device and per-heap basis. Some platforms allow overallocation into other heaps. The overallocation behavior **can** be specified through the `VK_AMD_memory_overallocation_behavior` extension.

If the `memoryTypeIndex` belongs to a heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM bit included in its properties, this allocation is backed by tile memory, which is an on device cache. Unlike other heaps, allocations out of the tile memory will always have a starting address at the start of the heap and its contents are aliased with all other VkDeviceMemory objects bound to the same range while executing within the same *tile memory scope*.

If the VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT::`pageableDeviceLocalMemory` feature is enabled, memory allocations made from a heap that includes VK_MEMORY_HEAP_DEVICE_LOCAL_BIT in VkMemoryHeap::`flags` **may** be transparently moved to host-local memory allowing multiple applications to share device-local memory. If there is no space

left in device-local memory when this new allocation is made, other allocations **may** be moved out transparently to make room. The operating system will determine which allocations to move to device-local memory or host-local memory based on platform-specific criteria. To help the operating system make good choices, the application **should** set the appropriate memory priority with VkMemoryPriorityAllocateInfoEXT and adjust it as necessary with vkSetDeviceMemoryPriorityEXT. Higher priority allocations will be moved to device-local memory first.

Memory allocations made on heaps without the VK_MEMORY_HEAP_DEVICE_LOCAL_BIT property will not be transparently promoted to device-local memory by the operating system.

Valid Usage

- VUID-vkAllocateMemory-pAllocateInfo-01713
  `pAllocateInfo->allocationSize` **must** be less than or equal to VkPhysicalDeviceMemoryProperties::`memoryHeaps`[memindex].`size` where `memindex` = VkPhysicalDeviceMemoryProperties::`memoryTypes`[`pAllocateInfo->memoryTypeIndex`].`heapIndex` as returned by vkGetPhysicalDeviceMemoryProperties for the VkPhysicalDevice that `device` was created from
- VUID-vkAllocateMemory-pAllocateInfo-01714
  `pAllocateInfo->memoryTypeIndex` **must** be less than VkPhysicalDeviceMemoryProperties::`memoryTypeCount` as returned by vkGetPhysicalDeviceMemoryProperties for the VkPhysicalDevice that `device` was created from
- VUID-vkAllocateMemory-deviceCoherentMemory-02790
  If the `deviceCoherentMemory` feature is not enabled, `pAllocateInfo->memoryTypeIndex` **must** not identify a memory type supporting VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD
- VUID-vkAllocateMemory-maxMemoryAllocationCount-04101
  There **must** be less than `VkPhysicalDeviceLimits`::`maxMemoryAllocationCount` device memory allocations currently allocated on the device
- VUID-vkAllocateMemory-tileMemoryHeap-10976
  If the `tileMemoryHeap` feature is not enabled, `pAllocateInfo->memoryTypeIndex` **must** not identify a memory type that corresponds to a VkMemoryHeap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property

Valid Usage (Implicit)

- VUID-vkAllocateMemory-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkAllocateMemory-pAllocateInfo-parameter
  `pAllocateInfo` **must** be a valid pointer to a valid VkMemoryAllocateInfo structure
- VUID-vkAllocateMemory-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkAllocateMemory-pMemory-parameter
  `pMemory` **must** be a valid pointer to a VkDeviceMemory handle
- VUID-vkAllocateMemory-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkMemoryAllocateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize       allocationSize;
    uint32_t           memoryTypeIndex;
} VkMemoryAllocateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allocationSize` is the size of the allocation in bytes.
- `memoryTypeIndex` is an index identifying a memory type from the `memoryTypes` array of the VkPhysicalDeviceMemoryProperties structure.

The internal data of an allocated device memory object **must** include a reference to implementation-specific resources, referred to as the memory object's *payload*. Applications **can** also import and export that internal data to and from device memory objects to share data between Vulkan instances and other compatible APIs. A `VkMemoryAllocateInfo` structure defines a memory import operation if its `pNext` chain includes one of the following structures:

- VkImportMemoryWin32HandleInfoKHR with a non-zero `handleType` value
- VkImportMemoryFdInfoKHR with a non-zero `handleType` value

- VkImportMemoryHostPointerInfoEXT with a non-zero `handleType` value
- VkImportAndroidHardwareBufferInfoANDROID with a non-`NULL` `buffer` value
- VkImportMemoryZirconHandleInfoFUCHSIA with a non-zero `handleType` value
- VkImportMemoryBufferCollectionFUCHSIA
- VkImportScreenBufferInfoQNX with a non-`NULL` `buffer` value
- VkImportMemoryMetalHandleInfoEXT with a non-zero `handleType` value

If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, `allocationSize` is ignored. The implementation **must** query the size of these allocations from the OS.

If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLTEXTURE_BIT_EXT, `allocationSize` is ignored. The implementation **must** query the size of these allocations from the OS.

Whether device memory objects constructed via a memory import operation hold a reference to their payload depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory **must** not modify the content of the memory. Implementations **must** ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations **must** also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.

NOTE How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation **may** prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications **should** avoid creating many small external memory objects whenever possible.

Importing memory **must** not increase overall heap usage within a system. However, it **must** affect the following per-process values:

- VkPhysicalDeviceLimits::`maxMemoryAllocationCount`
- VkPhysicalDeviceMemoryBudgetPropertiesEXT::`heapUsage`

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation **must** fail the memory import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE. If the parameters define an export operation and the

external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, implementations **should** not strictly follow `memoryTypeIndex`. Instead, they **should** modify the allocation internally to use the required memory type for the application's given usage. This is because for an export operation, there is currently no way for the application to know the memory type index before allocating.

Valid Usage

- VUID-VkMemoryAllocateInfo-allocationSize-07897
  If the parameters do not define an import or export operation, `allocationSize` **must** be greater than `0`
- VUID-VkMemoryAllocateInfo-None-06657
  The parameters **must** not define more than one import operation
- VUID-VkMemoryAllocateInfo-allocationSize-07899
  If the parameters define an export operation and the handle type is not VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID , `allocationSize` **must** be greater than `0`
- VUID-VkMemoryAllocateInfo-buffer-06380
  If the parameters define an import operation from a VkBufferCollectionFUCHSIA, and VkMemoryDedicatedAllocateInfo::`buffer` is present and non-`NULL`, VkImportMemoryBufferCollectionFUCHSIA::`collection` and VkImportMemoryBufferCollectionFUCHSIA::`index` **must** match VkBufferCollectionBufferCreateInfoFUCHSIA::`collection` and VkBufferCollectionBufferCreateInfoFUCHSIA::`index`, respectively, of the VkBufferCollectionBufferCreateInfoFUCHSIA structure used to create the VkMemoryDedicatedAllocateInfo::`buffer`
- VUID-VkMemoryAllocateInfo-image-06381
  If the parameters define an import operation from a VkBufferCollectionFUCHSIA, and VkMemoryDedicatedAllocateInfo::`image` is present and non-`NULL`, VkImportMemoryBufferCollectionFUCHSIA::`collection` and VkImportMemoryBufferCollectionFUCHSIA::`index` **must** match VkBufferCollectionImageCreateInfoFUCHSIA::`collection` and VkBufferCollectionImageCreateInfoFUCHSIA::`index`, respectively, of the VkBufferCollectionImageCreateInfoFUCHSIA structure used to create the VkMemoryDedicatedAllocateInfo::`image`
- VUID-VkMemoryAllocateInfo-allocationSize-06382
  If the parameters define an import operation from a VkBufferCollectionFUCHSIA, `allocationSize` **must** match VkMemoryRequirements::`size` value retrieved by vkGetImageMemoryRequirements or vkGetBufferMemoryRequirements for image-based or buffer-based collections respectively
- VUID-VkMemoryAllocateInfo-pNext-06383
  If the parameters define an import operation from a VkBufferCollectionFUCHSIA, the `pNext` chain **must** include a VkMemoryDedicatedAllocateInfo structure with either its `image` or `buffer` field set to a value other than VK_NULL_HANDLE

- VUID-VkMemoryAllocateInfo-image-06384
  If the parameters define an import operation from a VkBufferCollectionFUCHSIA and VkMemoryDedicatedAllocateInfo::image is not VK_NULL_HANDLE, the image **must** be created with a VkBufferCollectionImageCreateInfoFUCHSIA structure chained to its VkImageCreateInfo::pNext pointer
- VUID-VkMemoryAllocateInfo-buffer-06385
  If the parameters define an import operation from a VkBufferCollectionFUCHSIA and VkMemoryDedicatedAllocateInfo::buffer is not VK_NULL_HANDLE, the buffer **must** be created with a VkBufferCollectionBufferCreateInfoFUCHSIA structure chained to its VkBufferCreateInfo::pNext pointer
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-06386
  If the parameters define an import operation from a VkBufferCollectionFUCHSIA, memoryTypeIndex **must** be from VkBufferCollectionPropertiesFUCHSIA as retrieved by vkGetBufferCollectionPropertiesFUCHSIA
- VUID-VkMemoryAllocateInfo-pNext-00639
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, and any of the handle types specified in VkExportMemoryAllocateInfo::handleTypes require a dedicated allocation, as reported by vkGetPhysicalDeviceImageFormatProperties2 in VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures, or by vkGetPhysicalDeviceExternalBufferProperties in VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures, the pNext chain **must** include a VkMemoryDedicatedAllocateInfo or VkDedicatedAllocationMemoryAllocateInfoNV structure with either its image or buffer member set to a value other than VK_NULL_HANDLE
- VUID-VkMemoryAllocateInfo-pNext-09858
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, and any of the handle types specified in VkExportMemoryAllocateInfo::handleTypes require a dedicated allocation, as reported by vkGetPhysicalDeviceExternalTensorPropertiesARM in VkExternalTensorPropertiesARM::externalMemoryProperties.externalMemoryFeatures, the pNext chain **must** include a VkMemoryDedicatedAllocateInfoTensorARM structure with its tensor member set to a value other than VK_NULL_HANDLE
- VUID-VkMemoryAllocateInfo-pNext-00640
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, it **must** not include a VkExportMemoryAllocateInfoNV or VkExportMemoryWin32HandleInfoNV structure
- VUID-VkMemoryAllocateInfo-pNext-00641
  If the pNext chain includes a VkImportMemoryWin32HandleInfoKHR structure, it **must** not include a VkImportMemoryWin32HandleInfoNV structure
- VUID-VkMemoryAllocateInfo-allocationSize-01742
  If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, then the values of allocationSize and memoryTypeIndex **must** match those specified when the payload being imported was created
- VUID-VkMemoryAllocateInfo-None-00643
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the device mask specified by VkMemoryAllocateFlagsInfo

must match the mask specified when the payload being imported was allocated

- VUID-VkMemoryAllocateInfo-None-00644
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the list of physical devices that comprise the logical device passed to vkAllocateMemory **must** match the list of physical devices that comprise the logical device on which the payload was originally allocated
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-00645
  If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of `memoryTypeIndex` **must** be one of those returned by vkGetMemoryWin32HandlePropertiesKHR
- VUID-VkMemoryAllocateInfo-allocationSize-01743
  If the parameters define an import operation, the external handle was created by the Vulkan API, and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, then the values of `allocationSize` and `memoryTypeIndex` **must** match those specified when the payload being imported was created
- VUID-VkMemoryAllocateInfo-allocationSize-00647
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, `allocationSize` **must** match the size specified when creating the Direct3D 12 heap from which the payload was extracted
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-00648
  If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of `memoryTypeIndex` **must** be one of those returned by vkGetMemoryFdPropertiesKHR
- VUID-VkMemoryAllocateInfo-None-12523
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT, the number of instances allocated **must** be 1
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-01872
  If the `protectedMemory` feature is not enabled, the `VkMemoryAllocateInfo`::`memoryTypeIndex` **must** not indicate a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-01744
  If the parameters define an import operation and the external handle is a host pointer, the value of `memoryTypeIndex` **must** be one of those returned by vkGetMemoryHostPointerPropertiesEXT
- VUID-VkMemoryAllocateInfo-allocationSize-01745
  If the parameters define an import operation and the external handle is a host pointer, `allocationSize` **must** be an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT`::`minImportedHostPointerAlignment`
- VUID-VkMemoryAllocateInfo-pNext-02805
  If the parameters define an import operation and the external handle is a host pointer, the `pNext` chain **must** not include a VkDedicatedAllocationMemoryAllocateInfoNV

structure with either its image or buffer field set to a value other than VK_NULL_HANDLE

- VUID-VkMemoryAllocateInfo-pNext-02806
  If the parameters define an import operation and the external handle is a host pointer, the pNext chain **must** not include a VkMemoryDedicatedAllocateInfo structure with either its image or buffer field set to a value other than VK_NULL_HANDLE
- VUID-VkMemoryAllocateInfo-allocationSize-02383
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, allocationSize **must** be the size returned by vkGetAndroidHardwareBufferPropertiesANDROID for the Android hardware buffer
- VUID-VkMemoryAllocateInfo-pNext-02384
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, and the pNext chain does not include a VkMemoryDedicatedAllocateInfo structure or VkMemoryDedicatedAllocateInfo::image is VK_NULL_HANDLE, the Android hardware buffer **must** have a AHardwareBuffer_Desc::format of AHARDWAREBUFFER_FORMAT_BLOB and a AHardwareBuffer_Desc::usage that includes AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-02385
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, memoryTypeIndex **must** be one of those returned by vkGetAndroidHardwareBufferPropertiesANDROID for the Android hardware buffer
- VUID-VkMemoryAllocateInfo-pNext-01874
  If the parameters do not define an import operation, and the pNext chain includes a VkExportMemoryAllocateInfo structure with VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID included in its handleTypes member, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image not equal to VK_NULL_HANDLE, then allocationSize **must** be 0
- VUID-VkMemoryAllocateInfo-pNext-07900
  If the parameters define an export operation, the handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, and the pNext does not include a VkMemoryDedicatedAllocateInfo structure, allocationSize **must** be greater than 0
- VUID-VkMemoryAllocateInfo-pNext-07901
  If the parameters define an export operation, the handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with buffer set to a valid VkBuffer object, allocationSize **must** be greater than 0
- VUID-VkMemoryAllocateInfo-pNext-02386
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo with image that is not VK_NULL_HANDLE, the Android hardware buffer's AHardwareBuffer::usage **must** include at least one of AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER, AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE or AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER

- VUID-VkMemoryAllocateInfo-pNext-02387
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a VkMemoryDedicatedAllocateInfo with `image` that is not VK_NULL_HANDLE, the format of `image` **must** be VK_FORMAT_UNDEFINED or the format returned by vkGetAndroidHardwareBufferPropertiesANDROID in VkAndroidHardwareBufferFormatPropertiesANDROID::`format` for the Android hardware buffer
- VUID-VkMemoryAllocateInfo-pNext-02388
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a VkMemoryDedicatedAllocateInfo structure with `image` that is not VK_NULL_HANDLE, the width, height, and array layer dimensions of `image` and the Android hardware buffer's `AHardwareBuffer_Desc` **must** be identical
- VUID-VkMemoryAllocateInfo-pNext-02389
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a VkMemoryDedicatedAllocateInfo structure with `image` that is not VK_NULL_HANDLE, and the Android hardware buffer's AHardwareBuffer::`usage` includes `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE`, the `image` **must** have a complete mipmap chain
- VUID-VkMemoryAllocateInfo-pNext-02586
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a VkMemoryDedicatedAllocateInfo structure with `image` that is not VK_NULL_HANDLE, and the Android hardware buffer's AHardwareBuffer::`usage` does not include `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE`, the `image` **must** have exactly one mipmap level
- VUID-VkMemoryAllocateInfo-pNext-02390
  If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes a VkMemoryDedicatedAllocateInfo structure with `image` that is not VK_NULL_HANDLE, each bit set in the usage of `image` **must** be listed in AHardwareBuffer Usage Equivalence, and if there is a corresponding `AHARDWAREBUFFER_USAGE` bit listed that bit **must** be included in the Android hardware buffer's `AHardwareBuffer_Desc`::`usage`
- VUID-VkMemoryAllocateInfo-screenBufferImport-08941
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX, VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX::`screenBufferImport` **must** be enabled
- VUID-VkMemoryAllocateInfo-allocationSize-08942
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX, `allocationSize` **must** be the size returned by vkGetScreenBufferPropertiesQNX for the QNX Screen buffer
- VUID-VkMemoryAllocateInfo-memoryTypeIndex-08943
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX, `memoryTypeIndex` **must** be one of those returned by vkGetScreenBufferPropertiesQNX for the QNX Screen buffer

- VUID-VkMemoryAllocateInfo-pNext-08944
  If the parameters define an import operation, the external handle is a QNX Screen buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo with image that is not VK_NULL_HANDLE, the QNX Screen's buffer **must** be a valid QNX Screen buffer
- VUID-VkMemoryAllocateInfo-pNext-08945
  If the parameters define an import operation, the external handle is a QNX Screen buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo with image that is not VK_NULL_HANDLE, the format of image **must** be VK_FORMAT_UNDEFINED or the format returned by vkGetScreenBufferPropertiesQNX in VkScreenBufferFormatPropertiesQNX ::format for the QNX Screen buffer
- VUID-VkMemoryAllocateInfo-pNext-08946
  If the parameters define an import operation, the external handle is a QNX Screen buffer, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image that is not VK_NULL_HANDLE, the width, height, and array layer dimensions of image and the QNX Screen buffer's _screen_buffer **must** be identical
- VUID-VkMemoryAllocateInfo-pNext-10395
  If the parameters define an import operation and the external handle is a VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLTEXTURE_BIT_EXT, then pNext **must** include a VkMemoryDedicatedAllocateInfo with image that is not VK_NULL_HANDLE
- VUID-VkMemoryAllocateInfo-pNext-10396
  If the parameters define an import operation, the external handle is a Metal MTLTexture, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image that is not VK_NULL_HANDLE, the width, height, array layer dimensions, and mipmap levels of image and the Metal MTLTexture **must** be identical
- VUID-VkMemoryAllocateInfo-pNext-10397
  If the parameters define an import operation, the external handle is a Metal MTLTexture, and the pNext chain includes a VkMemoryDedicatedAllocateInfo structure with image that is not VK_NULL_HANDLE, allocationSize **must** be 0
- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329
  If VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress is not zero, VkMemoryAllocateFlagsInfo::flags **must** include VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT
- VUID-VkMemoryAllocateInfo-flags-03330
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the bufferDeviceAddressCaptureReplay feature **must** be enabled
- VUID-VkMemoryAllocateInfo-flags-03331
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT, the bufferDeviceAddress feature **must** be enabled
- VUID-VkMemoryAllocateInfo-pNext-03332
  If the pNext chain includes a VkImportMemoryHostPointerInfoEXT structure, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress **must** be zero
- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333

If the parameters define an import operation, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress **must** be zero

- VUID-VkMemoryAllocateInfo-None-04749
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the value of memoryTypeIndex **must** be an index identifying a memory type from the memoryTypeBits field of the VkMemoryZirconHandlePropertiesFUCHSIA structure populated by a call to vkGetMemoryZirconHandlePropertiesFUCHSIA
- VUID-VkMemoryAllocateInfo-allocationSize-07902
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the value of allocationSize **must** be greater than 0
- VUID-VkMemoryAllocateInfo-allocationSize-07903
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the value of allocationSize **must** be less than or equal to the size of the VMO as determined by zx_vmo_get_size(handle) where handle is the VMO handle to the imported external memory
- VUID-VkMemoryAllocateInfo-pNext-06780
  If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member **must** be VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT
- VUID-VkMemoryAllocateInfo-flags-12510
  If VkMemoryAllocateFlagsInfo::flags does not include VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT, VkBufferDeviceAddressAlignmentAllocateInfoVALVE::alignment **must** be 0
- VUID-VkMemoryAllocateInfo-alignment-12511
  If VkBufferDeviceAddressAlignmentAllocateInfoVALVE::alignment is not 0, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress **must** be 0

Valid Usage (Implicit)

- VUID-VkMemoryAllocateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO
- VUID-VkMemoryAllocateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkBufferDeviceAddressAlignmentAllocateInfoVALVE, VkDedicatedAllocationMemoryAllocateInfoNV, VkExportMemoryAllocateInfo, VkExportMemoryAllocateInfoNV, VkExportMemoryWin32HandleInfoKHR, VkExportMemoryWin32HandleInfoNV, VkExportMetalObjectCreateInfoEXT, VkImportAndroidHardwareBufferInfoANDROID, VkImportMemoryBufferCollectionFUCHSIA, VkImportMemoryFdInfoKHR, VkImportMemoryHostPointerInfoEXT, VkImportMemoryMetalHandleInfoEXT, VkImportMemoryWin32HandleInfoKHR, VkImportMemoryWin32HandleInfoNV,

VkImportMemoryZirconHandleInfoFUCHSIA, VkImportMetalBufferInfoEXT, VkImportNativeBufferInfoOHOS, VkImportScreenBufferInfoQNX, VkMemoryAllocateFlagsInfo, VkMemoryDedicatedAllocateInfo, VkMemoryDedicatedAllocateInfoTensorARM, VkMemoryOpaqueCaptureAddressAllocateInfo, or VkMemoryPriorityAllocateInfoEXT

- VUID-VkMemoryAllocateInfo-sType-unique
  The sType value of each structure in the pNext chain **must** be unique, with the exception of structures of type VkExportMetalObjectCreateInfoEXT

If the pNext chain includes a VkMemoryDedicatedAllocateInfo structure, then that structure includes a handle of the sole buffer or image resource that the memory **can** be bound to.

The VkMemoryDedicatedAllocateInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
    VkBuffer           buffer;
} VkMemoryDedicatedAllocateInfo;
```

```
// Provided by VK_KHR_dedicated_allocation
// Equivalent to VkMemoryDedicatedAllocateInfo
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- image is VK_NULL_HANDLE or a handle of an image which this memory will be bound to.
- buffer is VK_NULL_HANDLE or a handle of a buffer which this memory will be bound to.

Valid Usage

- VUID-VkMemoryDedicatedAllocateInfo-image-01432
  At least one of image and buffer **must** be VK_NULL_HANDLE
- VUID-VkMemoryDedicatedAllocateInfo-image-02964
  If image is not VK_NULL_HANDLE and the memory is not an imported Android Hardware Buffer or an imported QNX Screen buffer , VkMemoryAllocateInfo::allocationSize **must** be greater than or equal to the VkMemoryRequirements::size of the image
- VUID-VkMemoryDedicatedAllocateInfo-image-01434
  If image is not VK_NULL_HANDLE, image **must** have been created without VK_IMAGE_CREATE_SPARSE_BINDING_BIT set in VkImageCreateInfo::flags
- VUID-VkMemoryDedicatedAllocateInfo-buffer-02965

If `buffer` is not VK_NULL_HANDLE and the memory is not an imported Android Hardware Buffer or an imported QNX Screen buffer , `VkMemoryAllocateInfo`::`allocationSize` **must** be greater than or equal to the `VkMemoryRequirements`::`size` of the buffer

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01436
  If `buffer` is not VK_NULL_HANDLE, `buffer` **must** have been created without VK_BUFFER_CREATE_SPARSE_BINDING_BIT set in VkBufferCreateInfo::`flags`
- VUID-VkMemoryDedicatedAllocateInfo-image-01876
  If `image` is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported **must** also be a dedicated image allocation and `image` **must** be identical to the image associated with the imported memory
- VUID-VkMemoryDedicatedAllocateInfo-buffer-01877
  If `buffer` is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported **must** also be a dedicated buffer allocation and `buffer` **must** be identical to the buffer associated with the imported memory
- VUID-VkMemoryDedicatedAllocateInfo-image-01878
  If `image` is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported **must** also be a dedicated image allocation and `image` **must** be identical to the image associated with the imported memory
- VUID-VkMemoryDedicatedAllocateInfo-buffer-01879
  If `buffer` is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported **must** also be a dedicated buffer allocation and `buffer` **must** be identical to the buffer associated with the imported memory
- VUID-VkMemoryDedicatedAllocateInfo-image-01797
  If `image` is not VK_NULL_HANDLE, `image` **must** not have been created with VK_IMAGE_CREATE_DISJOINT_BIT set in VkImageCreateInfo::`flags`
- VUID-VkMemoryDedicatedAllocateInfo-image-04751
  If `image` is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import

operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported **must** also be a dedicated image allocation and `image` **must** be identical to the image associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-buffer-04752
  If `buffer` is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA, the memory being imported **must** also be a dedicated buffer allocation and `buffer` **must** be identical to the buffer associated with the imported memory

Valid Usage (Implicit)

- VUID-VkMemoryDedicatedAllocateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO
- VUID-VkMemoryDedicatedAllocateInfo-image-parameter
  If `image` is not VK_NULL_HANDLE, `image` **must** be a valid VkImage handle
- VUID-VkMemoryDedicatedAllocateInfo-buffer-parameter
  If `buffer` is not VK_NULL_HANDLE, `buffer` **must** be a valid VkBuffer handle
- VUID-VkMemoryDedicatedAllocateInfo-commonparent
  Both of `buffer`, and `image` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To bind a range of tile memory to the command buffer, call:

```
// Provided by VK_QCOM_tile_memory_heap
void vkCmdBindTileMemoryQCOM(
    VkCommandBuffer                             commandBuffer,
    const VkTileMemoryBindInfoQCOM*             pTileMemoryBindInfo);
```

- `commandBuffer` is the command buffer that the tile memory will be bound to.
- `pTileMemoryBindInfo` is VK_NULL_HANDLE or a pointer to a VkTileMemoryBindInfoQCOM structure defining how tile memory is bound.

Calling vkCmdBindTileMemoryQCOM when `pTileMemoryBindInfo` is `NULL` is equivalent to binding no tile memory to the command buffer.

Valid Usage (Implicit)

- VUID-vkCmdBindTileMemoryQCOM-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBindTileMemoryQCOM-pTileMemoryBindInfo-parameter
  If `pTileMemoryBindInfo` is not `NULL`, `pTileMemoryBindInfo` **must** be a valid pointer to a valid VkTileMemoryBindInfoQCOM structure
- VUID-vkCmdBindTileMemoryQCOM-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBindTileMemoryQCOM-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdBindTileMemoryQCOM-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdBindTileMemoryQCOM-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdBindTileMemoryQCOM is not affected by conditional rendering

The `VkTileMemoryBindInfoQCOM` structure is defined as:

```
// Provided by VK_QCOM_tile_memory_heap
typedef struct VkTileMemoryBindInfoQCOM {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
} VkTileMemoryBindInfoQCOM;
```

- `memory` is the tile memory object to be bound.

`memory` is used to bind this memory object to tile memory for all subsequent commands in the `commandBuffer`. Tile memory contents for ranges in the heap outside the bound `memory` are discarded and become undefined for the active *tile memory scope* if an action command is executed.

For secondary command buffers executing within a render pass instance, the active bound tile memory object is provided with this structure included in the `pNext` chain of `VkCommandBufferInheritanceInfo`.

If this structure was not specified since recording started for `commandBuffer`, no tile memory is bound to the command buffer and all contents become undefined for the *tile memory scope* if an action command is executed.

Valid Usage

- VUID-VkTileMemoryBindInfoQCOM-memory-10726
  `memory` **must** have been allocated from a VkMemoryHeap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property

Valid Usage (Implicit)

- VUID-VkTileMemoryBindInfoQCOM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_TILE_MEMORY_BIND_INFO_QCOM
- VUID-VkTileMemoryBindInfoQCOM-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle

Structure Chaining

Extends the structure

- VkCommandBufferInheritanceInfo

If the `pNext` chain includes a `VkMemoryDedicatedAllocateInfoTensorARM` structure, then that structure includes a handle of the sole tensor resource that the memory **can** be bound to.

The `VkMemoryDedicatedAllocateInfoTensorARM` structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkMemoryDedicatedAllocateInfoTensorARM {
    VkStructureType    sType;
    const void*        pNext;
    VkTensorARM        tensor;
} VkMemoryDedicatedAllocateInfoTensorARM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tensor` is a handle of a tensor which this memory will be bound to.

Valid Usage

- VUID-VkMemoryDedicatedAllocateInfoTensorARM-allocationSize-09710
  `VkMemoryAllocateInfo`::`allocationSize` **must** equal the `VkMemoryRequirements`::`size` of the tensor
- VUID-VkMemoryDedicatedAllocateInfoTensorARM-tensor-09859
  If VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported **must** also be a dedicated tensor allocation and `tensor` **must** be identical to the tensor associated with the imported memory

Valid Usage (Implicit)

- VUID-VkMemoryDedicatedAllocateInfoTensorARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO_TENSOR_ARM
- VUID-VkMemoryDedicatedAllocateInfoTensorARM-tensor-parameter
  `tensor` **must** be a valid VkTensorARM handle

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

If the `pNext` chain includes a `VkDedicatedAllocationMemoryAllocateInfoNV` structure, then that structure includes a handle of the sole buffer or image resource that the memory **can** be bound to.

The `VkDedicatedAllocationMemoryAllocateInfoNV` structure is defined as:

```
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationMemoryAllocateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
    VkBuffer           buffer;
} VkDedicatedAllocationMemoryAllocateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is VK_NULL_HANDLE or a handle of an image which this memory will be bound to.
- `buffer` is VK_NULL_HANDLE or a handle of a buffer which this memory will be bound to.

Valid Usage

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00649
  At least one of `image` and `buffer` **must** be VK_NULL_HANDLE
- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00650
  If `image` is not VK_NULL_HANDLE, the image **must** have been created with VkDedicatedAllocationImageCreateInfoNV::`dedicatedAllocation` equal to VK_TRUE
- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00651
  If `buffer` is not VK_NULL_HANDLE, the buffer **must** have been created with VkDedicatedAllocationBufferCreateInfoNV::`dedicatedAllocation` equal to VK_TRUE
- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00652
  If `image` is not VK_NULL_HANDLE, VkMemoryAllocateInfo::`allocationSize` **must** equal the VkMemoryRequirements::`size` of the image
- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00653
  If `buffer` is not VK_NULL_HANDLE, VkMemoryAllocateInfo::`allocationSize` **must** equal the VkMemoryRequirements::`size` of the buffer
- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-00654
  If `image` is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation, the memory being imported **must** also be a dedicated image allocation and `image` **must** be identical to the image associated with the imported memory
- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-00655
  If `buffer` is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation, the memory being imported **must** also be a dedicated buffer allocation and `buffer` **must** be identical to the buffer associated with the imported memory

Valid Usage (Implicit)

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-sType-sType
  `sType` **must** be

VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV

- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-image-parameter
  If `image` is not VK_NULL_HANDLE, `image` **must** be a valid VkImage handle
- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-buffer-parameter
  If `buffer` is not VK_NULL_HANDLE, `buffer` **must** be a valid VkBuffer handle
- VUID-VkDedicatedAllocationMemoryAllocateInfoNV-commonparent
  Both of `buffer`, and `image` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

If the `pNext` chain includes a `VkMemoryPriorityAllocateInfoEXT` structure, then that structure includes a priority for the memory.

The `VkMemoryPriorityAllocateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_memory_priority
typedef struct VkMemoryPriorityAllocateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    float              priority;
} VkMemoryPriorityAllocateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priority` is a floating-point value between `0` and `1`, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority **may** be more likely to stay in device-local memory when the system is under memory pressure.

If this structure is not included, it is as if the `priority` value were `0.5`.

Valid Usage

- VUID-VkMemoryPriorityAllocateInfoEXT-priority-02602
  `priority` **must** be between `0` and `1`, inclusive

Valid Usage (Implicit)

- VUID-VkMemoryPriorityAllocateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_PRIORITY_ALLOCATE_INFO_EXT

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

If the `pNext` chain includes a `VkBufferDeviceAddressAlignmentAllocateInfoVALVE` structure, then that structure requests a minimum buffer device address alignment for bound buffers.

The VkBufferDeviceAddressAlignmentAllocateInfoVALVE structure is defined as:

```
// Provided by VK_VALVE_buffer_device_address_allocation_alignment
typedef struct VkBufferDeviceAddressAlignmentAllocateInfoVALVE {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           alignment;
} VkBufferDeviceAddressAlignmentAllocateInfoVALVE;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `alignment` is the minimum alignment that the implementation **must** allocate for any buffer device addresses.

If this struct is not present in a `pNext` chain, `alignment` is assumed to be 0. If `alignment` is 0, this alignment request is ignored.

Valid Usage

- VUID-VkBufferDeviceAddressAlignmentAllocateInfoVALVE-alignment-12512
  If `alignment` is not 0, it **must** be a power-of-two
- VUID-VkBufferDeviceAddressAlignmentAllocateInfoVALVE-alignment-12513
  If `alignment` is not 0, `bufferDeviceAddressAllocationAlignment` **must** be enabled
- VUID-VkBufferDeviceAddressAlignmentAllocateInfoVALVE-alignment-12514
  `alignment` **must** be less-than or equal-to `maxBufferDeviceAddressAllocationAlignment`

Valid Usage (Implicit)

- VUID-VkBufferDeviceAddressAlignmentAllocateInfoVALVE-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_ALIGNMENT_ALLOCATE_INFO_VALVE`

Structure Chaining

Extends the structures

- VkBufferCreateInfo
- VkMemoryAllocateInfo

To modify the priority of an existing memory allocation, call:

```
// Provided by VK_EXT_pageable_device_local_memory
void vkSetDeviceMemoryPriorityEXT(
    VkDevice                                    device,
    VkDeviceMemory                              memory,
    float                                       priority);
```

- `device` is the logical device that owns the memory.
- `memory` is the VkDeviceMemory object to which the new priority will be applied.
- `priority` is a floating-point value between `0` and `1`, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority **may** be more likely to stay in device-local memory when the system is under memory pressure.

Valid Usage

- VUID-vkSetDeviceMemoryPriorityEXT-priority-06258
  `priority` **must** be between `0` and `1`, inclusive

Valid Usage (Implicit)

- VUID-vkSetDeviceMemoryPriorityEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkSetDeviceMemoryPriorityEXT-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-vkSetDeviceMemoryPriorityEXT-memory-parent
  `memory` **must** have been created, allocated, or retrieved from `device`

When allocating memory whose payload **may** be exported to another process or Vulkan instance, add a VkExportMemoryAllocateInfo structure to the `pNext` chain of the VkMemoryAllocateInfo

structure, specifying the handle types that **may** be exported.

The VkExportMemoryAllocateInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType                    sType;
    const void*                        pNext;
    VkExternalMemoryHandleTypeFlags    handleTypes;
} VkExportMemoryAllocateInfo;
```

```
// Provided by VK_KHR_external_memory
// Equivalent to VkExportMemoryAllocateInfo
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of VkExternalMemoryHandleTypeFlagBits specifying one or more memory handle types the application **can** export from the resulting allocation. The application **can** request multiple handle types for the same allocation.

Valid Usage

- VUID-VkExportMemoryAllocateInfo-handleTypes-09860
  The bits in `handleTypes` **must** be supported and compatible, as reported by VkExternalTensorPropertiesARM, VkExternalImageFormatProperties, or VkExternalBufferProperties

Valid Usage (Implicit)

- VUID-VkExportMemoryAllocateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO
- VUID-VkExportMemoryAllocateInfo-handleTypes-parameter
  If `handleTypes` is not `0`, `handleTypes` **must** be a valid combination of VkExternalMemoryHandleTypeFlagBits values

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

When allocating memory that **may** be exported to another process or Vulkan instance, add a

VkExportMemoryAllocateInfoNV structure to the pNext chain of the VkMemoryAllocateInfo structure, specifying the handle types that **may** be exported.

The VkExportMemoryAllocateInfoNV structure is defined as:

```
// Provided by VK_NV_external_memory
typedef struct VkExportMemoryAllocateInfoNV {
    VkStructureType                    sType;
    const void*                        pNext;
    VkExternalMemoryHandleTypeFlagsNV  handleTypes;
} VkExportMemoryAllocateInfoNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleTypes is a bitmask of VkExternalMemoryHandleTypeFlagBitsNV specifying one or more memory handle types that **may** be exported. Multiple handle types **may** be requested for the same allocation as long as they are compatible, as reported by vkGetPhysicalDeviceExternalImageFormatPropertiesNV.

Valid Usage (Implicit)

- VUID-VkExportMemoryAllocateInfoNV-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV
- VUID-VkExportMemoryAllocateInfoNV-handleTypes-parameter
  If handleTypes is not 0, handleTypes **must** be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

11.2.4. Win32 External Memory

To specify additional attributes of NT handles exported from a memory object, add a VkExportMemoryWin32HandleInfoKHR structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkExportMemoryWin32HandleInfoKHR structure is defined as:

```
// Provided by VK_KHR_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType               sType;
    const void*                   pNext;
    const SECURITY_ATTRIBUTES*    pAttributes;
    DWORD                         dwAccess;
    LPCWSTR                       name;
} VkExportMemoryWin32HandleInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the payload referenced by NT handles exported from the created memory.

If VkExportMemoryAllocateInfo is not included in the same `pNext` chain, this structure is ignored.

If VkExportMemoryAllocateInfo is included in the `pNext` chain of VkMemoryAllocateInfo with a Windows `handleType`, but either `VkExportMemoryWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for "Synchronization Object Security and Access Rights"[1]. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

- VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT

The implementation **must** ensure the access rights allow read and write access to the memory.

1

https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights

Valid Usage

- VUID-VkExportMemoryWin32HandleInfoKHR-handleTypes-00657
  If VkExportMemoryAllocateInfo::`handleTypes` does not include VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, a `VkExportMemoryWin32HandleInfoKHR` structure **must** not be included in the `pNext` chain of VkMemoryAllocateInfo

Valid Usage (Implicit)

- VUID-VkExportMemoryWin32HandleInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR
- VUID-VkExportMemoryWin32HandleInfoKHR-pAttributes-parameter
  If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To import memory from a Windows handle, add a VkImportMemoryWin32HandleInfoKHR structure to the `pNext` chain of the VkMemoryAllocateInfo structure.

The `VkImportMemoryWin32HandleInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlagBits    handleType;
    HANDLE                                handle;
    LPCWSTR                               name;
} VkImportMemoryWin32HandleInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the type of `handle` or `name`.
- `handle` is `NULL` or the external handle to import.
- `name` is `NULL` or a null-terminated UTF-16 string naming the payload to import.

Importing memory object payloads from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release handle ownership using the `CloseHandle` system call when the handle is no longer needed. For handle types defined as NT handles, the imported memory object holds a reference to its payload.

NOTE	Non-NT handle import operations do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Applications **can** import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.

Valid Usage

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-09861
  If `handleType` is not `0`, it **must** be supported for import, as reported by VkExternalTensorPropertiesARM, VkExternalImageFormatProperties, or VkExternalBufferProperties
- VUID-VkImportMemoryWin32HandleInfoKHR-handle-00659
  The memory from which `handle` was exported, or the memory named by `name` **must** have been created on the same underlying physical device as `device`
- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00660
  If `handleType` is not `0`, it **must** be defined as an NT handle or a global share handle
- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01439
  If `handleType` is not VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, `name` **must** be `NULL`
- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01440
  If `handleType` is not `0` and `handle` is `NULL`, `name` **must** name a valid memory resource of the type specified by `handleType`
- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00661
  If `handleType` is not `0` and `name` is `NULL`, `handle` **must** be a valid handle of the type specified by `handleType`
- VUID-VkImportMemoryWin32HandleInfoKHR-handle-01441
  If `handle` is not `NULL`, `name` **must** be `NULL`
- VUID-VkImportMemoryWin32HandleInfoKHR-handle-01518
  If `handle` is not `NULL`, it **must** obey any requirements listed for `handleType` in external memory handle types compatibility
- VUID-VkImportMemoryWin32HandleInfoKHR-name-01519
  If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in external memory handle types compatibility

Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR
- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-parameter
  If `handleType` is not `0`, `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To export a Windows handle representing the payload of a Vulkan device memory object, call:

```
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandleKHR(
    VkDevice                                    device,
    const VkMemoryGetWin32HandleInfoKHR*        pGetWin32HandleInfo,
    HANDLE*                                     pHandle);
```

- `device` is the logical device that created the device memory being exported.
- `pGetWin32HandleInfo` is a pointer to a VkMemoryGetWin32HandleInfoKHR structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the payload of the device memory object.

For handle types defined as NT handles, the handles returned by `vkGetMemoryWin32HandleKHR` are owned by the application and hold a reference to their payload. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

NOTE	Non-NT handle types do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandleKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryWin32HandleKHR-pGetWin32HandleInfo-parameter
  `pGetWin32HandleInfo` **must** be a valid pointer to a valid VkMemoryGetWin32HandleInfoKHR structure
- VUID-vkGetMemoryWin32HandleKHR-pHandle-parameter
  `pHandle` **must** be a valid pointer to a `HANDLE` value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkMemoryGetWin32HandleInfoKHR structure is defined as:

```
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryGetWin32HandleInfoKHR {
    VkStructureType                       sType;
    const void*                           pNext;
    VkDeviceMemory                        memory;
    VkExternalMemoryHandleTypeFlagBits    handleType;
} VkMemoryGetWin32HandleInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is the memory object from which the handle will be exported.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of handle requested.

The properties of the handle returned depend on the value of handleType. See VkExternalMemoryHandleTypeFlagBits for a description of the properties of the defined external memory handle types.

Valid Usage

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00662
  handleType **must** have been included in VkExportMemoryAllocateInfo::handleTypes when memory was created
- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00663
  If handleType is defined as an NT handle, vkGetMemoryWin32HandleKHR **must** be called no more than once for each valid unique combination of memory and handleType
- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00664
  handleType **must** be defined as an NT handle or a global share handle

Valid Usage (Implicit)

- VUID-VkMemoryGetWin32HandleInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR
- VUID-VkMemoryGetWin32HandleInfoKHR-pNext-pNext

pNext must be NULL

- VUID-VkMemoryGetWin32HandleInfoKHR-memory-parameter
memory must be a valid VkDeviceMemory handle
- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-parameter
handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

Windows memory handles compatible with Vulkan **may** also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandlePropertiesKHR(
    VkDevice                                    device,
    VkExternalMemoryHandleTypeFlagBits          handleType,
    HANDLE                                      handle,
    VkMemoryWin32HandlePropertiesKHR*           pMemoryWin32HandleProperties);
```

- device is the logical device that will be importing handle.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle handle.
- handle is the handle which will be imported.
- pMemoryWin32HandleProperties is a pointer to a VkMemoryWin32HandlePropertiesKHR structure in which properties of handle are returned.

Valid Usage

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handle-00665
handle must point to a valid Windows memory handle
- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-00666
handleType must not be one of the handle types defined as opaque

Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandlePropertiesKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-parameter
handleType must be a valid VkExternalMemoryHandleTypeFlagBits value
- VUID-vkGetMemoryWin32HandlePropertiesKHR-pMemoryWin32HandleProperties-parameter
pMemoryWin32HandleProperties must be a valid pointer to a VkMemoryWin32HandlePropertiesKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkMemoryWin32HandlePropertiesKHR structure returned is defined as:

```
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryWin32HandlePropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryWin32HandlePropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memoryTypeBits is a bitmask containing one bit set for every memory type which the specified Windows handle **can** be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryWin32HandlePropertiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR
- VUID-VkMemoryWin32HandlePropertiesKHR-pNext-pNext
  pNext **must** be NULL

When VkExportMemoryAllocateInfoNV::handleTypes includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV, add a VkExportMemoryWin32HandleInfoNV structure to the pNext chain of the VkExportMemoryAllocateInfoNV structure to specify security attributes and access rights for the memory object's external handle.

The VkExportMemoryWin32HandleInfoNV structure is defined as:

```
// Provided by VK_NV_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoNV {
    VkStructureType                sType;
    const void*                    pNext;
    const SECURITY_ATTRIBUTES*     pAttributes;
    DWORD                          dwAccess;
} VkExportMemoryWin32HandleInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.

If this structure is not present, or if `pAttributes` is `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for "Synchronization Object Security and Access Rights"[1]. Further, if the structure is not present, the access rights will be

`DXGI_SHARED_RESOURCE_READ` | `DXGI_SHARED_RESOURCE_WRITE`

1 https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights

Valid Usage (Implicit)

- VUID-VkExportMemoryWin32HandleInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_NV
- VUID-VkExportMemoryWin32HandleInfoNV-pAttributes-parameter
  If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To import memory created on the same physical device but outside of the current Vulkan instance, add a VkImportMemoryWin32HandleInfoNV structure to the `pNext` chain of the VkMemoryAllocateInfo structure, specifying a handle to and the type of the memory.

The `VkImportMemoryWin32HandleInfoNV` structure is defined as:

```
// Provided by VK_NV_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoNV {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlagsNV     handleType;
    HANDLE                                handle;
} VkImportMemoryWin32HandleInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is `0` or a VkExternalMemoryHandleTypeFlagBitsNV value specifying the type of memory handle in `handle`.
- `handle` is a Windows `HANDLE` referring to the memory.

If `handleType` is `0`, this structure is ignored by consumers of the VkMemoryAllocateInfo structure it is chained from.

Valid Usage

- VUID-VkImportMemoryWin32HandleInfoNV-handleType-01327
  `handleType` **must** not have more than one bit set
- VUID-VkImportMemoryWin32HandleInfoNV-handle-01328
  `handle` **must** be a valid handle to memory, obtained as specified by `handleType`

Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_NV
- VUID-VkImportMemoryWin32HandleInfoNV-handleType-parameter
  If `handleType` is not `0`, `handleType` **must** be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

Bits which **can** be set in `handleType` are:

Possible values of VkImportMemoryWin32HandleInfoNV::`handleType`, specifying the type of an external memory handle, are:

```
// Provided by VK_NV_external_memory_capabilities
typedef enum VkExternalMemoryHandleTypeFlagBitsNV {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV = 0x00000008,
} VkExternalMemoryHandleTypeFlagBitsNV;
```

- VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV specifies a handle to memory returned by vkGetMemoryWin32HandleNV.
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV specifies a handle to memory returned by vkGetMemoryWin32HandleNV, or one duplicated from such a handle using DuplicateHandle().
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV specifies a valid NT handle to memory returned by IDXGIResource1::CreateSharedHandle, or a handle duplicated from such a handle using DuplicateHandle().
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV specifies a handle to memory returned by IDXGIResource::GetSharedHandle().

```
// Provided by VK_NV_external_memory_capabilities
typedef VkFlags VkExternalMemoryHandleTypeFlagsNV;
```

VkExternalMemoryHandleTypeFlagsNV is a bitmask type for setting a mask of zero or more VkExternalMemoryHandleTypeFlagBitsNV.

To retrieve the handle corresponding to a device memory object created with VkExportMemoryAllocateInfoNV::handleTypes set to include VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV or VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV, call:

```
// Provided by VK_NV_external_memory_win32
VkResult vkGetMemoryWin32HandleNV(
    VkDevice                                    device,
    VkDeviceMemory                              memory,
    VkExternalMemoryHandleTypeFlagsNV           handleType,
    HANDLE*                                     pHandle);
```

- device is the logical device that owns the memory.
- memory is the VkDeviceMemory object.
- handleType is a bitmask of VkExternalMemoryHandleTypeFlagBitsNV containing a single bit specifying the type of handle requested.
- pHandle is a pointer to a Windows HANDLE in which the handle is returned.

Valid Usage

- VUID-vkGetMemoryWin32HandleNV-handleType-01326
  `handleType` **must** be a flag specified in VkExportMemoryAllocateInfoNV::`handleTypes` when allocating `memory`

Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandleNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryWin32HandleNV-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-vkGetMemoryWin32HandleNV-handleType-parameter
  `handleType` **must** be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values
- VUID-vkGetMemoryWin32HandleNV-pHandle-parameter
  `pHandle` **must** be a valid pointer to a `HANDLE` value
- VUID-vkGetMemoryWin32HandleNV-memory-parent
  `memory` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

11.2.5. File Descriptor External Memory

To import memory from a POSIX file descriptor handle, add a VkImportMemoryFdInfoKHR structure to the `pNext` chain of the VkMemoryAllocateInfo structure. The `VkImportMemoryFdInfoKHR` structure is defined as:

```
// Provided by VK_KHR_external_memory_fd
typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlagBits    handleType;
    int                                   fd;
} VkImportMemoryFdInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the handle type of `fd`.
- `fd` is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import. The imported memory object holds a reference to its payload.

Applications **can** import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.

Valid Usage

- VUID-VkImportMemoryFdInfoKHR-handleType-09862
  If `handleType` is not `0`, it **must** be supported for import, as reported by VkExternalTensorPropertiesARM, VkExternalImageFormatProperties or VkExternalBufferProperties
- VUID-VkImportMemoryFdInfoKHR-fd-00668
  The memory from which `fd` was exported **must** have been created on the same underlying physical device as `device`
- VUID-VkImportMemoryFdInfoKHR-handleType-00669
  If `handleType` is not `0`, it **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT
- VUID-VkImportMemoryFdInfoKHR-handleType-00670
  If `handleType` is not `0`, `fd` **must** be a valid handle of the type specified by `handleType`
- VUID-VkImportMemoryFdInfoKHR-fd-01746
  The memory represented by `fd` **must** have been created from a physical device and driver that is compatible with `device` and `handleType`, as described in external memory handle types compatibility
- VUID-VkImportMemoryFdInfoKHR-fd-01520
  `fd` **must** obey any requirements listed for `handleType` in external memory handle types compatibility

Valid Usage (Implicit)

- VUID-VkImportMemoryFdInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR
- VUID-VkImportMemoryFdInfoKHR-handleType-parameter
  If `handleType` is not `0`, `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To export a POSIX file descriptor referencing the payload of a Vulkan device memory object, call:

```
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdKHR(
    VkDevice                                    device,
    const VkMemoryGetFdInfoKHR*                 pGetFdInfo,
    int*                                        pFd);
```

- `device` is the logical device that created the device memory being exported.
- `pGetFdInfo` is a pointer to a VkMemoryGetFdInfoKHR structure containing parameters of the export operation.
- `pFd` will return a file descriptor referencing the payload of the device memory object.

Each call to `vkGetMemoryFdKHR` **must** create a new file descriptor holding a reference to the memory object's payload and transfer ownership of the file descriptor to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor using the `close` system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Valid Usage (Implicit)

- VUID-vkGetMemoryFdKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryFdKHR-pGetFdInfo-parameter
  `pGetFdInfo` **must** be a valid pointer to a valid VkMemoryGetFdInfoKHR structure
- VUID-vkGetMemoryFdKHR-pFd-parameter
  `pFd` **must** be a valid pointer to an `int` value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkMemoryGetFdInfoKHR structure is defined as:

```
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType                       sType;
    const void*                           pNext;
    VkDeviceMemory                        memory;
    VkExternalMemoryHandleTypeFlagBits    handleType;
} VkMemoryGetFdInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is the memory object from which the handle will be exported.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of handle requested.

The properties of the file descriptor exported depend on the value of handleType. See VkExternalMemoryHandleTypeFlagBits for a description of the properties of the defined external memory handle types.

NOTE The size of the exported file **may** be larger than the size requested by VkMemoryAllocateInfo::allocationSize. If handleType is VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT, then the application **can** query the file's actual size with lseek.

Valid Usage

- VUID-VkMemoryGetFdInfoKHR-handleType-00671
  handleType **must** have been included in VkExportMemoryAllocateInfo::handleTypes when memory was created
- VUID-VkMemoryGetFdInfoKHR-handleType-00672
  handleType **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT or

VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT

- VUID-VkMemoryGetFdInfoKHR-handleType-12524
  If `handleType` is VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT, `memory` **must** not have been allocated with multiple instances

Valid Usage (Implicit)

- VUID-VkMemoryGetFdInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR
- VUID-VkMemoryGetFdInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkMemoryGetFdInfoKHR-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-VkMemoryGetFdInfoKHR-handleType-parameter
  `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value

POSIX file descriptor memory handles compatible with Vulkan **may** also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdPropertiesKHR(
    VkDevice                                    device,
    VkExternalMemoryHandleTypeFlagBits          handleType,
    int                                         fd,
    VkMemoryFdPropertiesKHR*                    pMemoryFdProperties);
```

- `device` is the logical device that will be importing `fd`.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle `fd`.
- `fd` is the handle which will be imported.
- `pMemoryFdProperties` is a pointer to a VkMemoryFdPropertiesKHR structure in which the properties of the handle `fd` are returned.

Valid Usage

- VUID-vkGetMemoryFdPropertiesKHR-fd-00673
  `fd` **must** point to a valid POSIX file descriptor memory handle
- VUID-vkGetMemoryFdPropertiesKHR-handleType-00674
  `handleType` **must** not be VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT

Valid Usage (Implicit)

- VUID-vkGetMemoryFdPropertiesKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryFdPropertiesKHR-handleType-parameter
  `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value
- VUID-vkGetMemoryFdPropertiesKHR-pMemoryFdProperties-parameter
  `pMemoryFdProperties` **must** be a valid pointer to a VkMemoryFdPropertiesKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkMemoryFdPropertiesKHR` structure returned is defined as:

```
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified file descriptor **can** be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryFdPropertiesKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR
- VUID-VkMemoryFdPropertiesKHR-pNext-pNext
  `pNext` **must** be `NULL`

11.2.6. Host External Memory

To import memory from a host pointer, add a VkImportMemoryHostPointerInfoEXT structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkImportMemoryHostPointerInfoEXT structure is defined as:

```
// Provided by VK_EXT_external_memory_host
typedef struct VkImportMemoryHostPointerInfoEXT {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlagBits    handleType;
    void*                                 pHostPointer;
} VkImportMemoryHostPointerInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the handle type.
- pHostPointer is the host pointer to import from.

Importing memory from a host pointer shares ownership of the memory between the host and the Vulkan implementation. The application **can** continue to access the memory through the host pointer but it is the application's responsibility to synchronize device and non-device access to the payload as defined in Host Access to Device Memory Objects.

Applications **can** import the same payload into multiple instances of Vulkan and multiple times into a given Vulkan instance. However, implementations **may** fail to import the same payload multiple times into a given physical device due to platform constraints.

Importing memory from a particular host pointer **may** not be possible due to additional platform-specific restrictions beyond the scope of this specification in which case the implementation **must** fail the memory import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR.

Whether device memory objects imported from a host pointer hold a reference to their payload is undefined. As such, the application **must** ensure that the imported memory range remains valid and accessible for the lifetime of the imported memory object.

Implementations **may** support importing host pointers for memory types which are not host-visible. In this case, after a successful call to vkAllocateMemory, the memory range imported from pHostPointer **must** not be accessed by the application until the VkDeviceMemory has been destroyed. Memory contents for the host memory become undefined on import, and are left undefined after the VkDeviceMemory has been destroyed. Applications **must** also not access host memory which is mapped to the same physical memory as pHostPointer, but mapped to a different host pointer while the VkDeviceMemory handle is valid. Implementations running on general-purpose operating systems **should** not support importing host pointers for memory types which are not host-visible.

NOTE

Using host pointers to back non-host visible allocations is a platform-specific use case, and applications should not attempt to do this unless instructed by the platform.

Valid Usage

- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01747
  If `handleType` is not `0`, it **must** be supported for import, as reported in VkExternalMemoryProperties
- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01748
  If `handleType` is not `0`, it **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT
- VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-01749
  `pHostPointer` **must** be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT`::`minImportedHostPointerAlignment`
- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01750
  If `handleType` is VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to
- VUID-VkImportMemoryHostPointerInfoEXT-handleType-01751
  If `handleType` is VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT, `pHostPointer` **must** be a pointer to `allocationSize` number of bytes of host mapped foreign memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

Valid Usage (Implicit)

- VUID-VkImportMemoryHostPointerInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT
- VUID-VkImportMemoryHostPointerInfoEXT-handleType-parameter
  `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value
- VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-parameter
  `pHostPointer` **must** be a pointer value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To determine the correct parameters to use when importing host pointers, call:

```
// Provided by VK_EXT_external_memory_host
VkResult vkGetMemoryHostPointerPropertiesEXT(
    VkDevice                                    device,
    VkExternalMemoryHandleTypeFlagBits          handleType,
    const void*                                 pHostPointer,
    VkMemoryHostPointerPropertiesEXT*           pMemoryHostPointerProperties);
```

- `device` is the logical device that will be importing `pHostPointer`.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle `pHostPointer`.
- `pHostPointer` is the host pointer to import from.
- `pMemoryHostPointerProperties` is a pointer to a VkMemoryHostPointerPropertiesEXT structure in which the host pointer properties are returned.

Valid Usage

- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01752
  `handleType` **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT
- VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-01753
  `pHostPointer` **must** be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT`::`minImportedHostPointerAlignment`
- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01754
  If `handleType` is VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT, `pHostPointer` **must** be a pointer to host memory
- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01755
  If `handleType` is VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT, `pHostPointer` **must** be a pointer to host mapped foreign memory

Valid Usage (Implicit)

- VUID-vkGetMemoryHostPointerPropertiesEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-parameter
  `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value
- VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-parameter
  `pHostPointer` **must** be a pointer value
- VUID-vkGetMemoryHostPointerPropertiesEXT-pMemoryHostPointerProperties-

parameter `pMemoryHostPointerProperties` **must** be a valid pointer to a VkMemoryHostPointerPropertiesEXT structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkMemoryHostPointerPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_external_memory_host
typedef struct VkMemoryHostPointerPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryHostPointerPropertiesEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified host pointer **can** be imported as.

The value returned by `memoryTypeBits` **should** only include bits that identify memory types which are host visible. Implementations **may** include bits that identify memory types which are not host visible. Behavior for imported pointers of such types is defined by VkImportMemoryHostPointerInfoEXT.

Valid Usage (Implicit)

- VUID-VkMemoryHostPointerPropertiesEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT
- VUID-VkMemoryHostPointerPropertiesEXT-pNext-pNext
  `pNext` **must** be `NULL`

11.2.7. Android Hardware Buffer External Memory

To import memory created outside of the current Vulkan instance from an Android hardware buffer, add a VkImportAndroidHardwareBufferInfoANDROID structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkImportAndroidHardwareBufferInfoANDROID structure is defined as:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkImportAndroidHardwareBufferInfoANDROID {
    VkStructureType            sType;
    const void*                pNext;
    struct AHardwareBuffer*    buffer;
} VkImportAndroidHardwareBufferInfoANDROID;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- buffer is the Android hardware buffer to import.

If the vkAllocateMemory command succeeds, the implementation **must** acquire a reference to the imported hardware buffer, which it **must** release when the device memory object is freed. If the command fails, the implementation **must** not retain a reference.

Valid Usage

- VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-09863
  If buffer is not NULL, Android hardware buffers **must** be supported for import, as reported by VkExternalTensorPropertiesARM, VkExternalImageFormatProperties, or VkExternalBufferProperties
- VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-01881
  If buffer is not NULL, it **must** be a valid Android hardware buffer object with AHardwareBuffer_Desc::usage compatible with Vulkan as described in Android Hardware Buffers

Valid Usage (Implicit)

- VUID-VkImportAndroidHardwareBufferInfoANDROID-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMPORT_ANDROID_HARDWARE_BUFFER_INFO_ANDROID
- VUID-VkImportAndroidHardwareBufferInfoANDROID-buffer-parameter
  buffer **must** be a valid pointer to an AHardwareBuffer value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To export an Android hardware buffer referencing the payload of a Vulkan device memory object, call:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
VkResult vkGetMemoryAndroidHardwareBufferANDROID(
    VkDevice                                    device,
    const VkMemoryGetAndroidHardwareBufferInfoANDROID* pInfo,
    struct AHardwareBuffer**                    pBuffer);
```

- `device` is the logical device that created the device memory being exported.
- `pInfo` is a pointer to a VkMemoryGetAndroidHardwareBufferInfoANDROID structure containing parameters of the export operation.
- `pBuffer` will return an Android hardware buffer referencing the payload of the device memory object.

Each call to `vkGetMemoryAndroidHardwareBufferANDROID` **must** return an Android hardware buffer with a new reference acquired in addition to the reference held by the VkDeviceMemory. To avoid leaking resources, the application **must** release the reference by calling `AHardwareBuffer_release` when it is no longer needed. When called with the same handle in VkMemoryGetAndroidHardwareBufferInfoANDROID::`memory`, `vkGetMemoryAndroidHardwareBufferANDROID` **must** return the same Android hardware buffer object. If the device memory was created by importing an Android hardware buffer, `vkGetMemoryAndroidHardwareBufferANDROID` **must** return that same Android hardware buffer object.

Valid Usage (Implicit)

- VUID-vkGetMemoryAndroidHardwareBufferANDROID-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryAndroidHardwareBufferANDROID-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkMemoryGetAndroidHardwareBufferInfoANDROID structure
- VUID-vkGetMemoryAndroidHardwareBufferANDROID-pBuffer-parameter
  `pBuffer` **must** be a valid pointer to a valid pointer to an AHardwareBuffer value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkMemoryGetAndroidHardwareBufferInfoANDROID structure is defined as:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkMemoryGetAndroidHardwareBufferInfoANDROID {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
} VkMemoryGetAndroidHardwareBufferInfoANDROID;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is the memory object from which the Android hardware buffer will be exported.

Valid Usage

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-handleTypes-01882
  VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID **must** have been included in VkExportMemoryAllocateInfo::handleTypes when memory was created
- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-pNext-01883
  If the pNext chain of the VkMemoryAllocateInfo used to allocate memory included a VkMemoryDedicatedAllocateInfo with non-NULL image member, then that image **must** already be bound to memory

Valid Usage (Implicit)

- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_GET_ANDROID_HARDWARE_BUFFER_INFO_ANDROID
- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-pNext-pNext
  pNext **must** be NULL
- VUID-VkMemoryGetAndroidHardwareBufferInfoANDROID-memory-parameter
  memory **must** be a valid VkDeviceMemory handle

To determine the memory parameters to use when importing an Android hardware buffer, call:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
VkResult vkGetAndroidHardwareBufferPropertiesANDROID(
    VkDevice                                    device,
    const struct AHardwareBuffer*               buffer,
    VkAndroidHardwareBufferPropertiesANDROID*   pProperties);
```

- `device` is the logical device that will be importing `buffer`.
- `buffer` is the Android hardware buffer which will be imported.
- `pProperties` is a pointer to a VkAndroidHardwareBufferPropertiesANDROID structure in which the properties of `buffer` are returned.

Valid Usage

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-buffer-01884
  `buffer` **must** be a valid Android hardware buffer object with at least one of the `AHARDWAREBUFFER_USAGE_GPU_*` flags in its `AHardwareBuffer_Desc`::`usage`

Valid Usage (Implicit)

- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-buffer-parameter
  `buffer` **must** be a valid pointer to a valid AHardwareBuffer value
- VUID-vkGetAndroidHardwareBufferPropertiesANDROID-pProperties-parameter
  `pProperties` **must** be a valid pointer to a VkAndroidHardwareBufferPropertiesANDROID structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkAndroidHardwareBufferPropertiesANDROID` structure returned is defined as:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferPropertiesANDROID {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       allocationSize;
    uint32_t           memoryTypeBits;
} VkAndroidHardwareBufferPropertiesANDROID;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allocationSize` is the size of the external memory.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified Android hardware buffer **can** be imported as.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferPropertiesANDROID-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_PROPERTIES_ANDROID
- VUID-VkAndroidHardwareBufferPropertiesANDROID-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkAndroidHardwareBufferFormatProperties2ANDROID, VkAndroidHardwareBufferFormatPropertiesANDROID, or VkAndroidHardwareBufferFormatResolvePropertiesANDROID
- VUID-VkAndroidHardwareBufferPropertiesANDROID-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique

To obtain format properties of an Android hardware buffer, include a `VkAndroidHardwareBufferFormatPropertiesANDROID` structure in the `pNext` chain of the VkAndroidHardwareBufferPropertiesANDROID structure passed to vkGetAndroidHardwareBufferPropertiesANDROID. This structure is defined as:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferFormatPropertiesANDROID {
    VkStructureType                  sType;
    void*                            pNext;
    VkFormat                         format;
    uint64_t                         externalFormat;
    VkFormatFeatureFlags             formatFeatures;
    VkComponentMapping               samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion    suggestedYcbcrModel;
    VkSamplerYcbcrRange              suggestedYcbcrRange;
    VkChromaLocation                 suggestedXChromaOffset;
    VkChromaLocation                 suggestedYChromaOffset;
} VkAndroidHardwareBufferFormatPropertiesANDROID;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the Vulkan format corresponding to the Android hardware buffer's format, or VK_FORMAT_UNDEFINED if there is not an equivalent Vulkan format.
- `externalFormat` is an implementation-defined external format identifier for use with VkExternalFormatANDROID. It **must** not be zero.
- `formatFeatures` describes the capabilities of this external format when used with an image bound to memory imported from `buffer`.
- `samplerYcbcrConversionComponents` is the component swizzle that **should** be used in VkSamplerYcbcrConversionCreateInfo.
- `suggestedYcbcrModel` is a suggested color model to use in the VkSamplerYcbcrConversionCreateInfo.
- `suggestedYcbcrRange` is a suggested numerical value range to use in VkSamplerYcbcrConversionCreateInfo.
- `suggestedXChromaOffset` is a suggested X chroma offset to use in VkSamplerYcbcrConversionCreateInfo.
- `suggestedYChromaOffset` is a suggested Y chroma offset to use in VkSamplerYcbcrConversionCreateInfo.

If the Android hardware buffer has one of the formats listed in the Format Equivalence table, then `format` **must** have the equivalent Vulkan format listed in the table. Otherwise, `format` **may** be VK_FORMAT_UNDEFINED, indicating the Android hardware buffer **can** only be used with an external format.

The `formatFeatures` member **must** include VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT and at least one of VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT or VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, and **should** include VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT and VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT.

NOTE

The `formatFeatures` member only indicates the features available when using an external-format image created from the Android hardware buffer. Images from Android hardware buffers with a format other than VK_FORMAT_UNDEFINED are subject to the format capabilities obtained from vkGetPhysicalDeviceFormatProperties2, and vkGetPhysicalDeviceImageFormatProperties2 with appropriate parameters. These sets of features are independent of each other, e.g. the external format will support sampler $Y'C_BC_R$ conversion even if the non-external format does not, and rendering directly to the external format will not be supported even if the non-external format does support this.

Android hardware buffers with the same external format **must** have the same support for VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT, VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT, VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT, VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT, and VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT in `formatFeatures`. Other format features **may** differ between Android hardware buffers that have the same external format. This allows applications to use the same VkSamplerYcbcrConversion object (and samplers and pipelines created from them) for any Android hardware buffers that have the same external format.

If `format` is not VK_FORMAT_UNDEFINED, then the value of `samplerYcbcrConversionComponents` **must** be valid when used as the `components` member of VkSamplerYcbcrConversionCreateInfo with that format. If `format` is VK_FORMAT_UNDEFINED, all members of `samplerYcbcrConversionComponents` **must** be the identity swizzle.

Implementations **may** not always be able to determine the color model, numerical range, or chroma offsets of the image contents, so the values in `VkAndroidHardwareBufferFormatPropertiesANDROID` are only suggestions. Applications **should** treat these values as sensible defaults to use in the absence of more reliable information obtained through some other means. If the underlying physical device is also usable via OpenGL ES with the `GL_OES_EGL_image_external` extension, the implementation **should** suggest values that will produce similar sampled values as would be obtained by sampling the same external image via `samplerExternalOES` in OpenGL ES using equivalent sampler parameters.

NOTE

Since `GL_OES_EGL_image_external` does not require the same sampling and conversion calculations as Vulkan does, achieving identical results between APIs **may** not be possible on some implementations.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferFormatPropertiesANDROID-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_ANDROID

Structure Chaining

Extends the structure

- VkAndroidHardwareBufferPropertiesANDROID

The format properties of an Android hardware buffer **can** be obtained by including a VkAndroidHardwareBufferFormatProperties2ANDROID structure in the pNext chain of the VkAndroidHardwareBufferPropertiesANDROID structure passed to vkGetAndroidHardwareBufferPropertiesANDROID. This structure is defined as:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer with
VK_KHR_format_feature_flags2 or VK_VERSION_1_3
typedef struct VkAndroidHardwareBufferFormatProperties2ANDROID {
    VkStructureType                  sType;
    void*                            pNext;
    VkFormat                         format;
    uint64_t                         externalFormat;
    VkFormatFeatureFlags2            formatFeatures;
    VkComponentMapping               samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion    suggestedYcbcrModel;
    VkSamplerYcbcrRange              suggestedYcbcrRange;
    VkChromaLocation                 suggestedXChromaOffset;
    VkChromaLocation                 suggestedYChromaOffset;
} VkAndroidHardwareBufferFormatProperties2ANDROID;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- format is the Vulkan format corresponding to the Android hardware buffer's format, or VK_FORMAT_UNDEFINED if there is not an equivalent Vulkan format.
- externalFormat is an implementation-defined external format identifier for use with VkExternalFormatANDROID. It **must** not be zero.
- formatFeatures describes the capabilities of this external format when used with an image bound to memory imported from buffer.
- samplerYcbcrConversionComponents is the component swizzle that **should** be used in VkSamplerYcbcrConversionCreateInfo.
- suggestedYcbcrModel is a suggested color model to use in the VkSamplerYcbcrConversionCreateInfo.
- suggestedYcbcrRange is a suggested numerical value range to use in VkSamplerYcbcrConversionCreateInfo.
- suggestedXChromaOffset is a suggested X chroma offset to use in VkSamplerYcbcrConversionCreateInfo.
- suggestedYChromaOffset is a suggested Y chroma offset to use in VkSamplerYcbcrConversionCreateInfo.

The bits reported in formatFeatures **must** include the bits reported in the corresponding fields of VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferFormatProperties2ANDROID-sType-sType sType **must** be VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_2_ANDROID

Structure Chaining

Extends the structure

- VkAndroidHardwareBufferPropertiesANDROID

The VkAndroidHardwareBufferFormatResolvePropertiesANDROID structure is defined as:

```
// Provided by VK_ANDROID_external_format_resolve
typedef struct VkAndroidHardwareBufferFormatResolvePropertiesANDROID {
    VkStructureType    sType;
    void*              pNext;
    VkFormat           colorAttachmentFormat;
} VkAndroidHardwareBufferFormatResolvePropertiesANDROID;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- colorAttachmentFormat is a VkFormat specifying the format of color attachment images that **must** be used for color attachments when resolving to the specified external format. If the implementation supports external format resolves for the specified external format, this value will be a color format supporting the VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT in VkFormatProperties::optimalTilingFeatures as returned by vkGetPhysicalDeviceFormatProperties with format equal to colorAttachmentFormat. If external format resolves are not supported, this value will be VK_FORMAT_UNDEFINED.

Any Android hardware buffer created with the GRALLOC_USAGE_HW_RENDER flag **must** be renderable in some way in Vulkan, either:

- VkAndroidHardwareBufferFormatPropertiesANDROID::format **must** be a format that supports VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT in VkFormatProperties::optimalTilingFeatures; or
- colorAttachmentFormat **must** be a format that supports VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT in VkFormatProperties::optimalTilingFeatures.

Valid Usage (Implicit)

- VUID-VkAndroidHardwareBufferFormatResolvePropertiesANDROID-sType-sType `sType` **must** be VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_RESOLVE_PROPERTIES_ANDROID

Structure Chaining

Extends the structure

- VkAndroidHardwareBufferPropertiesANDROID

11.2.8. Remote Device External Memory

To export an address representing the payload of a Vulkan device memory object accessible by remote devices, call:

```
// Provided by VK_NV_external_memory_rdma
VkResult vkGetMemoryRemoteAddressNV(
    VkDevice                                    device,
    const VkMemoryGetRemoteAddressInfoNV*       pMemoryGetRemoteAddressInfo,
    VkRemoteAddressNV*                          pAddress);
```

- `device` is the logical device that created the device memory being exported.
- `pMemoryGetRemoteAddressInfo` is a pointer to a VkMemoryGetRemoteAddressInfoNV structure containing parameters of the export operation.
- `pAddress` is a pointer to a VkRemoteAddressNV value in which an address representing the payload of the device memory object is returned.

More communication may be required between the kernel-mode drivers of the devices involved. This information is out of scope of this documentation and should be requested from the vendors of the devices.

Valid Usage (Implicit)

- VUID-vkGetMemoryRemoteAddressNV-device-parameter `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryRemoteAddressNV-pMemoryGetRemoteAddressInfo-parameter `pMemoryGetRemoteAddressInfo` **must** be a valid pointer to a valid VkMemoryGetRemoteAddressInfoNV structure
- VUID-vkGetMemoryRemoteAddressNV-pAddress-parameter `pAddress` **must** be a valid pointer to a VkRemoteAddressNV value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkMemoryGetRemoteAddressInfoNV` structure is defined as:

```
// Provided by VK_NV_external_memory_rdma
typedef struct VkMemoryGetRemoteAddressInfoNV {
    VkStructureType                       sType;
    const void*                           pNext;
    VkDeviceMemory                        memory;
    VkExternalMemoryHandleTypeFlagBits    handleType;
} VkMemoryGetRemoteAddressInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the remote accessible address will be exported.
- `handleType` is the type of handle requested.

Valid Usage

- VUID-VkMemoryGetRemoteAddressInfoNV-handleType-04966
  `handleType` **must** have been included in VkExportMemoryAllocateInfo::`handleTypes` when `memory` was created

Valid Usage (Implicit)

- VUID-VkMemoryGetRemoteAddressInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_GET_REMOTE_ADDRESS_INFO_NV
- VUID-VkMemoryGetRemoteAddressInfoNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkMemoryGetRemoteAddressInfoNV-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-VkMemoryGetRemoteAddressInfoNV-handleType-parameter
  `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value

VkRemoteAddressNV represents an address of a memory object accessible by remote devices, as returned in vkGetMemoryRemoteAddressNV::pAddress.

```
// Provided by VK_NV_external_memory_rdma
typedef void* VkRemoteAddressNV;
```

11.2.9. Fuchsia External Memory

On Fuchsia, when allocating memory that **may** be imported from another device, process, or Vulkan instance, add a VkImportMemoryZirconHandleInfoFUCHSIA structure to the pNext chain of the VkMemoryAllocateInfo structure.

External memory on Fuchsia is imported and exported using VMO handles of type zx_handle_t. VMO handles to external memory are canonically obtained from Fuchsia's Sysmem service or from syscalls such as zx_vmo_create(). VMO handles for import can also be obtained by exporting them from another Vulkan instance as described in exporting fuchsia device memory.

Importing VMO handles to the Vulkan instance transfers ownership of the handle to the instance from the application. The application **must** not perform any operations on the handle after successful import.

Applications **can** import the same underlying memory into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct VkDeviceMemory object.

Importing Fuchsia External Memory

The VkImportMemoryZirconHandleInfoFUCHSIA structure is defined as:

```
// Provided by VK_FUCHSIA_external_memory
typedef struct VkImportMemoryZirconHandleInfoFUCHSIA {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlagBits    handleType;
    zx_handle_t                           handle;
} VkImportMemoryZirconHandleInfoFUCHSIA;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of handle.
- handle is a zx_handle_t (Zircon) handle to the external memory.

Valid Usage

- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handleType-04771
  handleType **must** be

VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA

- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handle-04772
  `handle` **must** be a valid VMO handle

Valid Usage (Implicit)

- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_MEMORY_ZIRCON_HANDLE_INFO_FUCHSIA
- VUID-VkImportMemoryZirconHandleInfoFUCHSIA-handleType-parameter
  If `handleType` is not `0`, `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To obtain the memoryTypeIndex for the VkMemoryAllocateInfo structure, call `vkGetMemoryZirconHandlePropertiesFUCHSIA`:

```
// Provided by VK_FUCHSIA_external_memory
VkResult vkGetMemoryZirconHandlePropertiesFUCHSIA(
    VkDevice                                    device,
    VkExternalMemoryHandleTypeFlagBits          handleType,
    zx_handle_t                                 zirconHandle,
    VkMemoryZirconHandlePropertiesFUCHSIA*      pMemoryZirconHandleProperties);
```

- `device` is the VkDevice.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the type of `zirconHandle`.
- `zirconHandle` is a `zx_handle_t` (Zircon) handle to the external resource.
- `pMemoryZirconHandleProperties` is a pointer to a VkMemoryZirconHandlePropertiesFUCHSIA structure in which the result will be stored.

Valid Usage

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-handleType-04773
  `handleType` **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA
- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-zirconHandle-04774
  `zirconHandle` **must** reference a valid VMO

Valid Usage (Implicit)

- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-handleType-parameter
  `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value
- VUID-vkGetMemoryZirconHandlePropertiesFUCHSIA-pMemoryZirconHandleProperties-parameter
  `pMemoryZirconHandleProperties` **must** be a valid pointer to a VkMemoryZirconHandlePropertiesFUCHSIA structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkMemoryZirconHandlePropertiesFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_external_memory
typedef struct VkMemoryZirconHandlePropertiesFUCHSIA {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryZirconHandlePropertiesFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified handle can be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryZirconHandlePropertiesFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_ZIRCON_HANDLE_PROPERTIES_FUCHSIA
- VUID-VkMemoryZirconHandlePropertiesFUCHSIA-pNext-pNext
  `pNext` **must** be `NULL`

With pMemoryZirconHandleProperties now successfully populated by vkGetMemoryZirconHandlePropertiesFUCHSIA, assign the VkMemoryAllocateInfo memoryTypeIndex field to a memory type which has a bit set in the VkMemoryZirconHandlePropertiesFUCHSIA memoryTypeBits field.

Exporting Fuchsia Device Memory

Similar to importing, exporting a VMO handle from Vulkan transfers ownership of the handle from the Vulkan instance to the application. The application is responsible for closing the handle with zx_handle_close() when it is no longer in use.

To export device memory as a Zircon handle that can be used by another instance, device, or process, retrieve the handle to the VkDeviceMemory using the command:

```
// Provided by VK_FUCHSIA_external_memory
VkResult vkGetMemoryZirconHandleFUCHSIA(
    VkDevice                                    device,
    const VkMemoryGetZirconHandleInfoFUCHSIA*   pGetZirconHandleInfo,
    zx_handle_t*                                pZirconHandle);
```

- device is the VkDevice.
- pGetZirconHandleInfo is a pointer to a VkMemoryGetZirconHandleInfoFUCHSIA structure.
- pZirconHandle is a pointer to a zx_handle_t which holds the resulting Zircon handle.

Valid Usage (Implicit)

- VUID-vkGetMemoryZirconHandleFUCHSIA-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetMemoryZirconHandleFUCHSIA-pGetZirconHandleInfo-parameter
  pGetZirconHandleInfo **must** be a valid pointer to a valid VkMemoryGetZirconHandleInfoFUCHSIA structure
- VUID-vkGetMemoryZirconHandleFUCHSIA-pZirconHandle-parameter
  pZirconHandle **must** be a valid pointer to a zx_handle_t value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

VkMemoryGetZirconHandleInfoFUCHSIA is defined as:

```
// Provided by VK_FUCHSIA_external_memory
typedef struct VkMemoryGetZirconHandleInfoFUCHSIA {
    VkStructureType                       sType;
    const void*                           pNext;
    VkDeviceMemory                        memory;
    VkExternalMemoryHandleTypeFlagBits    handleType;
} VkMemoryGetZirconHandleInfoFUCHSIA;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is the VkDeviceMemory being exported.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle pointed to by vkGetMemoryZirconHandleFUCHSIA::pZirconHandle.

Valid Usage

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-04775
  handleType **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA
- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-04776
  handleType **must** have been included in the handleTypes field of the VkExportMemoryAllocateInfo structure when the external memory was allocated

Valid Usage (Implicit)

- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_GET_ZIRCON_HANDLE_INFO_FUCHSIA
- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-pNext-pNext
  pNext **must** be NULL
- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-memory-parameter
  memory **must** be a valid VkDeviceMemory handle
- VUID-VkMemoryGetZirconHandleInfoFUCHSIA-handleType-parameter
  handleType **must** be a valid VkExternalMemoryHandleTypeFlagBits value

With the result pZirconHandle now obtained, the memory properties for the handle can be retrieved using vkGetMemoryZirconHandlePropertiesFUCHSIA as documented above substituting the dereferenced, retrieved pZirconHandle in for the zirconHandle argument.

11.2.10. Metal Objects

A Vulkan implementation that is layered on top of Metal on Apple device platform, and implements the VK_EXT_metal_objects extension, supports the ability to import and export the underlying Metal objects associated with specific Vulkan objects.

The underlying Metal objects associated with certain Vulkan objects can be exported from those Vulkan objects using the pNext chain of the VkExportMetalObjectsInfoEXT parameter of the vkExportMetalObjectsEXT command.

A VkDeviceMemory object can be allocated on an existing MTLBuffer object, by including the MTLBuffer object in a VkImportMetalBufferInfoEXT structure in the pNext chain of the VkMemoryAllocateInfo structure in the vkAllocateMemory command.

A new VkImage object can be created on an existing IOSurface object, or one or more existing Metal MTLTexture objects, by including those Metal objects in either VkImportMetalIOSurfaceInfoEXT or VkImportMetalTextureInfoEXT structures in the pNext chain of the VkImageCreateInfo structure in the vkCreateImage command.

To export Metal objects from Vulkan objects, the application **must** first indicate the intention to do so during the creation of the Vulkan object, by including one or more VkExportMetalObjectCreateInfoEXT structures in the pNext chain of the VkInstanceCreateInfo, VkMemoryAllocateInfo, VkImageCreateInfo, VkImageViewCreateInfo, VkBufferViewCreateInfo, VkSemaphoreCreateInfo, or VkEventCreateInfo, in the corresponding Vulkan object creation command.

The VkExportMetalObjectCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalObjectCreateInfoEXT {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExportMetalObjectTypeFlagBitsEXT    exportObjectType;
} VkExportMetalObjectCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- exportObjectType is a VkExportMetalObjectTypeFlagBitsEXT indicating the type of Metal object that the application may request to be exported from the Vulkan object.

Valid Usage (Implicit)

- VUID-VkExportMetalObjectCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXPORT_METAL_OBJECT_CREATE_INFO_EXT
- VUID-VkExportMetalObjectCreateInfoEXT-exportObjectType-parameter
  If exportObjectType is not 0, exportObjectType **must** be a valid VkExportMetalObjectTypeFlagBitsEXT value

Structure Chaining

Extends the structures

- VkBufferViewCreateInfo
- VkEventCreateInfo
- VkImageCreateInfo
- VkImageViewCreateInfo
- VkInstanceCreateInfo
- VkMemoryAllocateInfo
- VkSemaphoreCreateInfo

Bits which indicate the types of Metal objects that may be exported from a corresponding Vulkan object are:

```
// Provided by VK_EXT_metal_objects
typedef enum VkExportMetalObjectTypeFlagBitsEXT {
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT = 0x00000001,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT = 0x00000002,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT = 0x00000004,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT = 0x00000008,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT = 0x00000010,
    VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT = 0x00000020,
} VkExportMetalObjectTypeFlagBitsEXT;
```

- VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT specifies that a Metal MTLDevice may be exported.
- VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT specifies that a Metal MTLCommandQueue may be exported.
- VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT specifies that a Metal MTLBuffer may be exported.
- VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT specifies that a Metal MTLTexture may be exported.
- VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT specifies that a Metal IOSurface may be exported.
- VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT specifies that a Metal MTLSharedEvent may be exported.

```
// Provided by VK_EXT_metal_objects
typedef VkFlags VkExportMetalObjectTypeFlagsEXT;
```

VkExportMetalObjectTypeFlagsEXT is a bitmask type for setting a mask of zero or more

VkExportMetalObjectTypeFlagBitsEXT.

To export Metal objects that underlie Vulkan objects, call:

```
// Provided by VK_EXT_metal_objects
void vkExportMetalObjectsEXT(
    VkDevice                                    device,
    VkExportMetalObjectsInfoEXT*                pMetalObjectsInfo);
```

- `device` is the device that created the Vulkan objects.
- `pMetalObjectsInfo` is a pointer to a VkExportMetalObjectsInfoEXT structure whose `pNext` chain contains structures, each identifying a Vulkan object and providing a pointer through which the Metal object will be returned.

Valid Usage (Implicit)

- VUID-vkExportMetalObjectsEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkExportMetalObjectsEXT-pMetalObjectsInfo-parameter
  `pMetalObjectsInfo` **must** be a valid pointer to a VkExportMetalObjectsInfoEXT structure

The `VkExportMetalObjectsInfoEXT` structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalObjectsInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
} VkExportMetalObjectsInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage

- VUID-VkExportMetalObjectsInfoEXT-pNext-06791
  If the `pNext` chain includes a VkExportMetalDeviceInfoEXT structure, the VkInstance **must** have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_DEVICE_BIT_EXT in the `exportObjectType` member of a VkExportMetalObjectCreateInfoEXT structure in the `pNext` chain of the VkInstanceCreateInfo structure in the vkCreateInstance command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06792
  If the `pNext` chain includes a VkExportMetalCommandQueueInfoEXT structure, the VkInstance **must** have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_COMMAND_QUEUE_BIT_EXT in the `exportObjectType` member of a VkExportMetalObjectCreateInfoEXT structure in the `pNext`

chain of the VkInstanceCreateInfo structure in the vkCreateInstance command

- VUID-VkExportMetalObjectsInfoEXT-pNext-06793
  If the pNext chain includes a VkExportMetalBufferInfoEXT structure, the VkDeviceMemory in its memory member **must** have been allocated with VK_EXPORT_METAL_OBJECT_TYPE_METAL_BUFFER_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkMemoryAllocateInfo structure in the vkAllocateMemory command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06794
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, exactly one of its image, imageView, or bufferView members **must** not be VK_NULL_HANDLE
- VUID-VkExportMetalObjectsInfoEXT-pNext-06795
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, and its image member is not VK_NULL_HANDLE, the VkImage in its image member **must** have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkImageCreateInfo structure in the vkCreateImage command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06796
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, and its imageView member is not VK_NULL_HANDLE, the VkImageView in its imageView member **must** have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkImageViewCreateInfo structure in the vkCreateImageView command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06797
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, and its bufferView member is not VK_NULL_HANDLE, the VkBufferView in its bufferView member **must** have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkBufferViewCreateInfo structure in the vkCreateBufferView command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06798
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, and if either its image or imageView member is not VK_NULL_HANDLE, then plane **must** be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT
- VUID-VkExportMetalObjectsInfoEXT-pNext-06799
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, and if the VkImage in its image member does not have a multi-planar format, then its plane member **must** be VK_IMAGE_ASPECT_PLANE_0_BIT
- VUID-VkExportMetalObjectsInfoEXT-pNext-06800
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, and if the VkImage in its image member has a multi-planar format with only two planes, then its plane member **must** not be VK_IMAGE_ASPECT_PLANE_2_BIT
- VUID-VkExportMetalObjectsInfoEXT-pNext-06801
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, and if the VkImageView in its imageView member does not have a multi-planar format, then its plane

member **must** be VK_IMAGE_ASPECT_PLANE_0_BIT

- VUID-VkExportMetalObjectsInfoEXT-pNext-06802
  If the pNext chain includes a VkExportMetalTextureInfoEXT structure, and if the VkImageView in its imageView member has a multi-planar format with only two planes, then its plane member **must** not be VK_IMAGE_ASPECT_PLANE_2_BIT
- VUID-VkExportMetalObjectsInfoEXT-pNext-06803
  If the pNext chain includes a VkExportMetalIOSurfaceInfoEXT structure, the VkImage in its image member **must** have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkImageCreateInfo structure in the vkCreateImage command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06804
  If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, exactly one of its semaphore or event members **must** not be VK_NULL_HANDLE
- VUID-VkExportMetalObjectsInfoEXT-pNext-06805
  If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, and its semaphore member is not VK_NULL_HANDLE, the VkSemaphore in its semaphore member **must** have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkSemaphoreCreateInfo structure in the vkCreateSemaphore command
- VUID-VkExportMetalObjectsInfoEXT-pNext-06806
  If the pNext chain includes a VkExportMetalSharedEventInfoEXT structure, and its event member is not VK_NULL_HANDLE, the VkEvent in its event member **must** have been created with VK_EXPORT_METAL_OBJECT_TYPE_METAL_SHARED_EVENT_BIT_EXT in the exportObjectType member of a VkExportMetalObjectCreateInfoEXT structure in the pNext chain of the VkEventCreateInfo structure in the vkCreateEvent command

Valid Usage (Implicit)

- VUID-VkExportMetalObjectsInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXPORT_METAL_OBJECTS_INFO_EXT
- VUID-VkExportMetalObjectsInfoEXT-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkExportMetalBufferInfoEXT, VkExportMetalCommandQueueInfoEXT, VkExportMetalDeviceInfoEXT, VkExportMetalIOSurfaceInfoEXT, VkExportMetalSharedEventInfoEXT, or VkExportMetalTextureInfoEXT
- VUID-VkExportMetalObjectsInfoEXT-sType-unique
  The sType value of each structure in the pNext chain **must** be unique, with the exception of structures of type VkExportMetalBufferInfoEXT, VkExportMetalCommandQueueInfoEXT, VkExportMetalIOSurfaceInfoEXT, VkExportMetalSharedEventInfoEXT, or VkExportMetalTextureInfoEXT

To export the Metal MTLDevice object underlying the VkPhysicalDevice associated with a VkDevice object, include a VkExportMetalDeviceInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalDeviceInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalDeviceInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    MTLDevice_id       mtlDevice;
} VkExportMetalDeviceInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- mtlDevice is the Metal id<MTLDevice> object underlying the VkPhysicalDevice associated with the VkDevice object identified in the call. The implementation will return the MTLDevice in this member, or it will return NULL if no MTLDevice could be found underlying the VkPhysicalDevice object.

Valid Usage (Implicit)

- VUID-VkExportMetalDeviceInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXPORT_METAL_DEVICE_INFO_EXT

Structure Chaining

Extends the structure

- VkExportMetalObjectsInfoEXT

The type id<MTLDevice> is defined in Apple's Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of MTLDevice_id is provided in the Vulkan headers:

```
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLDevice;
typedef __unsafe_unretained id<MTLDevice> MTLDevice_id;
#else
typedef void* MTLDevice_id;
#endif
```

To export the Metal MTLCommandQueue object underlying a VkQueue object, include a VkExportMetalCommandQueueInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter

of a vkExportMetalObjectsEXT call.

The VkExportMetalCommandQueueInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalCommandQueueInfoEXT {
    VkStructureType       sType;
    const void*           pNext;
    VkQueue               queue;
    MTLCommandQueue_id    mtlCommandQueue;
} VkExportMetalCommandQueueInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- queue is a VkQueue.
- mtlCommandQueue is the Metal id<MTLCommandQueue> object underlying the VkQueue object in queue. The implementation will return the MTLCommandQueue in this member, or it will return NULL if no MTLCommandQueue could be found underlying the VkQueue object.

Valid Usage (Implicit)

- VUID-VkExportMetalCommandQueueInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXPORT_METAL_COMMAND_QUEUE_INFO_EXT
- VUID-VkExportMetalCommandQueueInfoEXT-queue-parameter
  queue **must** be a valid VkQueue handle

Structure Chaining

Extends the structure

- VkExportMetalObjectsInfoEXT

The type id<MTLCommandQueue> is defined in Apple's Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of MTLCommandQueue_id is provided in the Vulkan headers:

```
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLCommandQueue;
typedef __unsafe_unretained id<MTLCommandQueue> MTLCommandQueue_id;
#else
typedef void* MTLCommandQueue_id;
#endif
```

To export the Metal MTLBuffer object underlying a VkDeviceMemory object, include a VkExportMetalBufferInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalBufferInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalBufferInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
    MTLBuffer_id       mtlBuffer;
} VkExportMetalBufferInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is a VkDeviceMemory.
- mtlBuffer is the Metal id<MTLBuffer> object underlying the VkDeviceMemory object in memory. The implementation will return the MTLBuffer in this member, or it will return NULL if no MTLBuffer could be found underlying the VkDeviceMemory object.

Valid Usage (Implicit)

- VUID-VkExportMetalBufferInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXPORT_METAL_BUFFER_INFO_EXT
- VUID-VkExportMetalBufferInfoEXT-memory-parameter
  memory **must** be a valid VkDeviceMemory handle

Structure Chaining

Extends the structure

- VkExportMetalObjectsInfoEXT

To import a Metal MTLBuffer object to underlie a VkDeviceMemory object, include a VkImportMetalBufferInfoEXT structure in the pNext chain of the VkMemoryAllocateInfo structure in a vkAllocateMemory command.

The VkImportMetalBufferInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalBufferInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    MTLBuffer_id       mtlBuffer;
} VkImportMetalBufferInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mtlBuffer` is the Metal `id<MTLBuffer>` object that is to underlie the VkDeviceMemory.

The application **must** ensure that the configuration of the `id<MTLBuffer>` object is compatible with the configuration of the VkDeviceMemory. Failure to do so results in undefined behavior.

Valid Usage (Implicit)

- VUID-VkImportMetalBufferInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_METAL_BUFFER_INFO_EXT

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

The type `id<MTLBuffer>` is defined in Apple's Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of MTLBuffer_id is provided in the Vulkan headers:

```
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLBuffer;
typedef __unsafe_unretained id<MTLBuffer> MTLBuffer_id;
#else
typedef void* MTLBuffer_id;
#endif
```

To export a Metal `MTLTexture` object underlying a VkImage, VkImageView, or VkBufferView object, include a `VkExportMetalTextureInfoEXT` structure in the `pNext` chain of the `pMetalObjectsInfo` parameter of a vkExportMetalObjectsEXT call.

The `VkExportMetalTextureInfoEXT` structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalTextureInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkImage                  image;
    VkImageView              imageView;
    VkBufferView             bufferView;
    VkImageAspectFlagBits    plane;
    MTLTexture_id            mtlTexture;
} VkExportMetalTextureInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is VK_NULL_HANDLE or a VkImage.
- `imageView` is VK_NULL_HANDLE or a VkImageView.
- `bufferView` is VK_NULL_HANDLE or a VkBufferView.
- `plane` specifies the plane of a multi-planar VkImage or VkImageView.
- `mtlTexture` is the Metal `id<MTLTexture>` object underlying the VkImage, VkImageView, or VkBufferView object in `image`, `imageView`, or `bufferView`, respectively, at the plane indicated in `plane`. The implementation will return the `MTLTexture` in this member, or it will return `NULL` if no `MTLTexture` could be found underlying the VkImage, VkImageView, or VkBufferView object, at the plane indicated in `plane`.

Valid Usage (Implicit)

- VUID-VkExportMetalTextureInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXPORT_METAL_TEXTURE_INFO_EXT
- VUID-VkExportMetalTextureInfoEXT-image-parameter
  If `image` is not VK_NULL_HANDLE, `image` **must** be a valid VkImage handle
- VUID-VkExportMetalTextureInfoEXT-imageView-parameter
  If `imageView` is not VK_NULL_HANDLE, `imageView` **must** be a valid VkImageView handle
- VUID-VkExportMetalTextureInfoEXT-bufferView-parameter
  If `bufferView` is not VK_NULL_HANDLE, `bufferView` **must** be a valid VkBufferView handle
- VUID-VkExportMetalTextureInfoEXT-plane-parameter
  `plane` **must** be a valid VkImageAspectFlagBits value
- VUID-VkExportMetalTextureInfoEXT-commonparent
  Each of `bufferView`, `image`, and `imageView` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Structure Chaining

Extends the structure

- VkExportMetalObjectsInfoEXT

To import one or more existing Metal `MTLTexture` objects to underlie a VkImage object, include one or more `VkImportMetalTextureInfoEXT` structures in the `pNext` chain of the VkImageCreateInfo structure in a vkCreateImage command.

The `VkImportMetalTextureInfoEXT` structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalTextureInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkImageAspectFlagBits    plane;
    MTLTexture_id            mtlTexture;
} VkImportMetalTextureInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `plane` specifies the plane of the VkImage that the `id<MTLTexture>` object should be attached to.
- `mtlTexture` is the Metal `id<MTLTexture>` object that is to underlie the VkImage plane.

The `pNext` chain **must** include one `VkImportMetalTextureInfoEXT` structure for each plane in the VkImage. The application **must** ensure that the configuration of the Metal `id<MTLTexture>` objects is compatible with the configuration of the VkImage. Failure to do so results in undefined behavior.

NOTE Due to `id<MTLTexture>` already being backed by memory, images created with `VkImportMetalTextureInfoEXT` in the `pNext` of the VkImageCreateInfo will be treated as bound to a VkDeviceMemory.

Valid Usage (Implicit)

- VUID-VkImportMetalTextureInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_METAL_TEXTURE_INFO_EXT
- VUID-VkImportMetalTextureInfoEXT-plane-parameter
  `plane` **must** be a valid VkImageAspectFlagBits value

Structure Chaining

Extends the structure

- VkImageCreateInfo

The type id<MTLTexture> is defined in Apple's Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of MTLTexture_id is provided in the Vulkan headers:

```
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLTexture;
typedef __unsafe_unretained id<MTLTexture> MTLTexture_id;
#else
typedef void* MTLTexture_id;
#endif
```

To export the Metal IOSurfaceRef object underlying a VkImage object, include a VkExportMetalIOSurfaceInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalIOSurfaceInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalIOSurfaceInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
    IOSurfaceRef       ioSurface;
} VkExportMetalIOSurfaceInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- image is a VkImage.
- ioSurface is the Metal IOSurfaceRef object underlying the VkImage object in image. The implementation will return the IOSurfaceRef in this member, or it will return NULL if no IOSurfaceRef could be found underlying the VkImage object.

Valid Usage (Implicit)

- VUID-VkExportMetalIOSurfaceInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXPORT_METAL_IO_SURFACE_INFO_EXT
- VUID-VkExportMetalIOSurfaceInfoEXT-image-parameter
  image **must** be a valid VkImage handle

Structure Chaining

Extends the structure

- VkExportMetalObjectsInfoEXT

To import, or create, a Metal IOSurfaceRef object to underlie a VkImage object, include a VkImportMetalIOSurfaceInfoEXT structure in the pNext chain of the VkImageCreateInfo structure in a vkCreateImage command.

The VkImportMetalIOSurfaceInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalIOSurfaceInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    IOSurfaceRef       ioSurface;
} VkImportMetalIOSurfaceInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- ioSurface is VK_NULL_HANDLE or the Metal IOSurfaceRef object that is to underlie the VkImage.

If ioSurface is not VK_NULL_HANDLE, it will be used to underlie the VkImage. If ioSurface is VK_NULL_HANDLE, the implementation will create a new IOSurface to underlie the VkImage.

If provided, the application **must** ensure that the configuration of the IOSurfaceRef object is compatible with the configuration of the VkImage. Failure to do so results in undefined behavior.

Valid Usage (Implicit)

- VUID-VkImportMetalIOSurfaceInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMPORT_METAL_IO_SURFACE_INFO_EXT

Structure Chaining

Extends the structure

- VkImageCreateInfo

The type IOSurfaceRef is defined in Apple's CoreGraphics framework, but to remove an unnecessary compile time dependency, an incomplete type definition of IOSurfaceRef is provided in the Vulkan headers:

```
// Provided by VK_EXT_metal_objects
typedef struct __IOSurface* IOSurfaceRef;
```

To export the Metal MTLSharedEvent object underlying a VkSemaphore or VkEvent object, include a VkExportMetalSharedEventInfoEXT structure in the pNext chain of the pMetalObjectsInfo parameter of a vkExportMetalObjectsEXT call.

The VkExportMetalSharedEventInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkExportMetalSharedEventInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkSemaphore          semaphore;
    VkEvent              event;
    MTLSharedEvent_id    mtlSharedEvent;
} VkExportMetalSharedEventInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- semaphore is VK_NULL_HANDLE or a VkSemaphore.
- event is VK_NULL_HANDLE or a VkEvent.
- mtlSharedEvent is the Metal id<MTLSharedEvent> object underlying the VkSemaphore or VkEvent object in semaphore or event, respectively. The implementation will return the MTLSharedEvent in this member, or it will return NULL if no MTLSharedEvent could be found underlying the VkSemaphore or VkEvent object.

Valid Usage (Implicit)

- VUID-VkExportMetalSharedEventInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXPORT_METAL_SHARED_EVENT_INFO_EXT
- VUID-VkExportMetalSharedEventInfoEXT-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore **must** be a valid VkSemaphore handle
- VUID-VkExportMetalSharedEventInfoEXT-event-parameter
  If event is not VK_NULL_HANDLE, event **must** be a valid VkEvent handle
- VUID-VkExportMetalSharedEventInfoEXT-commonparent
  Both of event, and semaphore that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Structure Chaining

Extends the structure

- VkExportMetalObjectsInfoEXT

To import a Metal id<MTLSharedEvent> object to underlie a VkSemaphore or VkEvent object, include a VkImportMetalSharedEventInfoEXT structure in the pNext chain of the VkSemaphoreCreateInfo or VkEventCreateInfo structure in a vkCreateSemaphore or vkCreateEvent command, respectively.

The VkImportMetalSharedEventInfoEXT structure is defined as:

```
// Provided by VK_EXT_metal_objects
typedef struct VkImportMetalSharedEventInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    MTLSharedEvent_id    mtlSharedEvent;
} VkImportMetalSharedEventInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mtlSharedEvent` is the Metal `id<MTLSharedEvent>` object that is to underlie the VkSemaphore or VkEvent.

If the `pNext` chain of the VkSemaphoreCreateInfo structure includes both `VkImportMetalSharedEventInfoEXT` and VkSemaphoreTypeCreateInfo, the `signaledValue` property of the imported `id<MTLSharedEvent>` object will be set to VkSemaphoreTypeCreateInfo::`initialValue`.

Valid Usage (Implicit)

- VUID-VkImportMetalSharedEventInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_METAL_SHARED_EVENT_INFO_EXT

Structure Chaining

Extends the structures

- VkEventCreateInfo
- VkSemaphoreCreateInfo

The type `id<MTLSharedEvent>` is defined in Apple's Metal framework, but to remove an unnecessary compile time dependency, an incomplete type definition of MTLSharedEvent_id is provided in the Vulkan headers:

```
// Provided by VK_EXT_metal_objects
#ifdef __OBJC__
@protocol MTLSharedEvent;
typedef __unsafe_unretained id<MTLSharedEvent> MTLSharedEvent_id;
#else
typedef void* MTLSharedEvent_id;
#endif
```

11.2.11. QNX Screen Buffer External Memory

To import memory created outside of the current Vulkan instance from a QNX Screen buffer, add a `VkImportScreenBufferInfoQNX` structure to the `pNext` chain of the VkMemoryAllocateInfo structure.

The VkImportScreenBufferInfoQNX structure is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkImportScreenBufferInfoQNX {
    VkStructureType           sType;
    const void*               pNext;
    struct _screen_buffer*    buffer;
} VkImportScreenBufferInfoQNX;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- buffer is a pointer to a struct _screen_buffer, the QNX Screen buffer to import.

The implementation **may** not acquire a reference to the imported Screen buffer. Therefore, the application **must** ensure that the object referred to by buffer stays valid as long as the device memory to which it is imported is being used.

Valid Usage

- VUID-VkImportScreenBufferInfoQNX-buffer-08966
  If buffer is not NULL, QNX Screen Buffers **must** be supported for import, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties
- VUID-VkImportScreenBufferInfoQNX-buffer-08967
  If buffer is not NULL, it **must** be a pointer to a valid QNX Screen buffer

Valid Usage (Implicit)

- VUID-VkImportScreenBufferInfoQNX-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMPORT_SCREEN_BUFFER_INFO_QNX

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To determine the memory parameters to use when importing a QNX Screen buffer, call:

```
// Provided by VK_QNX_external_memory_screen_buffer
VkResult vkGetScreenBufferPropertiesQNX(
    VkDevice                                    device,
    const struct _screen_buffer*                buffer,
    VkScreenBufferPropertiesQNX*                pProperties);
```

- `device` is the logical device that will be importing `buffer`.
- `buffer` is the QNX Screen buffer which will be imported.
- `pProperties` is a pointer to a VkScreenBufferPropertiesQNX structure in which the properties of `buffer` are returned.

Valid Usage

- VUID-vkGetScreenBufferPropertiesQNX-buffer-08968
  `buffer` **must** be a valid QNX Screen buffer

Valid Usage (Implicit)

- VUID-vkGetScreenBufferPropertiesQNX-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetScreenBufferPropertiesQNX-buffer-parameter
  `buffer` **must** be a valid pointer to a valid `_screen_buffer` value
- VUID-vkGetScreenBufferPropertiesQNX-pProperties-parameter
  `pProperties` **must** be a valid pointer to a VkScreenBufferPropertiesQNX structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkScreenBufferPropertiesQNX` structure returned is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkScreenBufferPropertiesQNX {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       allocationSize;
    uint32_t           memoryTypeBits;
} VkScreenBufferPropertiesQNX;
```

- `sType` is a VkStructureType value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `allocationSize` is the size of the external memory.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified Screen buffer **can** be imported as.

Valid Usage (Implicit)

- VUID-VkScreenBufferPropertiesQNX-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SCREEN_BUFFER_PROPERTIES_QNX
- VUID-VkScreenBufferPropertiesQNX-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkScreenBufferFormatPropertiesQNX
- VUID-VkScreenBufferPropertiesQNX-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique

To obtain format properties of a QNX Screen buffer, include a `VkScreenBufferFormatPropertiesQNX` structure in the `pNext` chain of the VkScreenBufferPropertiesQNX structure passed to vkGetScreenBufferPropertiesQNX. This structure is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkScreenBufferFormatPropertiesQNX {
    VkStructureType                 sType;
    void*                           pNext;
    VkFormat                        format;
    uint64_t                        externalFormat;
    uint64_t                        screenUsage;
    VkFormatFeatureFlags            formatFeatures;
    VkComponentMapping              samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion   suggestedYcbcrModel;
    VkSamplerYcbcrRange             suggestedYcbcrRange;
    VkChromaLocation                suggestedXChromaOffset;
    VkChromaLocation                suggestedYChromaOffset;
} VkScreenBufferFormatPropertiesQNX;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the Vulkan format corresponding to the Screen buffer's format or VK_FORMAT_UNDEFINED if there is not an equivalent Vulkan format.
- `externalFormat` is an implementation-defined external format identifier for use with VkExternalFormatQNX. It **must** not be zero.
- `screenUsage` is an implementation-defined external usage identifier for the QNX Screen buffer.
- `formatFeatures` describes the capabilities of this external format when used with an image bound to memory imported from `buffer`.

- samplerYcbcrConversionComponents is the component swizzle that **should** be used in VkSamplerYcbcrConversionCreateInfo.
- suggestedYcbcrModel is a suggested color model to use in the VkSamplerYcbcrConversionCreateInfo.
- suggestedYcbcrRange is a suggested numerical value range to use in VkSamplerYcbcrConversionCreateInfo.
- suggestedXChromaOffset is a suggested X chroma offset to use in VkSamplerYcbcrConversionCreateInfo.
- suggestedYChromaOffset is a suggested Y chroma offset to use in VkSamplerYcbcrConversionCreateInfo.

If the QNX Screen buffer has one of the formats listed in the QNX Screen Format Equivalence table, then format **must** have the equivalent Vulkan format listed in the table. Otherwise, format **may** be VK_FORMAT_UNDEFINED, indicating the QNX Screen buffer **can** only be used with an external format. The formatFeatures member **must** include VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT and **should** include VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT and VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT.

Valid Usage (Implicit)

- VUID-VkScreenBufferFormatPropertiesQNX-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SCREEN_BUFFER_FORMAT_PROPERTIES_QNX

Structure Chaining

Extends the structure

- VkScreenBufferPropertiesQNX

11.2.12. Metal External Memory

To import memory from a Metal handle, add a VkImportMemoryMetalHandleInfoEXT structure to the pNext chain of the VkMemoryAllocateInfo structure.

The VkImportMemoryMetalHandleInfoEXT structure is defined as:

```
// Provided by VK_EXT_external_memory_metal
typedef struct VkImportMemoryMetalHandleInfoEXT {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlagBits    handleType;
    void*                                 handle;
} VkImportMemoryMetalHandleInfoEXT;
```

- sType is a VkStructureType value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the type of `handle`.
- `handle` is `NULL` or the external handle to import.

Importing memory object payloads from Metal handles shares the ownership of the handle to the Vulkan implementation.

Applications **can** import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.

Valid Usage

- VUID-VkImportMemoryMetalHandleInfoEXT-handleType-10408
  If `handleType` is not `0`, it **must** be supported for import, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties
- VUID-VkImportMemoryMetalHandleInfoEXT-handle-10409
  The memory from which `handle` was exported **must** have been created on the same underlying physical device as `device`
- VUID-VkImportMemoryMetalHandleInfoEXT-handleType-10410
  If `handleType` is not `0`, it **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLBUFFER_BIT_EXT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLTEXTURE_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLHEAP_BIT_EXT
- VUID-VkImportMemoryMetalHandleInfoEXT-handleType-10411
  If `handleType` is not `0`, `handle` **must** be a valid non-NULL handle of the type specified by `handleType`
- VUID-VkImportMemoryMetalHandleInfoEXT-handle-10412
  `handle` **must** obey any requirements listed for `handleType` in external memory handle types compatibility

Valid Usage (Implicit)

- VUID-VkImportMemoryMetalHandleInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_MEMORY_METAL_HANDLE_INFO_EXT
- VUID-VkImportMemoryMetalHandleInfoEXT-handleType-parameter
  If `handleType` is not `0`, `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To export a Metal handle representing the payload of a Vulkan device memory object, call:

```
// Provided by VK_EXT_external_memory_metal
VkResult vkGetMemoryMetalHandleEXT(
    VkDevice                                    device,
    const VkMemoryGetMetalHandleInfoEXT*        pGetMetalHandleInfo,
    void**                                      pHandle);
```

- `device` is the logical device that created the device memory being exported.
- `pGetMetalHandleInfo` is a pointer to a VkMemoryGetMetalHandleInfoEXT structure containing parameters of the export operation.
- `pHandle` will return the Metal handle representing the payload of the device memory object.

Unless the app retains the handle object returned by the call, the lifespan will be the same as the associated `VkDeviceMemory`.

Valid Usage (Implicit)

- VUID-vkGetMemoryMetalHandleEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryMetalHandleEXT-pGetMetalHandleInfo-parameter
  `pGetMetalHandleInfo` **must** be a valid pointer to a valid VkMemoryGetMetalHandleInfoEXT structure
- VUID-vkGetMemoryMetalHandleEXT-pHandle-parameter
  `pHandle` **must** be a valid pointer to a pointer value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkMemoryGetMetalHandleInfoEXT` structure is defined as:

```
// Provided by VK_EXT_external_memory_metal
typedef struct VkMemoryGetMetalHandleInfoEXT {
    VkStructureType                       sType;
    const void*                           pNext;
    VkDeviceMemory                        memory;
    VkExternalMemoryHandleTypeFlagBits    handleType;
} VkMemoryGetMetalHandleInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See VkExternalMemoryHandleTypeFlagBits for a description of the properties of the defined external memory handle types.

Valid Usage

- VUID-VkMemoryGetMetalHandleInfoEXT-memory-10413
  `memory` **must** have been created with a valid VkExportMemoryAllocateInfo
- VUID-VkMemoryGetMetalHandleInfoEXT-handleType-10414
  `handleType` **must** have been included in VkExportMemoryAllocateInfo::`handleTypes` when `memory` was created
- VUID-VkMemoryGetMetalHandleInfoEXT-handleType-10415
  `handleType` **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLBUFFER_BIT_EXT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLTEXTURE_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLHEAP_BIT_EXT

Valid Usage (Implicit)

- VUID-VkMemoryGetMetalHandleInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_GET_METAL_HANDLE_INFO_EXT
- VUID-VkMemoryGetMetalHandleInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkMemoryGetMetalHandleInfoEXT-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-VkMemoryGetMetalHandleInfoEXT-handleType-parameter
  `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value

Metal memory handles compatible with Vulkan **may** also be created by non-Vulkan APIs using

methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```
// Provided by VK_EXT_external_memory_metal
VkResult vkGetMemoryMetalHandlePropertiesEXT(
    VkDevice                                    device,
    VkExternalMemoryHandleTypeFlagBits          handleType,
    const void*                                 pHandle,
    VkMemoryMetalHandlePropertiesEXT*           pMemoryMetalHandleProperties);
```

- `device` is the logical device that will be importing `pHandle`.
- `handleType` is a VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle `pHandle`.
- `pHandle` is the handle which will be imported.
- `pMemoryMetalHandleProperties` is a pointer to a VkMemoryMetalHandlePropertiesEXT structure in which properties of `pHandle` are returned.

Valid Usage

- VUID-vkGetMemoryMetalHandlePropertiesEXT-handle-10416
  `pHandle` **must** point to a valid id<MTLBuffer>, id<MTLTexture> or id<MTLDevice>
- VUID-vkGetMemoryMetalHandlePropertiesEXT-handleType-10417
  `handleType` **must** be VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLBUFFER_BIT_EXT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLTEXTURE_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLHEAP_BIT_EXT

Valid Usage (Implicit)

- VUID-vkGetMemoryMetalHandlePropertiesEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryMetalHandlePropertiesEXT-handleType-parameter
  `handleType` **must** be a valid VkExternalMemoryHandleTypeFlagBits value
- VUID-vkGetMemoryMetalHandlePropertiesEXT-pHandle-parameter
  `pHandle` **must** be a pointer value
- VUID-vkGetMemoryMetalHandlePropertiesEXT-pMemoryMetalHandleProperties-parameter
  `pMemoryMetalHandleProperties` **must** be a valid pointer to a VkMemoryMetalHandlePropertiesEXT structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkMemoryMetalHandlePropertiesEXT structure returned is defined as:

```
// Provided by VK_EXT_external_memory_metal
typedef struct VkMemoryMetalHandlePropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryMetalHandlePropertiesEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memoryTypeBits is a bitmask containing one bit set for every memory type which the specified Metal handle **can** be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryMetalHandlePropertiesEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_METAL_HANDLE_PROPERTIES_EXT
- VUID-VkMemoryMetalHandlePropertiesEXT-pNext-pNext
  pNext **must** be NULL

11.2.13. Device Group Memory Allocations

If the pNext chain of VkMemoryAllocateInfo includes a VkMemoryAllocateFlagsInfo structure, then that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The VkMemoryAllocateFlagsInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryAllocateFlagsInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkMemoryAllocateFlags    flags;
    uint32_t                 deviceMask;
} VkMemoryAllocateFlagsInfo;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkMemoryAllocateFlagsInfo
typedef VkMemoryAllocateFlagsInfo VkMemoryAllocateFlagsInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkMemoryAllocateFlagBits controlling the allocation.
- `deviceMask` is a mask of physical devices in the logical device, indicating that memory **must** be allocated on each device in the mask, if VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is set in `flags`.

If VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is not set, the number of instances allocated depends on whether VK_MEMORY_HEAP_MULTI_INSTANCE_BIT is set in the memory heap. If VK_MEMORY_HEAP_MULTI_INSTANCE_BIT is set, then memory is allocated for every physical device in the logical device (as if `deviceMask` has bits set for all device indices). If VK_MEMORY_HEAP_MULTI_INSTANCE_BIT is not set, then a single instance of memory is allocated (as if `deviceMask` is set to one).

On some implementations, allocations from a multi-instance heap **may** consume memory on all physical devices even if the `deviceMask` excludes some devices. If VkPhysicalDeviceGroupProperties::`subsetAllocation` is VK_TRUE, then memory is only consumed for the devices in the device mask.

NOTE	In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.

Valid Usage

- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00675
  If VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is set, `deviceMask` **must** be a valid device mask
- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00676
  If VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT is set, `deviceMask` **must** not be zero
- VUID-VkMemoryAllocateFlagsInfo-flags-10760
  If the allocation is performing a memory import operation, then `flags` **must** not contain

VK_MEMORY_ALLOCATE_ZERO_INITIALIZE_BIT_EXT

- VUID-VkMemoryAllocateFlagsInfo-flags-10761
  If the allocation uses protected memory, then `flags` **must** not contain VK_MEMORY_ALLOCATE_ZERO_INITIALIZE_BIT_EXT

Valid Usage (Implicit)

- VUID-VkMemoryAllocateFlagsInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO
- VUID-VkMemoryAllocateFlagsInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkMemoryAllocateFlagBits values

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

Bits which **can** be set in VkMemoryAllocateFlagsInfo::`flags`, controlling device memory allocation, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,
  // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT = 0x00000002,
  // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000004,
  // Provided by VK_EXT_zero_initialize_device_memory
    VK_MEMORY_ALLOCATE_ZERO_INITIALIZE_BIT_EXT = 0x00000008,
  // Provided by VK_KHR_device_group
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT,
  // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT,
  // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR =
VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkMemoryAllocateFlagBits;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkMemoryAllocateFlagBits
typedef VkMemoryAllocateFlagBits VkMemoryAllocateFlagBitsKHR;
```

- VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT specifies that memory will be allocated for the

devices in VkMemoryAllocateFlagsInfo::deviceMask.

- VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT specifies that the memory **can** be attached to a buffer object created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT usage flag set.
- VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT specifies that the memory's address **can** be saved and reused on a subsequent run (e.g. for trace capture and replay), see VkBufferOpaqueCaptureAddressCreateInfo for more detail. If this bit is set, VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT **must** also be set.
- VK_MEMORY_ALLOCATE_ZERO_INITIALIZE_BIT_EXT specifies that the memory will be zeroed automatically by the implementation before the application is able to access it.

NOTE

Setting VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT is not expected to reduce performance on any known implementation. Applications should feel free to set it on every allocation, to help avoid needing to know in advance whether a device address will be needed for any buffer bound to the memory. Some development and/or debugging tools, such as a capture/replay layer, might have overhead for memory allocated with this bit, as they might need to track the device addresses of those allocations. However, this is not expected to be significant enough to be a reason for applications to avoid setting the bit unconditionally.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkMemoryAllocateFlags;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkMemoryAllocateFlags
typedef VkMemoryAllocateFlags VkMemoryAllocateFlagsKHR;
```

VkMemoryAllocateFlags is a bitmask type for setting a mask of zero or more VkMemoryAllocateFlagBits.

11.2.14. Opaque Capture Address Allocation

To request a specific device address for a memory allocation, add a VkMemoryOpaqueCaptureAddressAllocateInfo structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkMemoryOpaqueCaptureAddressAllocateInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkMemoryOpaqueCaptureAddressAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfo;
```

```
// Provided by VK_KHR_buffer_device_address
// Equivalent to VkMemoryOpaqueCaptureAddressAllocateInfo
typedef VkMemoryOpaqueCaptureAddressAllocateInfo
VkMemoryOpaqueCaptureAddressAllocateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `opaqueCaptureAddress` is the opaque capture address requested for the memory allocation.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, it **should** be an address retrieved from vkGetDeviceMemoryOpaqueCaptureAddress on an identically created memory allocation on the same implementation.

NOTE

In most cases, it is expected that a non-zero `opaqueCaptureAddress` is an address retrieved from vkGetDeviceMemoryOpaqueCaptureAddress on an identically created memory allocation. If this is not the case, it is likely that VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

Valid Usage (Implicit)

- VUID-VkMemoryOpaqueCaptureAddressAllocateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

11.2.15. Freeing Device Memory

To free a memory object, call:

```
// Provided by VK_VERSION_1_0
void vkFreeMemory(
    VkDevice                                    device,
    VkDeviceMemory                              memory,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that owns the memory.
- `memory` is the VkDeviceMemory object to be freed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Before freeing a memory object, an application **must** ensure the memory object is no longer in use by the device — for example by command buffers in the *pending state*. Memory **can** be freed whilst still bound to resources, but those resources **must** not be used afterwards. Freeing a memory object releases the reference it held, if any, to its payload. If there are still any bound images or buffers, the memory object's payload **may** not be immediately released by the implementation, but **must** be released by the time all bound images and buffers have been destroyed. Once all references to a payload are released, it is returned to the heap from which it was allocated.

How memory objects are bound to Images and Buffers is described in detail in the Resource Memory Association section.

If a memory object is mapped at the time it is freed, it is implicitly unmapped.

NOTE	As described below, host writes are not implicitly flushed when the memory object is unmapped, but the implementation **must** guarantee that writes that have not been flushed do not affect any other memory.

Valid Usage

- VUID-vkFreeMemory-memory-00677
  All submitted commands that refer to `memory` (via images or buffers) **must** have completed execution

Valid Usage (Implicit)

- VUID-vkFreeMemory-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkFreeMemory-memory-parameter
  If `memory` is not VK_NULL_HANDLE, `memory` **must** be a valid VkDeviceMemory handle
- VUID-vkFreeMemory-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkFreeMemory-memory-parent
  If `memory` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `memory` **must** be externally synchronized

11.2.16. Host Access to Device Memory Objects

Memory objects created with vkAllocateMemory are not directly host accessible.

Memory objects created with the memory property VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT are considered *mappable*. Memory objects **must** be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkMapMemory(
    VkDevice                                    device,
    VkDeviceMemory                              memory,
    VkDeviceSize                                offset,
    VkDeviceSize                                size,
    VkMemoryMapFlags                            flags,
    void**                                      ppData);
```

- `device` is the logical device that owns the memory.
- `memory` is the VkDeviceMemory object to be mapped.
- `offset` is a zero-based byte offset from the beginning of the memory object.
- `size` is the size of the memory range to map, or VK_WHOLE_SIZE to map from `offset` to the end of the allocation.
- `flags` is a bitmask of VkMemoryMapFlagBits specifying additional parameters of the memory map operation.
- `ppData` is a pointer to a `void*` variable in which a host-accessible pointer to the beginning of the mapped range is returned. The value of the returned pointer minus `offset` **must** be aligned to VkPhysicalDeviceLimits::`minMemoryMapAlignment`.

After a successful call to `vkMapMemory` the memory object `memory` is considered to be currently *host mapped*.

NOTE It is an application error to call `vkMapMemory` on a memory object that is already *host mapped*.

NOTE `vkMapMemory` will fail if the implementation is unable to allocate an appropriately sized contiguous virtual address range, e.g. due to virtual address space fragmentation or platform limits. In such cases, `vkMapMemory` **must** return VK_ERROR_MEMORY_MAP_FAILED. The application **can** improve the likelihood of success by reducing the size of the mapped range and/or removing unneeded

mappings using vkUnmapMemory.

vkMapMemory does not check whether the device memory is currently in use before returning the host-accessible pointer. The application **must** guarantee that any previously submitted command that writes to this range has completed before the host reads from or writes to that range, and that any previously submitted command that reads from that range has completed before the host writes to that region (see here for details on fulfilling such a guarantee). If the device memory was allocated without the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, these guarantees **must** be made for an extended range: the application **must** round down the start of the range to the nearest multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize, and round the end of the range up to the nearest multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize.

While a range of device memory is host mapped, the application is responsible for synchronizing both device and host access to that memory range.

NOTE It is important for the application developer to become meticulously familiar with all of the mechanisms described in the chapter on Synchronization and Cache Control as they are crucial to maintaining memory access ordering.

Calling vkMapMemory is equivalent to calling vkMapMemory2 with an empty pNext chain.

Valid Usage

- VUID-vkMapMemory-memory-00678
  memory **must** not be currently host mapped
- VUID-vkMapMemory-offset-00679
  offset **must** be less than the size of memory
- VUID-vkMapMemory-size-00680
  If size is not equal to VK_WHOLE_SIZE, size **must** be greater than 0
- VUID-vkMapMemory-size-00681
  If size is not equal to VK_WHOLE_SIZE, size **must** be less than or equal to the size of the memory minus offset
- VUID-vkMapMemory-memory-00682
  memory **must** have been created with a memory type that reports VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT
- VUID-vkMapMemory-memory-00683
  memory **must** not have been allocated with multiple instances
- VUID-vkMapMemory-flags-09568
  VK_MEMORY_MAP_PLACED_BIT_EXT **must** not be set in flags

Valid Usage (Implicit)

- VUID-vkMapMemory-device-parameter
  device **must** be a valid VkDevice handle

- VUID-vkMapMemory-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-vkMapMemory-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkMemoryMapFlagBits values
- VUID-vkMapMemory-ppData-parameter
  `ppData` **must** be a valid pointer to a pointer value
- VUID-vkMapMemory-memory-parent
  `memory` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `memory` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_MEMORY_MAP_FAILED
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Bits which **can** be set in vkMapMemory::`flags` and VkMemoryMapInfo::`flags`, specifying additional properties of a memory map, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkMemoryMapFlagBits {
  // Provided by VK_EXT_map_memory_placed
    VK_MEMORY_MAP_PLACED_BIT_EXT = 0x00000001,
} VkMemoryMapFlagBits;
```

- VK_MEMORY_MAP_PLACED_BIT_EXT requests that the implementation place the memory map at the virtual address specified by the application via VkMemoryMapPlacedInfoEXT ::`pPlacedAddress`, replacing any existing mapping at that address. This flag **must** not be used with vkMapMemory as there is no way to specify the placement address.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryMapFlags;
```

VkMemoryMapFlags is a bitmask type for setting a mask of zero or more VkMemoryMapFlagBits.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```
// Provided by VK_VERSION_1_4
VkResult vkMapMemory2(
    VkDevice                                    device,
    const VkMemoryMapInfo*                      pMemoryMapInfo,
    void**                                      ppData);
```

```
// Provided by VK_KHR_map_memory2
// Equivalent to vkMapMemory2
VkResult vkMapMemory2KHR(
    VkDevice                                    device,
    const VkMemoryMapInfo*                      pMemoryMapInfo,
    void**                                      ppData);
```

- device is the logical device that owns the memory.
- pMemoryMapInfo is a pointer to a VkMemoryMapInfo structure describing parameters of the map.
- ppData is a pointer to a void * variable in which is returned a host-accessible pointer to the beginning of the mapped range. This pointer minus VkMemoryMapInfo::offset **must** be aligned to at least VkPhysicalDeviceLimits::minMemoryMapAlignment.

This function behaves identically to vkMapMemory except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.

Valid Usage (Implicit)

- VUID-vkMapMemory2-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkMapMemory2-pMemoryMapInfo-parameter
  pMemoryMapInfo **must** be a valid pointer to a valid VkMemoryMapInfo structure
- VUID-vkMapMemory2-ppData-parameter
  ppData **must** be a valid pointer to a pointer value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_MEMORY_MAP_FAILED
- VK_ERROR_OUT_OF_DEVICE_MEMORY

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkMemoryMapInfo structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkMemoryMapInfo {
    VkStructureType     sType;
    const void*         pNext;
    VkMemoryMapFlags    flags;
    VkDeviceMemory      memory;
    VkDeviceSize        offset;
    VkDeviceSize        size;
} VkMemoryMapInfo;
```

```
// Provided by VK_KHR_map_memory2
// Equivalent to VkMemoryMapInfo
typedef VkMemoryMapInfo VkMemoryMapInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkMemoryMapFlagBits specifying additional parameters of the memory map operation.
- memory is the VkDeviceMemory object to be mapped.
- offset is a zero-based byte offset from the beginning of the memory object.
- size is the size of the memory range to map, or VK_WHOLE_SIZE to map from offset to the end of the allocation.

Valid Usage

- VUID-VkMemoryMapInfo-memory-07958
  memory **must** not be currently host mapped
- VUID-VkMemoryMapInfo-offset-07959
  offset **must** be less than the size of memory
- VUID-VkMemoryMapInfo-size-07960
  If size is not equal to VK_WHOLE_SIZE, size **must** be greater than 0
- VUID-VkMemoryMapInfo-size-07961
  If size is not equal to VK_WHOLE_SIZE, size **must** be less than or equal to the size of the memory minus offset
- VUID-VkMemoryMapInfo-memory-07962

memory **must** have been created with a memory type that reports VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT

- VUID-VkMemoryMapInfo-memory-07963
  memory **must** not have been allocated with multiple instances
- VUID-VkMemoryMapInfo-flags-09569
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags, the memoryMapPlaced feature **must** be enabled
- VUID-VkMemoryMapInfo-flags-09570
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags, the pNext chain **must** include a VkMemoryMapPlacedInfoEXT structure and VkMemoryMapPlacedInfoEXT::pPlacedAddress **must** not be NULL
- VUID-VkMemoryMapInfo-flags-09571
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and the memoryMapRangePlaced feature is not enabled, offset **must** be zero
- VUID-VkMemoryMapInfo-flags-09572
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and the memoryMapRangePlaced feature is not enabled, size **must** be VK_WHOLE_SIZE or VkMemoryAllocateInfo::allocationSize
- VUID-VkMemoryMapInfo-flags-09573
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and the memoryMapRangePlaced feature is enabled, offset **must** be aligned to an integer multiple of VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment
- VUID-VkMemoryMapInfo-flags-09574
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and size is not VK_WHOLE_SIZE, size **must** be aligned to an integer multiple of VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment
- VUID-VkMemoryMapInfo-flags-09651
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and size is VK_WHOLE_SIZE, VkMemoryAllocateInfo::allocationSize **must** be aligned to an integer multiple of VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment
- VUID-VkMemoryMapInfo-flags-09575
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags, the memory object **must** not have been imported from a handle type of VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT

Valid Usage (Implicit)

- VUID-VkMemoryMapInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MEMORY_MAP_INFO
- VUID-VkMemoryMapInfo-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkMemoryMapPlacedInfoEXT

- VUID-VkMemoryMapInfo-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkMemoryMapInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkMemoryMapFlagBits values
- VUID-VkMemoryMapInfo-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle

Host Synchronization

- Host access to `memory` **must** be externally synchronized

If VK_MEMORY_MAP_PLACED_BIT_EXT is set in `VkMemoryMapInfo`::`flags` and the `pNext` chain of VkMemoryMapInfo includes a `VkMemoryMapPlacedInfoEXT` structure, then that structure specifies the placement address of the memory map. The implementation will place the memory map at the specified address, replacing any existing maps in the specified memory range. Replacing memory maps in this way does not implicitly unmap Vulkan memory objects. Instead, the application **must** ensure no other Vulkan memory objects are mapped anywhere in the specified virtual address range. If successful, `ppData` will be set to the same value as `VkMemoryMapPlacedInfoEXT`::`pPlacedAddress` and `vkMapMemory2` will return VK_SUCCESS. If it cannot place the map at the requested address for any reason, the memory object is left unmapped and `vkMapMemory2` will return VK_ERROR_MEMORY_MAP_FAILED.

The `VkMemoryMapPlacedInfoEXT` structure is defined as:

```
// Provided by VK_EXT_map_memory_placed
typedef struct VkMemoryMapPlacedInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    void*              pPlacedAddress;
} VkMemoryMapPlacedInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pPlacedAddress` is the virtual address at which to place the address. If `VkMemoryMapInfo`::`flags` does not contain VK_MEMORY_MAP_PLACED_BIT_EXT, this value is ignored.

Valid Usage

- VUID-VkMemoryMapPlacedInfoEXT-pPlacedAddress-09577
  `pPlacedAddress` **must** be aligned to an integer multiple of `VkPhysicalDeviceMapMemoryPlacedPropertiesEXT`::`minPlacedMemoryMapAlignment`
- VUID-VkMemoryMapPlacedInfoEXT-pPlacedAddress-09578
  The address range specified by `pPlacedAddress` and `VkMemoryMapInfo`::`size` **must** not overlap

any existing Vulkan memory object mapping

Valid Usage (Implicit)

- VUID-VkMemoryMapPlacedInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_MAP_PLACED_INFO_EXT

Structure Chaining

Extends the structure

- VkMemoryMapInfo

Two commands are provided to enable applications to work with non-coherent memory allocations: `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`.

NOTE

If the memory object was created with the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are unnecessary and **may** have a performance cost. However, availability and visibility operations still need to be managed on the device. See the description of host access types for more information.

NOTE

While memory objects imported from a handle type of VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT are inherently mapped to host address space, they are not considered to be host mapped device memory unless they are explicitly host mapped using vkMapMemory. That means flushing or invalidating host caches with respect to host accesses performed on such memory through the original host pointer specified at import time is the responsibility of the application and **must** be performed with appropriate synchronization primitives provided by the platform which are outside the scope of Vulkan. `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`, however, **can** still be used on such memory objects to synchronize host accesses performed through the host pointer of the host mapped device memory range returned by vkMapMemory.

After a successful call to `vkMapMemory` or `vkMapMemory2` the memory object `memory` is considered to be currently *host mapped*.

To flush ranges of non-coherent memory from the host caches, call:

```
// Provided by VK_VERSION_1_0
VkResult vkFlushMappedMemoryRanges(
    VkDevice                                    device,
    uint32_t                                    memoryRangeCount,
    const VkMappedMemoryRange*                  pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of VkMappedMemoryRange structures describing the memory ranges to flush.

`vkFlushMappedMemoryRanges` guarantees that host writes to the memory ranges described by `pMemoryRanges` are made available to the host memory domain, such that they **can** be made available to the device memory domain via memory domain operations using the VK_ACCESS_HOST_WRITE_BIT access type.

The first synchronization scope includes all host operations that happened-before it, as defined by the host memory model.

NOTE

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call `_mm_sfence()`.

The second synchronization scope is empty.

The first access scope includes host writes to the specified memory ranges.

NOTE

When a host write to a memory location is made available in this way, each whole aligned set of `nonCoherentAtomSize` bytes that the memory location exists in will also be made available as if they were written by the host. For example, with a `nonCoherentAtomSize` of 128, if an application writes to the first byte of a memory object via a host mapping, the first 128 bytes of the memory object will be made available by this command. While the value of the following 127 bytes will be unchanged, this does count as an access for the purpose of synchronization, so care must be taken to avoid data races.

The second access scope is empty.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed **may** not ever be visible to the device. However, implementations **must** ensure that writes that have not been flushed do not become visible to any other memory.

NOTE

The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

Valid Usage (Implicit)

- VUID-vkFlushMappedMemoryRanges-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkFlushMappedMemoryRanges-pMemoryRanges-parameter
  `pMemoryRanges` **must** be a valid pointer to an array of `memoryRangeCount` valid VkMappedMemoryRange structures
- VUID-vkFlushMappedMemoryRanges-memoryRangeCount-arraylength
  `memoryRangeCount` **must** be greater than `0`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To invalidate ranges of non-coherent memory from the host caches, call:

```
// Provided by VK_VERSION_1_0
VkResult vkInvalidateMappedMemoryRanges(
    VkDevice                                    device,
    uint32_t                                    memoryRangeCount,
    const VkMappedMemoryRange*                  pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of VkMappedMemoryRange structures describing the memory ranges to invalidate.

`vkInvalidateMappedMemoryRanges` guarantees that device writes to the memory ranges described by `pMemoryRanges`, which have been made available to the host memory domain using the VK_ACCESS_HOST_WRITE_BIT and VK_ACCESS_HOST_READ_BIT access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

The first synchronization scope includes all host operations that happened-before it, as defined by the host memory model.

NOTE

This function does not synchronize with device operations directly - other host synchronization operations that depend on device operations such as vkWaitForFences must be executed beforehand. So for any non-coherent device write to be made visible to the host, there has to be a dependency chain along the following lines:

1. Device write
2. Device memory barrier including host reads in its second scope
3. Signal on the device (e.g. a fence signal operation)
4. Wait on the host (e.g. vkWaitForFences)
5. vkInvalidateMappedMemoryRanges

The second synchronization scope includes all host operations that happen-after it, as defined by the host memory model.

The first access scope is empty.

The second access scope includes host reads to the specified memory ranges.

NOTE

When a device write to a memory location is made visible to the host in this way, each whole aligned set of `nonCoherentAtomSize` bytes that the memory location exists in will also be made visible as if they were written by the device. For example, with a `nonCoherentAtomSize` of 128, if an application writes to the first byte of a memory object on the device, the first 128 bytes of the memory object will be made visible by this command. While the value of the following 127 bytes will be unchanged, this does count as an access for the purpose of synchronization, so care must be taken to avoid data races.

NOTE Mapping non-coherent memory does not implicitly invalidate that memory.

Valid Usage (Implicit)

- VUID-vkInvalidateMappedMemoryRanges-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkInvalidateMappedMemoryRanges-pMemoryRanges-parameter
  `pMemoryRanges` **must** be a valid pointer to an array of `memoryRangeCount` valid VkMappedMemoryRange structures
- VUID-vkInvalidateMappedMemoryRanges-memoryRangeCount-arraylength
  `memoryRangeCount` **must** be greater than `0`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkMappedMemoryRange structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMappedMemoryRange {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
    VkDeviceSize       offset;
    VkDeviceSize       size;
} VkMappedMemoryRange;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory is the memory object to which this range belongs.
- offset is the zero-based byte offset from the beginning of the memory object.
- size is either the size of the range, or VK_WHOLE_SIZE to affect the range from offset to the end of the current mapping of the allocation.

Valid Usage

- VUID-VkMappedMemoryRange-memory-00684
  memory **must** be currently host mapped
- VUID-VkMappedMemoryRange-size-00685
  If size is not equal to VK_WHOLE_SIZE, offset and size **must** specify a range contained within the currently mapped range of memory
- VUID-VkMappedMemoryRange-size-00686
  If size is equal to VK_WHOLE_SIZE, offset **must** be within the currently mapped range of memory
- VUID-VkMappedMemoryRange-offset-00687
  offset **must** be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize
- VUID-VkMappedMemoryRange-size-01389
  If size is equal to VK_WHOLE_SIZE, the end of the current mapping of memory **must** either be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize bytes from the beginning of the memory object, or be equal to the end of the memory object
- VUID-VkMappedMemoryRange-size-01390
  If size is not equal to VK_WHOLE_SIZE, size **must** either be a multiple of

VkPhysicalDeviceLimits::nonCoherentAtomSize, or offset plus size **must** equal the size of memory

Valid Usage (Implicit)

- VUID-VkMappedMemoryRange-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE
- VUID-VkMappedMemoryRange-pNext-pNext
  pNext **must** be NULL
- VUID-VkMappedMemoryRange-memory-parameter
  memory **must** be a valid VkDeviceMemory handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```
// Provided by VK_VERSION_1_0
void vkUnmapMemory(
    VkDevice                                    device,
    VkDeviceMemory                              memory);
```

- device is the logical device that owns the memory.
- memory is the memory object to be unmapped.

Calling vkUnmapMemory is equivalent to calling vkUnmapMemory2 with an empty pNext chain and flags set to zero.

Valid Usage

- VUID-vkUnmapMemory-memory-00689
  memory **must** be currently host mapped

Valid Usage (Implicit)

- VUID-vkUnmapMemory-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkUnmapMemory-memory-parameter
  memory **must** be a valid VkDeviceMemory handle
- VUID-vkUnmapMemory-memory-parent
  memory **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to `memory` **must** be externally synchronized

To unmap a memory object once host access to it is no longer needed by the application, call:

```
// Provided by VK_VERSION_1_4
VkResult vkUnmapMemory2(
    VkDevice                                    device,
    const VkMemoryUnmapInfo*                    pMemoryUnmapInfo);
```

```
// Provided by VK_KHR_map_memory2
// Equivalent to vkUnmapMemory2
VkResult vkUnmapMemory2KHR(
    VkDevice                                    device,
    const VkMemoryUnmapInfo*                    pMemoryUnmapInfo);
```

- `device` is the logical device that owns the memory.
- `pMemoryUnmapInfo` is a pointer to a VkMemoryUnmapInfo structure describing parameters of the unmap.

This function behaves identically to vkUnmapMemory except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.

Valid Usage (Implicit)

- VUID-vkUnmapMemory2-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkUnmapMemory2-pMemoryUnmapInfo-parameter
  `pMemoryUnmapInfo` **must** be a valid pointer to a valid VkMemoryUnmapInfo structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_MEMORY_MAP_FAILED
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkMemoryUnmapInfo` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkMemoryUnmapInfo {
    VkStructureType       sType;
    const void*           pNext;
    VkMemoryUnmapFlags    flags;
    VkDeviceMemory        memory;
} VkMemoryUnmapInfo;
```

```
// Provided by VK_KHR_map_memory2
// Equivalent to VkMemoryUnmapInfo
typedef VkMemoryUnmapInfo VkMemoryUnmapInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkMemoryUnmapFlagBits specifying additional parameters of the memory unmap operation.
- `memory` is the VkDeviceMemory object to be unmapped.

Valid Usage

- VUID-VkMemoryUnmapInfo-memory-07964
  `memory` **must** be currently host mapped
- VUID-VkMemoryUnmapInfo-flags-09579
  If VK_MEMORY_UNMAP_RESERVE_BIT_EXT is set in `flags`, the `memoryUnmapReserve` feature **must** be enabled
- VUID-VkMemoryUnmapInfo-flags-09580
  If VK_MEMORY_UNMAP_RESERVE_BIT_EXT is set in `flags`, the memory object **must** not have been imported from a handle type of VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT

Valid Usage (Implicit)

- VUID-VkMemoryUnmapInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_UNMAP_INFO
- VUID-VkMemoryUnmapInfo-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkMemoryUnmapInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkMemoryUnmapFlagBits values
- VUID-VkMemoryUnmapInfo-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle

Host Synchronization

- Host access to `memory` **must** be externally synchronized

Bits which **can** be set in VkMemoryUnmapInfo::`flags`, specifying additional properties of a memory unmap, are:

```
// Provided by VK_VERSION_1_4
typedef enum VkMemoryUnmapFlagBits {
  // Provided by VK_EXT_map_memory_placed
    VK_MEMORY_UNMAP_RESERVE_BIT_EXT = 0x00000001,
} VkMemoryUnmapFlagBits;
```

```
// Provided by VK_KHR_map_memory2
// Equivalent to VkMemoryUnmapFlagBits
typedef VkMemoryUnmapFlagBits VkMemoryUnmapFlagBitsKHR;
```

- VK_MEMORY_UNMAP_RESERVE_BIT_EXT requests that the virtual address range currently occupied by the memory map remain reserved after the vkUnmapMemory2 call completes. Future system memory map operations or calls to vkMapMemory or vkMapMemory2 will not return addresses in that range unless the range has since been unreserved by the client or the mapping is explicitly placed in that range by calling vkMapMemory2 with VK_MEMORY_MAP_PLACED_BIT_EXT, or doing the system memory map equivalent. When VK_MEMORY_UNMAP_RESERVE_BIT_EXT is set, the memory unmap operation **may** fail, in which case the memory object will remain host mapped and vkUnmapMemory2 will return VK_ERROR_MEMORY_MAP_FAILED.

```
// Provided by VK_VERSION_1_4
typedef VkFlags VkMemoryUnmapFlags;
```

```
// Provided by VK_KHR_map_memory2
// Equivalent to VkMemoryUnmapFlags
typedef VkMemoryUnmapFlags VkMemoryUnmapFlagsKHR;
```

`VkMemoryUnmapFlags` is a bitmask type for setting a mask of zero or more VkMemoryUnmapFlagBits.

11.2.17. Lazily Allocated Memory

If the memory object is allocated from a heap with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set, that object's backing memory **may** be provided by the implementation lazily. The actual committed size of the memory **may** initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a VkImage whose usage flags include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT.

NOTE	Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed **may** allow some implementations to never allocate memory for such attachments.

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

```
// Provided by VK_VERSION_1_0
void vkGetDeviceMemoryCommitment(
    VkDevice                                    device,
    VkDeviceMemory                              memory,
    VkDeviceSize*                               pCommittedMemoryInBytes);
```

- device is the logical device that owns the memory.
- memory is the memory object being queried.
- pCommittedMemoryInBytes is a pointer to a VkDeviceSize value in which the number of bytes currently committed is returned, on success.

The implementation **may** update the commitment at any time, and the value returned by this query **may** be out of date.

The implementation guarantees to allocate any committed memory from the heapIndex indicated by the memory type that the memory object was created with.

Valid Usage

- VUID-vkGetDeviceMemoryCommitment-memory-00690
  memory **must** have been created with a memory type that reports VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryCommitment-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetDeviceMemoryCommitment-memory-parameter
  memory **must** be a valid VkDeviceMemory handle
- VUID-vkGetDeviceMemoryCommitment-pCommittedMemoryInBytes-parameter
  pCommittedMemoryInBytes **must** be a valid pointer to a VkDeviceSize value
- VUID-vkGetDeviceMemoryCommitment-memory-parent
  memory **must** have been created, allocated, or retrieved from device

11.2.18. Protected Memory

Protected memory divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- Memory:
  - Unprotected device memory, which **can** be visible to the device and **can** be visible to the host
  - Protected device memory, which **can** be visible to the device but **must** not be visible to the host
- Resources:
  - Unprotected images , unprotected tensors, and unprotected buffers, to which unprotected memory **can** be bound
  - Protected images , protected tensors, and protected buffers, to which protected memory **can** be bound
- Command buffers:
  - Unprotected command buffers, which **can** be submitted to a device queue to execute unprotected queue operations
  - Protected command buffers, which **can** be submitted to a protected-capable device queue to execute protected queue operations
- Device queues:
  - Unprotected device queues, to which unprotected command buffers **can** be submitted
  - Protected-capable device queues, to which unprotected command buffers or protected command buffers **can** be submitted
- Queue submissions
  - Unprotected queue submissions, through which unprotected command buffers **can** be submitted
  - Protected queue submissions, through which protected command buffers **can** be submitted
- Queue operations
  - Unprotected queue operations
  - Protected queue operations

NOTE

When the `protectedMemory` feature is enabled, all pipelines **may** be recorded in either protected or unprotected command buffers (or both), which may incur an extra cost on some implementations. This **can** be mitigated by enabling the `pipelineProtectedAccess` feature, in which case pipelines created with VK_PIPELINE_CREATE_PROTECTED_ACCESS_ONLY_BIT may only be recorded in protected command buffers, and pipelines created with VK_PIPELINE_CREATE_NO_PROTECTED_ACCESS_BIT may only be recorded in unprotected command buffers.

Protected Memory Access Rules

If VkPhysicalDeviceProtectedMemoryProperties::`protectedNoFault` is VK_FALSE, applications **must** not perform any of the following operations:

- Write to unprotected memory within protected queue operations.
- Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, in video decode operations, in video encode operations, or the transfer stage.
- Perform a query within protected queue operations.

If VkPhysicalDeviceProtectedMemoryProperties::`protectedNoFault` is VK_TRUE, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Additionally, indirect operations **must** not be performed within protected queue operations.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation **must** guarantee that:

- Protected device memory **must** never be visible to the host.
- Values written to unprotected device memory **must** not be a function of values from protected memory.

11.2.19. External Memory Handle Types

Android Hardware Buffer

Android's NDK defines AHardwareBuffer objects, which represent device memory that is shareable across processes and that **can** be accessed by a variety of media APIs and the hardware used to implement them. These Android hardware buffer objects **may** be imported into VkDeviceMemory objects for access via Vulkan, or exported from Vulkan. A VkImage or VkBuffer or VkTensorARM **can** be bound to the imported or exported VkDeviceMemory object if it is created with VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID.

To remove an unnecessary compile time dependency, an incomplete type definition of AHardwareBuffer is provided in the Vulkan headers:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
struct AHardwareBuffer;
```

The actual AHardwareBuffer type is defined in Android NDK headers.

NOTE

The NDK format, usage, and size/dimensions of an AHardwareBuffer object can be obtained with the `AHardwareBuffer_describe` function. While Android hardware buffers can be imported to or exported from Vulkan without using that function, valid usage and implementation behavior is defined in terms of the

> `AHardwareBuffer_Desc` properties it returns.

Android hardware buffer objects are reference-counted using Android NDK functions outside of the scope of this specification. A VkDeviceMemory imported from an Android hardware buffer or that **can** be exported to an Android hardware buffer **must** acquire a reference to its AHardwareBuffer object, and **must** release this reference when the device memory is freed. During the host execution of a Vulkan command that has an Android hardware buffer as a parameter (including indirect parameters via `pNext` chains), the application **must** not decrement the Android hardware buffer's reference count to zero.

Android hardware buffers **can** be mapped and unmapped for CPU access using the NDK functions. These lock and unlock APIs are considered to acquire and release ownership of the Android hardware buffer, and applications **must** follow the rules described in External Resource Sharing to transfer ownership between the Vulkan instance and these native APIs.

Android hardware buffers **can** be shared with external APIs and Vulkan instances on the same device, and also with foreign devices. When transferring ownership of the Android hardware buffer, the external and foreign special queue families described in Queue Family Ownership Transfer are not identical. All APIs which produce or consume Android hardware buffers are considered to use foreign devices, except OpenGL ES contexts and Vulkan logical devices that have matching device and driver UUIDs. Implementations **may** treat a transfer to or from the foreign queue family as if it were a transfer to or from the external queue family when the Android hardware buffer's usage only permits it to be used on the same physical device.

Android Hardware Buffer Optimal Usages

Vulkan buffer and image usage flags do not correspond exactly to Android hardware buffer usage flags. When allocating Android hardware buffers with non-Vulkan APIs, if any `AHARDWAREBUFFER_USAGE_GPU_*` usage bits are included, by default the allocator **must** allocate the memory in such a way that it supports Vulkan usages and creation flags in the usage equivalence table which do not have Android hardware buffer equivalents.

A VkAndroidHardwareBufferUsageANDROID structure **can** be included in the `pNext` chain of a VkImageFormatProperties2 structure passed to vkGetPhysicalDeviceImageFormatProperties2 to obtain optimal Android hardware buffer usage flags for specific Vulkan resource creation parameters. Some usage flags returned by these commands are **required** based on the input parameters, but additional vendor-specific usage flags (`AHARDWAREBUFFER_USAGE_VENDOR_*`) **may** also be returned. Any Android hardware buffer allocated with these vendor-specific usage flags and imported to Vulkan **must** only be bound to resources created with parameters that are a subset of the parameters used to obtain the Android hardware buffer usage, since the memory **may** have been allocated in a way incompatible with other parameters. If an Android hardware buffer is successfully allocated with additional non-vendor-specific usage flags in addition to the recommended usage, it **must** support being used in the same ways as an Android hardware buffer allocated with only the recommended usage, and also in ways indicated by the additional usage.

Android Hardware Buffer External Formats

Android hardware buffers **may** represent images using implementation-specific formats, layouts, color models, etc., which do not have Vulkan equivalents. Such *external formats* are commonly used

by external image sources such as video decoders or cameras. Vulkan **can** import Android hardware buffers that have external formats, but since the image contents are in a possibly proprietary representation, images with external formats **must** have optimal tiling, and their use is restricted. Images with external formats **must** only be sampled with a sampler that has $Y'C_BC_R$ conversion enabled or rendered to as a resolve attachment .

Images that will be backed by an Android hardware buffer **can** use an external format by setting VkImageCreateInfo::`format` to VK_FORMAT_UNDEFINED and including a VkExternalFormatANDROID structure in the `pNext` chain. Images **can** be created with an external format even if the Android hardware buffer has a format which has an equivalent Vulkan format to enable consistent handling of images from sources that might use either category of format. However, all images created with an external format are subject to the valid usage requirements associated with external formats, even if the Android hardware buffer's format has a Vulkan equivalent. The external format of an Android hardware buffer **can** be obtained by passing a VkAndroidHardwareBufferFormatPropertiesANDROID structure to vkGetAndroidHardwareBufferPropertiesANDROID.

Android Hardware Buffer Image Resources

Android hardware buffers have intrinsic width, height, format, and usage properties, so Vulkan images bound to memory imported from an Android hardware buffer **must** use dedicated allocations: `VkMemoryDedicatedRequirements`::`requiresDedicatedAllocation` **must** be VK_TRUE for images created with VkExternalMemoryImageCreateInfo::`handleTypes` that includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID. When creating an image that will be bound to an imported Android hardware buffer, the image creation parameters **must** be equivalent to the AHardwareBuffer properties as described by the valid usage of VkMemoryAllocateInfo. Similarly, device memory allocated for a dedicated image **must** not be exported to an Android hardware buffer until it has been bound to that image, and the implementation **must** return an Android hardware buffer with properties derived from the image:

- The `width` and `height` members of `AHardwareBuffer_Desc` **must** be the same as the `width` and `height` members of VkImageCreateInfo::`extent`, respectively.
- The `layers` member of `AHardwareBuffer_Desc` **must** be the same as the `arrayLayers` member of VkImageCreateInfo.
- The `format` member of `AHardwareBuffer_Desc` **must** be equivalent to VkImageCreateInfo::`format` as defined by AHardwareBuffer Format Equivalence.
- The `usage` member of `AHardwareBuffer_Desc` **must** include bits corresponding to bits included in VkImageCreateInfo::`usage` and VkImageCreateInfo::`flags` where such a correspondence exists according to AHardwareBuffer Usage Equivalence. It **may** also include additional usage bits, including vendor-specific usages. Presence of vendor usage bits **may** make the Android hardware buffer only usable in ways indicated by the image creation parameters, even when used outside Vulkan, in a similar way that allocating the Android hardware buffer with usage returned in VkAndroidHardwareBufferUsageANDROID does.

Implementations **may** support fewer combinations of image creation parameters for images with Android hardware buffer external handle type than for non-external images. Support for a given set of parameters **can** be determined by passing VkExternalImageFormatProperties to vkGetPhysicalDeviceImageFormatProperties2 with `handleType` set to

VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID. Any Android hardware buffer successfully allocated outside Vulkan with usage that includes AHARDWAREBUFFER_USAGE_GPU_* **must** be supported when using equivalent Vulkan image parameters. If a given choice of image parameters are supported for import, they **can** also be used to create an image and memory that will be exported to an Android hardware buffer.

Table 14. AHardwareBuffer Format Equivalence

AHardwareBuffer Format	Vulkan Format
AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM	VK_FORMAT_R8G8B8A8_UNORM
AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM [1]	VK_FORMAT_R8G8B8A8_UNORM

Table 15. AHardwareBuffer Usage Equivalence

AHardwareBuffer Usage	Vulkan Usage or Creation Flag
None	VK_IMAGE_USAGE_TRANSFER_SRC_BIT
None	VK_IMAGE_USAGE_TRANSFER_DST_BIT
AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE	VK_IMAGE_USAGE_SAMPLED_BIT
AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE	VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT
AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER [3]	VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT
AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER [3]	VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT
AHARDWAREBUFFER_USAGE_GPU_CUBE_MAP	VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT
AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE	None [2]
AHARDWAREBUFFER_USAGE_PROTECTED_CONTENT	VK_IMAGE_CREATE_PROTECTED_BIT
None	VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT
None	VK_IMAGE_CREATE_EXTENDED_USAGE_BIT
AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER [4]	VK_IMAGE_USAGE_STORAGE_BIT

1

Vulkan does not differentiate between AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM and AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM: they both behave as VK_FORMAT_R8G8B8A8_UNORM. After an external entity writes to a AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM Android hardware buffer, the values read by Vulkan from the X/A component are undefined. To emulate the traditional behavior of the X component during sampling or blending, applications **should** use VK_COMPONENT_SWIZZLE_ONE in image view component mappings and VK_BLEND_FACTOR_ONE in color blend factors. There is no way to avoid copying these undefined values when copying from such an image to another image or buffer.

2

The AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE flag does not correspond to a Vulkan image usage or creation flag. Instead, its presence indicates that the Android hardware buffer contains a complete mipmap chain, and its absence indicates that the Android hardware buffer contains only a single mip level.

3

Only image usages valid for the format are valid. It would be invalid to take an Android Hardware Buffer with a format of AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM that has a AHARDWAREBUFFER_USAGE_GPU_FRAMEBUFFER usage and try to create an image with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

4

In combination with a hardware buffer format other than BLOB.

NOTE

When using VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT with Android hardware buffer images, applications **should** use VkImageFormatListCreateInfo to inform the implementation which view formats will be used with the image. For some common sets of formats, this allows some implementations to provide significantly better performance when accessing the image via Vulkan.

Android Hardware Buffer Resources

Android hardware buffers with a format of AHARDWAREBUFFER_FORMAT_BLOB and usage that includes AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER **can** be used as the backing store for VkBuffer objects. Such Android hardware buffers have a size in bytes specified by their `width`; `height` and `layers` are both 1.

Unlike images, buffer resources backed by Android hardware buffers do not require dedicated allocations.

Exported AHardwareBuffer objects that do not have dedicated images **must** have a format of AHARDWAREBUFFER_FORMAT_BLOB, usage **must** include AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER, `width` **must** equal the device memory allocation size, and `height` and `layers` **must** be 1.

QNX Screen Buffer

The QNX SDP defines `_screen_buffer` objects, which represent a buffer that the QNX Screen graphics subsystem can use directly in its windowing system APIs. More specifically, a Screen buffer is an area of memory that stores pixel data. It can be attached to Screen windows, streams, or pixmaps.

These QNX Screen buffer objects **may** be imported into VkDeviceMemory objects for access via Vulkan. A VkImage or VkBuffer **can** be bound to the imported VkDeviceMemory object if it is created with VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX.

`struct _screen_buffer` is strongly typed, so naming the handle type is redundant. The internal layout and therefore size of a `struct _screen_buffer` image may depend on native usage flags that do not have corresponding Vulkan counterparts.

QNX Screen Buffer Validity

The design of Screen in the QNX SDP makes it difficult to determine the validity of objects from outside of Screen. Therefore, applications **must** ensure that QNX Screen buffer objects provided used in various Vulkan interfaces are ones created explicitly with QNX Screen APIs. See QNX SDP documentation for more information.

A VkDeviceMemory imported from a QNX Screen buffer has no way to acquire a reference to its `_screen_buffer` object. Therefore, during the host execution of a Vulkan command that has a QNX Screen buffer as a parameter (including indirect parameters via `pNext` chains), the application **must** ensure that the QNX Screen buffer resource remains valid.

Generally, for a `_screen_buffer` object to be valid for use within a Vulkan implementation, the buffer object **should** have a `_screen_buffer`::`SCREEN_PROPERTY_USAGE` that includes at least one of: `SCREEN_USAGE_VULKAN`, `SCREEN_USAGE_OPENGL_ES2`, `SCREEN_USAGE_OPENGL_ES3`, or `SCREEN_USAGE_NATIVE`. The exact Screen-native usage flags required depend on the Vulkan implementation, and QNX Screen itself will not necessarily enforce these requirements. Note that Screen-native usage flags are in no way related to usage flags in the Vulkan specification.

QNX Screen Buffer External Formats

QNX Screen buffers **may** represent images using implementation-specific formats, layouts, color models, etc., which do not have Vulkan equivalents. Such *external formats* are commonly used by external image sources such as video decoders or cameras. Vulkan **can** import QNX Screen buffers that have external formats, but since the image contents are in an undiscoverable and possibly proprietary representation, images with external formats **must** only be used as sampled images, **must** only be sampled with a sampler that has $Y'C_BC_R$ conversion enabled, and **must** have optimal tiling.

Images that will be backed by a QNX Screen buffer **can** use an external format by setting VkImageCreateInfo::`format` to VK_FORMAT_UNDEFINED and including a VkExternalFormatQNX structure in the `pNext` chain. Images **can** be created with an external format even if the QNX Screen buffer has a format which has an equivalent Vulkan format to enable consistent handling of images from sources that might use either category of format. The external format of a QNX Screen buffer **can** be obtained by passing a VkScreenBufferFormatPropertiesQNX structure to vkGetScreenBufferPropertiesQNX.

QNX Screen Buffer Image Resources

QNX Screen buffers have intrinsic width, height, format, and usage properties, so Vulkan images bound to memory imported from a QNX Screen buffer **must** use dedicated allocations: `VkMemoryDedicatedRequirements`::`requiresDedicatedAllocation` **must** be VK_TRUE for images created

with VkExternalMemoryImageCreateInfo::handleTypes that includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX. When creating an image that will be bound to an imported QNX Screen buffer, the image creation parameters **must** be equivalent to the _screen_buffer properties as described by the valid usage of VkMemoryAllocateInfo.

Table 16. QNX Screen Buffer Format Equivalence

QNX Screen Format	Vulkan Format
SCREEN_FORMAT_RGBA8888	VK_FORMAT_B8G8R8A8_UNORM
SCREEN_FORMAT_RGBX8888 [1]	VK_FORMAT_B8G8R8A8_UNORM
SCREEN_FORMAT_BGRA8888	VK_FORMAT_R8G8B8A8_UNORM
SCREEN_FORMAT_BGRX8888 [1]	VK_FORMAT_R8G8B8A8_UNORM
SCREEN_FORMAT_RGBA1010102	VK_FORMAT_A2R10G10B10_UNORM_PACK32
SCREEN_FORMAT_RGBX1010102 [1]	VK_FORMAT_A2R10G10B10_UNORM_PACK32
SCREEN_FORMAT_BGRA1010102	VK_FORMAT_A2B10G10R10_UNORM_PACK32
SCREEN_FORMAT_BGRX1010102 [1]	VK_FORMAT_A2B10G10R10_UNORM_PACK32
SCREEN_FORMAT_RGBA5551	VK_FORMAT_A1R5G5B5_UNORM_PACK16
SCREEN_FORMAT_RGBX5551 [1]	VK_FORMAT_A1R5G5B5_UNORM_PACK16
SCREEN_FORMAT_RGB565	VK_FORMAT_R5G6B5_UNORM_PACK16
SCREEN_FORMAT_RGB888	VK_FORMAT_R8G8B8_UNORM

1

Vulkan does not differentiate between SCREEN_FORMAT_RGBA8888 and SCREEN_FORMAT_RGBX8888: they both behave as VK_FORMAT_R8G8B8A8_UNORM. After an external entity writes to a SCREEN_FORMAT_RGBX8888 QNX Screen buffer, the values read by Vulkan from the X/A component are undefined. To emulate the traditional behavior of the X component during sampling or blending, applications **should** use VK_COMPONENT_SWIZZLE_ONE in image view component mappings and VK_BLEND_FACTOR_ONE in color blend factors. There is no way to avoid copying these undefined values when copying from such an image to another image or buffer. The same behavior applies to the following pairs: SCREEN_FORMAT_BGRA8888 and SCREEN_FORMAT_BGRX8888, SCREEN_FORMAT_RGBA1010102 and SCREEN_FORMAT_RGBX1010102, SCREEN_FORMAT_BGRA1010102 and SCREEN_FORMAT_BGRX1010102, SCREEN_FORMAT_RGBA5551 and SCREEN_FORMAT_RGBX5551.

11.2.20. Peer Memory Features

Peer memory is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory **may** not be supported by a device.

To determine how peer memory **can** be accessed, call:

```
// Provided by VK_VERSION_1_1
void vkGetDeviceGroupPeerMemoryFeatures(
    VkDevice                                    device,
    uint32_t                                    heapIndex,
    uint32_t                                    localDeviceIndex,
    uint32_t                                    remoteDeviceIndex,
    VkPeerMemoryFeatureFlags*                   pPeerMemoryFeatures);
```

```
// Provided by VK_KHR_device_group
// Equivalent to vkGetDeviceGroupPeerMemoryFeatures
void vkGetDeviceGroupPeerMemoryFeaturesKHR(
    VkDevice                                    device,
    uint32_t                                    heapIndex,
    uint32_t                                    localDeviceIndex,
    uint32_t                                    remoteDeviceIndex,
    VkPeerMemoryFeatureFlags*                   pPeerMemoryFeatures);
```

- `device` is the logical device that owns the memory.
- `heapIndex` is the index of the memory heap from which the memory is allocated.
- `localDeviceIndex` is the device index of the physical device that performs the memory access.
- `remoteDeviceIndex` is the device index of the physical device that the memory is allocated for.
- `pPeerMemoryFeatures` is a pointer to a VkPeerMemoryFeatureFlags bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.

Valid Usage

- VUID-vkGetDeviceGroupPeerMemoryFeatures-heapIndex-00691
  `heapIndex` **must** be less than `memoryHeapCount`
- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00692
  `localDeviceIndex` **must** be a valid device index
- VUID-vkGetDeviceGroupPeerMemoryFeatures-remoteDeviceIndex-00693
  `remoteDeviceIndex` **must** be a valid device index
- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00694
  `localDeviceIndex` **must** not equal `remoteDeviceIndex`

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPeerMemoryFeatures-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceGroupPeerMemoryFeatures-pPeerMemoryFeatures-parameter
  `pPeerMemoryFeatures` **must** be a valid pointer to a VkPeerMemoryFeatureFlags value

Bits which **may** be set in vkGetDeviceGroupPeerMemoryFeatures::pPeerMemoryFeatures, indicating supported peer memory features, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkPeerMemoryFeatureFlagBits {
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT = 0x00000001,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT = 0x00000002,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT = 0x00000004,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT = 0x00000008,
  // Provided by VK_KHR_device_group
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT_KHR = VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT,
  // Provided by VK_KHR_device_group
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT_KHR = VK_PEER_MEMORY_FEATURE_COPY_DST_BIT,
  // Provided by VK_KHR_device_group
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT_KHR =
VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT,
  // Provided by VK_KHR_device_group
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT_KHR =
VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT,
} VkPeerMemoryFeatureFlagBits;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkPeerMemoryFeatureFlagBits
typedef VkPeerMemoryFeatureFlagBits VkPeerMemoryFeatureFlagBitsKHR;
```

- VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT specifies that the memory **can** be accessed as the source of any vkCmdCopy* command.
- VK_PEER_MEMORY_FEATURE_COPY_DST_BIT specifies that the memory **can** be accessed as the destination of any vkCmdCopy* command.
- VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT specifies that the memory **can** be read as any memory access type.
- VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT specifies that the memory **can** be written as any memory access type. Shader atomics are considered to be writes.

NOTE	The peer memory features of a memory heap also apply to any accesses that **may** be performed during image layout transitions.

VK_PEER_MEMORY_FEATURE_COPY_DST_BIT **must** be supported for all host local heaps and for at least one device-local memory heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.

```
// Provided by VK_VERSION_1_1
typedef VkFlags VkPeerMemoryFeatureFlags;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkPeerMemoryFeatureFlags
typedef VkPeerMemoryFeatureFlags VkPeerMemoryFeatureFlagsKHR;
```

VkPeerMemoryFeatureFlags is a bitmask type for setting a mask of zero or more VkPeerMemoryFeatureFlagBits.

11.2.21. Opaque Capture Address Query

To query a 64-bit opaque capture address value from a memory object, call:

```
// Provided by VK_VERSION_1_2
uint64_t vkGetDeviceMemoryOpaqueCaptureAddress(
    VkDevice                                    device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

```
// Provided by VK_KHR_buffer_device_address
// Equivalent to vkGetDeviceMemoryOpaqueCaptureAddress
uint64_t vkGetDeviceMemoryOpaqueCaptureAddressKHR(
    VkDevice                                    device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

- device is the logical device that the memory object was allocated on.
- pInfo is a pointer to a VkDeviceMemoryOpaqueCaptureAddressInfo structure specifying the memory object to retrieve an address for.

The 64-bit return value is an opaque address representing the start of pInfo->memory.

If the memory object was allocated with a non-zero value of VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress, the return value **must** be the same address.

NOTE	The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.

Valid Usage

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-None-03334
  The bufferDeviceAddress and bufferDeviceAddressCaptureReplay features **must** be enabled
- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-10727

pInfo->memory **must** have been allocated using the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-03335
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-parameter
  pInfo **must** be a valid pointer to a valid VkDeviceMemoryOpaqueCaptureAddressInfo structure

The VkDeviceMemoryOpaqueCaptureAddressInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
} VkDeviceMemoryOpaqueCaptureAddressInfo;
```

```
// Provided by VK_KHR_buffer_device_address
// Equivalent to VkDeviceMemoryOpaqueCaptureAddressInfo
typedef VkDeviceMemoryOpaqueCaptureAddressInfo
VkDeviceMemoryOpaqueCaptureAddressInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory specifies the memory whose address is being queried.

Valid Usage

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-03336
  memory **must** have been allocated with VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT

Valid Usage (Implicit)

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle

Chapter 12. Resource Creation

Vulkan supports three primary resource types: *buffers*, *images*, and *tensors*. Resources are views of memory with associated formatting and dimensionality. Buffers provide access to raw arrays of bytes, whereas images **can** be multidimensional and **may** have associated metadata. Tensors **can** be multidimensional, contain format information like images and **may** have associated metadata.

Other resource types, such as acceleration structures and micromaps use buffers as the backing store for opaque data structures.

12.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by `VkBuffer` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateBuffer(
    VkDevice                                    device,
    const VkBufferCreateInfo*                   pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkBuffer*                                   pBuffer);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pBuffer` is a pointer to a VkBuffer handle in which the resulting buffer object is returned.

Implementations **may** fail to create a buffer if the effective usage includes the VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT flag, and `size` is greater than the maximum of `maxResourceHeapSize` and `maxSamplerHeapSize`. If this happens, VK_ERROR_OUT_OF_DEVICE_MEMORY will be returned.

NOTE

This is an issue identified with VK_EXT_descriptor_heap, which we plan to tighten up for the KHR version. Applications using VK_EXT_descriptor_heap may wish to avoid suballocating heaps from the same buffer, instead creating one buffer per heap, to avoid situations where this causes issues.

Valid Usage

- VUID-vkCreateBuffer-device-09664
  `device` **must** support at least one queue family with one of the VK_QUEUE_VIDEO_ENCODE_BIT_KHR, VK_QUEUE_VIDEO_DECODE_BIT_KHR, VK_QUEUE_SPARSE_BINDING_BIT, VK_QUEUE_TRANSFER_BIT, VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT capabilities
- VUID-vkCreateBuffer-flags-00911
  If the `flags` member of `pCreateInfo` includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT, and the `extendedSparseAddressSpace` feature is not enabled, creating this `VkBuffer` **must** not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceLimits`::`sparseAddressSpaceSize`
- VUID-vkCreateBuffer-flags-09383
  If the `flags` member of `pCreateInfo` includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT, the `extendedSparseAddressSpace` feature is enabled, and the `usage` member of `pCreateInfo` contains bits not in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV`::`extendedSparseBufferUsageFlags`, creating this `VkBuffer` **must** not cause the total required sparse memory for all currently valid sparse resources on the device, excluding `VkBuffer` created with `usage` member of `pCreateInfo` containing bits in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV`::`extendedSparseBufferUsageFlags` and `VkImage` created with `usage` member of `pCreateInfo` containing bits in `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV`::`extendedSparseImageUsageFlags`, to exceed `VkPhysicalDeviceLimits`::`sparseAddressSpaceSize`
- VUID-vkCreateBuffer-flags-09384
  If the `flags` member of `pCreateInfo` includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT and the `extendedSparseAddressSpace` feature is enabled, creating this `VkBuffer` **must** not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV`::`extendedSparseAddressSpaceSize`
- VUID-vkCreateBuffer-pNext-06387
  If using the VkBuffer for an import operation from a VkBufferCollectionFUCHSIA where a VkBufferCollectionBufferCreateInfoFUCHSIA has been chained to `pNext`, `pCreateInfo` **must** match the VkBufferConstraintsInfoFUCHSIA::`createInfo` used when setting the constraints on the buffer collection with vkSetBufferCollectionBufferConstraintsFUCHSIA

Valid Usage (Implicit)

- VUID-vkCreateBuffer-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateBuffer-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkBufferCreateInfo structure
- VUID-vkCreateBuffer-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid

VkAllocationCallbacks structure

- VUID-vkCreateBuffer-pBuffer-parameter
  `pBuffer` **must** be a valid pointer to a VkBuffer handle
- VUID-vkCreateBuffer-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkBufferCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferCreateInfo {
    VkStructureType        sType;
    const void*            pNext;
    VkBufferCreateFlags    flags;
    VkDeviceSize           size;
    VkBufferUsageFlags     usage;
    VkSharingMode          sharingMode;
    uint32_t               queueFamilyIndexCount;
    const uint32_t*        pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkBufferCreateFlagBits specifying additional parameters of the buffer.
- `size` is the size in bytes of the buffer to be created.
- `usage` is a bitmask of VkBufferUsageFlagBits specifying allowed usages of the buffer.
- `sharingMode` is a VkSharingMode value specifying the sharing mode of the buffer when it will be accessed by multiple queue families.
- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a pointer to an array of queue families that will access this buffer. It is

ignored if sharingMode is not VK_SHARING_MODE_CONCURRENT.

usage defines the effective usage flags for the buffer. If the pNext chain includes a VkBufferUsageFlags2CreateInfo structure, usage is ignored, and the effective usage flags are defined by VkBufferUsageFlags2CreateInfo::usage.

If VkBufferDeviceAddressAlignmentAllocateInfoVALVE is included in the pNext chain, and a sparse buffer is being created, the alignment for buffer device addresses **can** be controlled. For non-sparse buffers, alignment requirements are specified at device memory allocation time in vkAllocateMemory instead. For implementations which allocate buffer device addresses regardless at buffer create time, the implementation is expected to allocate buffer device addresses with alignment equal to maxBufferDeviceAddressAllocationAlignment, effectively ignoring any application-requested alignment.

Valid Usage

- VUID-VkBufferCreateInfo-None-09499
  If the pNext chain does not include a VkBufferUsageFlags2CreateInfo structure, usage **must** be a valid combination of VkBufferUsageFlagBits values
- VUID-VkBufferCreateInfo-None-09500
  If the pNext chain does not include a VkBufferUsageFlags2CreateInfo structure, usage **must** not be 0
- VUID-VkBufferCreateInfo-size-00912
  size **must** be greater than 0
- VUID-VkBufferCreateInfo-sharingMode-00913
  If sharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices **must** be a valid pointer to an array of queueFamilyIndexCount uint32_t values
- VUID-VkBufferCreateInfo-maintenance11-13353
  If the maintenance11 feature is enabled and sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount **must** be greater than 0
- VUID-VkBufferCreateInfo-sharingMode-00914
  If the maintenance11 feature is not enabled and sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount **must** be greater than 1
- VUID-VkBufferCreateInfo-sharingMode-01419
  If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices **must** be unique and **must** be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties2 or vkGetPhysicalDeviceQueueFamilyProperties for the physicalDevice that was used to create device
- VUID-VkBufferCreateInfo-flags-00915
  If the sparseBinding feature is not enabled, flags **must** not contain VK_BUFFER_CREATE_SPARSE_BINDING_BIT
- VUID-VkBufferCreateInfo-flags-00916
  If the sparseResidencyBuffer feature is not enabled, flags **must** not contain VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkBufferCreateInfo-flags-00917
  If the sparseResidencyAliased feature is not enabled, flags **must** not contain VK_BUFFER_CREATE_SPARSE_ALIASED_BIT
- VUID-VkBufferCreateInfo-flags-00918
  If flags contains VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT, it **must** also contain VK_BUFFER_CREATE_SPARSE_BINDING_BIT
- VUID-VkBufferCreateInfo-pNext-00920
  If the pNext chain includes a VkExternalMemoryBufferCreateInfo structure, its handleTypes member **must** only contain bits that are also in VkExternalBufferProperties::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceExternalBufferProperties with pExternalBufferInfo->handleType equal to any one of the handle types specified in VkExternalMemoryBufferCreateInfo::handleTypes
- VUID-VkBufferCreateInfo-flags-01887
  If the protectedMemory feature is not enabled, flags **must** not contain VK_BUFFER_CREATE_PROTECTED_BIT
- VUID-VkBufferCreateInfo-None-01888
  If any of the bits VK_BUFFER_CREATE_SPARSE_BINDING_BIT, VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT, or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT are set, VK_BUFFER_CREATE_PROTECTED_BIT **must** not also be set
- VUID-VkBufferCreateInfo-pNext-01571
  If the pNext chain includes a VkDedicatedAllocationBufferCreateInfoNV structure, and the dedicatedAllocation member of the chained structure is VK_TRUE, then flags **must** not include VK_BUFFER_CREATE_SPARSE_BINDING_BIT, VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT, or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT
- VUID-VkBufferCreateInfo-deviceAddress-02604
  If VkBufferDeviceAddressCreateInfoEXT::deviceAddress is not zero, flags **must** include VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT
- VUID-VkBufferCreateInfo-opaqueCaptureAddress-03337
  If VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress is not zero, flags **must** include VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT
- VUID-VkBufferCreateInfo-flags-03338
  If flags includes VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddressCaptureReplay feature or the bufferDeviceAddressCaptureReplay feature **must** be enabled
- VUID-VkBufferCreateInfo-usage-04813
  If usage includes VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR or VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR, and flags does not include VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then the pNext chain **must** include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a

videoCodecOperation member specifying a decode operation

- VUID-VkBufferCreateInfo-usage-04814
  If usage includes VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR or VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR, and flags does not include VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then the pNext chain **must** include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying an encode operation
- VUID-VkBufferCreateInfo-flags-08325
  If flags includes VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then videoMaintenance1 **must** be enabled
- VUID-VkBufferCreateInfo-pNext-10783
  If the pNext chain includes a VkVideoProfileListInfoKHR structure and for any element of its pProfiles member videoCodecOperation is VK_VIDEO_CODEC_OPERATION_DECODE_VP9_BIT_KHR, then the videoDecodeVP9 feature **must** be enabled
- VUID-VkBufferCreateInfo-pNext-10249
  If the pNext chain includes a VkVideoProfileListInfoKHR structure and for any element of its pProfiles member videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the videoEncodeAV1 feature **must** be enabled
- VUID-VkBufferCreateInfo-pNext-10919
  If the pNext chain includes a VkVideoEncodeProfileRgbConversionInfoVALVE structure, then the videoEncodeRgbConversion feature **must** be enabled
- VUID-VkBufferCreateInfo-size-06409
  size **must** be less than or equal to VkPhysicalDeviceMaintenance4Properties ::maxBufferSize
- VUID-VkBufferCreateInfo-usage-08097
  If usage includes VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT, creating this VkBuffer **must** not cause the total required space for all currently valid buffers using this flag on the device to exceed VkPhysicalDeviceDescriptorBufferPropertiesEXT ::samplerDescriptorBufferAddressSpaceSize or VkPhysicalDeviceDescriptorBufferPropertiesEXT::descriptorBufferAddressSpaceSize
- VUID-VkBufferCreateInfo-usage-08098
  If usage includes VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT, creating this VkBuffer **must** not cause the total required space for all currently valid buffers using this flag on the device to exceed VkPhysicalDeviceDescriptorBufferPropertiesEXT ::resourceDescriptorBufferAddressSpaceSize or VkPhysicalDeviceDescriptorBufferPropertiesEXT::descriptorBufferAddressSpaceSize
- VUID-VkBufferCreateInfo-flags-08099
  If flags includes VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the descriptorBufferCaptureReplay feature **must** be enabled
- VUID-VkBufferCreateInfo-pNext-08100
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure,

flags **must** contain VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT

- VUID-VkBufferCreateInfo-usage-08101
  If usage includes VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT, the descriptorBufferPushDescriptors feature **must** be enabled
- VUID-VkBufferCreateInfo-usage-08102
  If usage includes VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT, VkPhysicalDeviceDescriptorBufferPropertiesEXT::bufferlessPushDescriptors **must** be VK_FALSE
- VUID-VkBufferCreateInfo-usage-08103
  If usage includes VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT, usage **must** contain at least one of VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT or VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT
- VUID-VkBufferCreateInfo-tileMemoryHeap-10762
  If the tileMemoryHeap feature is not enabled, usage **must** not include VK_BUFFER_USAGE_TILE_MEMORY_BIT_QCOM
- VUID-VkBufferCreateInfo-usage-10763
  If usage includes VK_BUFFER_USAGE_TILE_MEMORY_BIT_QCOM, then flags **must** not contain any of the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, VK_BUFFER_CREATE_SPARSE_BINDING_BIT, VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT, VK_BUFFER_CREATE_SPARSE_ALIASED_BIT, or VK_BUFFER_CREATE_PROTECTED_BIT flags
- VUID-VkBufferCreateInfo-usage-10764
  If usage includes VK_BUFFER_USAGE_TILE_MEMORY_BIT_QCOM, then only the following usages may be set:
  - VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
  - VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT
  - VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT
  - VK_BUFFER_USAGE_STORAGE_BUFFER_BIT
  - VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT
  - and if VkPhysicalDeviceTileMemoryHeapPropertiesQCOM::tileBufferTransfers is VK_TRUE then additionally VK_BUFFER_USAGE_TRANSFER_SRC_BIT or VK_BUFFER_USAGE_TRANSFER_DST_BIT
- VUID-VkBufferCreateInfo-flags-09641
  If flags includes VK_BUFFER_CREATE_PROTECTED_BIT, then the effective usage flags **must** not contain bits other than

- VK_BUFFER_USAGE_TRANSFER_SRC_BIT
- VK_BUFFER_USAGE_TRANSFER_DST_BIT
- VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
- VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT
- VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT
- VK_BUFFER_USAGE_STORAGE_BUFFER_BIT
- VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT
- VK_BUFFER_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR
- VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT

- VUID-VkBufferCreateInfo-flags-11277
  If the `protectedDescriptorHeaps` property is not supported and the effective usage flags include the VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT flag, `flags` **must** not include the VK_BUFFER_CREATE_PROTECTED_BIT flag
- VUID-VkBufferCreateInfo-flags-11279
  If the `sparseDescriptorHeaps` property is not supported and the effective usage flags include the VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT flag, `flags` **must** not include any of the VK_BUFFER_CREATE_SPARSE_BINDING_BIT, VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT, or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT flags
- VUID-VkBufferCreateInfo-flags-12515
  If `flags` does not include VK_BUFFER_CREATE_SPARSE_BINDING_BIT, VkBufferDeviceAddressAlignmentAllocateInfoVALVE::`alignment` **must** be 0
- VUID-VkBufferCreateInfo-alignment-12516
  If VkBufferDeviceAddressAlignmentAllocateInfoVALVE::`alignment` is not 0, the effective usage flags **must** include VK_BUFFER_USAGE_2_SHADER_DEVICE_ADDRESS_BIT
- VUID-VkBufferCreateInfo-alignment-12517
  If VkBufferDeviceAddressAlignmentAllocateInfoVALVE::`alignment` is not 0, VkBufferOpaqueCaptureAddressCreateInfo::`opaqueCaptureAddress` **must** be 0

Valid Usage (Implicit)

- VUID-VkBufferCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO
- VUID-VkBufferCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkBufferCollectionBufferCreateInfoFUCHSIA, VkBufferDeviceAddressAlignmentAllocateInfoVALVE, VkBufferDeviceAddressCreateInfoEXT, VkBufferOpaqueCaptureAddressCreateInfo, VkBufferUsageFlags2CreateInfo, VkDedicatedAllocationBufferCreateInfoNV, VkExternalMemoryBufferCreateInfo, VkOpaqueCaptureDescriptorDataCreateInfoEXT, or

VkVideoProfileListInfoKHR

- VUID-VkBufferCreateInfo-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkBufferCreateInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkBufferCreateFlagBits values
- VUID-VkBufferCreateInfo-sharingMode-parameter
  `sharingMode` **must** be a valid VkSharingMode value

The `VkBufferUsageFlags2CreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkBufferUsageFlags2CreateInfo {
    VkStructureType        sType;
    const void*            pNext;
    VkBufferUsageFlags2    usage;
} VkBufferUsageFlags2CreateInfo;
```

```
// Provided by VK_KHR_extended_flags, VK_KHR_maintenance5
// Equivalent to VkBufferUsageFlags2CreateInfo
typedef VkBufferUsageFlags2CreateInfo VkBufferUsageFlags2CreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of VkBufferUsageFlagBits2 specifying allowed usages of the buffer.

If this structure is included in the `pNext` chain of a buffer creation structure, `usage` is used instead of the corresponding `usage` value passed in that creation structure, allowing additional usage flags to be specified.

If this structure is included in the `pNext` chain of a query structure including VkBufferUsageFlags, the usage flags of the buffer are returned in `flags` of this structure, allowing additional usage flags to be queried. The flags representable in VkBufferUsageFlags are still returned in the query structure in this case.

Valid Usage (Implicit)

- VUID-VkBufferUsageFlags2CreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BUFFER_USAGE_FLAGS_2_CREATE_INFO
- VUID-VkBufferUsageFlags2CreateInfo-usage-parameter
  `usage` **must** be a valid combination of VkBufferUsageFlagBits2 values

Structure Chaining

Extends the structures

- VkBufferCreateInfo
- VkBufferViewCreateInfo
- VkDescriptorBufferBindingInfoEXT
- VkPhysicalDeviceExternalBufferInfo

Bits which **can** be set in VkBufferUsageFlags2CreateInfo::usage, specifying usage behavior of a buffer, are:

```
// Provided by VK_VERSION_1_4
// Flag bits for VkBufferUsageFlagBits2
typedef VkFlags64 VkBufferUsageFlagBits2;

```

- VK_BUFFER_USAGE_2_TRANSFER_SRC_BIT specifies that the buffer **can** be used as the source of a *transfer command* (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT).
- VK_BUFFER_USAGE_2_TRANSFER_DST_BIT specifies that the buffer **can** be used as the destination of a transfer command.
- VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT specifies that the buffer **can** be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.
- VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT specifies that the buffer **can** be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.
- VK_BUFFER_USAGE_2_UNIFORM_BUFFER_BIT specifies that the buffer **can** be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC.
- VK_BUFFER_USAGE_2_STORAGE_BUFFER_BIT specifies that the buffer **can** be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.
- VK_BUFFER_USAGE_2_INDEX_BUFFER_BIT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndexBuffer2 and vkCmdBindIndexBuffer.
- VK_BUFFER_USAGE_2_VERTEX_BUFFER_BIT specifies that the buffer is suitable for passing as an element of the pBuffers array to vkCmdBindVertexBuffers.
- VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdDrawIndirect, vkCmdDrawIndexedIndirect, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectCountNV, vkCmdDrawMeshTasksIndirectEXT, vkCmdDrawMeshTasksIndirectCountEXT, vkCmdDrawClusterIndirectHUAWEI, or vkCmdDispatchIndirect. It is also suitable for passing as the buffer member of VkIndirectCommandsStreamNV, or sequencesCountBuffer or sequencesIndexBuffer or preprocessedBuffer member of VkGeneratedCommandsInfoNV. It is also suitable for passing as the underlying buffer of either the preprocessAddress or sequenceCountAddress members of VkGeneratedCommandsInfoEXT.

- VK_BUFFER_USAGE_2_CONDITIONAL_RENDERING_BIT_EXT specifies that the buffer is suitable for passing as the `buffer` parameter to vkCmdBeginConditionalRenderingEXT.
- VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT specifies that the buffer is suitable for using for binding as a transform feedback buffer with vkCmdBindTransformFeedbackBuffers2EXT or vkCmdBindTransformFeedbackBuffersEXT.
- VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT specifies that the buffer is suitable for using as a counter buffer with vkCmdBeginTransformFeedback2EXT, vkCmdEndTransformFeedback2EXT, vkCmdBeginTransformFeedbackEXT, and vkCmdEndTransformFeedbackEXT.
- VK_BUFFER_USAGE_2_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT specifies that the buffer is suitable to contain sampler and combined image sampler descriptors when bound as a descriptor buffer. Buffers containing combined image sampler descriptors **must** also specify VK_BUFFER_USAGE_2_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT.
- VK_BUFFER_USAGE_2_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT specifies that the buffer is suitable to contain resource descriptors when bound as a descriptor buffer.
- VK_BUFFER_USAGE_2_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT specifies that the buffer, when bound, **can** be used by the implementation to support push descriptors when using descriptor buffers.
- VK_BUFFER_USAGE_2_TILE_MEMORY_BIT_QCOM specifies that the buffer **can** be bound to `VkDeviceMemory` allocated from a VkMemoryHeap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property.
- VK_BUFFER_USAGE_2_RAY_TRACING_BIT_NV specifies that the buffer is suitable for use in vkCmdTraceRaysNV.
- VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR specifies that the buffer is suitable for use as a Shader Binding Table.
- VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.
- VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR specifies that the buffer is suitable for storage space for a VkAccelerationStructureKHR.
- VK_BUFFER_USAGE_2_SHADER_DEVICE_ADDRESS_BIT specifies that the buffer **can** be used to retrieve a buffer device address via vkGetBufferDeviceAddress and use that address to access the buffer's memory from a shader.
- VK_BUFFER_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR specifies that the buffer **can** be used as the source video bitstream buffer in a video decode operation.
- VK_BUFFER_USAGE_2_VIDEO_DECODE_DST_BIT_KHR is reserved for future use.
- VK_BUFFER_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR specifies that the buffer **can** be used as the destination video bitstream buffer in a video encode operation.
- VK_BUFFER_USAGE_2_VIDEO_ENCODE_SRC_BIT_KHR is reserved for future use.
- VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDX specifies that the buffer **can** be used as scratch memory for execution graph dispatch.

- VK_BUFFER_USAGE_2_PREPROCESS_BUFFER_BIT_EXT specifies that the buffer **can** be used as a preprocess buffer for Device-Generated Commands.
- VK_BUFFER_USAGE_2_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT specifies that the buffer **can** be used as a read-only VkMicromapEXT build input, which includes the `data` and `triangleArray` parameters.
- VK_BUFFER_USAGE_2_MICROMAP_STORAGE_BIT_EXT specifies that the buffer **can** be used to create VkMicromapEXT objects.
- VK_BUFFER_USAGE_2_COMPRESSED_DATA_DGF1_BIT_AMDX specifies that the buffer is suitable as storage space for Dense Geometry Format data.
- VK_BUFFER_USAGE_2_DATA_GRAPH_FOREIGN_DESCRIPTOR_BIT_ARM specifies that the buffer is suitable to contain resource descriptors when bound as a descriptor buffer in command buffers allocated from a command pool that **can** target foreign data graph processing engines.
- VK_BUFFER_USAGE_2_MEMORY_DECOMPRESSION_BIT_EXT specifies that the buffer **can** be used as a destination buffer in memory decompression.
- VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT specifies that the buffer **can** be used as a descriptor heap.

```
// Provided by VK_VERSION_1_4
typedef VkFlags64 VkBufferUsageFlags2;
```

```
// Provided by VK_KHR_extended_flags, VK_KHR_maintenance5
// Equivalent to VkBufferUsageFlags2
typedef VkBufferUsageFlags2 VkBufferUsageFlags2KHR;
```

`VkBufferUsageFlags2` is a bitmask type for setting a mask of zero or more VkBufferUsageFlagBits2.

Bits which **can** be set in VkBufferCreateInfo::`usage`, specifying usage behavior of a buffer, are:

WARNING	This functionality is superseded by VkBufferUsageFlagBits2. See Legacy Functionality for more information.

```

  // Provided by VK_EXT_opacity_micromap
    VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT = 0x00800000,
  // Provided by VK_EXT_opacity_micromap
    VK_BUFFER_USAGE_MICROMAP_STORAGE_BIT_EXT = 0x01000000,
  // Provided by VK_QCOM_tile_memory_heap
    VK_BUFFER_USAGE_TILE_MEMORY_BIT_QCOM = 0x08000000,
  // Provided by VK_NV_ray_tracing
    VK_BUFFER_USAGE_RAY_TRACING_BIT_NV = VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR,
  // Provided by VK_EXT_buffer_device_address
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_EXT =
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT,
  // Provided by VK_KHR_buffer_device_address
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR =
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT,
} VkBufferUsageFlagBits;
```

- VK_BUFFER_USAGE_TRANSFER_SRC_BIT specifies that the buffer **can** be used as the source of a *transfer command* (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT).

- VK_BUFFER_USAGE_TRANSFER_DST_BIT specifies that the buffer **can** be used as the destination of a transfer command.
- VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT specifies that the buffer **can** be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.
- VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT specifies that the buffer **can** be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.
- VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT specifies that the buffer **can** be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC.
- VK_BUFFER_USAGE_STORAGE_BUFFER_BIT specifies that the buffer **can** be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.
- VK_BUFFER_USAGE_INDEX_BUFFER_BIT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndexBuffer2 and vkCmdBindIndexBuffer.
- VK_BUFFER_USAGE_VERTEX_BUFFER_BIT specifies that the buffer is suitable for passing as an element of the pBuffers array to vkCmdBindVertexBuffers.
- VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdDrawIndirect, vkCmdDrawIndexedIndirect, vkCmdDrawMeshTasksIndirectNV, vkCmdDrawMeshTasksIndirectCountNV, vkCmdDrawMeshTasksIndirectEXT, vkCmdDrawMeshTasksIndirectCountEXT, vkCmdDrawClusterIndirectHUAWEI, or vkCmdDispatchIndirect. It is also suitable for passing as the buffer member of VkIndirectCommandsStreamNV, or sequencesCountBuffer or sequencesIndexBuffer or preprocessedBuffer member of VkGeneratedCommandsInfoNV. It is also suitable for passing as the underlying buffer of either the preprocessAddress or sequenceCountAddress members of VkGeneratedCommandsInfoEXT.
- VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBeginConditionalRenderingEXT.
- VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT specifies that the buffer is suitable for using for binding as a transform feedback buffer with vkCmdBindTransformFeedbackBuffers2EXT or vkCmdBindTransformFeedbackBuffersEXT.
- VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT specifies that the buffer is suitable for using as a counter buffer with vkCmdBeginTransformFeedback2EXT, vkCmdEndTransformFeedback2EXT, vkCmdBeginTransformFeedbackEXT, and vkCmdEndTransformFeedbackEXT.
- VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT specifies that the buffer is suitable to contain sampler and combined image sampler descriptors when bound as a descriptor buffer. Buffers containing combined image sampler descriptors **must** also specify VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT.
- VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT specifies that the buffer is

suitable to contain resource descriptors when bound as a descriptor buffer.

- VK_BUFFER_USAGE_PUSH_DESCRIPTORS_DESCRIPTOR_BUFFER_BIT_EXT specifies that the buffer, when bound, **can** be used by the implementation to support push descriptors when using descriptor buffers.
- VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT specifies that when building a VkMicromapEXT, the buffer **can** be used as a read-only micromap build input, which includes the `data` and `triangleArray` parameters.
- VK_BUFFER_USAGE_MICROMAP_STORAGE_BIT_EXT specifies that the buffer **can** be used to create VkMicromapEXT objects.
- VK_BUFFER_USAGE_TILE_MEMORY_BIT_QCOM specifies that the buffer **can** be bound to `VkDeviceMemory` allocated from a VkMemoryHeap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property.
- VK_BUFFER_USAGE_RAY_TRACING_BIT_NV specifies that the buffer is suitable for use in vkCmdTraceRaysNV.
- VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR specifies that the buffer is suitable for use as a Shader Binding Table.
- VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.
- VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR specifies that the buffer is suitable for storage space for a VkAccelerationStructureKHR.
- VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT specifies that the buffer **can** be used to retrieve a buffer device address via vkGetBufferDeviceAddress and use that address to access the buffer's memory from a shader.
- VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR specifies that the buffer **can** be used as the source video bitstream buffer in a video decode operation.
- VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR is reserved for future use.
- VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR specifies that the buffer **can** be used as the destination video bitstream buffer in a video encode operation.
- VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR is reserved for future use.
- VK_BUFFER_USAGE_EXECUTION_GRAPH_SCRATCH_BIT_AMDX specifies that the buffer **can** be used as scratch memory for execution graph dispatch.
- VK_BUFFER_USAGE_DESCRIPTOR_HEAP_BIT_EXT specifies that the buffer **can** be used as a descriptor heap.

WARNING	This functionality is superseded by VkBufferUsageFlags2. See Legacy Functionality for more information.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferUsageFlags;
```

VkBufferUsageFlags is a bitmask type for setting a mask of zero or more VkBufferUsageFlagBits.

Bits which **can** be set in VkBufferCreateInfo::flags, specifying additional parameters of a buffer, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBufferCreateFlagBits {
    VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
  // Provided by VK_VERSION_1_1
    VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
  // Provided by VK_VERSION_1_2
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000010,
  // Provided by VK_EXT_descriptor_buffer
    VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT = 0x00000020,
  // Provided by VK_KHR_video_maintenance1
    VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR = 0x00000040,
  // Provided by VK_EXT_buffer_device_address
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT =
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
  // Provided by VK_KHR_buffer_device_address
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR =
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkBufferCreateFlagBits;
```

- VK_BUFFER_CREATE_SPARSE_BINDING_BIT specifies that the buffer will be backed using sparse memory binding.
- VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT specifies that the buffer **can** be partially backed using sparse memory binding. Buffers created with this flag **must** also be created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag.
- VK_BUFFER_CREATE_SPARSE_ALIASED_BIT specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag **must** also be created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag.
- VK_BUFFER_CREATE_PROTECTED_BIT specifies that the buffer is a protected buffer.
- VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT specifies that the buffer's address **can** be saved and reused on a subsequent run (e.g. for trace capture and replay), see VkBufferOpaqueCaptureAddressCreateInfo for more detail.
- VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT specifies that the buffer **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.
- VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR specifies that the buffer **can** be used in video coding operations without having to specify at buffer creation time the set of video profiles the buffer will be used with.

See Sparse Resource Features and Physical Device Features for details of the sparse memory features supported on a device.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferCreateFlags;
```

VkBufferCreateFlags is a bitmask type for setting a mask of zero or more VkBufferCreateFlagBits.

If the pNext chain includes a VkDedicatedAllocationBufferCreateInfoNV structure, then that structure includes an enable controlling whether the buffer will have a dedicated memory allocation bound to it.

The VkDedicatedAllocationBufferCreateInfoNV structure is defined as:

```
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationBufferCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           dedicatedAllocation;
} VkDedicatedAllocationBufferCreateInfoNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- dedicatedAllocation specifies whether the buffer will have a dedicated allocation bound to it.

Valid Usage (Implicit)

- VUID-VkDedicatedAllocationBufferCreateInfoNV-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_BUFFER_CREATE_INFO_NV

Structure Chaining

Extends the structure

- VkBufferCreateInfo

To define a set of external memory handle types that **may** be used as backing store for a buffer, add a VkExternalMemoryBufferCreateInfo structure to the pNext chain of the VkBufferCreateInfo structure. The VkExternalMemoryBufferCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlags       handleTypes;
} VkExternalMemoryBufferCreateInfo;
```

```
// Provided by VK_KHR_external_memory
// Equivalent to VkExternalMemoryBufferCreateInfo
typedef VkExternalMemoryBufferCreateInfo VkExternalMemoryBufferCreateInfoKHR;
```

NOTE	A VkExternalMemoryBufferCreateInfo structure with a non-zero handleTypes field must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleTypes is zero or a bitmask of VkExternalMemoryHandleTypeFlagBits specifying one or more external memory handle types.

Valid Usage (Implicit)

- VUID-VkExternalMemoryBufferCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO
- VUID-VkExternalMemoryBufferCreateInfo-handleTypes-parameter
  If handleTypes is not 0, handleTypes **must** be a valid combination of VkExternalMemoryHandleTypeFlagBits values

Structure Chaining

Extends the structure

- VkBufferCreateInfo

To request a specific device address for a buffer, add a VkBufferOpaqueCaptureAddressCreateInfo structure to the pNext chain of the VkBufferCreateInfo structure. The VkBufferOpaqueCaptureAddressCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkBufferOpaqueCaptureAddressCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfo;
```

```
// Provided by VK_KHR_buffer_device_address
// Equivalent to VkBufferOpaqueCaptureAddressCreateInfo
typedef VkBufferOpaqueCaptureAddressCreateInfo
VkBufferOpaqueCaptureAddressCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `opaqueCaptureAddress` is the opaque capture address requested for the buffer.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, then it **should** be an address retrieved from vkGetBufferOpaqueCaptureAddress for an identically created buffer on the same implementation.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

Applications **should** avoid creating buffers with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS errors.

NOTE

The expected usage for this is that a trace capture/replay tool will add the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag to all buffers that use VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT, and during capture will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Applications and tools should avoid mixing application-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

Valid Usage (Implicit)

- VUID-VkBufferOpaqueCaptureAddressCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO

Structure Chaining

Extends the structure

- VkBufferCreateInfo

To request a specific device address for a buffer, add a VkBufferDeviceAddressCreateInfoEXT structure to the pNext chain of the VkBufferCreateInfo structure. The VkBufferDeviceAddressCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_buffer_device_address
typedef struct VkBufferDeviceAddressCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceAddress    deviceAddress;
} VkBufferDeviceAddressCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- deviceAddress is the device address requested for the buffer.

If deviceAddress is zero, no specific address is requested.

If deviceAddress is not zero, then it **must** be an address retrieved from an identically created buffer on the same implementation. The buffer **must** also be bound to an identically created VkDeviceMemory object.

If this structure is not present, it is as if deviceAddress is zero.

Applications **should** avoid creating buffers with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_DEVICE_ADDRESS_EXT errors.

Valid Usage (Implicit)

- VUID-VkBufferDeviceAddressCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_CREATE_INFO_EXT
- VUID-VkBufferDeviceAddressCreateInfoEXT-deviceAddress-parameter
  If deviceAddress is not 0, deviceAddress **must** be a valid VkDeviceAddress value

Structure Chaining

Extends the structure

- VkBufferCreateInfo

The VkBufferCollectionBufferCreateInfoFUCHSIA structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionBufferCreateInfoFUCHSIA {
    VkStructureType              sType;
    const void*                  pNext;
    VkBufferCollectionFUCHSIA    collection;
    uint32_t                     index;
} VkBufferCollectionBufferCreateInfoFUCHSIA;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- collection is the VkBufferCollectionFUCHSIA handle.
- index is the index of the buffer in the buffer collection from which the memory will be imported.

Valid Usage

- VUID-VkBufferCollectionBufferCreateInfoFUCHSIA-index-06388
  index **must** be less than VkBufferCollectionPropertiesFUCHSIA::bufferCount

Valid Usage (Implicit)

- VUID-VkBufferCollectionBufferCreateInfoFUCHSIA-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_BUFFER_COLLECTION_BUFFER_CREATE_INFO_FUCHSIA
- VUID-VkBufferCollectionBufferCreateInfoFUCHSIA-collection-parameter
  collection **must** be a valid VkBufferCollectionFUCHSIA handle

Structure Chaining

Extends the structure

- VkBufferCreateInfo

To destroy a buffer, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyBuffer(
    VkDevice                                    device,
    VkBuffer                                    buffer,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the buffer.
- `buffer` is the buffer to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyBuffer-buffer-00922
  All submitted commands that refer to `buffer`, either directly or via a `VkBufferView`, **must** have completed execution
- VUID-vkDestroyBuffer-buffer-00923
  If `VkAllocationCallbacks` were provided when `buffer` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyBuffer-buffer-00924
  If no `VkAllocationCallbacks` were provided when `buffer` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyBuffer-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyBuffer-buffer-parameter
  If `buffer` is not VK_NULL_HANDLE, `buffer` **must** be a valid VkBuffer handle
- VUID-vkDestroyBuffer-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyBuffer-buffer-parent
  If `buffer` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `buffer` **must** be externally synchronized

12.2. Buffer Views

A *buffer view* represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents using image operations. In order to create a valid buffer view, the buffer **must** have been created with at least one of the following usage flags:

- VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
- VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

Buffer views are represented by VkBufferView handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferView)
```

To create a buffer view, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateBufferView(
    VkDevice                                    device,
    const VkBufferViewCreateInfo*               pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkBufferView*                               pView);
```

- device is the logical device that creates the buffer view.
- pCreateInfo is a pointer to a VkBufferViewCreateInfo structure containing parameters to be used to create the buffer view.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pView is a pointer to a VkBufferView handle in which the resulting buffer view object is returned.

Valid Usage

- VUID-vkCreateBufferView-device-09665
  device **must** support at least one queue family with one of the VK_QUEUE_COMPUTE_BIT or VK_QUEUE_GRAPHICS_BIT capabilities

Valid Usage (Implicit)

- VUID-vkCreateBufferView-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkCreateBufferView-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkBufferViewCreateInfo structure
- VUID-vkCreateBufferView-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateBufferView-pView-parameter
  pView **must** be a valid pointer to a VkBufferView handle
- VUID-vkCreateBufferView-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkBufferViewCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBufferViewCreateInfo {
    VkStructureType            sType;
    const void*                pNext;
    VkBufferViewCreateFlags    flags;
    VkBuffer                   buffer;
    VkFormat                   format;
    VkDeviceSize               offset;
    VkDeviceSize               range;
} VkBufferViewCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- buffer is a VkBuffer on which the view will be created.
- format is a VkFormat describing the format of the data elements in the buffer.
- offset is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.
- range is a size in bytes of the buffer view. If range is equal to VK_WHOLE_SIZE, the range from offset to the end of the buffer is used. If VK_WHOLE_SIZE is used and the remaining size of the buffer is not a multiple of the texel block size of format, the nearest smaller multiple is used.

The buffer view has a *buffer view usage* identifying which descriptor types can be created from it. This usage **can** be defined by including the VkBufferUsageFlags2CreateInfo structure in the pNext chain, and specifying the usage value there. If this structure is not included, it is equal to the VkBufferCreateInfo::usage value used to create buffer.

Valid Usage

- VUID-VkBufferViewCreateInfo-offset-00925

`offset` **must** be less than the size of `buffer`

- VUID-VkBufferViewCreateInfo-range-00928
  If `range` is not equal to VK_WHOLE_SIZE, `range` **must** be greater than `0`
- VUID-VkBufferViewCreateInfo-range-00929
  If `range` is not equal to VK_WHOLE_SIZE, `range` **must** be an integer multiple of the texel block size of `format`
- VUID-VkBufferViewCreateInfo-range-00930
  If `range` is not equal to VK_WHOLE_SIZE, the number of texel buffer elements given by (⌊`range` / (texel block size)⌋ × (texels per block)) where texel block size and texels per block are as defined in the Compatible Formats table for `format`, **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxTexelBufferElements`
- VUID-VkBufferViewCreateInfo-offset-00931
  If `range` is not equal to VK_WHOLE_SIZE, the sum of `offset` and `range` **must** be less than or equal to the size of `buffer`
- VUID-VkBufferViewCreateInfo-range-04059
  If `range` is equal to VK_WHOLE_SIZE, the number of texel buffer elements given by (⌊(size - `offset`) / (texel block size)⌋ × (texels per block)) where size is the size of `buffer`, and texel block size and texels per block are as defined in the Compatible Formats table for `format`, **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxTexelBufferElements`
- VUID-VkBufferViewCreateInfo-buffer-00932
  `buffer` **must** have been created with at least one of the VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT usage flags set
- VUID-VkBufferViewCreateInfo-format-08778
  If the buffer view usage contains VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT, then format features of `format` **must** contain VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT
- VUID-VkBufferViewCreateInfo-format-08779
  If the buffer view usage contains VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, then format features of `format` **must** contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT
- VUID-VkBufferViewCreateInfo-buffer-00935
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkBufferViewCreateInfo-buffer-02750
  If `buffer` was created with the VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT usage flag set, `offset` **must** be a multiple of the effective alignment requirement of `format` for VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER as defined by `minTexelBufferOffsetAlignment`
- VUID-VkBufferViewCreateInfo-buffer-02751
  If `buffer` was created with the VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT usage flag set, `offset` **must** be a multiple of the effective alignment requirement of `format` for VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER as defined by

minTexelBufferOffsetAlignment

- VUID-VkBufferViewCreateInfo-pNext-06782
  If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member **must** be VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT
- VUID-VkBufferViewCreateInfo-pNext-08780
  If the pNext chain includes a VkBufferUsageFlags2CreateInfo, its usage **must** not contain any other bit than VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT
- VUID-VkBufferViewCreateInfo-pNext-08781
  If the pNext chain includes a VkBufferUsageFlags2CreateInfo, its usage **must** be a subset of the VkBufferCreateInfo::usage specified or VkBufferUsageFlags2CreateInfo::usage from VkBufferCreateInfo::pNext when creating buffer
- VUID-VkBufferViewCreateInfo-None-12278
  If Vulkan 1.3 is not supported and the ycbcr2plane444Formats feature is not enabled, format **must** not be VK_FORMAT_G8_B8R8_2PLANE_444_UNORM, VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16, VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16, or VK_FORMAT_G16_B16R16_2PLANE_444_UNORM

Valid Usage (Implicit)

- VUID-VkBufferViewCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO
- VUID-VkBufferViewCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkBufferUsageFlags2CreateInfo or VkExportMetalObjectCreateInfoEXT
- VUID-VkBufferViewCreateInfo-sType-unique
  The sType value of each structure in the pNext chain **must** be unique, with the exception of structures of type VkExportMetalObjectCreateInfoEXT
- VUID-VkBufferViewCreateInfo-flags-zerobitmask
  flags **must** be 0
- VUID-VkBufferViewCreateInfo-buffer-parameter
  buffer **must** be a valid VkBuffer handle
- VUID-VkBufferViewCreateInfo-format-parameter
  format **must** be a valid VkFormat value

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferViewCreateFlags;
```

VkBufferViewCreateFlags is a bitmask type for setting a mask, but is currently reserved for future

use.

To destroy a buffer view, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyBufferView(
    VkDevice                                    device,
    VkBufferView                                bufferView,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the buffer view.
- `bufferView` is the buffer view to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyBufferView-bufferView-00936
  All submitted commands that refer to `bufferView` **must** have completed execution
- VUID-vkDestroyBufferView-bufferView-00937
  If `VkAllocationCallbacks` were provided when `bufferView` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyBufferView-bufferView-00938
  If no `VkAllocationCallbacks` were provided when `bufferView` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyBufferView-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyBufferView-bufferView-parameter
  If `bufferView` is not VK_NULL_HANDLE, `bufferView` **must** be a valid VkBufferView handle
- VUID-vkDestroyBufferView-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyBufferView-bufferView-parent
  If `bufferView` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `bufferView` **must** be externally synchronized

12.2.1. Buffer View Format Features

Valid uses of a VkBufferView **may** depend on the buffer view's *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the VK_KHR_format_feature_flags2 extension is supported, then the buffer view's set of *format features* is the value of VkFormatProperties3::bufferFeatures found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkBufferViewCreateInfo::format.

12.3. Buffer Device Addresses

To query a 64-bit buffer device address value which can be used to identify a buffer to API commands or through which buffer memory **can** be accessed, call:

```
// Provided by VK_VERSION_1_2
VkDeviceAddress vkGetBufferDeviceAddress(
    VkDevice                                    device,
    const VkBufferDeviceAddressInfo*            pInfo);
```

```
// Provided by VK_KHR_buffer_device_address
// Equivalent to vkGetBufferDeviceAddress
VkDeviceAddress vkGetBufferDeviceAddressKHR(
    VkDevice                                    device,
    const VkBufferDeviceAddressInfo*            pInfo);
```

```
// Provided by VK_EXT_buffer_device_address
// Equivalent to vkGetBufferDeviceAddress
VkDeviceAddress vkGetBufferDeviceAddressEXT(
    VkDevice                                    device,
    const VkBufferDeviceAddressInfo*            pInfo);
```

- device is the logical device that the buffer was created on.
- pInfo is a pointer to a VkBufferDeviceAddressInfo structure specifying the buffer to retrieve an address for.

The 64-bit return value, bufferBaseAddress, is an address of the start of pInfo->buffer. Addresses in the range [bufferBaseAddress, bufferBaseAddress + VkBufferCreateInfo::size) **can** be used to access the memory bound to this buffer on the device.

A value of zero is reserved as a "null" pointer and **must** not be returned as a valid buffer device address.

If the buffer was created with a non-zero value of VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress or VkBufferDeviceAddressCreateInfoEXT::deviceAddress, the return value will be the same address that was returned at capture time.

The returned address **must** satisfy alignment requirements if certain conditions are met, outlined below. The required alignment **must** be observed for either the returned address of the buffer, or, if the buffer was created without VK_BUFFER_CREATE_SPARSE_BINDING_BIT, the returned address of the buffer minus VkBindBufferMemoryInfo::memoryOffset or equivalent vkBindBufferMemory offset. The required alignment is the maximum of the following values:

- The value of VkMemoryRequirements::alignment queried via vkGetBufferMemoryRequirements for pInfo->buffer
- minStorageBufferOffsetAlignment if pInfo->buffer was created with VK_BUFFER_USAGE_2_STORAGE_BUFFER_BIT
- minUniformBufferOffsetAlignment if pInfo->buffer was created with VK_BUFFER_USAGE_2_UNIFORM_BUFFER_BIT
- minTexelBufferOffsetAlignment if pInfo->buffer was created with VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT
- resourceHeapAlignment if pInfo->buffer was created with VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT
- samplerHeapAlignment if pInfo->buffer was created with VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT
- descriptorBufferOffsetAlignment if pInfo->buffer was created with VK_BUFFER_USAGE_2_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT or VK_BUFFER_USAGE_2_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT
- VkBufferDeviceAddressAlignmentAllocateInfoVALVE::alignment if pInfo->buffer was created without VK_BUFFER_CREATE_SPARSE_BINDING_BIT and the bound VkDeviceMemory was created with specified non-zero alignment of VkBufferDeviceAddressAlignmentAllocateInfoVALVE::alignment
- VkBufferDeviceAddressAlignmentAllocateInfoVALVE::alignment if pInfo->buffer was created with VK_BUFFER_CREATE_SPARSE_BINDING_BIT, and the buffer was created with non-zero VkBufferDeviceAddressAlignmentAllocateInfoVALVE::alignment
- 256, if pInfo->buffer was created with VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR, and VK_KHR_device_address_commands is supported

If multiple VkBuffer objects are bound to overlapping ranges of VkDeviceMemory, implementations **may** return address ranges which overlap. In this case, it is ambiguous which VkBuffer is associated with any given device address. For purposes of valid usage, if multiple VkBuffer objects **can** be attributed to a device address, a VkBuffer is selected such that valid usage passes, if it exists.

Valid Usage

- VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324
  The bufferDeviceAddress feature or the VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddress feature **must** be

enabled, and at least one of the following conditions **must** be met

- `buffer` is sparse
- `buffer` is bound completely and contiguously to a single `VkDeviceMemory` object
- `buffer` was created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag and the VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::`bufferDeviceAddress` feature is enabled on the device

- VUID-vkGetBufferDeviceAddress-device-03325
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` or VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::`bufferDeviceAddressMultiDevice` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetBufferDeviceAddress-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetBufferDeviceAddress-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkBufferDeviceAddressInfo structure

The `VkBufferDeviceAddressInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           buffer;
} VkBufferDeviceAddressInfo;
```

```
// Provided by VK_KHR_buffer_device_address
// Equivalent to VkBufferDeviceAddressInfo
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;
```

```
// Provided by VK_EXT_buffer_device_address
// Equivalent to VkBufferDeviceAddressInfo
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` specifies the buffer whose address is being queried.

Valid Usage

- VUID-VkBufferDeviceAddressInfo-buffer-02601
  `buffer` **must** have been created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT usage flag set

Valid Usage (Implicit)

- VUID-VkBufferDeviceAddressInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO
- VUID-VkBufferDeviceAddressInfo-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkBufferDeviceAddressInfo-buffer-parameter
  `buffer` **must** be a valid VkBuffer handle

To query a 64-bit buffer opaque capture address, call:

```
// Provided by VK_VERSION_1_2
uint64_t vkGetBufferOpaqueCaptureAddress(
    VkDevice                                    device,
    const VkBufferDeviceAddressInfo*            pInfo);
```

```
// Provided by VK_KHR_buffer_device_address
// Equivalent to vkGetBufferOpaqueCaptureAddress
uint64_t vkGetBufferOpaqueCaptureAddressKHR(
    VkDevice                                    device,
    const VkBufferDeviceAddressInfo*            pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a VkBufferDeviceAddressInfo structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of `pInfo->buffer`.

If the buffer was created with a non-zero value of VkBufferOpaqueCaptureAddressCreateInfo ::`opaqueCaptureAddress` the return value **must** be the same address.

Valid Usage

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  The `bufferDeviceAddress` and `bufferDeviceAddressCaptureReplay` features **must** be enabled
- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-10725
  `pInfo->buffer` **must** have been created with the

VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag

- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetBufferOpaqueCaptureAddress-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkBufferDeviceAddressInfo structure

The `VkStridedDeviceAddressRegionKHR` structure is defined as:

```
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkStridedDeviceAddressRegionKHR {
    VkDeviceAddress    deviceAddress;
    VkDeviceSize       stride;
    VkDeviceSize       size;
} VkStridedDeviceAddressRegionKHR;
```

- `deviceAddress` is the device address (as returned by the vkGetBufferDeviceAddress command) at which the region starts, or zero if the region is unused.
- `stride` is the byte stride between consecutive elements.
- `size` is the size in bytes of the region starting at `deviceAddress`.

Valid Usage

- VUID-VkStridedDeviceAddressRegionKHR-size-04631
  If `size` is not zero, all addresses between `deviceAddress` and `deviceAddress` + `size` - 1 **must** be in the buffer device address range of the same buffer
- VUID-VkStridedDeviceAddressRegionKHR-size-04632
  If `size` is not zero, `stride` **must** be less than or equal to the size of the buffer from which `deviceAddress` was queried

Valid Usage (Implicit)

- VUID-VkStridedDeviceAddressRegionKHR-deviceAddress-parameter
  If `deviceAddress` is not `0`, `deviceAddress` **must** be a valid VkDeviceAddress value

12.4. Images

Images are specialized resources that have multi-dimensional access, as outlined in the Images chapter. Images **can** be used for various purposes, such as rendering attachments, for copy operations, or accessed through shaders via resource descriptors.

Images are represented by VkImage handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```

To create images, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateImage(
    VkDevice                                    device,
    const VkImageCreateInfo*                    pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkImage*                                    pImage);
```

- device is the logical device that creates the image.
- pCreateInfo is a pointer to a VkImageCreateInfo structure containing parameters to be used to create the image.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pImage is a pointer to a VkImage handle in which the resulting image object is returned.

Valid Usage

- VUID-vkCreateImage-device-09666
  device **must** support at least one queue family with one of the VK_QUEUE_VIDEO_ENCODE_BIT_KHR, VK_QUEUE_VIDEO_DECODE_BIT_KHR, VK_QUEUE_OPTICAL_FLOW_BIT_NV, VK_QUEUE_SPARSE_BINDING_BIT, VK_QUEUE_TRANSFER_BIT, VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT capabilities
- VUID-vkCreateImage-flags-00939
  If the flags member of pCreateInfo includes VK_IMAGE_CREATE_SPARSE_BINDING_BIT, and the extendedSparseAddressSpace feature is not enabled, creating this VkImage **must** not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize
- VUID-vkCreateImage-flags-09385
  If the flags member of pCreateInfo includes VK_IMAGE_CREATE_SPARSE_BINDING_BIT, the extendedSparseAddressSpace feature is enabled, and the usage member of pCreateInfo contains bits not in VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseImageUsageFlags, creating this VkImage **must** not cause the total required

sparse memory for all currently valid sparse resources on the device, excluding VkBuffer created with usage member of pCreateInfo containing bits in VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseBufferUsageFlags and VkImage created with usage member of pCreateInfo containing bits in VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseImageUsageFlags, to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize

- VUID-vkCreateImage-flags-09386
  If the flags member of pCreateInfo includes VK_IMAGE_CREATE_SPARSE_BINDING_BIT and the extendedSparseAddressSpace feature is enabled, creating this VkImage **must** not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV::extendedSparseAddressSpaceSize

- VUID-vkCreateImage-pNext-06389
  If a VkBufferCollectionImageCreateInfoFUCHSIA has been chained to pNext, pCreateInfo **must** match the Sysmem chosen VkImageCreateInfo excepting members VkImageCreateInfo::extent and VkImageCreateInfo::usage in the match criteria

Valid Usage (Implicit)

- VUID-vkCreateImage-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkCreateImage-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkImageCreateInfo structure
- VUID-vkCreateImage-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateImage-pImage-parameter
  pImage **must** be a valid pointer to a VkImage handle
- VUID-vkCreateImage-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_COMPRESSION_EXHAUSTED_EXT
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkImageCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkImageCreateFlags       flags;
    VkImageType              imageType;
    VkFormat                 format;
    VkExtent3D               extent;
    uint32_t                 mipLevels;
    uint32_t                 arrayLayers;
    VkSampleCountFlagBits    samples;
    VkImageTiling            tiling;
    VkImageUsageFlags        usage;
    VkSharingMode            sharingMode;
    uint32_t                 queueFamilyIndexCount;
    const uint32_t*          pQueueFamilyIndices;
    VkImageLayout            initialLayout;
} VkImageCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkImageCreateFlagBits describing additional parameters of the image.
- imageType is a VkImageType value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.
- format is a VkFormat describing the format and type of the texel blocks that will be contained in the image.
- extent is a VkExtent3D describing the number of texels/pixels in each dimension of the base level.
- mipLevels describes the number of levels of detail available for minified sampling of the image.
- arrayLayers is the number of layers in the image.
- samples is a VkSampleCountFlagBits value specifying the number of samples per texel.
- tiling is a VkImageTiling value specifying the tiling arrangement of the texel blocks in memory.
- usage is a bitmask of VkImageUsageFlagBits describing the intended usage of the image.
- sharingMode is a VkSharingMode value specifying the sharing mode of the image when it will be accessed by multiple queue families.
- queueFamilyIndexCount is the number of entries in the pQueueFamilyIndices array.
- pQueueFamilyIndices is a pointer to an array of queue families that will access this image. It is

ignored if sharingMode is not VK_SHARING_MODE_CONCURRENT.

- initialLayout is a VkImageLayout value specifying the initial VkImageLayout of all image subresources of the image. See Image Layouts.

flags defines the effective create flags for the image. If the pNext chain includes a VkImageCreateFlags2CreateInfoKHR structure, flags is ignored, and the effective create flags are defined by VkImageCreateFlags2CreateInfoKHR::flags.

usage defines the effective usage flags for the image. If the pNext chain includes a VkImageUsageFlags2CreateInfoKHR structure, usage is ignored, and the effective usage flags are defined by VkImageUsageFlags2CreateInfoKHR::usage.

Images created with tiling equal to VK_IMAGE_TILING_LINEAR have further restrictions on their limits and capabilities compared to images created with tiling equal to VK_IMAGE_TILING_OPTIMAL. Creation of images with tiling VK_IMAGE_TILING_LINEAR **may** not be supported unless other parameters meet all of the constraints:

- imageType is VK_IMAGE_TYPE_2D
- format is not a depth/stencil format
- mipLevels is 1
- arrayLayers is 1
- samples is VK_SAMPLE_COUNT_1_BIT
- usage only includes VK_IMAGE_USAGE_TRANSFER_SRC_BIT and/or VK_IMAGE_USAGE_TRANSFER_DST_BIT

Images created with one of the formats that require a sampler $Y'C_BC_R$ conversion have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring $Y'C_BC_R$ conversion **may** not be supported unless other parameters meet all of the constraints:

- imageType is VK_IMAGE_TYPE_2D
- mipLevels is 1
- arrayLayers is 1, unless the ycbcrImageArrays feature is enabled, or otherwise indicated by VkImageFormatProperties::maxArrayLayers, as returned by vkGetPhysicalDeviceImageFormatProperties
- samples is VK_SAMPLE_COUNT_1_BIT

Images created with the VK_IMAGE_USAGE_TILE_MEMORY_BIT_QCOM usage flag set have further restrictions on their limits and capabilities compared to images created without this flag. Creation of images with usage including VK_IMAGE_USAGE_TILE_MEMORY_BIT_QCOM **may** not be supported unless parameters meet all of the constraints:

- flags is 0 or only includes VK_IMAGE_CREATE_ALIAS_BIT
- imageType is VK_IMAGE_TYPE_2D
- mipLevels is 1

- `arrayLayers` is 1
- `samples` is VK_SAMPLE_COUNT_1_BIT
- `tiling` is VK_IMAGE_TILING_OPTIMAL
- `usage` includes VK_IMAGE_USAGE_TILE_MEMORY_BIT_QCOM and any valid combination of the following VK_IMAGE_USAGE_SAMPLED_BIT, VK_IMAGE_USAGE_STORAGE_BIT, VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

Implementations **may** support additional limits and capabilities beyond those listed above.

To determine the set of valid `usage` bits for a given format, call vkGetPhysicalDeviceFormatProperties.

If the size of the resultant image would exceed `maxResourceSize`, then vkCreateImage **must** fail and return VK_ERROR_OUT_OF_DEVICE_MEMORY. This failure **may** occur even when all image creation parameters satisfy their valid usage requirements.

If the implementation reports VK_TRUE in VkPhysicalDeviceHostImageCopyProperties ::`identicalMemoryTypeRequirements`, usage of VK_IMAGE_USAGE_HOST_TRANSFER_BIT **must** not affect the memory type requirements of the image as described in Sparse Resource Memory Requirements and Resource Memory Association.

NOTE

For images created without the VK_IMAGE_CREATE_EXTENDED_USAGE_BIT flag set, a `usage` bit is valid if it is supported for the format the image is created with.

For images created with VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a `usage` bit is valid if it is supported for at least one of the formats a `VkImageView` created from the image **can** have (see Image Views for more detail).

Image Creation Limits

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, VkImageCreateInfo::`arrayLayers` is limited by `imageCreateMaxArrayLayers`, defined below; and VkImageCreateInfo::`samples` is limited by `imageCreateSampleCounts`, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of VkImageCreateInfo.

- Let `uint64_t imageCreateDrmFormatModifiers[]` be the set of Linux DRM format modifiers that the resultant image **may** have.
  - If `tiling` is not VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then `imageCreateDrmFormatModifiers` is empty.
  - If VkImageCreateInfo::`pNext` contains VkImageDrmFormatModifierExplicitCreateInfoEXT, then

imageCreateDrmFormatModifiers contains exactly one modifier, VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier.

- If VkImageCreateInfo::pNext contains VkImageDrmFormatModifierListCreateInfoEXT, then imageCreateDrmFormatModifiers contains the entire array VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers.

- Let VkBool32 imageCreateMaybeLinear indicate if the resultant image may be linear.
  - If tiling is VK_IMAGE_TILING_LINEAR, then imageCreateMaybeLinear is VK_TRUE.
  - If tiling is VK_IMAGE_TILING_OPTIMAL, then imageCreateMaybeLinear is VK_FALSE.
  - If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then imageCreateMaybeLinear is VK_TRUE if and only if imageCreateDrmFormatModifiers contains DRM_FORMAT_MOD_LINEAR.
- Let VkFormatFeatureFlags imageCreateFormatFeatures be the set of valid *format features* available during image creation.
  - If tiling is VK_IMAGE_TILING_LINEAR, then imageCreateFormatFeatures is the value of VkFormatProperties::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties with parameter format equal to VkImageCreateInfo::format.
  - If tiling is VK_IMAGE_TILING_OPTIMAL, and if the pNext chain includes no VkExternalFormatANDROID or VkExternalFormatQNX structure with non-zero externalFormat, then imageCreateFormatFeatures is the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties with parameter format equal to VkImageCreateInfo::format.
  - If tiling is VK_IMAGE_TILING_OPTIMAL, and if the pNext chain includes a VkExternalFormatANDROID structure with non-zero externalFormat, then imageCreateFormatFeatures is empty.
  - If tiling is VK_IMAGE_TILING_OPTIMAL, and if the pNext chain includes a VkExternalFormatQNX structure with non-zero externalFormat, then imageCreateFormatFeatures is the value of VkScreenBufferFormatPropertiesQNX::formatFeatures obtained by vkGetScreenBufferPropertiesQNX with a matching externalFormat value.
  - If the pNext chain includes a VkBufferCollectionImageCreateInfoFUCHSIA structure, then imageCreateFormatFeatures is the value of VkBufferCollectionPropertiesFUCHSIA::formatFeatures found by calling vkGetBufferCollectionPropertiesFUCHSIA with a parameter collection equal to VkBufferCollectionImageCreateInfoFUCHSIA::collection
  - If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the value of imageCreateFormatFeatures is found by calling vkGetPhysicalDeviceFormatProperties2 with format equal to VkImageCreateInfo::format and with VkDrmFormatModifierPropertiesListEXT chained into VkFormatProperties2; by collecting all members of the returned array VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties whose drmFormatModifier belongs to imageCreateDrmFormatModifiers; and by taking the bitwise intersection, over the collected array members, of drmFormatModifierTilingFeatures.

The resultant imageCreateFormatFeatures **may** be empty.

- Let VkImageFormatProperties2 imageCreateImageFormatPropertiesList[] be defined as follows.
  - If VkImageCreateInfo::pNext contains no VkExternalFormatANDROID or VkExternalFormatQNX structure with non-zero externalFormat, then imageCreateImageFormatPropertiesList is the list of structures obtained by calling vkGetPhysicalDeviceImageFormatProperties2, possibly multiple times, as follows:
    - The parameters VkPhysicalDeviceImageFormatInfo2::format, imageType, tiling, usage, and flags **must** be equal to those in VkImageCreateInfo.
    - If VkImageCreateInfo::pNext contains a VkExternalMemoryImageCreateInfo structure whose handleTypes is not 0, then VkPhysicalDeviceImageFormatInfo2::pNext **must** contain a VkPhysicalDeviceExternalImageFormatInfo structure whose handleType is not 0; and vkGetPhysicalDeviceImageFormatProperties2 **must** be called for each handle type in VkExternalMemoryImageCreateInfo::handleTypes, successively setting VkPhysicalDeviceExternalImageFormatInfo::handleType on each call.
    - If VkImageCreateInfo::pNext contains no VkExternalMemoryImageCreateInfo structure, or contains a structure whose handleTypes is 0, then VkPhysicalDeviceImageFormatInfo2::pNext **must** either contain no VkPhysicalDeviceExternalImageFormatInfo structure, or contain a structure whose handleType is 0.
    - If VkImageCreateInfo::pNext contains a VkVideoProfileListInfoKHR structure then VkPhysicalDeviceImageFormatInfo2::pNext **must** also contain the same VkVideoProfileListInfoKHR structure on each call.
    - If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then:
      - VkPhysicalDeviceImageFormatInfo2::pNext **must** contain a VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure where sharingMode is equal to VkImageCreateInfo::sharingMode;
      - if sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount and pQueueFamilyIndices **must** be equal to those in VkImageCreateInfo;
      - if flags contains VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, then the VkImageFormatListCreateInfo structure included in the pNext chain of VkPhysicalDeviceImageFormatInfo2 **must** be equivalent to the one included in the pNext chain of VkImageCreateInfo;
      - if VkImageCreateInfo::pNext contains a VkImageCompressionControlEXT structure, then the VkPhysicalDeviceImageFormatInfo2::pNext chain **must** contain an equivalent structure;
      - vkGetPhysicalDeviceImageFormatProperties2 **must** be called for each modifier in imageCreateDrmFormatModifiers, successively setting VkPhysicalDeviceImageDrmFormatModifierInfoEXT::drmFormatModifier on each call.
    - If tiling is not VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then

VkPhysicalDeviceImageFormatInfo2::pNext **must** contain no VkPhysicalDeviceImageDrmFormatModifierInfoEXT structure.

- If any call to vkGetPhysicalDeviceImageFormatProperties2 returns an error, then imageCreateImageFormatPropertiesList is defined to be the empty list.

◦ If VkImageCreateInfo::pNext contains a VkExternalFormatANDROID structure with non-zero externalFormat, then imageCreateImageFormatPropertiesList contains a single element where:

- VkImageFormatProperties::maxMipLevels is $\lfloor \log_2(\max(\text{extent.width}, \text{extent.height}, \text{extent.depth})) \rfloor + 1$.
- VkImageFormatProperties::maxArrayLayers is VkPhysicalDeviceLimits::maxImageArrayLayers.
- Each component of VkImageFormatProperties::maxExtent is VkPhysicalDeviceLimits::maxImageDimension2D.
- VkImageFormatProperties::sampleCounts contains exactly VK_SAMPLE_COUNT_1_BIT.

- Let uint32_t imageCreateMaxMipLevels be the minimum value of VkImageFormatProperties::maxMipLevels in imageCreateImageFormatPropertiesList. The value is undefined if imageCreateImageFormatPropertiesList is empty.
- Let uint32_t imageCreateMaxArrayLayers be the minimum value of VkImageFormatProperties::maxArrayLayers in imageCreateImageFormatPropertiesList. The value is undefined if imageCreateImageFormatPropertiesList is empty.
- Let VkExtent3D imageCreateMaxExtent be the component-wise minimum over all VkImageFormatProperties::maxExtent values in imageCreateImageFormatPropertiesList. The value is undefined if imageCreateImageFormatPropertiesList is empty.
- Let VkSampleCountFlags imageCreateSampleCounts be the intersection of each VkImageFormatProperties::sampleCounts in imageCreateImageFormatPropertiesList. The value is undefined if imageCreateImageFormatPropertiesList is empty.
- Let VkVideoFormatPropertiesKHR videoFormatProperties[] be defined as follows.
  - If VkImageCreateInfo::pNext contains a VkVideoProfileListInfoKHR structure, then videoFormatProperties is the list of structures obtained by calling vkGetPhysicalDeviceVideoFormatPropertiesKHR with VkPhysicalDeviceVideoFormatInfoKHR::imageUsage equal to the usage member of VkImageCreateInfo and VkPhysicalDeviceVideoFormatInfoKHR::pNext containing the same VkVideoProfileListInfoKHR structure chained to VkImageCreateInfo.
  - If VkImageCreateInfo::pNext contains no VkVideoProfileListInfoKHR structure, then videoFormatProperties is an empty list.
- Let VkBool32 supportedVideoFormat indicate if the image parameters are supported by the specified video profiles.
  - supportedVideoFormat is VK_TRUE if there exists an element in the videoFormatProperties list for which all of the following conditions are true:
    - VkImageCreateInfo::format equals VkVideoFormatPropertiesKHR::format.
    - VkImageCreateInfo::flags only contains

VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and/or bits also set in VkVideoFormatPropertiesKHR::imageCreateFlags.

- VkImageCreateInfo::imageType equals VkVideoFormatPropertiesKHR::imageType.
- VkImageCreateInfo::tiling equals VkVideoFormatPropertiesKHR::imageTiling.
- VkImageCreateInfo::usage only contains bits also set in VkVideoFormatPropertiesKHR::imageUsageFlags, or VkImageCreateInfo::flags includes VK_IMAGE_CREATE_EXTENDED_USAGE_BIT.

◦ Otherwise supportedVideoFormat is VK_FALSE.

Valid Usage

- VUID-VkImageCreateInfo-imageCreateMaxMipLevels-02251
  Each of the following values (as described in Image Creation Limits) **must** not be undefined : imageCreateMaxMipLevels, imageCreateMaxArrayLayers, imageCreateMaxExtent, and imageCreateSampleCounts
- VUID-VkImageCreateInfo-sharingMode-00941
  If sharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices **must** be a valid pointer to an array of queueFamilyIndexCount uint32_t values
- VUID-VkImageCreateInfo-maintenance11-13354
  If the maintenance11 feature is enabled and sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount **must** be greater than 0
- VUID-VkImageCreateInfo-sharingMode-00942
  If the maintenance11 feature is not enabled and sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount **must** be greater than 1
- VUID-VkImageCreateInfo-sharingMode-01420
  If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices **must** be unique and **must** be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device
- VUID-VkImageCreateInfo-pNext-01974
  If the pNext chain includes a VkExternalFormatANDROID structure, and its externalFormat member is non-zero, the format **must** be VK_FORMAT_UNDEFINED
- VUID-VkImageCreateInfo-pNext-01975
  If the pNext chain does not include a VkExternalFormatANDROID structure, or does and its externalFormat member is 0, the format **must** not be VK_FORMAT_UNDEFINED
- VUID-VkImageCreateInfo-extent-00944
  extent.width **must** be greater than 0
- VUID-VkImageCreateInfo-extent-00945
  extent.height **must** be greater than 0
- VUID-VkImageCreateInfo-extent-00946
  extent.depth **must** be greater than 0

- VUID-VkImageCreateInfo-mipLevels-00947
  `mipLevels` **must** be greater than `0`
- VUID-VkImageCreateInfo-arrayLayers-00948
  `arrayLayers` **must** be greater than `0`
- VUID-VkImageCreateInfo-flags-00949
  If `flags` contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, `imageType` **must** be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-flags-08865
  If `flags` contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, `extent.width` and `extent.height` **must** be equal
- VUID-VkImageCreateInfo-flags-08866
  If `flags` contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, `arrayLayers` **must** be greater than or equal to 6
- VUID-VkImageCreateInfo-initialLayout-10765
  If the zeroInitializeDeviceMemory feature is not enabled, `initialLayout` **must** not be VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT
- VUID-VkImageCreateInfo-flags-02557
  If `usage` contains VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, `imageType` **must** be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-flags-00950
  If `flags` contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, `imageType` **must** be VK_IMAGE_TYPE_3D
- VUID-VkImageCreateInfo-flags-09403
  If `flags` contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, `flags` **must** not include VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, VK_IMAGE_CREATE_SPARSE_BINDING_BIT, or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-flags-07755
  If `flags` contains VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT, `imageType` **must** be VK_IMAGE_TYPE_3D
- VUID-VkImageCreateInfo-imageType-10197
  If `flags` contains VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT and either the `maintenance9` feature is not enabled on the device or `image2DViewOf3DSparse` is VK_FALSE , `flags` **must** not include VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, VK_IMAGE_CREATE_SPARSE_BINDING_BIT, or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-extent-02252
  `extent.width` **must** be less than or equal to `imageCreateMaxExtent.width` (as defined in Image Creation Limits)
- VUID-VkImageCreateInfo-extent-02253
  `extent.height` **must** be less than or equal to `imageCreateMaxExtent.height` (as defined in Image Creation Limits)
- VUID-VkImageCreateInfo-extent-02254

`extent.depth` **must** be less than or equal to `imageCreateMaxExtent.depth` (as defined in Image Creation Limits)

- VUID-VkImageCreateInfo-imageType-00956
  If `imageType` is VK_IMAGE_TYPE_1D, both `extent.height` and `extent.depth` **must** be `1`
- VUID-VkImageCreateInfo-imageType-00957
  If `imageType` is VK_IMAGE_TYPE_2D, `extent.depth` **must** be `1`
- VUID-VkImageCreateInfo-mipLevels-00958
  `mipLevels` **must** be less than or equal to the number of levels in the complete mipmap chain based on `extent.width`, `extent.height`, and `extent.depth`
- VUID-VkImageCreateInfo-mipLevels-02255
  `mipLevels` **must** be less than or equal to `imageCreateMaxMipLevels` (as defined in Image Creation Limits)
- VUID-VkImageCreateInfo-arrayLayers-02256
  `arrayLayers` **must** be less than or equal to `imageCreateMaxArrayLayers` (as defined in Image Creation Limits)
- VUID-VkImageCreateInfo-imageType-00961
  If `imageType` is VK_IMAGE_TYPE_3D, `arrayLayers` **must** be `1`
- VUID-VkImageCreateInfo-samples-02257
  If `samples` is not VK_SAMPLE_COUNT_1_BIT, then `imageType` **must** be VK_IMAGE_TYPE_2D, `flags` **must** not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, `mipLevels` **must** be equal to `1`, and `imageCreateMaybeLinear` (as defined in Image Creation Limits) **must** be VK_FALSE
- VUID-VkImageCreateInfo-samples-02558
  If `samples` is not VK_SAMPLE_COUNT_1_BIT, `usage` **must** not contain VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT
- VUID-VkImageCreateInfo-usage-00963
  If `usage` includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, then bits other than VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT **must** not be set
- VUID-VkImageCreateInfo-usage-00964
  If `usage` includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, `extent.width` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxFramebufferWidth`
- VUID-VkImageCreateInfo-usage-00965
  If `usage` includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, `extent.height` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxFramebufferHeight`
- VUID-VkImageCreateInfo-fragmentDensityMapOffset-06514

If the fragmentDensityMapOffset feature is not enabled and usage includes VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, extent.width **must** be less than or equal to $\lceil \frac{maxFramebufferWidth}{minFragmentDensityTexelSize_{width}} \rceil$

- VUID-VkImageCreateInfo-fragmentDensityMapOffset-06515
  If the fragmentDensityMapOffset feature is not enabled and usage includes VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, extent.height **must** be less than or equal to $\lceil \frac{maxFramebufferHeight}{minFragmentDensityTexelSize_{height}} \rceil$
- VUID-VkImageCreateInfo-usage-00966
  If usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, usage **must** also contain at least one of VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT
- VUID-VkImageCreateInfo-samples-02258
  samples **must** be a valid VkSampleCountFlagBits value that is set in imageCreateSampleCounts (as defined in Image Creation Limits)
- VUID-VkImageCreateInfo-usage-00968
  If the shaderStorageImageMultisample feature is not enabled, and usage contains VK_IMAGE_USAGE_STORAGE_BIT, samples **must** be VK_SAMPLE_COUNT_1_BIT
- VUID-VkImageCreateInfo-flags-00969
  If the sparseBinding feature is not enabled, flags **must** not contain VK_IMAGE_CREATE_SPARSE_BINDING_BIT
- VUID-VkImageCreateInfo-flags-01924
  If the sparseResidencyAliased feature is not enabled, flags **must** not contain VK_IMAGE_CREATE_SPARSE_ALIASED_BIT
- VUID-VkImageCreateInfo-tiling-04121
  If tiling is VK_IMAGE_TILING_LINEAR, flags **must** not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-imageType-00970
  If imageType is VK_IMAGE_TYPE_1D, flags **must** not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-imageType-00971
  If the sparseResidencyImage2D feature is not enabled, and imageType is VK_IMAGE_TYPE_2D, flags **must** not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-imageType-00972
  If the sparseResidencyImage3D feature is not enabled, and imageType is VK_IMAGE_TYPE_3D, flags **must** not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-imageType-00973
  If the sparseResidency2Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_2_BIT, flags **must** not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-imageType-00974
  If the sparseResidency4Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_4_BIT, flags **must** not contain

VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-imageType-00975
  If the sparseResidency8Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_8_BIT, flags **must** not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-imageType-00976
  If the sparseResidency16Samples feature is not enabled, imageType is VK_IMAGE_TYPE_2D, and samples is VK_SAMPLE_COUNT_16_BIT, flags **must** not contain VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkImageCreateInfo-flags-00987
  If flags contains VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, it **must** also contain VK_IMAGE_CREATE_SPARSE_BINDING_BIT
- VUID-VkImageCreateInfo-None-01925
  If any of the bits VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT are set, VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT **must** not also be set
- VUID-VkImageCreateInfo-flags-01890
  If the protectedMemory feature is not enabled, flags **must** not contain VK_IMAGE_CREATE_PROTECTED_BIT
- VUID-VkImageCreateInfo-None-01891
  If any of the bits VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT are set, VK_IMAGE_CREATE_PROTECTED_BIT **must** not also be set
- VUID-VkImageCreateInfo-pNext-00988
  If the pNext chain includes a VkExternalMemoryImageCreateInfoNV structure, it **must** not contain a VkExternalMemoryImageCreateInfo structure
- VUID-VkImageCreateInfo-pNext-00990
  If the pNext chain includes a VkExternalMemoryImageCreateInfo structure, its handleTypes member **must** only contain bits that are also in VkExternalImageFormatProperties::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceImageFormatProperties2 with format, imageType, tiling, usage, and flags equal to those in this structure, and with a VkPhysicalDeviceExternalImageFormatInfo structure included in the pNext chain, with a handleType equal to any one of the handle types specified in VkExternalMemoryImageCreateInfo::handleTypes
- VUID-VkImageCreateInfo-pNext-00991
  If the pNext chain includes a VkExternalMemoryImageCreateInfoNV structure, its handleTypes member **must** only contain bits that are also in VkExternalImageFormatPropertiesNV::compatibleHandleTypes, as returned by vkGetPhysicalDeviceExternalImageFormatPropertiesNV with format, imageType, tiling, usage, and flags equal to those in this structure, and with externalHandleType equal to any

one of the handle types specified in VkExternalMemoryImageCreateInfoNV::handleTypes

- VUID-VkImageCreateInfo-physicalDeviceCount-01421
  If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags **must** not contain VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT
- VUID-VkImageCreateInfo-flags-02259
  If flags contains VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT, then mipLevels **must** be one, arrayLayers **must** be one, imageType **must** be VK_IMAGE_TYPE_2D, and imageCreateMaybeLinear (as defined in Image Creation Limits) **must** be VK_FALSE
- VUID-VkImageCreateInfo-flags-01572
  If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then format **must** be a compressed image format
- VUID-VkImageCreateInfo-flags-01573
  If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then flags **must** also contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT
- VUID-VkImageCreateInfo-initialLayout-00993
  initialLayout **must** be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT, or VK_IMAGE_LAYOUT_PREINITIALIZED
- VUID-VkImageCreateInfo-initialLayout-12478
  If initialLayout is VK_IMAGE_LAYOUT_PREINITIALIZED, tiling **must** be VK_IMAGE_TILING_LINEAR
- VUID-VkImageCreateInfo-pNext-01443
  If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, initialLayout **must** be VK_IMAGE_LAYOUT_UNDEFINED
- VUID-VkImageCreateInfo-format-06410
  If the image format is one of the formats that require a sampler $Y'C_BC_R$ conversion, mipLevels **must** be 1
- VUID-VkImageCreateInfo-format-06411
  If the image format is one of the formats that require a sampler $Y'C_BC_R$ conversion, samples **must** be VK_SAMPLE_COUNT_1_BIT
- VUID-VkImageCreateInfo-format-06412
  If the image format is one of the formats that require a sampler $Y'C_BC_R$ conversion, imageType **must** be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-imageCreateFormatFeatures-02260
  If format is a *multi-planar* format, and if imageCreateFormatFeatures (as defined in Image Creation Limits) does not contain VK_FORMAT_FEATURE_DISJOINT_BIT, then flags **must** not contain VK_IMAGE_CREATE_DISJOINT_BIT
- VUID-VkImageCreateInfo-format-01577
  If format is not a *multi-planar* format, and flags does not include VK_IMAGE_CREATE_ALIAS_BIT, flags **must** not contain VK_IMAGE_CREATE_DISJOINT_BIT
- VUID-VkImageCreateInfo-format-04712

If `format` has a `_422` or `_420` suffix, `extent.width` **must** be a multiple of 2

- VUID-VkImageCreateInfo-format-04713
  If `format` has a `_420` suffix, `extent.height` **must** be a multiple of 2
- VUID-VkImageCreateInfo-format-09583
  If `format` is one of the `VK_FORMAT_PVRTC1_*_IMG` formats, `extent.width` **must** be a power of 2
- VUID-VkImageCreateInfo-format-09584
  If `format` is one of the `VK_FORMAT_PVRTC1_*_IMG` formats, `extent.height` **must** be a power of 2
- VUID-VkImageCreateInfo-tiling-02261
  If `tiling` is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the `pNext` chain **must** include exactly one of VkImageDrmFormatModifierListCreateInfoEXT or VkImageDrmFormatModifierExplicitCreateInfoEXT structures
- VUID-VkImageCreateInfo-pNext-02262
  If the `pNext` chain includes a VkImageDrmFormatModifierListCreateInfoEXT or VkImageDrmFormatModifierExplicitCreateInfoEXT structure, then `tiling` **must** be VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT
- VUID-VkImageCreateInfo-tiling-02353
  If `tiling` is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and `flags` contains VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, then the `pNext` chain **must** include a VkImageFormatListCreateInfo structure with non-zero `viewFormatCount`
- VUID-VkImageCreateInfo-flags-01533
  If `flags` contains VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT, `format` **must** be a depth or depth/stencil format
- VUID-VkImageCreateInfo-pNext-02393
  If the `pNext` chain includes a VkExternalMemoryImageCreateInfo structure whose `handleTypes` member includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, `imageType` **must** be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-pNext-02394
  If the `pNext` chain includes a VkExternalMemoryImageCreateInfo structure whose `handleTypes` member includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID, `mipLevels` **must** either be `1` or equal to the number of levels in the complete mipmap chain based on `extent.width`, `extent.height`, and `extent.depth`
- VUID-VkImageCreateInfo-pNext-02396
  If the `pNext` chain includes a VkExternalFormatANDROID structure whose `externalFormat` member is not `0`, `flags` **must** not include VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT
- VUID-VkImageCreateInfo-pNext-02397
  If the `pNext` chain includes a VkExternalFormatANDROID structure whose `externalFormat` member is not `0`, `usage` **must** not include any usages except VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, or VK_IMAGE_USAGE_SAMPLED_BIT
- VUID-VkImageCreateInfo-pNext-09457

If the pNext chain includes a VkExternalFormatANDROID structure whose externalFormat member is not 0, and the externalFormatResolve feature is not enabled, usage **must** not include VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-pNext-02398
  If the pNext chain includes a VkExternalFormatANDROID structure whose externalFormat member is not 0, tiling **must** be VK_IMAGE_TILING_OPTIMAL
- VUID-VkImageCreateInfo-pNext-08951
  If the pNext chain includes a VkExternalMemoryImageCreateInfo structure whose handleTypes member includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX, imageType **must** be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-pNext-08952
  If the pNext chain includes a VkExternalMemoryImageCreateInfo structure whose handleTypes member includes VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX, mipLevels **must** either be 1 or equal to the number of levels in the complete mipmap chain based on extent.width, extent.height, and extent.depth
- VUID-VkImageCreateInfo-pNext-08953
  If the pNext chain includes a VkExternalFormatQNX structure whose externalFormat member is not 0, flags **must** not include VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT
- VUID-VkImageCreateInfo-pNext-08954
  If the pNext chain includes a VkExternalFormatQNX structure whose externalFormat member is not 0, usage **must** not include any usages except VK_IMAGE_USAGE_SAMPLED_BIT
- VUID-VkImageCreateInfo-pNext-08955
  If the pNext chain includes a VkExternalFormatQNX structure whose externalFormat member is not 0, tiling **must** be VK_IMAGE_TILING_OPTIMAL
- VUID-VkImageCreateInfo-format-02795
  If format is a depth-stencil format, usage includes VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member **must** also include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkImageCreateInfo-format-02796
  If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member **must** also not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkImageCreateInfo-format-02797
  If format is a depth-stencil format, usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo

::stencilUsage member **must** also include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- VUID-VkImageCreateInfo-format-02798
  If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member **must** also not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT
- VUID-VkImageCreateInfo-Format-02536
  If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width **must** be less than or equal to VkPhysicalDeviceLimits::maxFramebufferWidth
- VUID-VkImageCreateInfo-format-02537
  If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.height **must** be less than or equal to VkPhysicalDeviceLimits::maxFramebufferHeight
- VUID-VkImageCreateInfo-format-02538
  If the shaderStorageImageMultisample feature is not enabled, format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage including VK_IMAGE_USAGE_STORAGE_BIT, samples **must** be VK_SAMPLE_COUNT_1_BIT
- VUID-VkImageCreateInfo-flags-02050
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV, imageType **must** be VK_IMAGE_TYPE_2D or VK_IMAGE_TYPE_3D
- VUID-VkImageCreateInfo-flags-02051
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV, it **must** not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT and the format **must** not be a depth/stencil format
- VUID-VkImageCreateInfo-flags-02052
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV and imageType is VK_IMAGE_TYPE_2D, extent.width and extent.height **must** be greater than 1
- VUID-VkImageCreateInfo-flags-02053
  If flags contains VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV and imageType is VK_IMAGE_TYPE_3D, extent.width, extent.height, and extent.depth **must** be greater than 1
- VUID-VkImageCreateInfo-imageType-02082
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, imageType **must** be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-samples-02083
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, samples **must**

be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-shadingRateImage-07727
  If the shadingRateImage feature is enabled and usage includes VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV, tiling **must** be VK_IMAGE_TILING_OPTIMAL
- VUID-VkImageCreateInfo-flags-02565
  If flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, tiling **must** be VK_IMAGE_TILING_OPTIMAL
- VUID-VkImageCreateInfo-flags-02566
  If flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, imageType **must** be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-flags-02567
  If flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, flags **must** not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT
- VUID-VkImageCreateInfo-flags-02568
  If flags contains VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, mipLevels **must** be 1
- VUID-VkImageCreateInfo-usage-04992
  If usage includes VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI, tiling **must** be VK_IMAGE_TILING_LINEAR
- VUID-VkImageCreateInfo-imageView2DOn3DImage-04459
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageView2DOn3DImage is VK_FALSE, flags **must** not contain VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT
- VUID-VkImageCreateInfo-multisampleArrayImage-04460
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::multisampleArrayImage is VK_FALSE, and samples is not VK_SAMPLE_COUNT_1_BIT, then arrayLayers **must** be 1
- VUID-VkImageCreateInfo-pNext-06722
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and format is not a multi-planar format and VkImageFormatListCreateInfo::viewFormatCount is not zero, then each format in VkImageFormatListCreateInfo::pViewFormats **must** either be compatible with the format as described in the compatibility table or, if flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, be an uncompressed format that is size-compatible with format
- VUID-VkImageCreateInfo-pNext-10062
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and format is a multi-planar format and flags contains VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VkImageFormatListCreateInfo::viewFormatCount is not zero, then each format in VkImageFormatListCreateInfo::pViewFormats **must** be compatible with the VkFormat for the plane of the image format
- VUID-VkImageCreateInfo-flags-04738
  If flags does not contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and the pNext chain includes a VkImageFormatListCreateInfo structure, then VkImageFormatListCreateInfo

::viewFormatCount **must** be 0 or 1

- VUID-VkImageCreateInfo-usage-04815
  If usage includes VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, and flags does not include VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then the pNext chain **must** include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying a decode operation
- VUID-VkImageCreateInfo-usage-04816
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, and flags does not include VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then the pNext chain **must** include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying an encode operation
- VUID-VkImageCreateInfo-flags-08328
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then videoMaintenance1 **must** be enabled
- VUID-VkImageCreateInfo-flags-08329
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage does not include VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, then usage **must** not include VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
- VUID-VkImageCreateInfo-flags-08331
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then usage **must** not include VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR
- VUID-VkImageCreateInfo-pNext-06811
  If the pNext chain includes a VkVideoProfileListInfoKHR structure with profileCount greater than 0, then supportedVideoFormat **must** be VK_TRUE
- VUID-VkImageCreateInfo-pNext-10784
  If the pNext chain includes a VkVideoProfileListInfoKHR structure and for any element of its pProfiles member videoCodecOperation is VK_VIDEO_CODEC_OPERATION_DECODE_VP9_BIT_KHR, then the videoDecodeVP9 feature **must** be enabled
- VUID-VkImageCreateInfo-pNext-10250
  If the pNext chain includes a VkVideoProfileListInfoKHR structure and for any element of its pProfiles member videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR, then the videoEncodeAV1 feature **must** be enabled
- VUID-VkImageCreateInfo-pNext-10920

If the pNext chain includes a VkVideoEncodeProfileRgbConversionInfoVALVE structure, then the videoEncodeRgbConversion feature **must** be enabled

- VUID-VkImageCreateInfo-usage-10251
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, then the videoEncodeQuantizationMap feature **must** be enabled
- VUID-VkImageCreateInfo-usage-10252
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, imageType **must** be VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-usage-10253
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, samples **must** be VK_SAMPLE_COUNT_1_BIT
- VUID-VkImageCreateInfo-usage-10254
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, then the pNext chain **must** include a VkVideoProfileListInfoKHR structure with profileCount equal to 1 and pProfiles pointing to a VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying an encode operation
- VUID-VkImageCreateInfo-usage-10255
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR, then VkVideoEncodeCapabilitiesKHR::flags **must** include VK_VIDEO_ENCODE_CAPABILITY_QUANTIZATION_DELTA_MAP_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified in the pProfiles member of the VkVideoProfileListInfoKHR structure included in the pNext chain
- VUID-VkImageCreateInfo-usage-10256
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, then VkVideoEncodeCapabilitiesKHR::flags **must** include VK_VIDEO_ENCODE_CAPABILITY_EMPHASIS_MAP_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified in the pProfiles member of the VkVideoProfileListInfoKHR structure included in the pNext chain
- VUID-VkImageCreateInfo-usage-10257
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, extent.width **must** be less than or equal to VkVideoEncodeQuantizationMapCapabilitiesKHR::maxQuantizationMapExtent.width, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified in the pProfiles member of the VkVideoProfileListInfoKHR structure included in the pNext chain

- VUID-VkImageCreateInfo-usage-10258
  If `usage` includes VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, `extent.height` **must** be less than or equal to VkVideoEncodeQuantizationMapCapabilitiesKHR::`maxQuantizationMapExtent.height`, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified in the `pProfiles` member of the VkVideoProfileListInfoKHR structure included in the `pNext` chain
- VUID-VkImageCreateInfo-pNext-06390
  If the VkImage is to be used to import memory from a VkBufferCollectionFUCHSIA, a VkBufferCollectionImageCreateInfoFUCHSIA structure **must** be chained to `pNext`
- VUID-VkImageCreateInfo-multisampledRenderToSingleSampled-06882
  If the `multisampledRenderToSingleSampled` feature is not enabled, `flags` **must** not contain VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT
- VUID-VkImageCreateInfo-flags-06883
  If `flags` contains VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT, `samples` **must** be VK_SAMPLE_COUNT_1_BIT
- VUID-VkImageCreateInfo-pNext-06743
  If the `pNext` chain includes a VkImageCompressionControlEXT structure, `format` is a multi-planar format, and VkImageCompressionControlEXT::`flags` includes VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, then VkImageCompressionControlEXT::`compressionControlPlaneCount` **must** be equal to the number of planes in `format`
- VUID-VkImageCreateInfo-pNext-06744
  If the `pNext` chain includes a VkImageCompressionControlEXT structure, `format` is not a multi-planar format, and VkImageCompressionControlEXT::`flags` includes VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, then VkImageCompressionControlEXT::`compressionControlPlaneCount` **must** be 1
- VUID-VkImageCreateInfo-pNext-06746
  If the `pNext` chain includes a VkImageCompressionControlEXT structure, it **must** not contain a VkImageDrmFormatModifierExplicitCreateInfoEXT structure
- VUID-VkImageCreateInfo-flags-08104
  If `flags` includes VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT, the `descriptorBufferCaptureReplay` or `descriptorHeapCaptureReplay` feature **must** be enabled
- VUID-VkImageCreateInfo-pNext-08105
  If the `pNext` chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, `flags` **must** contain VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT
- VUID-VkImageCreateInfo-pNext-06783
  If the `pNext` chain includes a VkExportMetalObjectCreateInfoEXT structure, its `exportObjectType` member **must** be either VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT or VK_EXPORT_METAL_OBJECT_TYPE_METAL_IOSURFACE_BIT_EXT

- VUID-VkImageCreateInfo-pNext-06784
  If the pNext chain includes a VkImportMetalTextureInfoEXT structure, its plane member **must** be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT
- VUID-VkImageCreateInfo-pNext-06785
  If the pNext chain includes a VkImportMetalTextureInfoEXT structure and the image does not have a multi-planar format, then VkImportMetalTextureInfoEXT::plane **must** be VK_IMAGE_ASPECT_PLANE_0_BIT
- VUID-VkImageCreateInfo-pNext-06786
  If the pNext chain includes a VkImportMetalTextureInfoEXT structure and the image has a multi-planar format with only two planes, then VkImportMetalTextureInfoEXT::plane **must** not be VK_IMAGE_ASPECT_PLANE_2_BIT
- VUID-VkImageCreateInfo-imageCreateFormatFeatures-09048
  If imageCreateFormatFeatures (as defined in Image Creation Limits) does not contain VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT, then usage **must** not contain VK_IMAGE_USAGE_HOST_TRANSFER_BIT
- VUID-VkImageCreateInfo-usage-10245
  If usage includes VK_IMAGE_USAGE_HOST_TRANSFER_BIT, then the hostImageCopy feature **must** be enabled
- VUID-VkImageCreateInfo-tileMemoryHeap-10766
  If the tileMemoryHeap feature is not enabled, usage **must** not include VK_IMAGE_USAGE_TILE_MEMORY_BIT_QCOM
- VUID-VkImageCreateInfo-pNext-09653
  If the pNext chain contains a VkImageAlignmentControlCreateInfoMESA structure, tiling **must** be VK_IMAGE_TILING_OPTIMAL
- VUID-VkImageCreateInfo-pNext-09654
  If the pNext chain contains a VkImageAlignmentControlCreateInfoMESA structure, it **must** not contain a VkExternalMemoryImageCreateInfo structure
- VUID-VkImageCreateInfo-tiling-09711
  If tiling is VK_IMAGE_TILING_LINEAR then VK_IMAGE_USAGE_TENSOR_ALIASING_BIT_ARM **must** not be set in usage
- VUID-VkImageCreateInfo-pNext-12503
  If the pNext chain includes a VkExternalFormatANDROID structure with non-zero externalFormat, usage **must** not include VK_IMAGE_USAGE_TENSOR_ALIASING_BIT_ARM
- VUID-VkImageCreateInfo-flags-13355
  If flags contains VK_IMAGE_CREATE_ALIAS_SINGLE_LAYER_DESCRIPTOR_BIT_KHR, the maintenance11 feature **must** be enabled
- VUID-VkImageCreateInfo-flags-13356
  If flags contains VK_IMAGE_CREATE_ALIAS_SINGLE_LAYER_DESCRIPTOR_BIT_KHR, imageType **must** be VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D
- VUID-VkImageCreateInfo-None-12279
  If Vulkan 1.3 is not supported and the ycbcr2plane444Formats feature is not enabled, format **must** not be VK_FORMAT_G8_B8R8_2PLANE_444_UNORM,

VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16, VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16, or VK_FORMAT_G16_B16R16_2PLANE_444_UNORM

- VUID-VkImageCreateInfo-flags-11281
  If VkOpaqueCaptureDataCreateInfoEXT::pData is not NULL, flags **must** contain VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT
- VUID-VkImageCreateInfo-pData-11286
  If flags contains VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT, and VkOpaqueCaptureDataCreateInfoEXT::pData is not NULL, VkOpaqueCaptureDataCreateInfoEXT::pData->size **must** be equal to imageCaptureReplayOpaqueDataSize
- VUID-VkImageCreateInfo-pNext-12480
  If the pNext chain includes a VkImageTilingControlCreateInfoEXT structure, then the pNext chain **must** not include a VkImageDrmFormatModifierExplicitCreateInfoEXT structure
- VUID-VkImageCreateInfo-pNext-12442
  pNext **must** contain at most one of the structures VkImageStencilUsageCreateInfo and VkImageStencilUsage2CreateInfoKHR

Valid Usage (Implicit)

- VUID-VkImageCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO
- VUID-VkImageCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkBufferCollectionImageCreateInfoFUCHSIA, VkDataGraphOpticalFlowImageFormatInfoARM, VkDedicatedAllocationImageCreateInfoNV, VkExportMetalObjectCreateInfoEXT, VkExternalFormatANDROID, VkExternalFormatOHOS, VkExternalFormatQNX, VkExternalMemoryImageCreateInfo, VkExternalMemoryImageCreateInfoNV, VkImageAlignmentControlCreateInfoMESA, VkImageCompressionControlEXT, VkImageCreateFlags2CreateInfoKHR, VkImageDrmFormatModifierExplicitCreateInfoEXT, VkImageDrmFormatModifierListCreateInfoEXT, VkImageFormatListCreateInfo, VkImageStencilUsage2CreateInfoKHR, VkImageStencilUsageCreateInfo, VkImageSwapchainCreateInfoKHR, VkImageTilingControlCreateInfoEXT, VkImageUsageFlags2CreateInfoKHR, VkImportMetalIOSurfaceInfoEXT, VkImportMetalTextureInfoEXT, VkOpaqueCaptureDataCreateInfoEXT, VkOpaqueCaptureDescriptorDataCreateInfoEXT, VkOpticalFlowImageFormatInfoNV, or VkVideoProfileListInfoKHR
- VUID-VkImageCreateInfo-sType-unique
  The sType value of each structure in the pNext chain **must** be unique, with the exception of structures of type VkExportMetalObjectCreateInfoEXT or VkImportMetalTextureInfoEXT
- VUID-VkImageCreateInfo-flags-parameter
  If flags is not 0, flags **must** be a valid combination of VkImageCreateFlagBits values

- VUID-VkImageCreateInfo-imageType-parameter
  `imageType` **must** be a valid VkImageType value
- VUID-VkImageCreateInfo-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-VkImageCreateInfo-samples-parameter
  `samples` **must** be a valid VkSampleCountFlagBits value
- VUID-VkImageCreateInfo-tiling-parameter
  `tiling` **must** be a valid VkImageTiling value
- VUID-VkImageCreateInfo-usage-parameter
  `usage` **must** be a valid combination of VkImageUsageFlagBits values
- VUID-VkImageCreateInfo-sharingMode-parameter
  `sharingMode` **must** be a valid VkSharingMode value
- VUID-VkImageCreateInfo-initialLayout-parameter
  `initialLayout` **must** be a valid VkImageLayout value

The `VkImageCreateFlags2CreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_extended_flags
typedef struct VkImageCreateFlags2CreateInfoKHR {
    VkStructureType           sType;
    void*                     pNext;
    VkImageCreateFlags2KHR    flags;
} VkImageCreateFlags2CreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkImageCreateFlagBits2KHR specifying creation flags of the image.

If this structure is included in the `pNext` chain of an image creation structure, `flags` is used instead of the corresponding `flags` value passed in that creation structure, allowing additional create flags to be specified.

If this structure is included in the `pNext` chain of a query structure including VkImageCreateFlags, the create flags of the image are returned in `flags` of this structure, allowing additional create flags to be queried. The flags representable in VkImageCreateFlags are still returned in the query structure in this case.

Valid Usage (Implicit)

- VUID-VkImageCreateFlags2CreateInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_CREATE_FLAGS_2_CREATE_INFO_KHR
- VUID-VkImageCreateFlags2CreateInfoKHR-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkImageCreateFlagBits2KHR values

Structure Chaining

Extends the structures

- VkFramebufferAttachmentImageInfo
- VkImageCreateInfo
- VkPhysicalDeviceImageFormatInfo2
- VkVideoFormatPropertiesKHR

The `VkImageUsageFlags2CreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_extended_flags
typedef struct VkImageUsageFlags2CreateInfoKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkImageUsageFlags2KHR    usage;
} VkImageUsageFlags2CreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of VkImageUsageFlagBits2KHR specifying allowed usages of the image.

If this structure is included in the `pNext` chain of an image creation structure, `usage` is used instead of the corresponding `usage` value passed in that creation structure, allowing additional usage flags to be specified.

If this structure is included in the `pNext` chain of a query structure including VkImageCreateFlags, the usage flags of the image are returned in `flags` of this structure, allowing additional usage flags to be queried. The flags representable in VkImageUsageFlags are still returned in the query structure in this case.

Valid Usage (Implicit)

- VUID-VkImageUsageFlags2CreateInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_USAGE_FLAGS_2_CREATE_INFO_KHR
- VUID-VkImageUsageFlags2CreateInfoKHR-usage-parameter
  `usage` **must** be a valid combination of VkImageUsageFlagBits2KHR values

Structure Chaining

Extends the structures

- VkFramebufferAttachmentImageInfo
- VkImageCreateInfo

- VkPhysicalDeviceImageFormatInfo2
- VkPhysicalDeviceSparseImageFormatInfo2
- VkPhysicalDeviceVideoFormatInfoKHR
- VkSurfaceCapabilities2KHR
- VkSwapchainCreateInfoKHR
- VkVideoFormatPropertiesKHR

The VkBufferCollectionImageCreateInfoFUCHSIA structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionImageCreateInfoFUCHSIA {
    VkStructureType              sType;
    const void*                  pNext;
    VkBufferCollectionFUCHSIA    collection;
    uint32_t                     index;
} VkBufferCollectionImageCreateInfoFUCHSIA;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- collection is the VkBufferCollectionFUCHSIA handle.
- index is the index of the buffer in the buffer collection from which the memory will be imported.

Valid Usage

- VUID-VkBufferCollectionImageCreateInfoFUCHSIA-index-06391
  index **must** be less than VkBufferCollectionPropertiesFUCHSIA::bufferCount

Valid Usage (Implicit)

- VUID-VkBufferCollectionImageCreateInfoFUCHSIA-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_BUFFER_COLLECTION_IMAGE_CREATE_INFO_FUCHSIA
- VUID-VkBufferCollectionImageCreateInfoFUCHSIA-collection-parameter
  collection **must** be a valid VkBufferCollectionFUCHSIA handle

Structure Chaining

Extends the structure

- VkImageCreateInfo

The VkImageStencilUsageCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkImageStencilUsageCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageUsageFlags    stencilUsage;
} VkImageStencilUsageCreateInfo;
```

```
// Provided by VK_EXT_separate_stencil_usage
// Equivalent to VkImageStencilUsageCreateInfo
typedef VkImageStencilUsageCreateInfo VkImageStencilUsageCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stencilUsage is a bitmask of VkImageUsageFlagBits describing the intended usage of the stencil aspect of the image.

If the pNext chain of VkImageCreateInfo includes a VkImageStencilUsageCreateInfo structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the pNext chain of VkImageCreateInfo, the stencil aspect of the image **must** only be used as specified by stencilUsage. Use of other aspects of an image is unaffected by this structure.

This structure **can** also be included in the pNext chain of VkPhysicalDeviceImageFormatInfo2 to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using vkGetPhysicalDeviceImageFormatProperties2. When this structure is not included in the pNext chain of VkPhysicalDeviceImageFormatInfo2 then the implicit value of stencilUsage matches that of VkPhysicalDeviceImageFormatInfo2::usage.

Valid Usage

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-02539
  If stencilUsage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, it **must** not include bits other than VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

Valid Usage (Implicit)

- VUID-VkImageStencilUsageCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_CREATE_INFO

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-parameter
  `stencilUsage` **must** be a valid combination of VkImageUsageFlagBits values

Structure Chaining

Extends the structures

- VkImageCreateInfo
- VkPhysicalDeviceImageFormatInfo2

The `VkImageStencilUsage2CreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_extended_flags with VK_VERSION_1_2 or
VK_EXT_separate_stencil_usage
typedef struct VkImageStencilUsage2CreateInfoKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkImageUsageFlags2KHR    stencilUsage;
} VkImageStencilUsage2CreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stencilUsage` is a bitmask of VkImageUsageFlagBits2KHR describing the intended usage of the stencil aspect of the image.

If the `pNext` chain of VkImageCreateInfo includes a `VkImageStencilUsage2CreateInfoKHR` structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the `pNext` chain of VkImageCreateInfo, the stencil aspect of the image **must** only be used as specified by `stencilUsage`. Use of other aspects of an image is unaffected by this structure.

This structure **can** also be included in the `pNext` chain of VkPhysicalDeviceImageFormatInfo2 to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using vkGetPhysicalDeviceImageFormatProperties2. When this structure is not included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` then the implicit value of `stencilUsage` matches that of `VkPhysicalDeviceImageFormatInfo2`::`usage`.

Valid Usage

- VUID-VkImageStencilUsage2CreateInfoKHR-stencilUsage-12443
  If `stencilUsage` includes VK_IMAGE_USAGE_2_TRANSIENT_ATTACHMENT_BIT_KHR, it **must** not include bits other than

VK_IMAGE_USAGE_2_DEPTH_STENCIL_ATTACHMENT_BIT_KHR or VK_IMAGE_USAGE_2_INPUT_ATTACHMENT_BIT_KHR

Valid Usage (Implicit)

- VUID-VkImageStencilUsage2CreateInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_2_CREATE_INFO_KHR
- VUID-VkImageStencilUsage2CreateInfoKHR-stencilUsage-parameter
  `stencilUsage` **must** be a valid combination of VkImageUsageFlagBits2KHR values

Structure Chaining

Extends the structures

- VkImageCreateInfo
- VkPhysicalDeviceImageFormatInfo2

If the `pNext` chain includes a `VkDedicatedAllocationImageCreateInfoNV` structure, then that structure includes an enable controlling whether the image will have a dedicated memory allocation bound to it.

The `VkDedicatedAllocationImageCreateInfoNV` structure is defined as:

```
// Provided by VK_NV_dedicated_allocation
typedef struct VkDedicatedAllocationImageCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           dedicatedAllocation;
} VkDedicatedAllocationImageCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dedicatedAllocation` specifies whether the image will have a dedicated allocation bound to it.

NOTE Using a dedicated allocation for color and depth/stencil attachments or other large images **may** improve performance on some devices.

Valid Usage

- VUID-VkDedicatedAllocationImageCreateInfoNV-dedicatedAllocation-00994
  If `dedicatedAllocation` is VK_TRUE, VkImageCreateInfo::`flags` **must** not include VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

Valid Usage (Implicit)

- VUID-VkDedicatedAllocationImageCreateInfoNV-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV`

Structure Chaining

Extends the structure

- VkImageCreateInfo

To define a set of external memory handle types that **may** be used as backing store for an image, add a VkExternalMemoryImageCreateInfo structure to the `pNext` chain of the VkImageCreateInfo structure. The `VkExternalMemoryImageCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryImageCreateInfo {
    VkStructureType                       sType;
    const void*                           pNext;
    VkExternalMemoryHandleTypeFlags       handleTypes;
} VkExternalMemoryImageCreateInfo;
```

```
// Provided by VK_KHR_external_memory
// Equivalent to VkExternalMemoryImageCreateInfo
typedef VkExternalMemoryImageCreateInfo VkExternalMemoryImageCreateInfoKHR;
```

NOTE A `VkExternalMemoryImageCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for an image that will be bound to memory that is either exported or imported.

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of VkExternalMemoryHandleTypeFlagBits specifying one or more external memory handle types.

Valid Usage (Implicit)

- VUID-VkExternalMemoryImageCreateInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO`
- VUID-VkExternalMemoryImageCreateInfo-handleTypes-parameter
  If `handleTypes` is not `0`, `handleTypes` **must** be a valid combination of VkExternalMemoryHandleTypeFlagBits values

Structure Chaining

Extends the structure

- VkImageCreateInfo

12.4.1. Use External Memory On Open Harmony OS platform

The `VkExternalFormatOHOS` structure is defined as:

```
// Provided by VK_OHOS_external_memory
typedef struct VkExternalFormatOHOS {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           externalFormat;
} VkExternalFormatOHOS;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalFormat` is an implementation-defined identifier for the external format.

To obtain additional formats that are not provided by VkFormat for an Open Harmony OS hardware buffer, this structure should be included in the `pNext` chain of another structure. The return value of `externalFormat` indicates whether an additional format exists. If zero is returned, then no external format is used and other format information should be used for implementations, and this is also true if this structure is not present.

Valid Usage (Implicit)

- VUID-VkExternalFormatOHOS-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_OHOS

Structure Chaining

Extends the structures

- VkAttachmentDescription2
- VkCommandBufferInheritanceInfo
- VkGraphicsPipelineCreateInfo
- VkImageCreateInfo
- VkSamplerYcbcrConversionCreateInfo

To import memory created outside of the current Vulkan instance from an Open Harmony OS

native buffer, add a VkImportNativeBufferInfoOHOS structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkImportNativeBufferInfoOHOS structure is defined as:

```
// Provided by VK_OHOS_external_memory
typedef struct VkImportNativeBufferInfoOHOS {
    VkStructureType            sType;
    const void*                pNext;
    struct OH_NativeBuffer*    buffer;
} VkImportNativeBufferInfoOHOS;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- buffer is a pointer to a OH_NativeBuffer structure.

A reference to the imported native buffer should be acquired by the implementation if the vkAllocateMemory command succeeds. Then the reference **must** be released when the device memory object is freed. If the command fails, the implementation **must** not retain a reference.

Valid Usage (Implicit)

- VUID-VkImportNativeBufferInfoOHOS-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMPORT_NATIVE_BUFFER_INFO_OHOS
- VUID-VkImportNativeBufferInfoOHOS-buffer-parameter
  buffer **must** be a valid pointer to an OH_NativeBuffer value

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

The OH_NativeBuffer structure is defined as:

```
// Provided by VK_OHOS_external_memory
struct OH_NativeBuffer;
```

It is the native buffer structure on Open Harmony OS platform. It is defined in Open Harmony OS NDK headers.

To obtain optimal Open Harmony OS native buffer usage flags for specific image creation parameters, add a VkNativeBufferUsageOHOS structure to the pNext chain of a VkImageFormatProperties2 structure passed to vkGetPhysicalDeviceImageFormatProperties2.

The VkNativeBufferUsageOHOS structure is defined as:

```
// Provided by VK_OHOS_external_memory
typedef struct VkNativeBufferUsageOHOS {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           OHOSNativeBufferUsage;
} VkNativeBufferUsageOHOS;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `OHOSNativeBufferUsage` returns the Open Harmony OS buffer usage flags.

Valid Usage (Implicit)

- VUID-VkNativeBufferUsageOHOS-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_NATIVE_BUFFER_USAGE_OHOS

Structure Chaining

Extends the structure

- VkImageFormatProperties2

To determine the memory parameters to use when importing an Open Harmony OS native buffer:

```
// Provided by VK_OHOS_external_memory
VkResult vkGetNativeBufferPropertiesOHOS(
    VkDevice                                    device,
    const struct OH_NativeBuffer*               buffer,
    VkNativeBufferPropertiesOHOS*               pProperties);
```

- `device` is the logical device that will be importing `buffer`.
- `buffer` is the OH_NativeBuffer object specifying the buffer for which its properties are to be queried.
- `pProperties` is a pointer to a VkNativeBufferPropertiesOHOS structure in which the properties of `buffer` are returned.

Valid Usage (Implicit)

- VUID-vkGetNativeBufferPropertiesOHOS-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetNativeBufferPropertiesOHOS-buffer-parameter
  `buffer` **must** be a valid pointer to a valid OH_NativeBuffer value

- VUID-vkGetNativeBufferPropertiesOHOS-pProperties-parameter
  `pProperties` **must** be a valid pointer to a VkNativeBufferPropertiesOHOS structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To obtain an OH_NativeBuffer object, call:

```
// Provided by VK_OHOS_external_memory
VkResult vkGetMemoryNativeBufferOHOS(
    VkDevice                                    device,
    const VkMemoryGetNativeBufferInfoOHOS*      pInfo,
    struct OH_NativeBuffer**                    pBuffer);
```

- `device` is a valid Vulkan device object.
- `pInfo` is a pointer pointing to a `VkMemoryGetNativeBufferInfoOHOS` structure.
- `pBuffer` is a pointer to a OH_NativeBuffer object.

Valid Usage (Implicit)

- VUID-vkGetMemoryNativeBufferOHOS-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMemoryNativeBufferOHOS-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkMemoryGetNativeBufferInfoOHOS structure
- VUID-vkGetMemoryNativeBufferOHOS-pBuffer-parameter
  `pBuffer` **must** be a valid pointer to a valid pointer to an OH_NativeBuffer value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkNativeBufferPropertiesOHOS structure is defined as:

```
// Provided by VK_OHOS_external_memory
typedef struct VkNativeBufferPropertiesOHOS {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       allocationSize;
    uint32_t           memoryTypeBits;
} VkNativeBufferPropertiesOHOS;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- allocationSize is the size of the external memory.
- memoryTypeBits is a bitmask containing one bit set for every memory type which the specified Open Harmony OS native buffer **can** be imported as.

Valid Usage (Implicit)

- VUID-VkNativeBufferPropertiesOHOS-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_NATIVE_BUFFER_PROPERTIES_OHOS
- VUID-VkNativeBufferPropertiesOHOS-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkNativeBufferFormatPropertiesOHOS
- VUID-VkNativeBufferPropertiesOHOS-sType-unique
  The sType value of each structure in the pNext chain **must** be unique

To obtain format properties of an Open Harmony OS native buffer, include a VkNativeBufferFormatPropertiesOHOS structure in the pNext chain of the VkNativeBufferPropertiesOHOS structure passed to vkGetNativeBufferPropertiesOHOS. The VkNativeBufferFormatPropertiesOHOS structure is defined as:

```
// Provided by VK_OHOS_external_memory
typedef struct VkNativeBufferFormatPropertiesOHOS {
    VkStructureType                 sType;
    void*                           pNext;
    VkFormat                        format;
    uint64_t                        externalFormat;
    VkFormatFeatureFlags            formatFeatures;
    VkComponentMapping              samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion   suggestedYcbcrModel;
    VkSamplerYcbcrRange             suggestedYcbcrRange;
    VkChromaLocation                suggestedXChromaOffset;
    VkChromaLocation                suggestedYChromaOffset;
} VkNativeBufferFormatPropertiesOHOS;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the Vulkan format corresponding to the Open Harmony OS native buffer's format, or VK_FORMAT_UNDEFINED if there is not an equivalent Vulkan format.
- `externalFormat` is an implementation-defined external format identifier for use with VkExternalFormatOHOS.
- `formatFeatures` describes the capabilities of this external format when used with an image bound to memory imported from `buffer`.
- `samplerYcbcrConversionComponents` represents a set of VkComponentSwizzle.
- `suggestedYcbcrModel` represents the color model.
- `suggestedYcbcrRange` represents the numerical value range.
- `suggestedXChromaOffset` represents the X chroma offset.
- `suggestedYChromaOffset` represents the Y chroma offset.

Valid Usage (Implicit)

- VUID-VkNativeBufferFormatPropertiesOHOS-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_NATIVE_BUFFER_FORMAT_PROPERTIES_OHOS

Structure Chaining

Extends the structure

- VkNativeBufferPropertiesOHOS

The `VkMemoryGetNativeBufferInfoOHOS` structure is defined as:

```
// Provided by VK_OHOS_external_memory
typedef struct VkMemoryGetNativeBufferInfoOHOS {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
} VkMemoryGetNativeBufferInfoOHOS;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is a valid `VkDeviceMemory` object from which the Open Harmony OS native buffer will be exported.

Valid Usage (Implicit)

- VUID-VkMemoryGetNativeBufferInfoOHOS-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_GET_NATIVE_BUFFER_INFO_OHOS
- VUID-VkMemoryGetNativeBufferInfoOHOS-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkMemoryGetNativeBufferInfoOHOS-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfoNV` structure, then that structure defines a set of external memory handle types that **may** be used as backing store for the image.

The `VkExternalMemoryImageCreateInfoNV` structure is defined as:

```
// Provided by VK_NV_external_memory
typedef struct VkExternalMemoryImageCreateInfoNV {
    VkStructureType                    sType;
    const void*                        pNext;
    VkExternalMemoryHandleTypeFlagsNV  handleTypes;
} VkExternalMemoryImageCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of VkExternalMemoryHandleTypeFlagBitsNV specifying one or more external memory handle types.

Valid Usage (Implicit)

- VUID-VkExternalMemoryImageCreateInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_NV
- VUID-VkExternalMemoryImageCreateInfoNV-handleTypes-parameter

If `handleTypes` is not `0`, `handleTypes` **must** be a valid combination of VkExternalMemoryHandleTypeFlagBitsNV values

Structure Chaining

Extends the structure

- VkImageCreateInfo

`VkExternalFormatANDROID` is defined as:

```
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkExternalFormatANDROID {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           externalFormat;
} VkExternalFormatANDROID;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalFormat` is an implementation-defined identifier for the external format.

When included in the `pNext` chain of another structure, it indicates additional format information beyond what is provided by VkFormat values for an Android hardware buffer. If `externalFormat` is zero, it indicates that no external format is used, and implementations should rely only on other format information. If this structure is not present, it is equivalent to setting `externalFormat` to zero.

Valid Usage

- VUID-VkExternalFormatANDROID-externalFormat-01894
  `externalFormat` **must** be `0` or a value returned in the `externalFormat` member of VkAndroidHardwareBufferFormatPropertiesANDROID by an earlier call to vkGetAndroidHardwareBufferPropertiesANDROID

Valid Usage (Implicit)

- VUID-VkExternalFormatANDROID-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_ANDROID

Structure Chaining

Extends the structures

- VkAttachmentDescription2

- VkCommandBufferInheritanceInfo
- VkGraphicsPipelineCreateInfo
- VkImageCreateInfo
- VkSamplerYcbcrConversionCreateInfo

To create an image with a QNX Screen external format, add a `VkExternalFormatQNX` structure in the `pNext` chain of VkImageCreateInfo. `VkExternalFormatQNX` is defined as:

```
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkExternalFormatQNX {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           externalFormat;
} VkExternalFormatQNX;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalFormat` is an implementation-defined identifier for the external format.

If `externalFormat` is zero, the effect is as if the `VkExternalFormatQNX` structure was not present. Otherwise, the `image` will have the specified external format.

Valid Usage

- VUID-VkExternalFormatQNX-externalFormat-08956
  `externalFormat` **must** be `0` or a value returned in the `externalFormat` member of VkScreenBufferFormatPropertiesQNX by an earlier call to vkGetScreenBufferPropertiesQNX

Valid Usage (Implicit)

- VUID-VkExternalFormatQNX-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_QNX

Structure Chaining

Extends the structures

- VkImageCreateInfo
- VkSamplerYcbcrConversionCreateInfo

If the `pNext` chain of VkImageCreateInfo includes a `VkImageSwapchainCreateInfoKHR` structure, then

that structure includes a swapchain handle indicating that the image will be bound to memory from that swapchain.

The VkImageSwapchainCreateInfoKHR structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkImageSwapchainCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
} VkImageSwapchainCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchain is VK_NULL_HANDLE or a handle of a swapchain that the image will be bound to.

Valid Usage

- VUID-VkImageSwapchainCreateInfoKHR-swapchain-00995
  If swapchain is not VK_NULL_HANDLE, the fields of VkImageCreateInfo **must** match the implied image creation parameters of the swapchain

Valid Usage (Implicit)

- VUID-VkImageSwapchainCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR
- VUID-VkImageSwapchainCreateInfoKHR-swapchain-parameter
  If swapchain is not VK_NULL_HANDLE, swapchain **must** be a valid VkSwapchainKHR handle

Structure Chaining

Extends the structure

- VkImageCreateInfo

If the pNext chain of VkImageCreateInfo includes a VkImageFormatListCreateInfo structure, then that structure contains a list of all formats that **can** be used when creating views of this image.

The VkImageFormatListCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkImageFormatListCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           viewFormatCount;
    const VkFormat*    pViewFormats;
} VkImageFormatListCreateInfo;
```

```
// Provided by VK_KHR_image_format_list
// Equivalent to VkImageFormatListCreateInfo
typedef VkImageFormatListCreateInfo VkImageFormatListCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewFormatCount` is the number of entries in the `pViewFormats` array.
- `pViewFormats` is a pointer to an array of VkFormat values specifying all formats which **can** be used when creating views of this image.

If `viewFormatCount` is zero, `pViewFormats` is ignored and the image is created as if the `VkImageFormatListCreateInfo` structure were not included in the `pNext` chain of VkImageCreateInfo.

Valid Usage

- VUID-VkImageFormatListCreateInfo-viewFormatCount-09540
  If `viewFormatCount` is not 0, each element of `pViewFormats` **must** not be VK_FORMAT_UNDEFINED

Valid Usage (Implicit)

- VUID-VkImageFormatListCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_FORMAT_LIST_CREATE_INFO
- VUID-VkImageFormatListCreateInfo-pViewFormats-parameter
  If `viewFormatCount` is not `0`, `pViewFormats` **must** be a valid pointer to an array of `viewFormatCount` valid VkFormat values

Structure Chaining

Extends the structures

- VkImageCreateInfo
- VkPhysicalDeviceImageFormatInfo2
- VkSwapchainCreateInfoKHR

If the pNext chain of VkImageCreateInfo includes a VkImageDrmFormatModifierListCreateInfoEXT structure, then the image will be created with one of the Linux DRM format modifiers listed in the structure. The choice of modifier **can** be influenced by also including a VkImageTilingControlCreateInfoEXT structure in the pNext chain, but otherwise, it is implementation-dependent.

The VkImageDrmFormatModifierListCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierListCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           drmFormatModifierCount;
    const uint64_t*    pDrmFormatModifiers;
} VkImageDrmFormatModifierListCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- drmFormatModifierCount is the length of the pDrmFormatModifiers array.
- pDrmFormatModifiers is a pointer to an array of *Linux DRM format modifiers*.

Valid Usage

- VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-02263
  Each *modifier* in pDrmFormatModifiers **must** be compatible with the parameters in VkImageCreateInfo and its pNext chain, as determined by querying VkPhysicalDeviceImageFormatInfo2 extended with VkPhysicalDeviceImageDrmFormatModifierInfoEXT

Valid Usage (Implicit)

- VUID-VkImageDrmFormatModifierListCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_LIST_CREATE_INFO_EXT
- VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-parameter
  pDrmFormatModifiers **must** be a valid pointer to an array of drmFormatModifierCount uint64_t values
- VUID-VkImageDrmFormatModifierListCreateInfoEXT-drmFormatModifierCount-arraylength
  drmFormatModifierCount **must** be greater than 0

Structure Chaining

Extends the structure

- VkImageCreateInfo

If the `pNext` chain of VkImageCreateInfo includes a VkImageDrmFormatModifierExplicitCreateInfoEXT structure, then the image will be created with the Linux DRM format modifier and memory layout defined by the structure.

The VkImageDrmFormatModifierExplicitCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierExplicitCreateInfoEXT {
    VkStructureType                sType;
    const void*                    pNext;
    uint64_t                       drmFormatModifier;
    uint32_t                       drmFormatModifierPlaneCount;
    const VkSubresourceLayout*     pPlaneLayouts;
} VkImageDrmFormatModifierExplicitCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifier` is the *Linux DRM format modifier* with which the image will be created.
- `drmFormatModifierPlaneCount` is the number of *memory planes* in the image (as reported by VkDrmFormatModifierPropertiesEXT) as well as the length of the `pPlaneLayouts` array.
- `pPlaneLayouts` is a pointer to an array of VkSubresourceLayout structures describing the image's *memory planes*.

The i^{th} member of `pPlaneLayouts` describes the layout of the image's i^{th} *memory plane* (that is, `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`). In each element of `pPlaneLayouts`, the implementation **must** ignore `size`. The implementation calculates the size of each plane, which the application **can** query with vkGetImageSubresourceLayout.

When creating an image with VkImageDrmFormatModifierExplicitCreateInfoEXT, it is the application's responsibility to satisfy all valid usage requirements. However, the implementation **must** validate that the provided `pPlaneLayouts`, when combined with the provided `drmFormatModifier` and other creation parameters in VkImageCreateInfo and its `pNext` chain, produce a valid image. (This validation is necessarily implementation-dependent and outside the scope of Vulkan, and therefore not described by valid usage requirements). If this validation fails, then vkCreateImage returns VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT.

Valid Usage

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifier-02264
  `drmFormatModifier` **must** be compatible with the parameters in VkImageCreateInfo and its

pNext chain, as determined by querying VkPhysicalDeviceImageFormatInfo2 extended with VkPhysicalDeviceImageDrmFormatModifierInfoEXT

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-02265
  drmFormatModifierPlaneCount **must** be equal to the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with VkImageCreateInfo::format and drmFormatModifier, as found by querying VkDrmFormatModifierPropertiesListEXT
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-size-02267
  For each element of pPlaneLayouts, size **must** be 0
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-arrayPitch-02268
  For each element of pPlaneLayouts, arrayPitch **must** be 0 if VkImageCreateInfo::arrayLayers is 1
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-depthPitch-02269
  For each element of pPlaneLayouts, depthPitch **must** be 0 if VkImageCreateInfo::extent.depth is 1

Valid Usage (Implicit)

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_EXPLICIT_CREATE_INFO_EXT
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-pPlaneLayouts-parameter
  pPlaneLayouts **must** be a valid pointer to an array of drmFormatModifierPlaneCount VkSubresourceLayout structures
- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-arraylength
  drmFormatModifierPlaneCount **must** be greater than 0

Structure Chaining

Extends the structure

- VkImageCreateInfo

If the pNext list of VkImageCreateInfo includes a VkImageCompressionControlEXT structure, then that structure describes compression controls for this image.

The VkImageCompressionControlEXT structure is defined as:

```
// Provided by VK_EXT_image_compression_control
typedef struct VkImageCompressionControlEXT {
    VkStructureType                          sType;
    const void*                              pNext;
    VkImageCompressionFlagsEXT               flags;
    uint32_t                                 compressionControlPlaneCount;
    VkImageCompressionFixedRateFlagsEXT*     pFixedRateFlags;
} VkImageCompressionControlEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkImageCompressionFlagBitsEXT describing compression controls for the image.
- `compressionControlPlaneCount` is the number of entries in the `pFixedRateFlags` array.
- `pFixedRateFlags` is `NULL` or a pointer to an array of VkImageCompressionFixedRateFlagsEXT bitfields describing allowed fixed-rate compression rates of each image plane. It is ignored if `flags` does not include VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT.

If enabled, fixed-rate compression is done in an implementation-defined manner and **may** be applied at block granularity. In that case, a write to an individual texel **may** modify the value of other texels in the same block.

Valid Usage

- VUID-VkImageCompressionControlEXT-flags-06747
  `flags` **must** be one of VK_IMAGE_COMPRESSION_DEFAULT_EXT, VK_IMAGE_COMPRESSION_FIXED_RATE_DEFAULT_EXT, VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, or VK_IMAGE_COMPRESSION_DISABLED_EXT
- VUID-VkImageCompressionControlEXT-flags-06748
  If `flags` includes VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, `pFixedRateFlags` **must** not be `NULL`

Valid Usage (Implicit)

- VUID-VkImageCompressionControlEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_COMPRESSION_CONTROL_EXT

Structure Chaining

Extends the structures

- VkImageCreateInfo

- VkPhysicalDeviceImageFormatInfo2
- VkSwapchainCreateInfoKHR

NOTE Some combinations of compression properties may not be supported. For example, some implementations may not support different fixed-rate compression rates per plane of a multi-planar format and will not be able to enable fixed-rate compression for any plane if the requested rates differ.

Possible values of VkImageCompressionControlEXT::`flags`, specifying compression controls for an image, are:

```
// Provided by VK_EXT_image_compression_control
typedef enum VkImageCompressionFlagBitsEXT {
    VK_IMAGE_COMPRESSION_DEFAULT_EXT = 0,
    VK_IMAGE_COMPRESSION_FIXED_RATE_DEFAULT_EXT = 0x00000001,
    VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT = 0x00000002,
    VK_IMAGE_COMPRESSION_DISABLED_EXT = 0x00000004,
} VkImageCompressionFlagBitsEXT;
```

- VK_IMAGE_COMPRESSION_DEFAULT_EXT specifies that the default image compression setting is used. Implementations **must** not apply fixed-rate compression.
- VK_IMAGE_COMPRESSION_FIXED_RATE_DEFAULT_EXT specifies that the implementation **may** choose any supported fixed-rate compression setting in an implementation-defined manner based on the properties of the image.
- VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT specifies that fixed-rate compression **may** be used and that the allowed compression rates are specified by VkImageCompressionControlEXT::`pFixedRateFlags`.
- VK_IMAGE_COMPRESSION_DISABLED_EXT specifies that all lossless and fixed-rate compression **should** be disabled.

If VkImageCompressionControlEXT::`flags` is VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, then the i^{th} member of the `pFixedRateFlags` array specifies the allowed compression rates for the image's i^{th} plane.

NOTE If VK_IMAGE_COMPRESSION_DISABLED_EXT is included in VkImageCompressionControlEXT::`flags`, both lossless and fixed-rate compression will be disabled. This is likely to have a negative impact on performance and is only intended to be used for debugging purposes.

```
// Provided by VK_EXT_image_compression_control
typedef VkFlags VkImageCompressionFlagsEXT;
```

`VkImageCompressionFlagsEXT` is a bitmask type for setting a mask of zero or more VkImageCompressionFlagBitsEXT.

```
// Provided by VK_EXT_image_compression_control
typedef VkFlags VkImageCompressionFixedRateFlagsEXT;
```

VkImageCompressionFixedRateFlagsEXT is a bitmask type for setting a mask of zero or more VkImageCompressionFixedRateFlagBitsEXT.

Bits which **can** be set in VkImageCompressionControlEXT::pFixedRateFlags, specifying allowed compression rates for an image plane, are:

```
// Provided by VK_EXT_image_compression_control
typedef enum VkImageCompressionFixedRateFlagBitsEXT {
    VK_IMAGE_COMPRESSION_FIXED_RATE_NONE_EXT = 0,
    VK_IMAGE_COMPRESSION_FIXED_RATE_1BPC_BIT_EXT = 0x00000001,
    VK_IMAGE_COMPRESSION_FIXED_RATE_2BPC_BIT_EXT = 0x00000002,
    VK_IMAGE_COMPRESSION_FIXED_RATE_3BPC_BIT_EXT = 0x00000004,
    VK_IMAGE_COMPRESSION_FIXED_RATE_4BPC_BIT_EXT = 0x00000008,
    VK_IMAGE_COMPRESSION_FIXED_RATE_5BPC_BIT_EXT = 0x00000010,
    VK_IMAGE_COMPRESSION_FIXED_RATE_6BPC_BIT_EXT = 0x00000020,
    VK_IMAGE_COMPRESSION_FIXED_RATE_7BPC_BIT_EXT = 0x00000040,
    VK_IMAGE_COMPRESSION_FIXED_RATE_8BPC_BIT_EXT = 0x00000080,
    VK_IMAGE_COMPRESSION_FIXED_RATE_9BPC_BIT_EXT = 0x00000100,
    VK_IMAGE_COMPRESSION_FIXED_RATE_10BPC_BIT_EXT = 0x00000200,
    VK_IMAGE_COMPRESSION_FIXED_RATE_11BPC_BIT_EXT = 0x00000400,
    VK_IMAGE_COMPRESSION_FIXED_RATE_12BPC_BIT_EXT = 0x00000800,
    VK_IMAGE_COMPRESSION_FIXED_RATE_13BPC_BIT_EXT = 0x00001000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_14BPC_BIT_EXT = 0x00002000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_15BPC_BIT_EXT = 0x00004000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_16BPC_BIT_EXT = 0x00008000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_17BPC_BIT_EXT = 0x00010000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_18BPC_BIT_EXT = 0x00020000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_19BPC_BIT_EXT = 0x00040000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_20BPC_BIT_EXT = 0x00080000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_21BPC_BIT_EXT = 0x00100000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_22BPC_BIT_EXT = 0x00200000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_23BPC_BIT_EXT = 0x00400000,
    VK_IMAGE_COMPRESSION_FIXED_RATE_24BPC_BIT_EXT = 0x00800000,
} VkImageCompressionFixedRateFlagBitsEXT;
```

- VK_IMAGE_COMPRESSION_FIXED_RATE_NONE_EXT specifies that fixed-rate compression **must** not be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_1BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [1,2) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_2BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [2,3) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_3BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [3,4) bits per component **may** be used.

- VK_IMAGE_COMPRESSION_FIXED_RATE_4BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [4,5) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_5BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [5,6) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_6BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [6,7) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_7BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [7,8) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_8BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [8,9) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_9BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [9,10) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_10BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [10,11) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_11BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of [11,12) bits per component **may** be used.
- VK_IMAGE_COMPRESSION_FIXED_RATE_12BPC_BIT_EXT specifies that fixed-rate compression with a bitrate of at least 12 bits per component **may** be used.

If the format has a different bit rate for different components, VkImageCompressionControlEXT ::`pFixedRateFlags` describes the rate of the component with the largest number of bits assigned to it, scaled pro rata. For example, to request that a VK_FORMAT_A2R10G10B10_UNORM_PACK32 format be stored at a rate of 8 bits per pixel, use VK_IMAGE_COMPRESSION_FIXED_RATE_2BPC_BIT_EXT (10 bits for the largest component, stored at quarter the original size, 2.5 bits, rounded down).

If `flags` includes VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT, and multiple bits are set in VkImageCompressionControlEXT::`pFixedRateFlags` for a plane, implementations **should** apply the lowest allowed bitrate that is supported.

NOTE

The choice of “bits per component” terminology was chosen so that the same compression rate describes the same degree of compression applied to formats that differ only in the number of components. For example, VK_FORMAT_R8G8_UNORM compressed to half its original size is a rate of 4 bits per component, 8 bits per pixel. VK_FORMAT_R8G8B8A8_UNORM compressed to half *its* original size is 4 bits per component, 16 bits per pixel. Both of these cases can be requested with VK_IMAGE_COMPRESSION_FIXED_RATE_4BPC_BIT_EXT.

To query the compression properties of an image, add a VkImageCompressionPropertiesEXT structure to the `pNext` chain of the VkSubresourceLayout2 structure in a call to vkGetImageSubresourceLayout2.

To determine the compression rates that are supported for a given image format, add a VkImageCompressionPropertiesEXT structure to the `pNext` chain of the VkImageFormatProperties2 structure in a call to vkGetPhysicalDeviceImageFormatProperties2.

NOTE	Since fixed-rate compression is disabled by default, the VkImageCompressionPropertiesEXT structure passed to vkGetPhysicalDeviceImageFormatProperties2 will not indicate any fixed-rate compression support unless a VkImageCompressionControlEXT structure is also included in the pNext chain of the VkPhysicalDeviceImageFormatInfo2 structure passed to the same command.

The VkImageCompressionPropertiesEXT structure is defined as:

```
// Provided by VK_EXT_image_compression_control
typedef struct VkImageCompressionPropertiesEXT {
    VkStructureType                         sType;
    void*                                   pNext;
    VkImageCompressionFlagsEXT              imageCompressionFlags;
    VkImageCompressionFixedRateFlagsEXT     imageCompressionFixedRateFlags;
} VkImageCompressionPropertiesEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- imageCompressionFlags returns a value describing the compression controls that apply to the image. The value will be either VK_IMAGE_COMPRESSION_DEFAULT_EXT to indicate no fixed-rate compression, VK_IMAGE_COMPRESSION_FIXED_RATE_EXPLICIT_EXT to indicate fixed-rate compression, or VK_IMAGE_COMPRESSION_DISABLED_EXT to indicate no compression.
- imageCompressionFixedRateFlags returns a VkImageCompressionFixedRateFlagsEXT value describing the compression rates that apply to the specified aspect of the image.

Valid Usage (Implicit)

- VUID-VkImageCompressionPropertiesEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_COMPRESSION_PROPERTIES_EXT

Structure Chaining

Extends the structures

- VkImageFormatProperties2
- VkSubresourceLayout2
- VkSurfaceFormat2KHR

If the pNext list of VkImageCreateInfo includes a VkImageAlignmentControlCreateInfoMESA structure, then that structure describes desired alignment for this image.

The VkImageAlignmentControlCreateInfoMESA structure is defined as:

```
// Provided by VK_MESA_image_alignment_control
typedef struct VkImageAlignmentControlCreateInfoMESA {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           maximumRequestedAlignment;
} VkImageAlignmentControlCreateInfoMESA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maximumRequestedAlignment` specifies the maximum alignment for the image.

If `maximumRequestedAlignment` is not 0, the implementation **should** choose an image memory layout that requires an alignment no larger than `maximumRequestedAlignment` as reported in VkMemoryRequirements::`alignment`. If such a layout does not exist for the given image creation parameters, the implementation **should** return the smallest alignment which is supported in VkMemoryRequirements.

If an implementation needs to disable image compression for `maximumRequestedAlignment` to be honored - where a larger alignment would enable image compression - the implementation **should** not use `maximumRequestedAlignment`, and **should** return the smallest alignment which does not compromise compression. If the `imageCompressionControl` feature is enabled, the application **can** chain a VkImageCompressionControlEXT with VK_IMAGE_COMPRESSION_DISABLED_EXT. In this case, image compression considerations **should** not apply when the implementation decides alignment.

Valid Usage

- VUID-VkImageAlignmentControlCreateInfoMESA-maximumRequestedAlignment-09655
  If `maximumRequestedAlignment` is not 0, `maximumRequestedAlignment` **must** be a power of two
- VUID-VkImageAlignmentControlCreateInfoMESA-maximumRequestedAlignment-09656
  If `maximumRequestedAlignment` is not 0, the bitwise-and of `maximumRequestedAlignment` and `supportedImageAlignmentMask` **must** be non-zero
- VUID-VkImageAlignmentControlCreateInfoMESA-imageAlignmentControl-09657
  `imageAlignmentControl` **must** be enabled

Valid Usage (Implicit)

- VUID-VkImageAlignmentControlCreateInfoMESA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_ALIGNMENT_CONTROL_CREATE_INFO_MESA

Structure Chaining

Extends the structure

- VkImageCreateInfo

If the `pNext` chain of VkImageCreateInfo includes a `VkImageTilingControlCreateInfoEXT` structure, then that structure specifies the optimal tiling arrangement for this image.

The `VkImageTilingControlCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_image_tiling_control
typedef struct VkImageTilingControlCreateInfoEXT {
    VkStructureType            sType;
    const void*                pNext;
    VkImageTilingControlEXT    tilingControl;
} VkImageTilingControlCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tilingControl` is a VkImageTilingControlEXT value specifying the optimal tiling arrangement for the image.

Valid Usage

- VUID-VkImageTilingControlCreateInfoEXT-tilingControl-12481
  If `VkImageTilingControlCreateInfoEXT::tilingControl` is not VK_IMAGE_TILING_CONTROL_DEFAULT_EXT, the `imageTilingControl` feature **must** be enabled
- VUID-VkImageTilingControlCreateInfoEXT-tilingControl-12479
  If `VkImageTilingControlCreateInfoEXT::tilingControl` is not VK_IMAGE_TILING_CONTROL_DEFAULT_EXT, VkImageCreateInfo::`tiling` **must** not be VK_IMAGE_TILING_LINEAR

Valid Usage (Implicit)

- VUID-VkImageTilingControlCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_TILING_CONTROL_CREATE_INFO_EXT
- VUID-VkImageTilingControlCreateInfoEXT-tilingControl-parameter
  `tilingControl` **must** be a valid VkImageTilingControlEXT value

Structure Chaining

Extends the structure

- VkImageCreateInfo

Possible values of VkImageTilingControlCreateInfoEXT::`tilingControl`, specifying image tiling arrangement, are:

```
// Provided by VK_EXT_image_tiling_control
typedef enum VkImageTilingControlEXT {
    VK_IMAGE_TILING_CONTROL_DEFAULT_EXT = 0,
    VK_IMAGE_TILING_CONTROL_MIN_SIZE_EXT = 1,
    VK_IMAGE_TILING_CONTROL_MAX_PERFORMANCE_EXT = 2,
} VkImageTilingControlEXT;
```

- VK_IMAGE_TILING_CONTROL_DEFAULT_EXT specifies that the image tiling arrangement balances memory size requirements and memory access performance. It is the same selection as with the VkImageTilingControlCreateInfoEXT structure omitted from the `pNext` chain of VkImageCreateInfo.
- VK_IMAGE_TILING_CONTROL_MIN_SIZE_EXT specifies that the image tiling arrangement minimizes memory size requirements with reduced consideration for memory access performance.
- VK_IMAGE_TILING_CONTROL_MAX_PERFORMANCE_EXT specifies that the image tiling arrangement maximizes memory access performance with reduced consideration for increases in memory size requirements.

These enumeration values only select the preferred tiling arrangement out of the subset that the implementation supports, which is dependent on the other image creation parameters.

There are cases where multiple enumeration values will result in the same tiling arrangement, especially for images with extents that are multiples of optimal tiling block sizes. For these cases, no tradeoff exists for the image.

The memory size requirements of the image are less than or equal when using VK_IMAGE_TILING_CONTROL_MIN_SIZE_EXT. However, there are no performance guarantees when using VK_IMAGE_TILING_CONTROL_MAX_PERFORMANCE_EXT as image access times are dependent on other variables such as the shader access pattern.

Bits which **can** be set in VkImageUsageFlags2CreateInfoKHR::`usage`, specifying intended usage of an image, are:

```
// Provided by VK_KHR_extended_flags
// Flag bits for VkImageUsageFlagBits2KHR
typedef VkFlags64 VkImageUsageFlagBits2KHR;
static const VkImageUsageFlagBits2KHR VK_IMAGE_USAGE_2_TRANSFER_SRC_BIT_KHR =
0x00000001ULL;
```

```
static const VkImageUsageFlagBits2KHR VK_IMAGE_USAGE_2_TRANSFER_DST_BIT_KHR =
0x00000002ULL;
static const VkImageUsageFlagBits2KHR VK_IMAGE_USAGE_2_SAMPLED_BIT_KHR =
0x00000004ULL;
static const VkImageUsageFlagBits2KHR VK_IMAGE_USAGE_2_STORAGE_BIT_KHR =
0x00000008ULL;

0x08000000ULL;
```

- VK_IMAGE_USAGE_2_TRANSFER_SRC_BIT_KHR specifies that the image **can** be used as the source of a transfer command.
- VK_IMAGE_USAGE_2_TRANSFER_DST_BIT_KHR specifies that the image **can** be used as the destination of a transfer command.
- VK_IMAGE_USAGE_2_SAMPLED_BIT_KHR specifies that the image **can** be used to create a VkImageView suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and be sampled by a shader.
- VK_IMAGE_USAGE_2_STORAGE_BIT_KHR specifies that the image **can** be used to create a VkImageView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE.
- VK_IMAGE_USAGE_2_COLOR_ATTACHMENT_BIT_KHR specifies that the image **can** be used to create a VkImageView suitable for use as a color or resolve attachment in a VkFramebuffer.
- VK_IMAGE_USAGE_2_DEPTH_STENCIL_ATTACHMENT_BIT_KHR specifies that the image **can** be used to create a VkImageView suitable for use as a depth/stencil or depth/stencil resolve attachment in a VkFramebuffer.
- VK_IMAGE_USAGE_2_TRANSIENT_ATTACHMENT_BIT_KHR specifies that implementations **may** support using memory allocations with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT to back an image with this usage. This bit **can** be set for any image that **can** be used to create a VkImageView suitable for use as a color, resolve, depth/stencil, or input attachment.
- VK_IMAGE_USAGE_2_INPUT_ATTACHMENT_BIT_KHR specifies that the image **can** be used to create a VkImageView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.
- VK_IMAGE_USAGE_2_FRAGMENT_DENSITY_MAP_BIT_EXT specifies that the image **can** be used to create a VkImageView suitable for use as a fragment density map image.
- VK_IMAGE_USAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that the image **can** be used to create a VkImageView suitable for use as a fragment shading rate attachment or shading rate image

- VK_IMAGE_USAGE_2_VIDEO_DECODE_DST_BIT_KHR specifies that the image **can** be used as a decode output picture in a video decode operation.
- VK_IMAGE_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR is reserved for future use.
- VK_IMAGE_USAGE_2_VIDEO_DECODE_DPB_BIT_KHR specifies that the image **can** be used as an output reconstructed picture or an input reference picture in a video decode operation.
- VK_IMAGE_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR is reserved for future use.
- VK_IMAGE_USAGE_2_VIDEO_ENCODE_SRC_BIT_KHR specifies that the image **can** be used as an encode input picture in a video encode operation.
- VK_IMAGE_USAGE_2_VIDEO_ENCODE_DPB_BIT_KHR specifies that the image **can** be used as an output reconstructed picture or an input reference picture in a video encode operation.
- VK_IMAGE_USAGE_2_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT specifies that the image **can** be used as a color or depth/stencil attachment with feedback loop enabled.
- VK_IMAGE_USAGE_2_TILE_MEMORY_BIT_QCOM specifies that the image **can** be bound to VkDeviceMemory allocated from a VkMemoryHeap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property.
- VK_IMAGE_USAGE_2_HOST_TRANSFER_BIT_KHR specifies that the image **can** be used with host copy commands and host layout transitions.
- VK_IMAGE_USAGE_2_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR specifies that the image **can** be used as a quantization delta map in a video encode operation.
- VK_IMAGE_USAGE_2_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR specifies that the image **can** be used as an emphasis map in a video encode operation.
- VK_IMAGE_USAGE_2_TENSOR_ALIASING_BIT_ARM specifies that the image **can** be transitioned to the VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM layout. See Memory Aliasing for a complete set of rules for tensor/image aliasing.

```
// Provided by VK_KHR_extended_flags
typedef VkFlags64 VkImageUsageFlags2KHR;
```

VkImageUsageFlags2KHR is a bitmask type for setting a mask of zero or more VkImageUsageFlagBits2KHR.

Bits which **can** be set in

- VkImageViewUsageCreateInfo::usage
- VkImageStencilUsageCreateInfo::stencilUsage
- VkImageCreateInfo::usage

specify intended usage of an image, and are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageUsageFlagBits {
    VK_IMAGE_USAGE_TRANSFER_SRC_BIT = 0x00000001,
```

```
    VK_IMAGE_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_IMAGE_USAGE_SAMPLED_BIT = 0x00000004,
    VK_IMAGE_USAGE_STORAGE_BIT = 0x00000008,
    VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT = 0x00000010,
    VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000020,
    VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT = 0x00000040,
    VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT = 0x00000080,
  // Provided by VK_VERSION_1_4
    VK_IMAGE_USAGE_HOST_TRANSFER_BIT = 0x00400000,
  // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00000400,
  // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00000800,
  // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR = 0x00001000,
  // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT = 0x00000200,
  // Provided by VK_KHR_fragment_shading_rate
    VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00000100,
  // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR = 0x00002000,
  // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR = 0x00004000,
  // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR = 0x00008000,
  // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT = 0x00080000,
  // Provided by VK_HUAWEI_invocation_mask
    VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI = 0x00040000,
  // Provided by VK_QCOM_image_processing
    VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM = 0x00100000,
  // Provided by VK_QCOM_image_processing
    VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM = 0x00200000,
  // Provided by VK_ARM_tensors
    VK_IMAGE_USAGE_TENSOR_ALIASING_BIT_ARM = 0x00800000,
  // Provided by VK_QCOM_tile_memory_heap
    VK_IMAGE_USAGE_TILE_MEMORY_BIT_QCOM = 0x08000000,
  // Provided by VK_KHR_video_encode_quantization_map
    VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR = 0x02000000,
  // Provided by VK_KHR_video_encode_quantization_map
    VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR = 0x04000000,
  // Provided by VK_NV_shading_rate_image
    VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV =
VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR,
  // Provided by VK_EXT_host_image_copy
    VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT = VK_IMAGE_USAGE_HOST_TRANSFER_BIT,
} VkImageUsageFlagBits;
```

- VK_IMAGE_USAGE_TRANSFER_SRC_BIT specifies that the image **can** be used as the source of a transfer command.

- VK_IMAGE_USAGE_TRANSFER_DST_BIT specifies that the image **can** be used as the destination of a transfer command.
- VK_IMAGE_USAGE_SAMPLED_BIT specifies that the image **can** be used to create a VkImageView suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and be sampled by a shader.
- VK_IMAGE_USAGE_STORAGE_BIT specifies that the image **can** be used to create a VkImageView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE.
- VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT specifies that the image **can** be used to create a VkImageView suitable for use as a color or resolve attachment in a VkFramebuffer.
- VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT specifies that the image **can** be used to create a VkImageView suitable for use as a depth/stencil or depth/stencil resolve attachment in a VkFramebuffer.
- VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT specifies that implementations **may** support using memory allocations with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT to back an image with this usage. This bit **can** be set for any image that **can** be used to create a VkImageView suitable for use as a color, resolve, depth/stencil, or input attachment.
- VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT specifies that the image **can** be used to create a VkImageView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.
- VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT specifies that the image **can** be used to create a VkImageView suitable for use as a fragment density map image.
- VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that the image **can** be used to create a VkImageView suitable for use as a fragment shading rate attachment or shading rate image
- VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR specifies that the image **can** be used as a decode output picture in a video decode operation.
- VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR is reserved for future use.
- VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR specifies that the image **can** be used as an output reconstructed picture or an input reference picture in a video decode operation.
- VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR is reserved for future use.
- VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR specifies that the image **can** be used as an encode input picture in a video encode operation.
- VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR specifies that the image **can** be used as an output reconstructed picture or an input reference picture in a video encode operation.
- VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT specifies that the image **can** be used as a color or depth/stencil attachment with feedback loop enabled.
- VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM specifies that the image **can** be used as a weight image in weight image sampling operations.
- VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM specifies that the image **can** be used in

block matching operations.

- VK_IMAGE_USAGE_TILE_MEMORY_BIT_QCOM specifies that the image **can** be bound to VkDeviceMemory allocated from a VkMemoryHeap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property.
- VK_IMAGE_USAGE_HOST_TRANSFER_BIT specifies that the image **can** be used with host copy commands and host layout transitions.
- VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR specifies that the image **can** be used as a quantization delta map in a video encode operation.
- VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR specifies that the image **can** be used as an emphasis map in a video encode operation.
- VK_IMAGE_USAGE_TENSOR_ALIASING_BIT_ARM specifies that the image **can** be transitioned to the VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM layout. See Memory Aliasing for a complete set of rules for tensor/image aliasing.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageUsageFlags;
```

VkImageUsageFlags is a bitmask type for setting a mask of zero or more VkImageUsageFlagBits.

Bits which **can** be set in VkImageCreateFlags2CreateInfoKHR::flags, specifying additional parameters of an image, are:

```
// Provided by VK_KHR_extended_flags
// Flag bits for VkImageCreateFlagBits2KHR
typedef VkFlags64 VkImageCreateFlagBits2KHR;
static const VkImageCreateFlagBits2KHR VK_IMAGE_CREATE_2_SPARSE_BINDING_BIT_KHR =
0x00000001ULL;
static const VkImageCreateFlagBits2KHR VK_IMAGE_CREATE_2_SPARSE_RESIDENCY_BIT_KHR =
0x00000002ULL;
static const VkImageCreateFlagBits2KHR VK_IMAGE_CREATE_2_SPARSE_ALIASED_BIT_KHR =
0x00000004ULL;

// Provided by VK_KHR_extended_flags with VK_EXT_image_2d_view_of_3d
static const VkImageCreateFlagBits2KHR VK_IMAGE_CREATE_2_2D_VIEW_COMPATIBLE_BIT_EXT =
0x00020000ULL;
// Provided by VK_KHR_extended_flags with VK_EXT_multisampled_render_to_single_sampled
static const VkImageCreateFlagBits2KHR
VK_IMAGE_CREATE_2_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT = 0x00040000ULL;
// Provided by VK_KHR_extended_flags with VK_KHR_video_maintenance1
static const VkImageCreateFlagBits2KHR
VK_IMAGE_CREATE_2_VIDEO_PROFILE_INDEPENDENT_BIT_KHR = 0x00100000ULL;
```

- VK_IMAGE_CREATE_2_SPARSE_BINDING_BIT_KHR specifies that the image will be backed using sparse memory binding.
- VK_IMAGE_CREATE_2_SPARSE_RESIDENCY_BIT_KHR specifies that the image **can** be partially backed using sparse memory binding. Images created with this flag **must** also be created with the VK_IMAGE_CREATE_2_SPARSE_BINDING_BIT_KHR flag.
- VK_IMAGE_CREATE_2_SPARSE_ALIASED_BIT_KHR specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag **must** also be created with the VK_IMAGE_CREATE_2_SPARSE_BINDING_BIT_KHR flag.
- VK_IMAGE_CREATE_2_MUTABLE_FORMAT_BIT_KHR specifies that the image **can** be used to

create a VkImageView with a different format from the image. For multi-planar formats, VK_IMAGE_CREATE_2_MUTABLE_FORMAT_BIT_KHR specifies that a VkImageView can be created of a *plane* of the image.

- VK_IMAGE_CREATE_2_CUBE_COMPATIBLE_BIT_KHR specifies that the image **can** be used to create a VkImageView of type VK_IMAGE_VIEW_TYPE_CUBE or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY.
- VK_IMAGE_CREATE_2_2D_ARRAY_COMPATIBLE_BIT_KHR specifies that the image **can** be used to create a VkImageView of type VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY.
- VK_IMAGE_CREATE_2_2D_VIEW_COMPATIBLE_BIT_EXT specifies that the image **can** be used to create a VkImageView of type VK_IMAGE_VIEW_TYPE_2D.
- VK_IMAGE_CREATE_2_PROTECTED_BIT_KHR specifies that the image is a protected image.
- VK_IMAGE_CREATE_2_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR specifies that the image **can** be used with a non-zero value of the splitInstanceBindRegionCount member of a VkBindImageMemoryDeviceGroupInfo structure passed into vkBindImageMemory2. This flag also has the effect of making the image use the standard sparse image block dimensions.
- VK_IMAGE_CREATE_2_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR specifies that the image having a compressed format **can** be used to create a VkImageView with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.
- VK_IMAGE_CREATE_2_EXTENDED_USAGE_BIT_KHR specifies that the image **can** be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a VkImageView created from the image **can** have.
- VK_IMAGE_CREATE_2_DISJOINT_BIT_KHR specifies that an image with a multi-planar format **must** have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a *disjoint image* from an image without this bit set.
- VK_IMAGE_CREATE_2_ALIAS_BIT_KHR specifies that two images created with the same creation parameters and aliased to the same memory **can** interpret the contents of the memory consistently with each other, subject to the rules described in the Memory Aliasing section. This flag further specifies that each plane of a *disjoint* image **can** share an in-memory non-linear representation with single-plane images, and that a single-plane image **can** share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in Compatible Formats of Planes of Multi-Planar Formats. If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, it is as if VK_IMAGE_CREATE_2_ALIAS_BIT_KHR is set.
- VK_IMAGE_CREATE_2_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT specifies that an image with a depth or depth/stencil format **can** be used with custom sample locations when used as a depth/stencil attachment.
- VK_IMAGE_CREATE_2_CORNER_SAMPLED_BIT_NV specifies that the image is a corner-sampled image.
- VK_IMAGE_CREATE_2_SUBSAMPLED_BIT_EXT specifies that an image **can** be in a subsampled format which **may** be more optimal when written as an attachment by a render pass that has a fragment density map attachment. Accessing a subsampled image has additional

considerations:

- Image data read as an image sampler will have undefined values if the sampler was not created with `flags` containing VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT or was not sampled through the use of a combined image sampler with an immutable sampler in `VkDescriptorSetLayoutBinding`.
- Image data read with an input attachment will have undefined values if the contents were not written as an attachment in an earlier subpass of the same render pass.
- Image data read as an image sampler in the fragment shader will additionally be read by the device during VK_PIPELINE_STAGE_VERTEX_SHADER_BIT if `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledCoarseReconstructionEarlyAccess` is VK_TRUE and the sampler was created with `flags` containing VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT.
- Image data read with load operations are resampled to the fragment density of the render pass if `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledLoads` is VK_TRUE. Otherwise, values of image data are undefined.
- Image contents outside of the render area take on undefined values if the image is stored as a render pass attachment.

- VK_IMAGE_CREATE_2_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT specifies that an image **can** be used in a render pass with non-zero fragment density map offsets. In a render pass with non-zero offsets, fragment density map attachments, input attachments, color attachments, depth/stencil attachment, resolve attachments, and preserve attachments **must** be created with VK_IMAGE_CREATE_2_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT.
- VK_IMAGE_CREATE_2_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT specifies that the image **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.
- VK_IMAGE_CREATE_2_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT specifies that an image **can** be used with multisampled rendering as a single-sampled framebuffer attachment.
- VK_IMAGE_CREATE_2_VIDEO_PROFILE_INDEPENDENT_BIT_KHR specifies that the image **can** be used in video coding operations without having to specify at image creation time the set of video profiles the image will be used with, except for images used only as DPB pictures, as long as the image is otherwise compatible with the video profile in question.

NOTE

This enables exchanging video picture data without additional copies or conversions when used as:

- Decode output pictures, regardless of the video profile used to produce them.
- Encode input pictures, regardless of the video profile used to consume them.

This includes images created with both VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR and VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, which is necessary to use the same video picture as the reconstructed picture and decode output picture in a video decode operation on implementations supporting

VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR.

However, images with only DPB usage remain tied to the video profiles the image was created with, as the data layout of such DPB-only images **may** be implementation- and codec-dependent.

If an application would like to share or reuse the device memory backing such images (e.g. for the purposes of temporal aliasing), then it **should** create separate image objects for each video profile and bind them to the same underlying device memory range, similar to how memory resources **can** be shared across separate video sessions or any other memory-backed resource.

See Sparse Resource Features and Sparse Physical Device Features for more details.

```
// Provided by VK_KHR_extended_flags
typedef VkFlags64 VkImageCreateFlags2KHR;
```

VkImageCreateFlags2KHR is a bitmask type for setting a mask of zero or more VkImageCreateFlagBits2KHR.

Bits which **can** be set in VkImageCreateInfo::flags, specifying additional parameters of an image, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_IMAGE_CREATE_SPARSE_ALIASED_BIT = 0x00000004,

    VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR = 0x00100000,
  // Provided by VK_EXT_fragment_density_map_offset
    VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT = 0x00008000,
  // Provided by VK_KHR_maintenance11
    VK_IMAGE_CREATE_ALIAS_SINGLE_LAYER_DESCRIPTOR_BIT_KHR = 0x00400000,
  // Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR =
VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT,
  // Provided by VK_KHR_maintenance1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT_KHR =
VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT,
  // Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR =
VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT,
  // Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR = VK_IMAGE_CREATE_EXTENDED_USAGE_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_CREATE_DISJOINT_BIT_KHR = VK_IMAGE_CREATE_DISJOINT_BIT,
  // Provided by VK_KHR_bind_memory2
    VK_IMAGE_CREATE_ALIAS_BIT_KHR = VK_IMAGE_CREATE_ALIAS_BIT,
  // Provided by VK_EXT_descriptor_buffer
    VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT =
VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT,
  // Provided by VK_QCOM_fragment_density_map_offset
    VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM =
VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT,
} VkImageCreateFlagBits;
```

- VK_IMAGE_CREATE_SPARSE_BINDING_BIT specifies that the image will be backed using sparse memory binding.
- VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT specifies that the image **can** be partially backed using sparse memory binding. Images created with this flag **must** also be created with the VK_IMAGE_CREATE_SPARSE_BINDING_BIT flag.
- VK_IMAGE_CREATE_SPARSE_ALIASED_BIT specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag **must** also be created with the VK_IMAGE_CREATE_SPARSE_BINDING_BIT flag.
- VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT specifies that the image **can** be used to create a VkImageView with a different format from the image. For multi-planar formats, VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT specifies that a VkImageView can be created of a

plane of the image.

- VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT specifies that the image **can** be used to create a `VkImageView` of type VK_IMAGE_VIEW_TYPE_CUBE or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY.
- VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT specifies that the image **can** be used to create a `VkImageView` of type VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY.
- VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT specifies that the image **can** be used to create a `VkImageView` of type VK_IMAGE_VIEW_TYPE_2D.
- VK_IMAGE_CREATE_PROTECTED_BIT specifies that the image is a protected image.
- VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT specifies that the image **can** be used with a non-zero value of the `splitInstanceBindRegionCount` member of a VkBindImageMemoryDeviceGroupInfo structure passed into vkBindImageMemory2. This flag also has the effect of making the image use the standard sparse image block dimensions.
- VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT specifies that the image having a compressed format **can** be used to create a `VkImageView` with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.
- VK_IMAGE_CREATE_EXTENDED_USAGE_BIT specifies that the image **can** be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a `VkImageView` created from the image **can** have.
- VK_IMAGE_CREATE_DISJOINT_BIT specifies that an image with a multi-planar format **must** have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a *disjoint image* from an image without this bit set.
- VK_IMAGE_CREATE_ALIAS_BIT specifies that two images created with the same creation parameters and aliased to the same memory **can** interpret the contents of the memory consistently with each other, subject to the rules described in the Memory Aliasing section. This flag further specifies that each plane of a *disjoint* image **can** share an in-memory non-linear representation with single-plane images, and that a single-plane image **can** share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in Compatible Formats of Planes of Multi-Planar Formats. If the `pNext` chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose `handleTypes` member is not `0`, it is as if VK_IMAGE_CREATE_ALIAS_BIT is set.
- VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT specifies that an image with a depth or depth/stencil format **can** be used with custom sample locations when used as a depth/stencil attachment.
- VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV specifies that the image is a corner-sampled image.
- VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT specifies that an image **can** be in a subsampled format which **may** be more optimal when written as an attachment by a render pass that has a fragment density map attachment. Accessing a subsampled image has additional considerations:
  - Image data read as an image sampler will have undefined values if the sampler was not created with `flags` containing VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT or was not sampled through a combined embedded sampler and image mapping if using descriptor

heaps, or the use of a combined image sampler with an immutable sampler in VkDescriptorSetLayoutBinding.

  - Image data read with an input attachment will have undefined values if the contents were not written as an attachment in an earlier subpass of the same render pass.
  - Image data read as an image sampler in the fragment shader will additionally be read by the device during VK_PIPELINE_STAGE_VERTEX_SHADER_BIT if VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledCoarseReconstructionEarlyAccess is VK_TRUE and the sampler was created with flags containing VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT.
  - Image data read with load operations are resampled to the fragment density of the render pass if VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledLoads is VK_TRUE. Otherwise, values of image data are undefined.
  - Image contents outside of the render area take on undefined values if the image is stored as a render pass attachment.

- VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT specifies that an image **can** be used in a render pass with non-zero fragment density map offsets. In a render pass with non-zero offsets, fragment density map attachments, input attachments, color attachments, depth/stencil attachment, resolve attachments, and preserve attachments **must** be created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_EXT.
- VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT specifies that the image **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.
- VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT specifies that an image **can** be used with multisampled rendering as a single-sampled render pass attachment.
- VK_IMAGE_CREATE_ALIAS_SINGLE_LAYER_DESCRIPTOR_BIT_KHR specifies that a single layer image view created from this image can be accessed with both Arrayed equal to 0 and Arrayed equal to 1 in a shader. If accessed with Arrayed equal to 1 in a shader, and VkImageViewCreateInfo::viewType is VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D, the image is treated as having an array size of 1, and subresourceRange.baseArrayLayer is accessed. If accessed with Arrayed equal to 0 in a shader, and VkImageViewCreateInfo::viewType is VK_IMAGE_VIEW_TYPE_1D_ARRAY or VK_IMAGE_VIEW_TYPE_2D_ARRAY, the descriptor is accessed as-if the view was created with VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D respectively. Cube map view aliasing is not included by this flag bit. Also, image views created with a multi-planar format **cannot** alias like this.
- VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR specifies that the image **can** be used in video coding operations without having to specify at image creation time the set of video profiles the image will be used with, except for images used only as DPB pictures, as long as the image is otherwise compatible with the video profile in question.

NOTE

This enables exchanging video picture data without additional copies or conversions when used as:

  - Decode output pictures, regardless of the video profile used to produce them.
  - Encode input pictures, regardless of the video profile used to consume them.

> This includes images created with both VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR and VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, which is necessary to use the same video picture as the reconstructed picture and decode output picture in a video decode operation on implementations supporting VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR.
>
> However, images with only DPB usage remain tied to the video profiles the image was created with, as the data layout of such DPB-only images **may** be implementation- and codec-dependent.
>
> If an application would like to share or reuse the device memory backing such images (e.g. for the purposes of temporal aliasing), then it **should** create separate image objects for each video profile and bind them to the same underlying device memory range, similar to how memory resources **can** be shared across separate video sessions or any other memory-backed resource.

See Sparse Resource Features and Sparse Physical Device Features for more details.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageCreateFlags;
```

`VkImageCreateFlags` is a bitmask type for setting a mask of zero or more VkImageCreateFlagBits.

Possible values of VkImageCreateInfo::`imageType`, specifying the basic dimensionality of an image, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageType {
    VK_IMAGE_TYPE_1D = 0,
    VK_IMAGE_TYPE_2D = 1,
    VK_IMAGE_TYPE_3D = 2,
} VkImageType;
```

- VK_IMAGE_TYPE_1D specifies a one-dimensional image.
- VK_IMAGE_TYPE_2D specifies a two-dimensional image.
- VK_IMAGE_TYPE_3D specifies a three-dimensional image.

Possible values of VkImageCreateInfo::`tiling`, specifying the tiling arrangement of texel blocks in an image, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageTiling {
    VK_IMAGE_TILING_OPTIMAL = 0,
    VK_IMAGE_TILING_LINEAR = 1,
  // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT = 1000158000,
} VkImageTiling;
```

- VK_IMAGE_TILING_OPTIMAL specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more efficient memory access).
- VK_IMAGE_TILING_LINEAR specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).
- VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT specifies that the image's tiling is defined by a Linux DRM format modifier. The modifier is specified at image creation with VkImageDrmFormatModifierListCreateInfoEXT or VkImageDrmFormatModifierExplicitCreateInfoEXT, and **can** be queried with vkGetImageDrmFormatModifierPropertiesEXT.

To query the memory layout of an image subresource, call:

```
// Provided by VK_VERSION_1_0
void vkGetImageSubresourceLayout(
    VkDevice                                    device,
    VkImage                                     image,
    const VkImageSubresource*                   pSubresource,
    VkSubresourceLayout*                        pLayout);
```

- `device` is the logical device that owns the image.
- `image` is the image whose layout is being queried.
- `pSubresource` is a pointer to a VkImageSubresource structure selecting a specific image subresource from the image.
- `pLayout` is a pointer to a VkSubresourceLayout structure in which the layout is returned.

If the image is linear, then the returned layout is valid for host access.

If the image's tiling is VK_IMAGE_TILING_LINEAR and its format is a multi-planar format, then `vkGetImageSubresourceLayout` describes one *format plane* of the image. If the image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then `vkGetImageSubresourceLayout` describes one *memory plane* of the image. If the image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT and the image is non-linear, then the returned layout has an implementation-dependent meaning; the vendor of the image's DRM format modifier **may** provide documentation that explains how to interpret the returned layout.

`vkGetImageSubresourceLayout` is invariant for the lifetime of a single image. However, the subresource layout of images in Android hardware buffer or QNX Screen buffer external memory

is not known until the image has been bound to memory, so applications **must** not call vkGetImageSubresourceLayout for such an image before it has been bound.

Valid Usage

- VUID-vkGetImageSubresourceLayout-image-07790
  `image` **must** have been created with `tiling` equal to VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT
- VUID-vkGetImageSubresourceLayout-aspectMask-00997
  The `aspectMask` member of `pSubresource` **must** only have a single bit set
- VUID-vkGetImageSubresourceLayout-mipLevel-01716
  The `mipLevel` member of `pSubresource` **must** be less than the `mipLevels` specified in `image`
- VUID-vkGetImageSubresourceLayout-arrayLayer-01717
  The `arrayLayer` member of `pSubresource` **must** be less than the `arrayLayers` specified in `image`
- VUID-vkGetImageSubresourceLayout-format-08886
  If `format` of the `image` is a color format that is not a multi-planar format, and `tiling` of the `image` is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the `aspectMask` member of `pSubresource` **must** be VK_IMAGE_ASPECT_COLOR_BIT
- VUID-vkGetImageSubresourceLayout-format-04462
  If `format` of the `image` has a depth component, the `aspectMask` member of `pSubresource` **must** contain VK_IMAGE_ASPECT_DEPTH_BIT
- VUID-vkGetImageSubresourceLayout-format-04463
  If `format` of the `image` has a stencil component, the `aspectMask` member of `pSubresource` **must** contain VK_IMAGE_ASPECT_STENCIL_BIT
- VUID-vkGetImageSubresourceLayout-format-04464
  If `format` of the `image` does not contain a stencil or depth component, the `aspectMask` member of `pSubresource` **must** not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT
- VUID-vkGetImageSubresourceLayout-tiling-08717
  If the `tiling` of the `image` is VK_IMAGE_TILING_LINEAR and has a multi-planar format, then the `aspectMask` member of `pSubresource` **must** be a single valid multi-planar aspect mask bit
- VUID-vkGetImageSubresourceLayout-image-09432
  If `image` was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then `image` **must** be bound to memory
- VUID-vkGetImageSubresourceLayout-tiling-09433
  If the `tiling` of the `image` is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the `aspectMask` member of `pSubresource` **must** be `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` and the index *i* **must** be less than the VkDrmFormatModifierPropertiesEXT::`drmFormatModifierPlaneCount` associated with the image's `format` and VkImageDrmFormatModifierPropertiesEXT::`drmFormatModifier`

Valid Usage (Implicit)

- VUID-vkGetImageSubresourceLayout-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageSubresourceLayout-image-parameter
  `image` **must** be a valid VkImage handle
- VUID-vkGetImageSubresourceLayout-pSubresource-parameter
  `pSubresource` **must** be a valid pointer to a valid VkImageSubresource structure
- VUID-vkGetImageSubresourceLayout-pLayout-parameter
  `pLayout` **must** be a valid pointer to a VkSubresourceLayout structure
- VUID-vkGetImageSubresourceLayout-image-parent
  `image` **must** have been created, allocated, or retrieved from `device`

The `VkImageSubresource` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresource {
    VkImageAspectFlags    aspectMask;
    uint32_t              mipLevel;
    uint32_t              arrayLayer;
} VkImageSubresource;
```

- `aspectMask` is a VkImageAspectFlags value selecting the image *aspect*.
- `mipLevel` selects the mipmap level.
- `arrayLayer` selects the array layer.

Valid Usage (Implicit)

- VUID-VkImageSubresource-aspectMask-parameter
  `aspectMask` **must** be a valid combination of VkImageAspectFlagBits values

Information about the layout of the image subresource is returned in a `VkSubresourceLayout` structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSubresourceLayout {
    VkDeviceSize    offset;
    VkDeviceSize    size;
    VkDeviceSize    rowPitch;
    VkDeviceSize    arrayPitch;
    VkDeviceSize    depthPitch;
} VkSubresourceLayout;
```

- `offset` is the byte offset from the start of the image or the plane where the image subresource begins.
- `size` is the size in bytes of the image subresource. `size` includes any extra memory that is required based on `rowPitch`.
- `rowPitch` describes the number of bytes between each row of texels in an image.
- `arrayPitch` describes the number of bytes between each array layer of an image.
- `depthPitch` describes the number of bytes between each slice of a 3D image.

If the image is linear, then `rowPitch`, `arrayPitch` and `depthPitch` describe the layout of the image subresource in linear memory. For uncompressed formats, `rowPitch` is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). `arrayPitch` is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). `depthPitch` is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

```
// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize +
offset
```

For compressed formats, the `rowPitch` is the number of bytes between compressed texel blocks in adjacent rows. `arrayPitch` is the number of bytes between compressed texel blocks in adjacent array layers. `depthPitch` is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

```
// (x,y,z,layer) are in compressed texel block coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x
*compressedTexelBlockByteSize + offset;
```

The value of `arrayPitch` is undefined for images that were not created as arrays. `depthPitch` is defined only for 3D images.

If the image has a *single-plane* color format and its tiling is VK_IMAGE_TILING_LINEAR , then the `aspectMask` member of `VkImageSubresource` **must** be VK_IMAGE_ASPECT_COLOR_BIT.

If the image has a depth/stencil format and its tiling is VK_IMAGE_TILING_LINEAR , then `aspectMask` **must** be either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different `offset` and `size` representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same `offset` and `size` are returned and represent the interleaved memory allocation.

If the image has a multi-planar format and its tiling is VK_IMAGE_TILING_LINEAR , then the `aspectMask` member of `VkImageSubresource` **must** be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or (for 3-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT. Querying each of these image subresource layouts will return a different `offset` and `size`

representing the region of memory used for that plane. If the image is *disjoint*, then the `offset` is relative to the base address of the plane. If the image is *non-disjoint*, then the `offset` is relative to the base address of the image.

If the image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the `aspectMask` member of `VkImageSubresource` **must** be one of `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`, where the maximum allowed plane index *i* is defined by the VkDrmFormatModifierPropertiesEXT ::`drmFormatModifierPlaneCount` associated with the image's VkImageCreateInfo::`format` and modifier. The memory range used by the subresource is described by `offset` and `size`. If the image is *disjoint*, then the `offset` is relative to the base address of the *memory plane*. If the image is *non-disjoint*, then the `offset` is relative to the base address of the image. If the image is non-linear, then `rowPitch`, `arrayPitch`, and `depthPitch` have an implementation-dependent meaning.

To query the memory layout of an image subresource, call:

```
// Provided by VK_VERSION_1_4
void vkGetImageSubresourceLayout2(
    VkDevice                                    device,
    VkImage                                     image,
    const VkImageSubresource2*                  pSubresource,
    VkSubresourceLayout2*                       pLayout);
```

```
// Provided by VK_KHR_maintenance5
// Equivalent to vkGetImageSubresourceLayout2
void vkGetImageSubresourceLayout2KHR(
    VkDevice                                    device,
    VkImage                                     image,
    const VkImageSubresource2*                  pSubresource,
    VkSubresourceLayout2*                       pLayout);
```

```
// Provided by VK_EXT_host_image_copy, VK_EXT_image_compression_control
// Equivalent to vkGetImageSubresourceLayout2
void vkGetImageSubresourceLayout2EXT(
    VkDevice                                    device,
    VkImage                                     image,
    const VkImageSubresource2*                  pSubresource,
    VkSubresourceLayout2*                       pLayout);
```

- `device` is the logical device that owns the image.
- `image` is the image whose layout is being queried.
- `pSubresource` is a pointer to a VkImageSubresource2 structure selecting a specific image for the image subresource.
- `pLayout` is a pointer to a VkSubresourceLayout2 structure in which the layout is returned.

`vkGetImageSubresourceLayout2` behaves similarly to vkGetImageSubresourceLayout, with the ability

to specify extended inputs via chained input structures, and to return extended information via chained output structures.

It is legal to call vkGetImageSubresourceLayout2 with an image created with tiling equal to VK_IMAGE_TILING_OPTIMAL, but the members of VkSubresourceLayout2::subresourceLayout will have undefined values in this case.

NOTE Structures chained from VkImageSubresource2::pNext will also be updated when tiling is equal to VK_IMAGE_TILING_OPTIMAL.

Valid Usage

- VUID-vkGetImageSubresourceLayout2-aspectMask-00997
  The aspectMask member of pSubresource **must** only have a single bit set
- VUID-vkGetImageSubresourceLayout2-mipLevel-01716
  The mipLevel member of pSubresource **must** be less than the mipLevels specified in image
- VUID-vkGetImageSubresourceLayout2-arrayLayer-01717
  The arrayLayer member of pSubresource **must** be less than the arrayLayers specified in image
- VUID-vkGetImageSubresourceLayout2-format-08886
  If format of the image is a color format that is not a multi-planar format, and tiling of the image is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the aspectMask member of pSubresource **must** be VK_IMAGE_ASPECT_COLOR_BIT
- VUID-vkGetImageSubresourceLayout2-format-04462
  If format of the image has a depth component, the aspectMask member of pSubresource **must** contain VK_IMAGE_ASPECT_DEPTH_BIT
- VUID-vkGetImageSubresourceLayout2-format-04463
  If format of the image has a stencil component, the aspectMask member of pSubresource **must** contain VK_IMAGE_ASPECT_STENCIL_BIT
- VUID-vkGetImageSubresourceLayout2-format-04464
  If format of the image does not contain a stencil or depth component, the aspectMask member of pSubresource **must** not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT
- VUID-vkGetImageSubresourceLayout2-tiling-08717
  If the tiling of the image is VK_IMAGE_TILING_LINEAR and has a multi-planar format, then the aspectMask member of pSubresource **must** be a single valid multi-planar aspect mask bit
- VUID-vkGetImageSubresourceLayout2-image-09434
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image **must** be bound to memory
- VUID-vkGetImageSubresourceLayout2-tiling-09435
  If the tiling of the image is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the aspectMask member of pSubresource **must** be VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT and

the index *i* **must** be less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier

Valid Usage (Implicit)

- VUID-vkGetImageSubresourceLayout2-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetImageSubresourceLayout2-image-parameter
  image **must** be a valid VkImage handle
- VUID-vkGetImageSubresourceLayout2-pSubresource-parameter
  pSubresource **must** be a valid pointer to a valid VkImageSubresource2 structure
- VUID-vkGetImageSubresourceLayout2-pLayout-parameter
  pLayout **must** be a valid pointer to a VkSubresourceLayout2 structure
- VUID-vkGetImageSubresourceLayout2-image-parent
  image **must** have been created, allocated, or retrieved from device

The VkImageSubresource2 structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkImageSubresource2 {
    VkStructureType       sType;
    void*                 pNext;
    VkImageSubresource    imageSubresource;
} VkImageSubresource2;
```

```
// Provided by VK_KHR_maintenance5
// Equivalent to VkImageSubresource2
typedef VkImageSubresource2 VkImageSubresource2KHR;
```

```
// Provided by VK_EXT_host_image_copy, VK_EXT_image_compression_control
// Equivalent to VkImageSubresource2
typedef VkImageSubresource2 VkImageSubresource2EXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- imageSubresource is a VkImageSubresource structure.

Valid Usage (Implicit)

- VUID-VkImageSubresource2-sType-sType

sType **must** be VK_STRUCTURE_TYPE_IMAGE_SUBRESOURCE_2

- VUID-VkImageSubresource2-pNext-pNext
  pNext **must** be NULL
- VUID-VkImageSubresource2-imageSubresource-parameter
  imageSubresource **must** be a valid VkImageSubresource structure

Information about the layout of the image subresource is returned in a VkSubresourceLayout2 structure:

```
// Provided by VK_VERSION_1_4
typedef struct VkSubresourceLayout2 {
    VkStructureType         sType;
    void*                   pNext;
    VkSubresourceLayout     subresourceLayout;
} VkSubresourceLayout2;
```

```
// Provided by VK_KHR_maintenance5
// Equivalent to VkSubresourceLayout2
typedef VkSubresourceLayout2 VkSubresourceLayout2KHR;
```

```
// Provided by VK_EXT_host_image_copy, VK_EXT_image_compression_control
// Equivalent to VkSubresourceLayout2
typedef VkSubresourceLayout2 VkSubresourceLayout2EXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- subresourceLayout is a VkSubresourceLayout structure.

Valid Usage (Implicit)

- VUID-VkSubresourceLayout2-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SUBRESOURCE_LAYOUT_2
- VUID-VkSubresourceLayout2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkImageCompressionPropertiesEXT or VkSubresourceHostMemcpySize
- VUID-VkSubresourceLayout2-sType-unique
  The sType value of each structure in the pNext chain **must** be unique

To query the memory size needed to copy to or from an image using vkCopyMemoryToImage or vkCopyImageToMemory when the VK_HOST_IMAGE_COPY_MEMCPY_BIT flag is specified, add a

VkSubresourceHostMemcpySize structure to the pNext chain of the VkSubresourceLayout2 structure in a call to vkGetImageSubresourceLayout2.

The VkSubresourceHostMemcpySize structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkSubresourceHostMemcpySize {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       size;
} VkSubresourceHostMemcpySize;
```

```
// Provided by VK_EXT_host_image_copy
// Equivalent to VkSubresourceHostMemcpySize
typedef VkSubresourceHostMemcpySize VkSubresourceHostMemcpySizeEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- size is the size in bytes of the image subresource.

Valid Usage (Implicit)

- VUID-VkSubresourceHostMemcpySize-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SUBRESOURCE_HOST_MEMCPY_SIZE

Structure Chaining

Extends the structure

- VkSubresourceLayout2

To query the memory layout of an image subresource, without an image object, call:

```
// Provided by VK_VERSION_1_4
void vkGetDeviceImageSubresourceLayout(
    VkDevice                                    device,
    const VkDeviceImageSubresourceInfo*         pInfo,
    VkSubresourceLayout2*                       pLayout);
```

```
// Provided by VK_KHR_maintenance5
// Equivalent to vkGetDeviceImageSubresourceLayout
void vkGetDeviceImageSubresourceLayoutKHR(
    VkDevice                                    device,
    const VkDeviceImageSubresourceInfo*         pInfo,
    VkSubresourceLayout2*                       pLayout);
```

- `device` is the logical device that owns the image.
- `pInfo` is a pointer to a VkDeviceImageSubresourceInfo structure containing parameters required for the subresource layout query.
- `pLayout` is a pointer to a VkSubresourceLayout2 structure in which the layout is returned.

`vkGetDeviceImageSubresourceLayout` behaves similarly to vkGetImageSubresourceLayout2, but uses a VkImageCreateInfo structure to specify the image rather than a VkImage object.

Valid Usage (Implicit)

- VUID-vkGetDeviceImageSubresourceLayout-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceImageSubresourceLayout-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkDeviceImageSubresourceInfo structure
- VUID-vkGetDeviceImageSubresourceLayout-pLayout-parameter
  `pLayout` **must** be a valid pointer to a VkSubresourceLayout2 structure

The `VkDeviceImageSubresourceInfo` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkDeviceImageSubresourceInfo {
    VkStructureType               sType;
    const void*                   pNext;
    const VkImageCreateInfo*      pCreateInfo;
    const VkImageSubresource2*    pSubresource;
} VkDeviceImageSubresourceInfo;
```

```
// Provided by VK_KHR_maintenance5
// Equivalent to VkDeviceImageSubresourceInfo
typedef VkDeviceImageSubresourceInfo VkDeviceImageSubresourceInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pCreateInfo` is a pointer to a VkImageCreateInfo structure containing parameters affecting creation of the image to query.

- `pSubresource` is a pointer to a VkImageSubresource2 structure selecting a specific image subresource for the query.

Valid Usage

- VUID-VkDeviceImageSubresourceInfo-aspectMask-00997
  The `aspectMask` member of `pSubresource` **must** only have a single bit set
- VUID-VkDeviceImageSubresourceInfo-mipLevel-01716
  The `mipLevel` member of `pSubresource` **must** be less than the `mipLevels` specified in `pCreateInfo`
- VUID-VkDeviceImageSubresourceInfo-arrayLayer-01717
  The `arrayLayer` member of `pSubresource` **must** be less than the `arrayLayers` specified in `pCreateInfo`
- VUID-VkDeviceImageSubresourceInfo-format-08886
  If `format` of the `pCreateInfo` is a color format that is not a multi-planar format, and `tiling` of the `pCreateInfo` is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the `aspectMask` member of `pSubresource` **must** be VK_IMAGE_ASPECT_COLOR_BIT
- VUID-VkDeviceImageSubresourceInfo-format-04462
  If `format` of the `pCreateInfo` has a depth component, the `aspectMask` member of `pSubresource` **must** contain VK_IMAGE_ASPECT_DEPTH_BIT
- VUID-VkDeviceImageSubresourceInfo-format-04463
  If `format` of the `pCreateInfo` has a stencil component, the `aspectMask` member of `pSubresource` **must** contain VK_IMAGE_ASPECT_STENCIL_BIT
- VUID-VkDeviceImageSubresourceInfo-format-04464
  If `format` of the `pCreateInfo` does not contain a stencil or depth component, the `aspectMask` member of `pSubresource` **must** not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT
- VUID-VkDeviceImageSubresourceInfo-tiling-08717
  If the `tiling` of the `pCreateInfo` is VK_IMAGE_TILING_LINEAR and has a multi-planar format, then the `aspectMask` member of `pSubresource` **must** be a single valid multi-planar aspect mask bit

Valid Usage (Implicit)

- VUID-VkDeviceImageSubresourceInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_DEVICE_IMAGE_SUBRESOURCE_INFO
- VUID-VkDeviceImageSubresourceInfo-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDeviceImageSubresourceInfo-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkImageCreateInfo structure
- VUID-VkDeviceImageSubresourceInfo-pSubresource-parameter
  `pSubresource` **must** be a valid pointer to a valid VkImageSubresource2 structure

If an image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the image has a Linux DRM format modifier. To query the *modifier*, call:

```
// Provided by VK_EXT_image_drm_format_modifier
VkResult vkGetImageDrmFormatModifierPropertiesEXT(
    VkDevice                                    device,
    VkImage                                     image,
    VkImageDrmFormatModifierPropertiesEXT*      pProperties);
```

- `device` is the logical device that owns the image.
- `image` is the queried image.
- `pProperties` is a pointer to a VkImageDrmFormatModifierPropertiesEXT structure in which properties of the image's *DRM format modifier* are returned.

Valid Usage

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-02272
  `image` **must** have been created with `tiling` equal to VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

Valid Usage (Implicit)

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parameter
  `image` **must** be a valid VkImage handle
- VUID-vkGetImageDrmFormatModifierPropertiesEXT-pProperties-parameter
  `pProperties` **must** be a valid pointer to a VkImageDrmFormatModifierPropertiesEXT structure
- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parent
  `image` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkImageDrmFormatModifierPropertiesEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           drmFormatModifier;
} VkImageDrmFormatModifierPropertiesEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- drmFormatModifier returns the image's Linux DRM format modifier.

If the image was created with VkImageDrmFormatModifierListCreateInfoEXT, then the returned drmFormatModifier **must** belong to the list of modifiers provided at time of image creation in VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers. If the image was created with VkImageDrmFormatModifierExplicitCreateInfoEXT, then the returned drmFormatModifier **must** be the modifier provided at time of image creation in VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier.

Valid Usage (Implicit)

- VUID-VkImageDrmFormatModifierPropertiesEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT
- VUID-VkImageDrmFormatModifierPropertiesEXT-pNext-pNext
  pNext **must** be NULL

To destroy an image, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyImage(
    VkDevice                                    device,
    VkImage                                     image,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the logical device that destroys the image.
- image is the image to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyImage-image-01000
  All submitted commands that refer to image, either directly or via a VkImageView, **must** have completed execution

- VUID-vkDestroyImage-image-01001
  If `VkAllocationCallbacks` were provided when `image` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyImage-image-01002
  If no `VkAllocationCallbacks` were provided when `image` was created, `pAllocator` **must** be `NULL`
- VUID-vkDestroyImage-image-04882
  `image` **must** not have been acquired from vkGetSwapchainImagesKHR

Valid Usage (Implicit)

- VUID-vkDestroyImage-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyImage-image-parameter
  If `image` is not VK_NULL_HANDLE, `image` **must** be a valid VkImage handle
- VUID-vkDestroyImage-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyImage-image-parent
  If `image` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `image` **must** be externally synchronized

12.4.2. Image Format Features

Valid uses of a VkImage **may** depend on the image's *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- If the image was created with VK_IMAGE_TILING_LINEAR, then its set of *format features* is the value of VkFormatProperties::`linearTilingFeatures` found by calling vkGetPhysicalDeviceFormatProperties on the same `format` as VkImageCreateInfo::`format`.
- If the image was created with VK_IMAGE_TILING_OPTIMAL, but without an Android hardware buffer external format, or a QNX Screen Buffer external format or an VkBufferCollectionImageCreateInfoFUCHSIA, then its set of *format features* is the value of VkFormatProperties::`optimalTilingFeatures` found by calling vkGetPhysicalDeviceFormatProperties on the same `format` as VkImageCreateInfo::`format`.
- If the image was created with an Android hardware buffer external format, then its set of *format features* is the value of VkAndroidHardwareBufferFormatPropertiesANDROID ::`formatFeatures` found by calling vkGetAndroidHardwareBufferPropertiesANDROID on the Android hardware buffer that was imported to the VkDeviceMemory to which the image is

bound.

- If the image was created with a QNX Screen buffer external format, then its set of *format features* is the value of VkScreenBufferFormatPropertiesQNX::`formatFeatures` found by calling vkGetScreenBufferPropertiesQNX on the QNX Screen buffer that was imported to the VkDeviceMemory to which the image is bound.
- If the image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then:
  - The image's DRM format modifier is the value of VkImageDrmFormatModifierPropertiesEXT::`drmFormatModifier` found by calling vkGetImageDrmFormatModifierPropertiesEXT.
  - Let VkDrmFormatModifierPropertiesListEXT::`pDrmFormatModifierProperties` be the array found by calling vkGetPhysicalDeviceFormatProperties2 on the same `format` as VkImageCreateInfo::`format`.
  - Let `VkDrmFormatModifierPropertiesEXT prop` be the array element whose `drmFormatModifier` member is the value of the image's DRM format modifier.
  - Then the image's set of *format features* is the value of `prop`::`drmFormatModifierTilingFeatures`.

12.4.3. Corner-Sampled Images

A *corner-sampled image* is an image where unnormalized texel coordinates are centered on integer values rather than half-integer values.

A corner-sampled image has a number of differences compared to a conventional texture image:

- Texels are centered on integer coordinates. See Unnormalized Texel Coordinate Operations.
- Normalized coordinates are scaled using coord × (dim - 1) rather than coord × dim, where dim is the size of one dimension of the image. See normalized texel coordinate transform.
- Partial derivatives are scaled using coord × (dim - 1) rather than coord × dim. See Scale Factor Operation.
- Calculation of the next higher LOD size goes according to ⌊dim / 2⌋ rather than ⌈dim / 2⌉. See Image Mip Level Sizing.
- The minimum level size is 2x2 for 2D images and 2x2x2 for 3D images. See Image Mip Level Sizing.

Corner-sampling is only supported for 2D and 3D images. When sampling a corner-sampled image, the sampler addressing mode **must** be VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE. Corner-sampled images are not supported as cube maps or depth/stencil images.

12.4.4. Image Mip Level Sizing

A *complete mipmap chain* is the full set of mip levels, from the largest mip level provided, down to the *minimum mip level size*.

Conventional Images

For conventional images, the dimensions of each successive mip level, n+1, are:

$$width_{n+1} = \max(\lfloor width_n/2 \rfloor, 1)$$

$$height_{n+1} = \max(\lfloor height_n/2 \rfloor, 1)$$

$$depth_{n+1} = \max(\lfloor depth_n/2 \rfloor, 1)$$

where $width_n$, $height_n$, and $depth_n$ are the dimensions of the next larger mip level, n.

The minimum mip level size is:

- 1 for one-dimensional images,
- 1x1 for two-dimensional images, and
- 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:

$$\lfloor \log_2(\max(width_0, height_0, depth_0)) \rfloor + 1$$

where $width_0$, $height_0$, and $depth_0$ are the dimensions of the largest (most detailed) mip level, 0.

Corner-Sampled Images

For corner-sampled images, the dimensions of each successive mip level, n+1, are:

$$width_{n+1} = \max(\lfloor width_n/2 \rfloor, 2)$$

$$height_{n+1} = \max(\lfloor height_n/2 \rfloor, 2)$$

$$depth_{n+1} = \max(\lfloor depth_n/2 \rfloor, 2)$$

where $width_n$, $height_n$, and $depth_n$ are the dimensions of the next larger mip level, n.

The minimum mip level size is:

- 2x2 for two-dimensional images, and
- 2x2x2 for three-dimensional images.

The number of levels in a complete mipmap chain is:

$$\lfloor \log_2(\max(width_0, height_0, depth_0)) \rfloor$$

where $width_0$, $height_0$, and $depth_0$ are the dimensions of the largest (most detailed) mip level, 0.

12.4.5. Image Capture Replay for Descriptor Heaps

To allow for a replay tool to capture and replay image descriptors used with descriptor heaps, opaque data **must** be captured during the initial recording and provided when recreating the image during replay, using the following functions:

To get the opaque capture descriptor data for images, call:

```
// Provided by VK_EXT_descriptor_heap
VkResult vkGetImageOpaqueCaptureDataEXT(
    VkDevice                                    device,
    uint32_t                                    imageCount,
    const VkImage*                              pImages,
    VkHostAddressRangeEXT*                      pDatas);
```

- `device` is the logical device that gets the data.
- `imageCount` is the number of images to retrieve data from.
- `pImages` is a pointer to an array of VkImage objects to retrieve the opaque capture data from.
- `pDatas` is a pointer to an array of VkHostAddressRangeEXT structures defining the host address ranges where each image's opaque capture data will be written.

Valid Usage

- VUID-vkGetImageOpaqueCaptureDataEXT-descriptorHeapCaptureReplay-11282
  The `descriptorHeapCaptureReplay` feature **must** be enabled
- VUID-vkGetImageOpaqueCaptureDataEXT-size-11283
  The `size` member of each element of `pDatas` **must** be equal to `imageCaptureReplayOpaqueDataSize`
- VUID-vkGetImageOpaqueCaptureDataEXT-device-11284
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled
- VUID-vkGetImageOpaqueCaptureDataEXT-pImages-11285
  Each element of `pImages` **must** have been created with VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT set in VkImageCreateInfo::`flags`

Valid Usage (Implicit)

- VUID-vkGetImageOpaqueCaptureDataEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageOpaqueCaptureDataEXT-pImages-parameter

pImages **must** be a valid pointer to an array of imageCount valid VkImage handles

- VUID-vkGetImageOpaqueCaptureDataEXT-pDatas-parameter
  pDatas **must** be a valid pointer to an array of imageCount VkHostAddressRangeEXT structures
- VUID-vkGetImageOpaqueCaptureDataEXT-imageCount-arraylength
  imageCount **must** be greater than 0
- VUID-vkGetImageOpaqueCaptureDataEXT-pImages-parent
  Each element of pImages **must** have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkOpaqueCaptureDataCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkOpaqueCaptureDataCreateInfoEXT {
    VkStructureType                     sType;
    const void*                         pNext;
    const VkHostAddressRangeConstEXT*   pData;
} VkOpaqueCaptureDataCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pData is a pointer to the range of host memory containing opaque data previously captured via vkGetImageOpaqueCaptureDataEXT.

When an image is created with VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT set in VkImageCreateInfo ::flags, if the pNext chain of VkImageCreateInfo includes this structure, and pData is not NULL, the implementation will attempt to recreate the image such that descriptors written with vkWriteResourceDescriptorsEXT will be reproduced with the same bit pattern as during capture if possible. If the implementation is unable to recreate the image based on this data, image creation will fail and return VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS.

When a tensor is created with

VK_TENSOR_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_ARM set in VkTensorCreateInfoARM::flags, if the pNext chain of VkTensorCreateInfoARM includes this structure, and pData is not NULL, the implementation will attempt to recreate the tensor such that descriptors written with vkWriteResourceDescriptorsEXT will be reproduced with the same bit pattern as during capture if possible. If the implementation is unable to recreate the tensor based on this data, tensor creation will fail and return VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS.

If this structure is not present, it is equivalent to setting pData to NULL.

Valid Usage (Implicit)

- VUID-VkOpaqueCaptureDataCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_OPAQUE_CAPTURE_DATA_CREATE_INFO_EXT
- VUID-VkOpaqueCaptureDataCreateInfoEXT-pData-parameter
  If pData is not NULL, pData **must** be a valid pointer to a valid VkHostAddressRangeConstEXT structure

Structure Chaining

Extends the structures

- VkImageCreateInfo
- VkTensorCreateInfoARM

12.4.6. Tensor Capture Replay for Descriptor Heaps

To allow for a replay tool to capture and replay tensor descriptors used with descriptor heaps, opaque data **must** be captured during the initial recording and provided when recreating the tensor during replay, using the following functions:

To get the opaque capture descriptor data for tensors, call:

```
// Provided by VK_EXT_descriptor_heap with VK_ARM_tensors
VkResult vkGetTensorOpaqueCaptureDataARM(
    VkDevice                                    device,
    uint32_t                                    tensorCount,
    const VkTensorARM*                          pTensors,
    VkHostAddressRangeEXT*                      pDatas);
```

- device is the logical device that gets the data.
- tensorCount is the number of tensors to retrieve data from.
- pTensors is a pointer to an array of VkTensorARM objects to retrieve the opaque capture data from.
- pDatas is a pointer to an array of VkHostAddressRangeEXT structures defining the host address

ranges where each tensor's opaque capture data will be written.

Valid Usage

- VUID-vkGetTensorOpaqueCaptureDataARM-descriptorHeapCaptureReplay-11391
  The `descriptorHeapCaptureReplay` feature **must** be enabled
- VUID-vkGetTensorOpaqueCaptureDataARM-size-11392
  The `size` member of each element of `pDatas` **must** be equal to `tensorCaptureReplayOpaqueDataSize`
- VUID-vkGetTensorOpaqueCaptureDataARM-device-11393
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled
- VUID-vkGetTensorOpaqueCaptureDataARM-pTensors-11394
  Each element of `pTensors` **must** have been created with VK_TENSOR_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_ARM set in VkTensorCreateInfoARM::`flags`

Valid Usage (Implicit)

- VUID-vkGetTensorOpaqueCaptureDataARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetTensorOpaqueCaptureDataARM-pTensors-parameter
  `pTensors` **must** be a valid pointer to an array of `tensorCount` valid VkTensorARM handles
- VUID-vkGetTensorOpaqueCaptureDataARM-pDatas-parameter
  `pDatas` **must** be a valid pointer to an array of `tensorCount` VkHostAddressRangeEXT structures
- VUID-vkGetTensorOpaqueCaptureDataARM-tensorCount-arraylength
  `tensorCount` **must** be greater than `0`
- VUID-vkGetTensorOpaqueCaptureDataARM-pTensors-parent
  Each element of `pTensors` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

12.5. Image Layouts

Images are stored in implementation-dependent opaque layouts in memory. Each layout has limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and **can** transition an image subresource from one layout to another. Transitions **can** happen with an image memory barrier, included as part of a vkCmdPipelineBarrier or a vkCmdWaitEvents command buffer command (see Image Memory Barriers), or as part of a subpass dependency within a render pass (see `VkSubpassDependency`).

Image layout is per-image subresource. Separate image subresources of the same image **can** be in different layouts at the same time, with the exception that depth and stencil aspects of a given image subresource **can** only be in different layouts if the `separateDepthStencilLayouts` feature is enabled. When a `VkImageView` descriptor is accessed on the device, all image subresources must be in a valid image layout.

NOTE

Each layout **may** offer optimal performance for a specific usage of image memory. For example, an image with a layout of VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL **may** provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications **can** transition an image subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this **may** produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the `VkImageCreateInfo`::`initialLayout` member. The `initialLayout` **must** be either VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT, or VK_IMAGE_LAYOUT_PREINITIALIZED. If it is VK_IMAGE_LAYOUT_PREINITIALIZED and the image has linear tiling, then the image data **can** be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT, then the image data is interpreted to be zeroed. If the memory bound to this image is not fully zeroed when the image is transitioned to a different layout, the results are undefined. If it is VK_IMAGE_LAYOUT_UNDEFINED, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial layouts, any image subresources **must** be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for linear images and for image subresources of those images which are currently in any of the following layouts:

- VK_IMAGE_LAYOUT_PREINITIALIZED
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT

Calling vkGetImageSubresourceLayout for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
    VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
    VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
    VK_IMAGE_LAYOUT_PREINITIALIZED = 8,
  // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 1000117000,
  // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 1000117001,
  // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL = 1000241000,
  // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL = 1000241001,
  // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL = 1000241002,
  // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL = 1000241003,
  // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL = 1000314000,
  // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL = 1000314001,
  // Provided by VK_VERSION_1_4
    VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ = 1000232000,
  // Provided by VK_KHR_swapchain
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
  // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR = 1000024000,
  // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR = 1000024001,
  // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR = 1000024002,
  // Provided by VK_KHR_shared_presentable_image
    VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR = 1000111000,
  // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT = 1000218000,
  // Provided by VK_KHR_fragment_shading_rate
    VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR = 1000164003,
  // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR = 1000299000,
```

```
  // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR = 1000299001,
  // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR = 1000299002,
  // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT = 1000339000,
  // Provided by VK_ARM_tensors
    VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM = 1000460000,
  // Provided by VK_KHR_video_encode_quantization_map
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR = 1000553000,
  // Provided by VK_EXT_zero_initialize_device_memory
    VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT = 1000620000,
  // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL,
  // Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
  // Provided by VK_NV_shading_rate_image
    VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV =
VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR,
  // Provided by VK_KHR_dynamic_rendering_local_read
    VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR = VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ,
  // Provided by VK_KHR_separate_depth_stencil_layouts
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
  // Provided by VK_KHR_separate_depth_stencil_layouts
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  // Provided by VK_KHR_separate_depth_stencil_layouts
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
  // Provided by VK_KHR_separate_depth_stencil_layouts
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,
  // Provided by VK_KHR_synchronization2
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR = VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL,
  // Provided by VK_KHR_synchronization2
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR = VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL,
} VkImageLayout;
```

The type(s) of device access supported by each layout are:

- VK_IMAGE_LAYOUT_UNDEFINED specifies that the layout is unknown. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the `initialLayout` member of VkImageCreateInfo. This layout **can** be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image's memory to be undefined.
- VK_IMAGE_LAYOUT_PREINITIALIZED specifies that a linear image's memory is in a defined layout and **can** be populated by data, but that it has not yet been initialized by the driver. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the `initialLayout`

member of VkImageCreateInfo when `tiling` is VK_IMAGE_TILING_LINEAR. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data **can** be written to memory immediately, without first executing a layout transition.

- VK_IMAGE_LAYOUT_GENERAL supports all types of device access, unless specified otherwise.
- VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT specifies that an image's memory is in a defined layout and is zeroed, but that it has not yet been initialized by the driver. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the `initialLayout` member of VkImageCreateInfo. This layout is intended to be used as the initial layout for an image whose contents are already zeroed, either from being explicitly set to zero by an application or from being allocated with VK_MEMORY_ALLOCATE_ZERO_INITIALIZE_BIT_EXT.
- VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL specifies a layout that **must** only be used with attachment accesses in the graphics pipeline.
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.
- VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL **must** only be used as a color or resolve attachment in a `VkFramebuffer`. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT usage flag set.
- VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.
- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL specifies a layout for the depth aspect of a

depth/stencil format image allowing read-only access as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

- VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment.
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL specifies a layout allowing read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT usage bits enabled.
- VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL **must** only be used as a source image of a transfer command (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT). This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag set.
- VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL **must** only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag set.
- VK_IMAGE_LAYOUT_PRESENT_SRC_KHR **must** only be used for presenting a presentable image for display.
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR is valid only for shared presentable images, and **must** be used for any usage the image supports.
- VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR **must** only be used as a fragment shading rate attachment or shading rate image. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR usage flag set.
- VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT **must** only be used as a fragment density map attachment in a `VkRenderPass`. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT usage flag set.
- VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR **must** only be used as a decode output picture in a video decode operation. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR usage flag set.
- VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR is reserved for future use.
- VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR **must** only be used as an output reconstructed picture or an input reference picture in a video decode operation. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR usage flag set.
- VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR is reserved for future use.
- VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR **must** only be used as an encode input picture in a video encode operation. This layout is valid only for image subresources of images created

with the VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR usage flag set.

- VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR **must** only be used as an output reconstructed picture or an input reference picture in a video encode operation. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR usage flag set.
- VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT **must** only be used as either a color attachment or depth/stencil attachment and/or read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT usage flag set, and either the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT usage flags set, and either the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT usage flags set.
- VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ **must** only be used as either a storage image, or a color or depth/stencil attachment and an input attachment. This layout is valid only for image subresources of images created with either the VK_IMAGE_USAGE_STORAGE_BIT usage flag set, or both the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT and either of the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT usage flags set.
- VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR **must** only be used as a quantization map in a video encode operation. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR usage flags set.
- VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM specifies the layout that an image created with VK_IMAGE_TILING_OPTIMAL **must** be in, if the `unifiedImageLayouts` feature is disabled, or **may** be in if it is enabled, for it and a tensor bound to the same aliased range of memory to consistently interpret the data in memory. See Memory Aliasing for a complete set of rules for tensor/image aliasing. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_TENSOR_ALIASING_BIT_ARM usage flag set.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application **must** specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see Clear Commands and Copy Commands). For use as a framebuffer attachment, this is a member in the substructures of the VkRenderPassCreateInfo (see Render Pass). For use in a descriptor set, this is a member in the `VkDescriptorImageInfo` structure (see Descriptor Set Updates).

If the `unifiedImageLayouts` feature is enabled, the VK_IMAGE_LAYOUT_GENERAL image layout **may** be used in place of the other layouts where allowed with no loss of performance.

NOTE VK_IMAGE_LAYOUT_GENERAL can be a useful catch-all image layout, but there are situations where a dedicated image layout must be used instead. Some examples

include:

- VK_IMAGE_LAYOUT_PRESENT_SRC_KHR
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR, VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR, and VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR without the `unifiedImageLayoutsVideo` feature
- VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR, VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR, and VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR without the `unifiedImageLayoutsVideo` feature
- VK_IMAGE_LAYOUT_VIDEO_ENCODE_QUANTIZATION_MAP_KHR without the `unifiedImageLayoutsVideo` feature

NOTE

While VK_IMAGE_LAYOUT_GENERAL suggests that all types of device access are possible, it does not mean that all patterns of memory accesses are safe in all situations. Common Render Pass Data Races outlines some situations where data races are unavoidable. For example, when a subresource is used as both an attachment and a sampled image (i.e., not an input attachment), enabling feedback loop adds extra guarantees which VK_IMAGE_LAYOUT_GENERAL alone does not.

12.5.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed **must** all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

- Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL are considered to match.
- Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the image layout of the stencil aspect, thus VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL are considered to match.

When performing a layout transition on an image subresource, the old layout value **must** either equal the current layout of the image subresource (at the time the transition executes), or else be VK_IMAGE_LAYOUT_UNDEFINED (implying that the contents of the image subresource need not be preserved). The new layout used in a transition **must** not be any of:

- VK_IMAGE_LAYOUT_UNDEFINED
- VK_IMAGE_LAYOUT_PREINITIALIZED
- VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT

The image layout of each image subresource of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus applications **must** provide the same sample locations that were last used to render to the given image subresource whenever a layout transition of the image subresource happens, otherwise the contents of the depth aspect of the image subresource become undefined.

In addition, depth reads from a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range return undefined values.

Similarly, depth writes to a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range make the contents of the depth aspect of those image subresources undefined.

12.5.2. Image Layout Rules with External Memory

When images created with external memory handle types listed in the external image implied layouts table are accessed outside of Vulkan, they **must** be in the layout specified in the table, and **can** be assumed to be in that layout when they are accessed in Vulkan after external access.

Table 17. External Image Implied Layouts

External Memory Handle Type	Implied Layout When Accessed Externally
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT	VK_IMAGE_LAYOUT_GENERAL
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT	VK_IMAGE_LAYOUT_GENERAL
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV	VK_IMAGE_LAYOUT_GENERAL
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV	VK_IMAGE_LAYOUT_GENERAL

12.6. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, *image views* representing contiguous ranges of the image subresources and containing

additional metadata are used for that purpose. Views **must** be created on images of compatible types, and **must** represent a valid subset of image subresources.

Image views are represented by `VkImageView` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

VK_REMAINING_ARRAY_LAYERS is a special constant value used for image views to indicate that all remaining array layers in an image after the base layer should be included in the view.

```
#define VK_REMAINING_ARRAY_LAYERS         (~0U)
```

VK_REMAINING_MIP_LEVELS is a special constant value used for image views to indicate that all remaining mipmap levels in an image after the base level should be included in the view.

```
#define VK_REMAINING_MIP_LEVELS           (~0U)
```

The types of image views that **can** be created are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    VK_IMAGE_VIEW_TYPE_1D_ARRAY = 4,
    VK_IMAGE_VIEW_TYPE_2D_ARRAY = 5,
    VK_IMAGE_VIEW_TYPE_CUBE_ARRAY = 6,
} VkImageViewType;
```

To create an image view, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateImageView(
    VkDevice                                    device,
    const VkImageViewCreateInfo*                pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkImageView*                                pView);
```

- `device` is the logical device that creates the image view.
- `pCreateInfo` is a pointer to a VkImageViewCreateInfo structure containing parameters to be used to create the image view.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

- `pView` is a pointer to a VkImageView handle in which the resulting image view object is returned.

Valid Usage

- VUID-vkCreateImageView-device-09667
  `device` **must** support at least one queue family with one of the VK_QUEUE_VIDEO_ENCODE_BIT_KHR, VK_QUEUE_VIDEO_DECODE_BIT_KHR, VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT capabilities
- VUID-vkCreateImageView-image-09179
  VkImageViewCreateInfo::`image` **must** have been created from `device`

Valid Usage (Implicit)

- VUID-vkCreateImageView-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateImageView-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkImageViewCreateInfo structure
- VUID-vkCreateImageView-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateImageView-pView-parameter
  `pView` **must** be a valid pointer to a VkImageView handle
- VUID-vkCreateImageView-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkImageViewCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageViewCreateInfo {
    VkStructureType            sType;
    const void*                pNext;
    VkImageViewCreateFlags     flags;
    VkImage                    image;
    VkImageViewType            viewType;
    VkFormat                   format;
    VkComponentMapping         components;
    VkImageSubresourceRange    subresourceRange;
} VkImageViewCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkImageViewCreateFlagBits specifying additional parameters of the image view.
- `image` is a VkImage on which the view will be created.
- `viewType` is a VkImageViewType value specifying the type of the image view.
- `format` is a VkFormat specifying the format and type used to interpret texel blocks of the image.
- `components` is a VkComponentMapping structure specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
- `subresourceRange` is a VkImageSubresourceRange structure selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the `image` creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter `usage` specifying the allowed usages of the image view that, by default, takes the value of the corresponding `usage` parameter specified in VkImageCreateInfo at image creation time. The implicit `usage` **can** be overridden by adding a VkImageViewUsageCreateInfo or VkImageViewUsage2CreateInfoKHR structure to the `pNext` chain, but the view usage **must** be a subset of the image usage. If `image` has a depth-stencil format and was created with a VkImageStencilUsageCreateInfo structure included in the `pNext` chain of VkImageCreateInfo, the usage is calculated based on the `subresourceRange.aspectMask` provided:

- If `aspectMask` includes only VK_IMAGE_ASPECT_STENCIL_BIT, the implicit `usage` is equal to VkImageStencilUsageCreateInfo::`stencilUsage`.
- If `aspectMask` includes only VK_IMAGE_ASPECT_DEPTH_BIT, the implicit `usage` is equal to VkImageCreateInfo::`usage`.
- If both aspects are included in `aspectMask`, the implicit `usage` is equal to the intersection of VkImageCreateInfo::`usage` and VkImageStencilUsageCreateInfo::`stencilUsage`.

If `image` is a 3D image, its Z range **can** be restricted to a subset by adding a VkImageViewSlicedCreateInfoEXT to the `pNext` chain.

If `image` was not created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, `format` **must** equal the `format` used to create `image`.

If `image` was created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, `format` **can** be set to a different format as follows:

- If `image` was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag and `format` is an uncompressed format, it **must** be *size-compatible* with the `format` used to create `image`.
- If creating a single-plane view, `format` **must** equal one of the *plane view formats*.
- If creating a multi-plane view, `format` **must** equal the `format` used to create `image`.
- Otherwise, `format` **must** be compatible with the `format` of `image`.

Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the `format`, with only the interpretation of the bit pattern changing.

NOTE

Values intended to be used with one view format **may** not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating-point denorm or NaN **may** be flushed or canonicalized when written or read through a view with a floating-point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to -2^b **may** be changed to $-2^b + 1$ as described in Conversion from Normalized Fixed-Point to Floating-Point.

The texel dimensions of the view are derived as follows:

- If `image` was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag and `format` is an uncompressed format, the dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.
- If creating a single-plane view, the dimensions equal the *plane view dimensions*.
- Otherwise, the dimensions are equal to the dimensions of the selected mip level as defined in Image Mip Level Sizing.

If `subresourceRange.aspectMask` is one of the multi-planar aspect mask bits, a single-plane image view will be created. The `image` of a single-plane view **must** have been created with a multi-planar format and the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT create flag.

The set of *plane view formats* for the plane is the compatible plane format and the formats compatible with it.

The *plane view dimensions* are derived from the dimensions of the `image` in the manner listed for plane compatibility for the plane.

The plane view's aspect mask is considered to be equivalent to VK_IMAGE_ASPECT_COLOR_BIT when used as a framebuffer attachment.

If the `format` of the `image` is a multi-planar format and `subresourceRange.aspectMask` is equal to VK_IMAGE_ASPECT_COLOR_BIT, a multi-plane image view will be created.

The VkComponentMapping `components` member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping **must** be

the identity swizzle for any VkImageView used with a combined image sampler that enables sampler $Y'C_BC_R$ conversion, input attachment descriptors, framebuffer attachments, and storage image descriptors.

Image views with formats that require YC_BC_R conversion and usage containing VK_IMAGE_USAGE_SAMPLED_BIT or external formats **must** be created with a VkSamplerYcbcrConversionInfo structure in the pNext chain to be used with sampling. Any image view created with a VkSamplerYcbcrConversionInfo structure in the pNext chain **must** only be sampled using a sampler with an identically defined VkSamplerYcbcrConversion. When used in a video coding operation, the specified sampler $Y'C_BC_R$ conversion has no effect.

Table 18. Image Type and Image View Type Compatibility Requirements

Image View Type	Compatible Image Types
VK_IMAGE_VIEW_TYPE_1D	VK_IMAGE_TYPE_1D
VK_IMAGE_VIEW_TYPE_1D_ARRAY	VK_IMAGE_TYPE_1D
VK_IMAGE_VIEW_TYPE_2D	VK_IMAGE_TYPE_2D , VK_IMAGE_TYPE_3D
VK_IMAGE_VIEW_TYPE_2D_ARRAY	VK_IMAGE_TYPE_2D , VK_IMAGE_TYPE_3D
VK_IMAGE_VIEW_TYPE_CUBE	VK_IMAGE_TYPE_2D
VK_IMAGE_VIEW_TYPE_CUBE_ARRAY	VK_IMAGE_TYPE_2D
VK_IMAGE_VIEW_TYPE_3D	VK_IMAGE_TYPE_3D

Valid Usage

- VUID-VkImageViewCreateInfo-image-01003
  If image was not created with VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT then viewType **must** not be VK_IMAGE_VIEW_TYPE_CUBE or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY
- VUID-VkImageViewCreateInfo-viewType-01004
  If the imageCubeArray feature is not enabled, viewType **must** not be VK_IMAGE_VIEW_TYPE_CUBE_ARRAY
- VUID-VkImageViewCreateInfo-image-06723
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set then viewType **must** not be VK_IMAGE_VIEW_TYPE_2D_ARRAY
- VUID-VkImageViewCreateInfo-image-06728
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, then viewType **must** not be VK_IMAGE_VIEW_TYPE_2D
- VUID-VkImageViewCreateInfo-image-04970
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then subresourceRange.levelCount **must** be 1
- VUID-VkImageViewCreateInfo-image-04972
  If image was created with a samples value not equal to VK_SAMPLE_COUNT_1_BIT then

`viewType` **must** be either VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-image-04441
  `image` **must** have been created with a `usage` value containing at least one of the following:
  - VK_IMAGE_USAGE_SAMPLED_BIT
  - VK_IMAGE_USAGE_STORAGE_BIT
  - VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT
  - VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT
  - VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT
  - VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT
  - VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
  - VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT
  - VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
  - VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
  - VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
  - VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR
  - VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM
  - VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM
  - VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR
  - VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR
- VUID-VkImageViewCreateInfo-None-02273
  The format features of the resultant image view **must** contain at least one bit
- VUID-VkImageViewCreateInfo-usage-02274
  If `usage` contains VK_IMAGE_USAGE_SAMPLED_BIT, then the format features of the resultant image view **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT
- VUID-VkImageViewCreateInfo-usage-02275
  If `usage` contains VK_IMAGE_USAGE_STORAGE_BIT, then the image view's format features **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT
- VUID-VkImageViewCreateInfo-usage-08931
  If `usage` contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then the image view's format features **must** contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV
- VUID-VkImageViewCreateInfo-usage-02277
  If `usage` contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then the image view's format features **must** contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkImageViewCreateInfo-image-08333
  If `usage` contains VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, then the image view's format features **must** contain VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08334
  If `usage` contains VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the image view's format features **must** contain VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR
- VUID-VkImageViewCreateInfo-image-08335
  `usage` **must** not include VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VUID-VkImageViewCreateInfo-image-08336
  If `usage` contains VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, then the image view's format features **must** contain VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR
- VUID-VkImageViewCreateInfo-image-08337
  If `usage` contains VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, then the image view's format features **must** contain VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR
- VUID-VkImageViewCreateInfo-image-08338
  `usage` **must** not include VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR
- VUID-VkImageViewCreateInfo-usage-10259
  If `usage` contains VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR, then the image view's format features **must** contain VK_FORMAT_FEATURE_2_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR
- VUID-VkImageViewCreateInfo-usage-10260
  If `usage` contains VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR, then the image view's format features **must** contain VK_FORMAT_FEATURE_2_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR
- VUID-VkImageViewCreateInfo-usage-08932
  If `usage` contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, and any of the following is true:
  - the `externalFormatResolve` feature is not enabled
  - the `nullColorAttachmentWithExternalFormatResolve` property is VK_FALSE
  - `image` was created with an VkExternalFormatANDROID::`externalFormat` value of 0

  then the image view's format features **must** contain at least one of VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV
- VUID-VkImageViewCreateInfo-subresourceRange-01478
  `subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in VkImageCreateInfo when `image` was created
- VUID-VkImageViewCreateInfo-subresourceRange-01718
  If `subresourceRange.levelCount` is not VK_REMAINING_MIP_LEVELS, `subresourceRange.baseMipLevel` + `subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in VkImageCreateInfo when `image` was created

- VUID-VkImageViewCreateInfo-usage-12488
  If `usage` contains VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, then the image view's format features **must** contain VK_FORMAT_FEATURE_2_FRAGMENT_DENSITY_MAP_BIT_EXT
- VUID-VkImageViewCreateInfo-image-02571
  If `image` was created with the VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT usage flag set, `subresourceRange.levelCount` **must** be `1`
- VUID-VkImageViewCreateInfo-image-06724
  If `image` is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, or `viewType` is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, `subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in VkImageCreateInfo when `image` was created
- VUID-VkImageViewCreateInfo-subresourceRange-06725
  If `subresourceRange.layerCount` is not VK_REMAINING_ARRAY_LAYERS, `image` is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, or `viewType` is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, `subresourceRange.layerCount` **must** be non-zero and `subresourceRange.baseArrayLayer` + `subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in VkImageCreateInfo when `image` was created
- VUID-VkImageViewCreateInfo-image-02724
  If `image` is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and `viewType` is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, `subresourceRange.baseArrayLayer` **must** be less than the depth computed from `baseMipLevel` and `extent.depth` specified in VkImageCreateInfo when `image` was created, according to the formula defined in Image Mip Level Sizing
- VUID-VkImageViewCreateInfo-subresourceRange-02725
  If `subresourceRange.layerCount` is not VK_REMAINING_ARRAY_LAYERS, `image` is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and `viewType` is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, `subresourceRange.layerCount` **must** be non-zero and `subresourceRange.baseArrayLayer` + `subresourceRange.layerCount` **must** be less than or equal to the depth computed from `baseMipLevel` and `extent.depth` specified in VkImageCreateInfo when `image` was created, according to the formula defined in Image Mip Level Sizing
- VUID-VkImageViewCreateInfo-image-01761
  If `image` was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, but without the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, and a single-plane view and a multi-plane view is not being created, `format` **must** be compatible with the `format` used to create `image`, as defined in Format Compatibility Classes
- VUID-VkImageViewCreateInfo-image-01583
  If `image` was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, `format` **must** be compatible with, or **must** be an uncompressed format that is size-compatible with, the `format` used to create `image`
- VUID-VkImageViewCreateInfo-image-07072

If `image` was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag and `format` is a non-compressed format, the `levelCount` member of `subresourceRange` **must** be `1`

- VUID-VkImageViewCreateInfo-image-09487
  If `image` was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, the `VkPhysicalDeviceMaintenance6Properties`::`blockTexelViewCompatibleMultipleLayers` property is not VK_TRUE, and `format` is a non-compressed format, then the `layerCount` member of `subresourceRange` **must** be `1`
- VUID-VkImageViewCreateInfo-pNext-01585
  If a VkImageFormatListCreateInfo structure was included in the `pNext` chain of the VkImageCreateInfo structure used when creating `image` and VkImageFormatListCreateInfo::`viewFormatCount` is not zero then `format` **must** be one of the formats in VkImageFormatListCreateInfo::`pViewFormats`
- VUID-VkImageViewCreateInfo-image-12397
  If `image` was not created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, `format` **must** be identical to the `format` used to create `image`
- VUID-VkImageViewCreateInfo-image-01586
  If creating a single-plane view, `format` **must** be compatible with the VkFormat for the plane of the `image` `format` indicated by `subresourceRange.aspectMask`, as defined in Compatible Formats of Planes of Multi-Planar Formats
- VUID-VkImageViewCreateInfo-subresourceRange-07818
  `subresourceRange.aspectMask` **must** only have at most 1 valid multi-planar aspect mask bit
- VUID-VkImageViewCreateInfo-format-12398
  If creating a multi-plane view, `format` **must** be identical to the `format` used to create `image`
- VUID-VkImageViewCreateInfo-format-06415
  If the image view's format requires a sampler $Y'C_BC_R$ conversion and `usage` contains VK_IMAGE_USAGE_SAMPLED_BIT, then the `pNext` chain **must** include a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE
- VUID-VkImageViewCreateInfo-format-04714
  If `format` has a `_422` or `_420` suffix then `image` **must** have been created with a width that is a multiple of 2
- VUID-VkImageViewCreateInfo-format-04715
  If `format` has a `_420` suffix then `image` **must** have been created with a height that is a multiple of 2
- VUID-VkImageViewCreateInfo-pNext-01970
  If the `pNext` chain includes a VkSamplerYcbcrConversionInfo structure with a `conversion` value other than VK_NULL_HANDLE, all members of `components` **must** have the identity swizzle
- VUID-VkImageViewCreateInfo-pNext-06658
  If the `pNext` chain includes a VkSamplerYcbcrConversionInfo structure with a `conversion` value other than VK_NULL_HANDLE, `format` **must** be the same used in VkSamplerYcbcrConversionCreateInfo::`format`

- VUID-VkImageViewCreateInfo-image-01020
  If `image` is non-sparse then the image or each specified *disjoint* plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-VkImageViewCreateInfo-subResourceRange-01021
  `viewType` **must** be compatible with the type of `image` as shown in the view type compatibility table
- VUID-VkImageViewCreateInfo-image-02399
  If `image` has an Android external format, `format` **must** be VK_FORMAT_UNDEFINED
- VUID-VkImageViewCreateInfo-image-02400
  If `image` has an Android external format, the `pNext` chain **must** include a VkSamplerYcbcrConversionInfo structure with a `conversion` object created with the same external format as `image`
- VUID-VkImageViewCreateInfo-image-02401
  If `image` has an Android external format, all members of `components` **must** be the identity swizzle
- VUID-VkImageViewCreateInfo-image-08957
  If `image` has a QNX Screen external format, `format` **must** be VK_FORMAT_UNDEFINED
- VUID-VkImageViewCreateInfo-image-08958
  If `image` has a QNX Screen external format, the `pNext` chain **must** include a VkSamplerYcbcrConversionInfo structure with a `conversion` object created with the same external format as `image`
- VUID-VkImageViewCreateInfo-image-08959
  If `image` has a QNX Screen external format, all members of `components` **must** be the identity swizzle
- VUID-VkImageViewCreateInfo-image-02086
  If `image` was created with the VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR usage flag set, `viewType` **must** be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY
- VUID-VkImageViewCreateInfo-image-02087
  If the `shadingRateImage` feature is enabled, and `image` was created with the VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV usage flag set, `format` **must** be VK_FORMAT_R8_UINT
- VUID-VkImageViewCreateInfo-attachmentFragmentShadingRate-12386
  If the `attachmentFragmentShadingRate` feature is not enabled, the `usage` for the image view **must** not contain VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- VUID-VkImageViewCreateInfo-usage-04550
  If the `usage` for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then the image view's format features **must** contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- VUID-VkImageViewCreateInfo-usage-04551
  If the `usage` for the image view includes

VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, and layeredShadingRateAttachments is VK_FALSE, subresourceRange.layerCount **must** be 1

- VUID-VkImageViewCreateInfo-flags-02572
  If the fragmentDensityMapDynamic feature is not enabled, flags **must** not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT
- VUID-VkImageViewCreateInfo-flags-03567
  If the fragmentDensityMapDeferred feature is not enabled, flags **must** not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT
- VUID-VkImageViewCreateInfo-flags-03568
  If flags contains VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT, flags **must** not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT
- VUID-VkImageViewCreateInfo-image-03569
  If image was created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT and the VK_IMAGE_USAGE_SAMPLED_BIT usage flag set, subresourceRange.layerCount **must** be less than or equal to VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxSubsampledArrayLayers
- VUID-VkImageViewCreateInfo-invocationMask-04993
  If the invocationMask feature is enabled, and image was created with the VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI usage flag set, format **must** be VK_FORMAT_R8_UINT
- VUID-VkImageViewCreateInfo-flags-04116
  If flags does not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT, and image was created with the VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT usage flag set, its flags **must** not contain any of VK_IMAGE_CREATE_PROTECTED_BIT, VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT
- VUID-VkImageViewCreateInfo-pNext-02662
  If the pNext chain includes a VkImageViewUsageCreateInfo structure, and image was not created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, its usage member **must** not include any bits that were not set in the usage member of the VkImageCreateInfo structure used to create image
- VUID-VkImageViewCreateInfo-pNext-02663
  If the pNext chain includes a VkImageViewUsageCreateInfo structure, image was created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, and subresourceRange.aspectMask includes VK_IMAGE_ASPECT_STENCIL_BIT, the usage member of the VkImageViewUsageCreateInfo structure **must** not include any bits that were not set in the usage member of the VkImageStencilUsageCreateInfo structure used to create image
- VUID-VkImageViewCreateInfo-pNext-02664
  If the pNext chain includes a VkImageViewUsageCreateInfo structure, image was created with a VkImageStencilUsageCreateInfo structure included in the pNext chain of VkImageCreateInfo, and subresourceRange.aspectMask includes bits other than

VK_IMAGE_ASPECT_STENCIL_BIT, the usage member of the VkImageViewUsageCreateInfo structure **must** not include any bits that were not set in the usage member of the VkImageCreateInfo structure used to create image

- VUID-VkImageViewCreateInfo-imageViewType-04973
  If viewType is VK_IMAGE_VIEW_TYPE_1D, VK_IMAGE_VIEW_TYPE_2D, or VK_IMAGE_VIEW_TYPE_3D; and subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, then subresourceRange.layerCount **must** be 1
- VUID-VkImageViewCreateInfo-imageViewType-04974
  If viewType is VK_IMAGE_VIEW_TYPE_1D, VK_IMAGE_VIEW_TYPE_2D, or VK_IMAGE_VIEW_TYPE_3D; and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, then the remaining number of layers **must** be 1
- VUID-VkImageViewCreateInfo-viewType-02960
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE and subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.layerCount **must** be 6
- VUID-VkImageViewCreateInfo-viewType-02961
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE_ARRAY and subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.layerCount **must** be a multiple of 6
- VUID-VkImageViewCreateInfo-viewType-02962
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, the remaining number of layers **must** be 6
- VUID-VkImageViewCreateInfo-viewType-02963
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE_ARRAY and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, the remaining number of layers **must** be a multiple of 6
- VUID-VkImageViewCreateInfo-imageViewFormatSwizzle-04465
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatSwizzle is VK_FALSE, all elements of components **must** have the identity swizzle
- VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04466
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatReinterpretation is VK_FALSE, the VkFormat in format **must** not contain a different number of components, or a different number of bits in each component, than the format of the VkImage in image
- VUID-VkImageViewCreateInfo-image-04817
  If image was created with the VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR usage flag set, VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the viewType **must** be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY
- VUID-VkImageViewCreateInfo-image-04818
  If image was created with the VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR usage flag set, VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, then the viewType **must** be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY
- VUID-VkImageViewCreateInfo-image-10261

If image was created with the VK_IMAGE_USAGE_VIDEO_ENCODE_QUANTIZATION_DELTA_MAP_BIT_KHR or VK_IMAGE_USAGE_VIDEO_ENCODE_EMPHASIS_MAP_BIT_KHR usage flags set, then viewType **must** be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-flags-08106
  If flags includes VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the descriptorBufferCaptureReplay feature **must** be enabled
- VUID-VkImageViewCreateInfo-pNext-08107
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, flags **must** contain VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT
- VUID-VkImageViewCreateInfo-pNext-06787
  If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member **must** be VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT
- VUID-VkImageViewCreateInfo-usage-12506
  If usage contains VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM, then the image view's format features **must** contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM
- VUID-VkImageViewCreateInfo-usage-12507
  If usage contains VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM, then the image view's format features **must** contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM
- VUID-VkImageViewCreateInfo-pNext-06944
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure, then the textureSampleWeighted feature **must** be enabled
- VUID-VkImageViewCreateInfo-pNext-06945
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure, then image **must** have been created with the VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM usage flag set
- VUID-VkImageViewCreateInfo-pNext-06946
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure, then components **must** be VK_COMPONENT_SWIZZLE_IDENTITY for all components
- VUID-VkImageViewCreateInfo-pNext-06947
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure, then subresourceRange.aspectMask **must** be VK_IMAGE_ASPECT_COLOR_BIT
- VUID-VkImageViewCreateInfo-pNext-06948
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure, then subresourceRange.levelCount **must** be 1
- VUID-VkImageViewCreateInfo-pNext-06949
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure, then viewType **must** be VK_IMAGE_VIEW_TYPE_1D_ARRAY or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-pNext-06950
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure and if viewType is VK_IMAGE_VIEW_TYPE_1D_ARRAY, then image **must** have been created with imageType VK_IMAGE_TYPE_1D
- VUID-VkImageViewCreateInfo-pNext-06951
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure and viewType is VK_IMAGE_VIEW_TYPE_1D_ARRAY, then subresourceRange.layerCount **must** be equal to 2
- VUID-VkImageViewCreateInfo-pNext-06952
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure and viewType is VK_IMAGE_VIEW_TYPE_1D_ARRAY, then image **must** have been created with width greater than or equal to $(numPhases \times \max(\text{align}(filterSize.width, 4), filterSize.height))$
- VUID-VkImageViewCreateInfo-pNext-06953
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure and if viewType is VK_IMAGE_VIEW_TYPE_2D_ARRAY, then image **must** have been created with imageType VK_IMAGE_TYPE_2D
- VUID-VkImageViewCreateInfo-pNext-06954
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure and viewType is VK_IMAGE_VIEW_TYPE_2D_ARRAY, then subresourceRange.layerCount **must** be greater than or equal to numPhases
- VUID-VkImageViewCreateInfo-pNext-06955
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure and viewType is VK_IMAGE_VIEW_TYPE_2D_ARRAY, then image **must** have been created with width greater than or equal to filterSize.width
- VUID-VkImageViewCreateInfo-pNext-06956
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure and viewType is VK_IMAGE_VIEW_TYPE_2D_ARRAY, then image **must** have been created with height greater than or equal to filterSize.height
- VUID-VkImageViewCreateInfo-pNext-06957
  If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure then VkImageViewSampleWeightCreateInfoQCOM::filterSize.height **must** be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.height
- VUID-VkImageViewCreateInfo-subresourceRange-09594
  subresourceRange.aspectMask **must** be valid for the format the image was created with
- VUID-VkImageViewCreateInfo-image-13357
  If image was created with VK_IMAGE_CREATE_ALIAS_SINGLE_LAYER_DESCRIPTOR_BIT_KHR, format **must** not be a multi-planar format
- VUID-VkImageViewCreateInfo-None-12280
  If Vulkan 1.3 is not supported and the ycbcr2plane444Formats feature is not enabled, format **must** not be VK_FORMAT_G8_B8R8_2PLANE_444_UNORM, VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16, VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16, or

VK_FORMAT_G16_B16R16_2PLANE_444_UNORM

- VUID-VkImageViewCreateInfo-pNext-12508
  The `pNext` chain **must** contain at most one of the VkImageViewUsageCreateInfo and VkImageViewUsage2CreateInfoKHR structures

Valid Usage (Implicit)

- VUID-VkImageViewCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO
- VUID-VkImageViewCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkExportMetalObjectCreateInfoEXT, VkImageViewASTCDecodeModeEXT, VkImageViewMinLodCreateInfoEXT, VkImageViewSampleWeightCreateInfoQCOM, VkImageViewSlicedCreateInfoEXT, VkImageViewUsage2CreateInfoKHR, VkImageViewUsageCreateInfo, VkOpaqueCaptureDescriptorDataCreateInfoEXT, or VkSamplerYcbcrConversionInfo
- VUID-VkImageViewCreateInfo-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique, with the exception of structures of type VkExportMetalObjectCreateInfoEXT
- VUID-VkImageViewCreateInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkImageViewCreateFlagBits values
- VUID-VkImageViewCreateInfo-image-parameter
  `image` **must** be a valid VkImage handle
- VUID-VkImageViewCreateInfo-viewType-parameter
  `viewType` **must** be a valid VkImageViewType value
- VUID-VkImageViewCreateInfo-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-VkImageViewCreateInfo-components-parameter
  `components` **must** be a valid VkComponentMapping structure
- VUID-VkImageViewCreateInfo-subresourceRange-parameter
  `subresourceRange` **must** be a valid VkImageSubresourceRange structure

Bits which **can** be set in VkImageViewCreateInfo::`flags`, specifying additional parameters of an image view, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
  // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT = 0x00000001,
  // Provided by VK_EXT_descriptor_buffer
    VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT = 0x00000004,
  // Provided by VK_EXT_fragment_density_map2
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT = 0x00000002,
} VkImageViewCreateFlagBits;
```

- VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT specifies that the fragment density map will be read by the device during VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT.
- VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT specifies that the fragment density map will be read by the host during vkEndCommandBuffer for the primary command buffer that the render pass is recorded into.
- VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT specifies that the image view **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageViewCreateFlags;
```

VkImageViewCreateFlags is a bitmask type for setting a mask of zero or more VkImageViewCreateFlagBits.

The set of usages for the created image view **can** be restricted compared to the parent image's usage flags by adding a VkImageViewUsageCreateInfo structure to the pNext chain of VkImageViewCreateInfo.

The VkImageViewUsageCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageUsageFlags    usage;
} VkImageViewUsageCreateInfo;
```

```
// Provided by VK_KHR_maintenance2
// Equivalent to VkImageViewUsageCreateInfo
typedef VkImageViewUsageCreateInfo VkImageViewUsageCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.
- usage is a bitmask of VkImageUsageFlagBits specifying allowed usages of the image view.

When this structure is chained to VkImageViewCreateInfo the usage field overrides the implicit usage parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of VkImageViewCreateInfo.

Valid Usage (Implicit)

- VUID-VkImageViewUsageCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO
- VUID-VkImageViewUsageCreateInfo-usage-parameter
  usage **must** be a valid combination of VkImageUsageFlagBits values

Structure Chaining

Extends the structure

- VkImageViewCreateInfo

The set of usages for the created image view **can** be restricted compared to the parent image's usage flags by adding a VkImageViewUsage2CreateInfoKHR structure to the pNext chain of VkImageViewCreateInfo.

The VkImageViewUsage2CreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_extended_flags
typedef struct VkImageViewUsage2CreateInfoKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkImageUsageFlags2KHR    usage;
} VkImageViewUsage2CreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- usage is a bitmask of VkImageUsageFlagBits2KHR specifying allowed usages of the image view.

When this structure is chained to VkImageViewCreateInfo the usage field overrides the implicit usage parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of VkImageViewCreateInfo.

Valid Usage (Implicit)

- VUID-VkImageViewUsage2CreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_2_CREATE_INFO_KHR

- VUID-VkImageViewUsage2CreateInfoKHR-usage-parameter
  `usage` **must** be a valid combination of VkImageUsageFlagBits2KHR values

Structure Chaining

Extends the structure

- VkImageViewCreateInfo

The range of 3D slices for the created image view **can** be restricted to a subset of the parent image's Z range by adding a `VkImageViewSlicedCreateInfoEXT` structure to the `pNext` chain of VkImageViewCreateInfo.

The `VkImageViewSlicedCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_image_sliced_view_of_3d
typedef struct VkImageViewSlicedCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           sliceOffset;
    uint32_t           sliceCount;
} VkImageViewSlicedCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sliceOffset` is the Z-offset for the first 3D slice accessible to the image view.
- `sliceCount` is the number of 3D slices accessible to the image view.

When this structure is chained to VkImageViewCreateInfo the `sliceOffset` field is treated as a Z-offset for the sliced view and `sliceCount` specifies the range. Shader accesses using a Z coordinate of 0 will access the depth slice corresponding to `sliceOffset` in the image, and in a shader, the maximum in-bounds Z coordinate for the view is `sliceCount` - 1.

A sliced 3D view **must** only be used with a single mip level. The slice coordinates are integer coordinates within the `subresourceRange.baseMipLevel` used to create the image view.

The effective view depth is equal to `extent.depth` used to create the `image` for this view adjusted by `subresourceRange.baseMipLevel` as specified in Image Mip Level Sizing.

Shader access to this image view is only affected by `VkImageViewSlicedCreateInfoEXT` if it uses a descriptor of type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE. For access using any other descriptor type, the contents of `VkImageViewSlicedCreateInfoEXT` are ignored; instead, `sliceOffset` is treated as being equal to 0, and `sliceCount` is treated as being equal to VK_REMAINING_3D_SLICES_EXT.

Valid Usage

- VUID-VkImageViewSlicedCreateInfoEXT-sliceOffset-07867
  `sliceOffset` **must** be less than the effective view depth as specified in Image Mip Level Sizing
- VUID-VkImageViewSlicedCreateInfoEXT-sliceCount-07868
  If `sliceCount` is not VK_REMAINING_3D_SLICES_EXT, it **must** be non-zero and `sliceOffset` + `sliceCount` **must** be less than or equal to the effective view depth as specified in Image Mip Level Sizing
- VUID-VkImageViewSlicedCreateInfoEXT-image-07869
  `image` **must** have been created with `imageType` equal to VK_IMAGE_TYPE_3D
- VUID-VkImageViewSlicedCreateInfoEXT-viewType-07909
  `viewType` **must** be VK_IMAGE_VIEW_TYPE_3D
- VUID-VkImageViewSlicedCreateInfoEXT-None-07870
  The image view **must** reference exactly 1 mip level
- VUID-VkImageViewSlicedCreateInfoEXT-None-07871
  The imageSlicedViewOf3D feature **must** be enabled

Valid Usage (Implicit)

- VUID-VkImageViewSlicedCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_SLICED_CREATE_INFO_EXT

Structure Chaining

Extends the structure

- VkImageViewCreateInfo

VK_REMAINING_3D_SLICES_EXT is a special constant value used for VkImageViewSlicedCreateInfoEXT::`sliceCount` to indicate that all remaining 3D slices in an image after the first slice offset specified should be included in the view.

```
#define VK_REMAINING_3D_SLICES_EXT        (~0U)
```

The `VkImageSubresourceRange` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceRange {
    VkImageAspectFlags    aspectMask;
    uint32_t              baseMipLevel;
    uint32_t              levelCount;
    uint32_t              baseArrayLayer;
    uint32_t              layerCount;
} VkImageSubresourceRange;
```

- `aspectMask` is a bitmask of VkImageAspectFlagBits specifying which aspect(s) of the image are included in the view.
- `baseMipLevel` is the first mipmap level accessible to the view.
- `levelCount` is the number of mipmap levels (starting from `baseMipLevel`) accessible to the view.
- `baseArrayLayer` is the first array layer accessible to the view.
- `layerCount` is the number of array layers (starting from `baseArrayLayer`) accessible to the view.

The number of mipmap levels and array layers **must** be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the `baseMipLevel` or `baseArrayLayer`, it **can** set `levelCount` and `layerCount` to the special values VK_REMAINING_MIP_LEVELS and VK_REMAINING_ARRAY_LAYERS without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at `baseArrayLayer` correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is `layerCount` / *6*, and image array layer (`baseArrayLayer` + i) is face index (i mod 6) of cube *i* / *6*. If the number of layers in the view, whether set explicitly in `layerCount` or implied by VK_REMAINING_ARRAY_LAYERS, is not a multiple of 6, the last cube map in the array **must** not be accessed.

`aspectMask` **must** be only VK_IMAGE_ASPECT_COLOR_BIT, VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT if `format` is a color, depth-only or stencil-only format, respectively.

When creating a VkImageView, if `image` was created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, and the image `format` is a multi-planar format, then `aspectMask` **can** be set to one of the multi-planar aspect bits.

When creating a VkImageView, if `image` was created with an Android hardware buffer external format, then `aspectMask` **must** equal VK_IMAGE_ASPECT_COLOR_BIT.

If using a depth/stencil format with both depth and stencil components, `aspectMask` **must** include at least one of VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT, and **can** include both.

When creating an image view of a depth/stencil image to be used as a descriptor (e.g. for sampling in the shader, or for use as an input attachment), the `aspectMask` **must** only include one bit, which selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input

attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the `aspectMask` is ignored and both depth and stencil image subresources are used.

When the `VkImageSubresourceRange` structure is used to select a subset of the slices of a 3D image's mip level in order to create a 2D or 2D array image view of a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, `baseArrayLayer` and `layerCount` specify the first slice index and the number of slices to include in the created image view. Such an image view **can** be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. If the `maintenance9` feature is not enabled, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

Valid Usage

- VUID-VkImageSubresourceRange-levelCount-01720
  If `levelCount` is not VK_REMAINING_MIP_LEVELS, it **must** be greater than `0`
- VUID-VkImageSubresourceRange-layerCount-01721
  If `layerCount` is not VK_REMAINING_ARRAY_LAYERS, it **must** be greater than `0`
- VUID-VkImageSubresourceRange-aspectMask-01670
  If `aspectMask` includes VK_IMAGE_ASPECT_COLOR_BIT, then it **must** not include any of the multi-planar aspect mask bits
- VUID-VkImageSubresourceRange-aspectMask-02278
  `aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index *i*

Valid Usage (Implicit)

- VUID-VkImageSubresourceRange-aspectMask-parameter
  `aspectMask` **must** be a valid combination of VkImageAspectFlagBits values

Bits which **can** be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
  // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
  // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
  // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
  // Provided by VK_VERSION_1_3
    VK_IMAGE_ASPECT_NONE = 0,
  // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT = 0x00000080,
  // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT = 0x00000100,
  // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT = 0x00000200,
  // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT = 0x00000400,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_0_BIT_KHR = VK_IMAGE_ASPECT_PLANE_0_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_1_BIT_KHR = VK_IMAGE_ASPECT_PLANE_1_BIT,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
  // Provided by VK_KHR_maintenance4
    VK_IMAGE_ASPECT_NONE_KHR = VK_IMAGE_ASPECT_NONE,
} VkImageAspectFlagBits;
```

- VK_IMAGE_ASPECT_NONE specifies no image aspect, or the image aspect is not applicable.
- VK_IMAGE_ASPECT_COLOR_BIT specifies the color aspect.
- VK_IMAGE_ASPECT_DEPTH_BIT specifies the depth aspect.
- VK_IMAGE_ASPECT_STENCIL_BIT specifies the stencil aspect.
- VK_IMAGE_ASPECT_METADATA_BIT specifies the metadata aspect used for sparse resource operations.
- VK_IMAGE_ASPECT_PLANE_0_BIT specifies plane 0 of a *multi-planar* image format.
- VK_IMAGE_ASPECT_PLANE_1_BIT specifies plane 1 of a *multi-planar* image format.
- VK_IMAGE_ASPECT_PLANE_2_BIT specifies plane 2 of a *multi-planar* image format.
- VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT specifies *memory plane* 0.
- VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT specifies *memory plane* 1.
- VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT specifies *memory plane* 2.

- VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT specifies *memory plane* 3.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageAspectFlags;
```

VkImageAspectFlags is a bitmask type for setting a mask of zero or more VkImageAspectFlagBits.

The VkComponentMapping structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkComponentMapping {
    VkComponentSwizzle    r;
    VkComponentSwizzle    g;
    VkComponentSwizzle    b;
    VkComponentSwizzle    a;
} VkComponentMapping;
```

- r is a VkComponentSwizzle specifying the component value placed in the R component of the output vector.
- g is a VkComponentSwizzle specifying the component value placed in the G component of the output vector.
- b is a VkComponentSwizzle specifying the component value placed in the B component of the output vector.
- a is a VkComponentSwizzle specifying the component value placed in the A component of the output vector.

Valid Usage (Implicit)

- VUID-VkComponentMapping-r-parameter
  r **must** be a valid VkComponentSwizzle value
- VUID-VkComponentMapping-g-parameter
  g **must** be a valid VkComponentSwizzle value
- VUID-VkComponentMapping-b-parameter
  b **must** be a valid VkComponentSwizzle value
- VUID-VkComponentMapping-a-parameter
  a **must** be a valid VkComponentSwizzle value

Possible values of the members of VkComponentMapping, specifying the component values placed in each component of the output vector, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
} VkComponentSwizzle;
```

- VK_COMPONENT_SWIZZLE_IDENTITY specifies that the component is set to the identity swizzle.
- VK_COMPONENT_SWIZZLE_ZERO specifies that the component is set to zero.
- VK_COMPONENT_SWIZZLE_ONE specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the Format Definition section for each VkFormat.
- VK_COMPONENT_SWIZZLE_R specifies that the component is set to the value of the R component of the image.
- VK_COMPONENT_SWIZZLE_G specifies that the component is set to the value of the G component of the image.
- VK_COMPONENT_SWIZZLE_B specifies that the component is set to the value of the B component of the image.
- VK_COMPONENT_SWIZZLE_A specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

Table 19. Component Mappings Equivalent To VK_COMPONENT_SWIZZLE_IDENTITY

Component	Identity Mapping
components.r	VK_COMPONENT_SWIZZLE_R
components.g	VK_COMPONENT_SWIZZLE_G
components.b	VK_COMPONENT_SWIZZLE_B
components.a	VK_COMPONENT_SWIZZLE_A

If the pNext chain includes a VkImageViewASTCDecodeModeEXT structure, then that structure includes a parameter specifying the decode mode for image views using ASTC compressed formats.

The VkImageViewASTCDecodeModeEXT structure is defined as:

```
// Provided by VK_EXT_astc_decode_mode
typedef struct VkImageViewASTCDecodeModeEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkFormat           decodeMode;
} VkImageViewASTCDecodeModeEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `decodeMode` is the intermediate format used to decode ASTC compressed formats.

Valid Usage

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02230
  `decodeMode` **must** be one of VK_FORMAT_R16G16B16A16_SFLOAT, VK_FORMAT_R8G8B8A8_UNORM, or VK_FORMAT_E5B9G9R9_UFLOAT_PACK32
- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02231
  If the `decodeModeSharedExponent` feature is not enabled, `decodeMode` **must** not be VK_FORMAT_E5B9G9R9_UFLOAT_PACK32
- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02232
  If `decodeMode` is VK_FORMAT_R8G8B8A8_UNORM, the image view **must** not include blocks using any of the ASTC HDR modes
- VUID-VkImageViewASTCDecodeModeEXT-format-04084
  `format` of the image view **must** be one of the ASTC Compressed Image Formats

If `format` uses sRGB encoding then the `decodeMode` has no effect.

Valid Usage (Implicit)

- VUID-VkImageViewASTCDecodeModeEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT
- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-parameter
  `decodeMode` **must** be a valid VkFormat value

Structure Chaining

Extends the structure

- VkImageViewCreateInfo

If the `pNext` chain includes a `VkImageViewSampleWeightCreateInfoQCOM` structure, then that structure includes a parameter specifying the parameters for weight image views used in weight image sampling.

The VkImageViewSampleWeightCreateInfoQCOM structure is defined as:

```
// Provided by VK_QCOM_image_processing
typedef struct VkImageViewSampleWeightCreateInfoQCOM {
    VkStructureType    sType;
    const void*        pNext;
    VkOffset2D         filterCenter;
    VkExtent2D         filterSize;
    uint32_t           numPhases;
} VkImageViewSampleWeightCreateInfoQCOM;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- filterCenter is a VkOffset2D describing the location of the weight filter origin.
- filterSize is a VkExtent2D specifying weight filter dimensions.
- numPhases is the number of sub-pixel filter phases.

The filterCenter specifies the origin or center of the filter kernel, as described in Weight Sampling Operation. The numPhases describes the number of sub-pixel filter phases as described in Weight Sampling Phases.

Valid Usage

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterSize-06958
  filterSize.width **must** be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.width
- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterSize-06959
  filterSize.height **must** be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.height
- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterCenter-06960
  filterCenter.x **must** be less than or equal to (filterSize.width - 1)
- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterCenter-06961
  filterCenter.y **must** be less than or equal to (filterSize.height - 1)
- VUID-VkImageViewSampleWeightCreateInfoQCOM-numPhases-06962
  numPhases **must** be a power of two squared value (i.e., 1, 4, 16, 64, 256, etc.)
- VUID-VkImageViewSampleWeightCreateInfoQCOM-numPhases-06963
  numPhases **must** be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterPhases

Valid Usage (Implicit)

- VUID-VkImageViewSampleWeightCreateInfoQCOM-sType-sType
  sType **must** be

VK_STRUCTURE_TYPE_IMAGE_VIEW_SAMPLE_WEIGHT_CREATE_INFO_QCOM

Structure Chaining

Extends the structure

- VkImageViewCreateInfo

To destroy an image view, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyImageView(
    VkDevice                                    device,
    VkImageView                                 imageView,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the image view.
- `imageView` is the image view to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyImageView-imageView-01026
  All submitted commands that refer to `imageView` **must** have completed execution
- VUID-vkDestroyImageView-imageView-01027
  If `VkAllocationCallbacks` were provided when `imageView` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyImageView-imageView-01028
  If no `VkAllocationCallbacks` were provided when `imageView` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyImageView-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyImageView-imageView-parameter
  If `imageView` is not VK_NULL_HANDLE, `imageView` **must** be a valid VkImageView handle
- VUID-vkDestroyImageView-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyImageView-imageView-parent
  If `imageView` is a valid handle, it **must** have been created, allocated, or retrieved from

`device`

Host Synchronization

- Host access to `imageView` **must** be externally synchronized

To get the handle for an image view, call:

```
// Provided by VK_NVX_image_view_handle
uint32_t vkGetImageViewHandleNVX(
    VkDevice                                    device,
    const VkImageViewHandleInfoNVX*             pInfo);
```

- `device` is the logical device that owns the image view.
- `pInfo` describes the image view to query and type of handle.

Valid Usage (Implicit)

- VUID-vkGetImageViewHandleNVX-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageViewHandleNVX-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkImageViewHandleInfoNVX structure

To get the 64-bit handle for an image view, call:

```
// Provided by VK_NVX_image_view_handle
uint64_t vkGetImageViewHandle64NVX(
    VkDevice                                    device,
    const VkImageViewHandleInfoNVX*             pInfo);
```

- `device` is the logical device that owns the image view.
- `pInfo` describes the image view to query and type of handle.

Valid Usage (Implicit)

- VUID-vkGetImageViewHandle64NVX-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageViewHandle64NVX-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkImageViewHandleInfoNVX structure

The `VkImageViewHandleInfoNVX` structure is defined as:

```
// Provided by VK_NVX_image_view_handle
typedef struct VkImageViewHandleInfoNVX {
    VkStructureType     sType;
    const void*         pNext;
    VkImageView         imageView;
    VkDescriptorType    descriptorType;
    VkSampler           sampler;
} VkImageViewHandleInfoNVX;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageView` is the image view to query.
- `descriptorType` is the type of descriptor for which to query a handle.
- `sampler` is the sampler to combine with the image view when generating the handle.

Valid Usage

- VUID-VkImageViewHandleInfoNVX-descriptorType-02654
  `descriptorType` **must** be VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER
- VUID-VkImageViewHandleInfoNVX-sampler-02655
  `sampler` **must** be a valid VkSampler if `descriptorType` is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER
- VUID-VkImageViewHandleInfoNVX-imageView-02656
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the image that `imageView` was created from **must** have been created with the VK_IMAGE_USAGE_SAMPLED_BIT usage flag set
- VUID-VkImageViewHandleInfoNVX-imageView-02657
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the image that `imageView` was created from **must** have been created with the VK_IMAGE_USAGE_STORAGE_BIT usage flag set

Valid Usage (Implicit)

- VUID-VkImageViewHandleInfoNVX-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_HANDLE_INFO_NVX
- VUID-VkImageViewHandleInfoNVX-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkImageViewHandleInfoNVX-imageView-parameter
  `imageView` **must** be a valid VkImageView handle

- VUID-VkImageViewHandleInfoNVX-descriptorType-parameter
  `descriptorType` **must** be a valid VkDescriptorType value
- VUID-VkImageViewHandleInfoNVX-sampler-parameter
  If `sampler` is not VK_NULL_HANDLE, `sampler` **must** be a valid VkSampler handle
- VUID-VkImageViewHandleInfoNVX-commonparent
  Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

To get the device address for an image view, call:

```
// Provided by VK_NVX_image_view_handle
VkResult vkGetImageViewAddressNVX(
    VkDevice                                    device,
    VkImageView                                 imageView,
    VkImageViewAddressPropertiesNVX*            pProperties);
```

- `device` is the logical device that owns the image view.
- `imageView` is a handle to the image view.
- `pProperties` contains the device address and size when the call returns.

Valid Usage (Implicit)

- VUID-vkGetImageViewAddressNVX-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageViewAddressNVX-imageView-parameter
  `imageView` **must** be a valid VkImageView handle
- VUID-vkGetImageViewAddressNVX-pProperties-parameter
  `pProperties` **must** be a valid pointer to a VkImageViewAddressPropertiesNVX structure
- VUID-vkGetImageViewAddressNVX-imageView-parent
  `imageView` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkImageViewAddressPropertiesNVX structure is defined as:

```
// Provided by VK_NVX_image_view_handle
typedef struct VkImageViewAddressPropertiesNVX {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceAddress    deviceAddress;
    VkDeviceSize       size;
} VkImageViewAddressPropertiesNVX;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- deviceAddress is the device address of the image view.
- size is the size in bytes of the image view device memory.

Valid Usage (Implicit)

- VUID-VkImageViewAddressPropertiesNVX-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_ADDRESS_PROPERTIES_NVX
- VUID-VkImageViewAddressPropertiesNVX-pNext-pNext
  pNext **must** be NULL

To get the handle for a combined image sampler, call:

```
// Provided by VK_NVX_image_view_handle
uint64_t vkGetDeviceCombinedImageSamplerIndexNVX(
    VkDevice                                    device,
    uint64_t                                    imageViewIndex,
    uint64_t                                    samplerIndex);
```

- device is the logical device that will use the result handle.
- imageViewIndex is the index within the resource heap.
- samplerIndex is the index within the sampler heap.

Shaders take imageViewIndex and samplerIndex, and multiply them by VkPhysicalDeviceDescriptorHeapPropertiesEXT::imageDescriptorSize and VkPhysicalDeviceDescriptorHeapPropertiesEXT::samplerDescriptorSize respectively to obtain the descriptor offset in bytes.

Valid Usage (Implicit)

- VUID-vkGetDeviceCombinedImageSamplerIndexNVX-device-parameter
  device **must** be a valid VkDevice handle

12.6.1. Image View Format Features

Valid uses of a VkImageView **may** depend on the image view's *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the VK_KHR_format_feature_flags2 extension is supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_LINEAR, then the image view's set of *format features* is the value of VkFormatProperties3::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkImageViewCreateInfo::format.
- If Vulkan 1.3 is not supported and the VK_KHR_format_feature_flags2 extension is not supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_LINEAR, then the image view's set of *format features* is the union of the value of VkFormatProperties::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format, with:
  - VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
  - VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and the shaderStorageImageReadWithoutFormat feature is enabled.
  - VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and the shaderStorageImageWriteWithoutFormat feature is enabled.
- If Vulkan 1.3 is supported or the VK_KHR_format_feature_flags2 extension is supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, but without an Android hardware buffer external format, or a QNX Screen buffer external format, then the image view's set of *format features* is the value of VkFormatProperties::optimalTilingFeatures or VkFormatProperties3::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties or vkGetPhysicalDeviceFormatProperties2 on the same format as VkImageViewCreateInfo::format.
- If Vulkan 1.3 is not supported and the VK_KHR_format_feature_flags2 extension is not supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, but without an Android hardware buffer external format, or a QNX Screen buffer external format, then the image view's set of *format features* is the union of the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format, with:
  - VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
  - VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and the shaderStorageImageReadWithoutFormat feature is enabled.
  - VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and the shaderStorageImageWriteWithoutFormat feature is

enabled.

- If VkImageViewCreateInfo::image was created with an Android hardware buffer external format, then the image view's set of *format features* is the value of VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures found by calling vkGetAndroidHardwareBufferPropertiesANDROID on the Android hardware buffer that was imported to the VkDeviceMemory to which the VkImageViewCreateInfo::image is bound.
- If VkImageViewCreateInfo::image was created with a QNX Screen buffer external format, then the image view's set of *format features* is the value of VkScreenBufferFormatPropertiesQNX ::formatFeatures found by calling vkGetScreenBufferPropertiesQNX on the QNX Screen buffer that was imported to the VkDeviceMemory to which the VkImageViewCreateInfo::image is bound.
- If VkImageViewCreateInfo::image was created with a chained VkBufferCollectionImageCreateInfoFUCHSIA, then the image view's set of *format features* is the value of VkBufferCollectionPropertiesFUCHSIA::formatFeatures found by calling vkGetBufferCollectionPropertiesFUCHSIA on the buffer collection passed as VkBufferCollectionImageCreateInfoFUCHSIA::collection when the image was created.
- If VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then:
  - The image's DRM format modifier is the value of VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier found by calling vkGetImageDrmFormatModifierPropertiesEXT.
  - Let VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties be the array found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkImageViewCreateInfo::format.
  - Let VkDrmFormatModifierPropertiesEXT prop be the array element whose drmFormatModifier member is the value of the image's DRM format modifier.
  - Then the image view's set of *format features* is prop::drmFormatModifierTilingFeatures.

The VkImageViewMinLodCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_image_view_min_lod
typedef struct VkImageViewMinLodCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    float              minLod;
} VkImageViewMinLodCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- minLod is the value to clamp the minimum LOD accessible by this VkImageView.

If the pNext chain includes a VkImageViewMinLodCreateInfoEXT structure, then that structure includes a parameter specifying a value to clamp the minimum LOD value during Image Level(s) Selection, Texel Gathering and Integer Texel Coordinate Operations.

If the image view contains `VkImageViewMinLodCreateInfoEXT` and it is used as part of a sampling operation:

$\text{minLodFloat}_{\text{imageView}}$ = `minLod`

otherwise:

$\text{minLodFloat}_{\text{imageView}}$ = 0.0

An integer variant of this parameter is also defined for sampling operations which access integer mipmap levels:

$\text{minLodInteger}_{\text{imageView}} = \lfloor \text{minLodFloat}_{\text{imageView}} \rfloor$

Valid Usage

- VUID-VkImageViewMinLodCreateInfoEXT-minLod-06455
  If the `minLod` feature is not enabled, `minLod` **must** be `0.0`
- VUID-VkImageViewMinLodCreateInfoEXT-minLod-06456
  `minLod` **must** be less than or equal to the index of the last mipmap level accessible to the view

Valid Usage (Implicit)

- VUID-VkImageViewMinLodCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_MIN_LOD_CREATE_INFO_EXT

Structure Chaining

Extends the structure

- VkImageViewCreateInfo

12.7. Acceleration Structures

Acceleration structures are opaque data structures that are built by the implementation to more efficiently perform spatial queries on the provided geometric data. For these extensions, an acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.

Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor, for example to trace inside the shader in the ray tracing pipeline.

Acceleration structures for the VK_KHR_acceleration_structure extension and micromaps for the VK_KHR_opacity_micromap extension are represented by VkAccelerationStructureKHR handles:

```
// Provided by VK_KHR_acceleration_structure
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureKHR)
```

To create an acceleration structure using a device address, call:

```
// Provided by VK_KHR_acceleration_structure with VK_KHR_device_address_commands
VkResult vkCreateAccelerationStructure2KHR(
    VkDevice                                    device,
    const VkAccelerationStructureCreateInfo2KHR* pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkAccelerationStructureKHR*                 pAccelerationStructure);
```

- device is the logical device that creates the acceleration structure object.
- pCreateInfo is a pointer to a VkAccelerationStructureCreateInfo2KHR structure containing parameters affecting creation of the acceleration structure.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pAccelerationStructure is a pointer to a VkAccelerationStructureKHR handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of VkAccelerationStructureCreateInfo2KHR.

The acceleration structure data is stored in the object referred to by VkAccelerationStructureCreateInfo2KHR::addressRange.address.

Once the VkAccelerationStructureKHR object has been created, it **must** be populated by acceleration structure build or acceleration structure copy commands such as vkCmdBuildAccelerationStructuresKHR and vkCmdCopyAccelerationStructureKHR. Acceleration structures created with this command **must** not be used by host commands.

NOTE The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the acceleration structure data using acceleration structure copy commands. During capture the tool will use vkCmdCopyAccelerationStructureToMemoryKHR with a mode of VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR, and vkCmdCopyMemoryToAccelerationStructureKHR with a mode of VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR during replay.

Valid Usage

- VUID-vkCreateAccelerationStructure2KHR-accelerationStructure-03611

The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature **must** be enabled

- VUID-vkCreateAccelerationStructure2KHR-deviceAddressCommands-13086
  The VkPhysicalDeviceDeviceAddressCommandsFeaturesKHR::deviceAddressCommands feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateAccelerationStructure2KHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateAccelerationStructure2KHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkAccelerationStructureCreateInfo2KHR structure
- VUID-vkCreateAccelerationStructure2KHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateAccelerationStructure2KHR-pAccelerationStructure-parameter
  `pAccelerationStructure` **must** be a valid pointer to a VkAccelerationStructureKHR handle
- VUID-vkCreateAccelerationStructure2KHR-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkAccelerationStructureCreateInfo2KHR structure is defined as:

```
// Provided by VK_KHR_acceleration_structure with VK_KHR_device_address_commands
typedef struct VkAccelerationStructureCreateInfo2KHR {
    VkStructureType                           sType;
    const void*                               pNext;
    VkAccelerationStructureCreateFlagsKHR     createFlags;
    VkDeviceAddressRangeKHR                   addressRange;
    VkAddressCommandFlagsKHR                  addressFlags;
    VkAccelerationStructureTypeKHR            type;
} VkAccelerationStructureCreateInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `createFlags` is a bitmask of VkAccelerationStructureCreateFlagBitsKHR specifying additional creation parameters of the acceleration structure.
- `addressRange` is a VkDeviceAddressRangeKHR structure defining the size required for the acceleration structure and its starting address.
- `addressFlags` is a VkAddressCommandFlagsKHR value defining the flags for the address range.
- `type` is a VkAccelerationStructureTypeKHR value specifying the type of acceleration structure that will be created.

Applications **should** create an acceleration structure with a specific VkAccelerationStructureTypeKHR other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

NOTE

VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR is intended to be used by API translation layers. This can be used at acceleration structure creation time in cases where the actual acceleration structure type (top or bottom) is not yet known. The actual acceleration structure type must be specified as VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR, VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR when the build is performed.

During replay, if `createFlags` includes VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR, `addressRange.address` **must** be an address used to create an identical acceleration structure on the same implementation. The address **must** be in the range of an identically created VkBuffer at the same offset.

Applications **should** avoid creating acceleration structures with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR errors.

NOTE

The expected usage for this is that a trace capture/replay tool will add the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag and VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT to all buffers used as storage

> for an acceleration structure with VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR included in `createFlags`. This also means that the tool will need to add VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT to memory allocations to allow the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.
>
> Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Applications and tools should avoid mixing application-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure **can** be queried with vkGetAccelerationStructureBuildSizesKHR. If the acceleration structure is going to be the target of a copy, vkCmdWriteAccelerationStructuresPropertiesKHR **can** be used to obtain the size required depending on the type of copy.

If the acceleration structure will be the target of a build operation with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV it **must** include VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV in `createFlags` and include VkAccelerationStructureMotionInfoNV as an extension structure in `pNext` with the number of instances as metadata for the object.

Valid Usage

- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-13097
  If the range specified by `addressRange` is not bound completely to memory when accessed, `addressFlags` **must** not include VK_ADDRESS_COMMAND_FULLY_BOUND_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-13098
  If the buffer from which the range specified by `addressRange` was queried was created with VK_BUFFER_CREATE_PROTECTED_BIT, and `protectedNoFault` is not supported, `addressFlags` **must** include VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-13099
  If the buffer from which the range specified by `addressRange` was queried was created without VK_BUFFER_CREATE_PROTECTED_BIT, and `protectedNoFault` is not supported, `addressFlags` **must** not include VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressFlags-13100
  `addressFlags` **must** not include both VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR and VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR

- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-13122
  If any buffer, which is bound to a range of VkDeviceMemory that overlaps the range backing addressRange, was created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT, addressFlags **must** include VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR or VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-13123
  If any buffer, which is bound to a range of VkDeviceMemory that overlaps the range backing addressRange, was created without VK_BUFFER_USAGE_STORAGE_BUFFER_BIT, addressFlags **must** not include VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressFlags-13101
  addressFlags **must** not include both VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR and VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-13124
  If any buffer, which is bound to a range of VkDeviceMemory that overlaps the range backing addressRange, was created with VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT, addressFlags **must** include VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR or VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-13125
  If any buffer, which is bound to a range of VkDeviceMemory that overlaps the range backing addressRange, was created without VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT, addressFlags **must** not include VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-11602
  addressRange.address **must** be a valid VkDeviceAddress
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-11603
  addressRange **must** specify a range within a valid address retrieved from buffer that was created with a usage value containing VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-11604
  addressRange **must** specify a range within a valid address retrieved from buffer that was not created with a flags value containing VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-11605
  addressRange.address **must** be a multiple of 256 bytes
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-11606
  If the address member of addressRange was retrieved from a VkBuffer created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, createFlags **must** include VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-11607
  If the address member of addressRange was retrieved from a VkBuffer not created with

VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, createFlags **must** not include VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR

- VUID-VkAccelerationStructureCreateInfo2KHR-addressRange-11608
  addressRange.size **must** be greater than zero
- VUID-VkAccelerationStructureCreateInfo2KHR-micromap-11609
  If type is VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR, the VkPhysicalDeviceOpacityMicromapFeaturesKHR::micromap feature **must** be enabled
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-11610
  If type is VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR, createFlags **must** not include VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-11611
  If type is VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR, createFlags **must** not include VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-03613
  If createFlags includes VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR, VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureCaptureReplay **must** be VK_TRUE
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-11673
  If createFlags includes VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR and device was created with multiple physical devices, the bufferDeviceAddressMultiDevice feature **must** be enabled
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-04954
  If VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV is set in createFlags and type is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, one member of the pNext chain **must** be a pointer to a valid instance of VkAccelerationStructureMotionInfoNV
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-04955
  If any geometry includes VkAccelerationStructureGeometryMotionTrianglesDataNV then createFlags **must** contain VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-08108
  If createFlags includes VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the descriptorBufferCaptureReplay feature **must** be enabled
- VUID-VkAccelerationStructureCreateInfo2KHR-pNext-08109
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, createFlags **must** contain VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT

Valid Usage (Implicit)

- VUID-VkAccelerationStructureCreateInfo2KHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_2_KHR
- VUID-VkAccelerationStructureCreateInfo2KHR-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkOpaqueCaptureDescriptorDataCreateInfoEXT
- VUID-VkAccelerationStructureCreateInfo2KHR-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkAccelerationStructureCreateInfo2KHR-createFlags-parameter
  If `createFlags` is not `0`, `createFlags` **must** be a valid combination of VkAccelerationStructureCreateFlagBitsKHR values
- VUID-VkAccelerationStructureCreateInfo2KHR-addressFlags-parameter
  If `addressFlags` is not `0`, `addressFlags` **must** be a valid combination of VkAddressCommandFlagBitsKHR values
- VUID-VkAccelerationStructureCreateInfo2KHR-type-parameter
  `type` **must** be a valid VkAccelerationStructureTypeKHR value

To create an acceleration structure using a buffer, call:

WARNING	This functionality is superseded by vkCreateAccelerationStructure2KHR. See Legacy Functionality for more information.

```
// Provided by VK_KHR_acceleration_structure
VkResult vkCreateAccelerationStructureKHR(
    VkDevice                                    device,
    const VkAccelerationStructureCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkAccelerationStructureKHR*                 pAccelerationStructure);
```

- `device` is the logical device that creates the acceleration structure object.
- `pCreateInfo` is a pointer to a VkAccelerationStructureCreateInfoKHR structure containing parameters affecting creation of the acceleration structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pAccelerationStructure` is a pointer to a `VkAccelerationStructureKHR` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of VkAccelerationStructureCreateInfoKHR.

The acceleration structure data is stored in the object referred to by `VkAccelerationStructureCreateInfoKHR`::`buffer`. Once memory has been bound to that buffer, it **must**

be populated by acceleration structure build or acceleration structure copy commands such as vkCmdBuildAccelerationStructuresKHR, vkBuildAccelerationStructuresKHR, vkCmdCopyAccelerationStructureKHR, and vkCopyAccelerationStructureKHR.

NOTE The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the acceleration structure data using acceleration structure copy commands. During capture the tool will use vkCopyAccelerationStructureToMemoryKHR or vkCmdCopyAccelerationStructureToMemoryKHR with a `mode` of VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR, and vkCopyMemoryToAccelerationStructureKHR or vkCmdCopyMemoryToAccelerationStructureKHR with a `mode` of VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR during replay.

NOTE Memory does not need to be bound to the underlying buffer when vkCreateAccelerationStructureKHR is called.

Valid Usage

- VUID-vkCreateAccelerationStructureKHR-accelerationStructure-03611
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled
- VUID-vkCreateAccelerationStructureKHR-deviceAddress-03488
  If VkAccelerationStructureCreateInfoKHR::`deviceAddress` is not zero, the `accelerationStructureCaptureReplay` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateAccelerationStructureKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateAccelerationStructureKHR-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkAccelerationStructureCreateInfoKHR structure
- VUID-vkCreateAccelerationStructureKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateAccelerationStructureKHR-pAccelerationStructure-parameter
  `pAccelerationStructure` **must** be a valid pointer to a VkAccelerationStructureKHR handle
- VUID-vkCreateAccelerationStructureKHR-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkAccelerationStructureCreateInfoKHR structure is defined as:

WARNING	This functionality is superseded by VkAccelerationStructureCreateInfo2KHR. See Legacy Functionality for more information.

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureCreateInfoKHR {
    VkStructureType                           sType;
    const void*                               pNext;
    VkAccelerationStructureCreateFlagsKHR     createFlags;
    VkBuffer                                  buffer;
    VkDeviceSize                              offset;
    VkDeviceSize                              size;
    VkAccelerationStructureTypeKHR            type;
    VkDeviceAddress                           deviceAddress;
} VkAccelerationStructureCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- createFlags is a bitmask of VkAccelerationStructureCreateFlagBitsKHR specifying additional creation parameters of the acceleration structure.
- buffer is the buffer on which the acceleration structure will be stored.
- offset is an offset in bytes from the base address of the buffer at which the acceleration structure will be stored, and **must** be a multiple of 256.
- size is the size required for the acceleration structure.
- type is a VkAccelerationStructureTypeKHR value specifying the type of acceleration structure that will be created.
- deviceAddress is the device address requested for the acceleration structure, obtained from vkGetAccelerationStructureDeviceAddressKHR, if the accelerationStructureCaptureReplay feature is being used. If deviceAddress is zero, no specific address is requested.

Applications **should** avoid creating acceleration structures with application-provided addresses

and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR errors.

NOTE

The expected usage for this is that a trace capture/replay tool will add the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag to all buffers that use VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT, and will add VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT to all buffers used as storage for an acceleration structure where `deviceAddress` is not zero. This also means that the tool will need to add VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Applications and tools should avoid mixing application-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

Applications **should** create an acceleration structure with a specific VkAccelerationStructureTypeKHR other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

NOTE

VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR is intended to be used by API translation layers. This can be used at acceleration structure creation time in cases where the actual acceleration structure type (top or bottom) is not yet known. The actual acceleration structure type is determined when the acceleration structure is constructed as VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR. For acceleration structures constructed by build commands, this type is specified by the build parameters. For acceleration structures constructed by acceleration structure copy commands, this type is determined by the source acceleration structure or serialized data, depending on the copy command.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure **can** be queried with vkGetAccelerationStructureBuildSizesKHR. If the acceleration structure is going to be the target of a compacting copy, vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR **can** be used to obtain the compacted size required.

If the acceleration structure will be the target of a build operation with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV it **must** include VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV in `createFlags` and include VkAccelerationStructureMotionInfoNV as an extension structure in `pNext` with the number of instances as metadata for the object.

Valid Usage

- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-03612
  If `deviceAddress` is not zero, `createFlags` **must** include VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR
- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09488
  If `deviceAddress` is not zero, it **must** have been retrieved from an identically created acceleration structure, except for `buffer` and `deviceAddress`
- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09489
  If `deviceAddress` is not zero, `buffer` **must** have been created identically to the `buffer` used to create the acceleration structure from which `deviceAddress` was retrieved, except for VkBufferOpaqueCaptureAddressCreateInfo::`opaqueCaptureAddress`
- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09490
  If `deviceAddress` is not zero, `buffer` **must** have been created with a VkBufferOpaqueCaptureAddressCreateInfo::`opaqueCaptureAddress` that was retrieved from vkGetBufferOpaqueCaptureAddress for the `buffer` that was used to create the acceleration structure from which `deviceAddress` was retrieved
- VUID-VkAccelerationStructureCreateInfoKHR-buffer-03614
  `buffer` **must** have been created with the VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR usage flag set
- VUID-VkAccelerationStructureCreateInfoKHR-buffer-03615
  `buffer` **must** not have been created with VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkAccelerationStructureCreateInfoKHR-offset-03616
  The sum of `offset` and `size` **must** be less than or equal to the size of `buffer`
- VUID-VkAccelerationStructureCreateInfoKHR-offset-03734
  `offset` **must** be a multiple of `256` bytes
- VUID-VkAccelerationStructureCreateInfoKHR-type-11600
  `type` **must** not equal VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR
- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-03613
  If `createFlags` includes VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR, VkPhysicalDeviceAccelerationStructureFeaturesKHR::`accelerationStructureCaptureReplay` **must** be VK_TRUE
- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-11673
  If `createFlags` includes VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR and `device` was created with multiple physical devices, the `bufferDeviceAddressMultiDevice` feature **must** be enabled
- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-04954
  If VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV is set in `createFlags` and `type` is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, one member of the `pNext` chain **must** be a pointer to a valid instance of VkAccelerationStructureMotionInfoNV

- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-04955
  If any geometry includes VkAccelerationStructureGeometryMotionTrianglesDataNV then createFlags **must** contain VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV
- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-08108
  If createFlags includes VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the descriptorBufferCaptureReplay feature **must** be enabled
- VUID-VkAccelerationStructureCreateInfoKHR-pNext-08109
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, createFlags **must** contain VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT

Valid Usage (Implicit)

- VUID-VkAccelerationStructureCreateInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR
- VUID-VkAccelerationStructureCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkAccelerationStructureMotionInfoNV or VkOpaqueCaptureDescriptorDataCreateInfoEXT
- VUID-VkAccelerationStructureCreateInfoKHR-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-parameter
  If createFlags is not 0, createFlags **must** be a valid combination of VkAccelerationStructureCreateFlagBitsKHR values
- VUID-VkAccelerationStructureCreateInfoKHR-buffer-parameter
  buffer **must** be a valid VkBuffer handle
- VUID-VkAccelerationStructureCreateInfoKHR-type-parameter
  type **must** be a valid VkAccelerationStructureTypeKHR value
- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-parameter
  If deviceAddress is not 0, deviceAddress **must** be a valid VkDeviceAddress value

The VkAccelerationStructureMotionInfoNV structure is defined as:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMotionInfoNV {
    VkStructureType                           sType;
    const void*                               pNext;
    uint32_t                                  maxInstances;
    VkAccelerationStructureMotionInfoFlagsNV    flags;
} VkAccelerationStructureMotionInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInstances` is the maximum number of instances that **may** be used in the motion top-level acceleration structure.
- `flags` is 0 and reserved for future use.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMotionInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MOTION_INFO_NV
- VUID-VkAccelerationStructureMotionInfoNV-flags-zerobitmask
  `flags` **must** be `0`

Structure Chaining

Extends the structure

- VkAccelerationStructureCreateInfoKHR

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef VkFlags VkAccelerationStructureMotionInfoFlagsNV;
```

`VkAccelerationStructureMotionInfoFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

To get the build sizes for an acceleration structure, call:

```
// Provided by VK_KHR_acceleration_structure
void vkGetAccelerationStructureBuildSizesKHR(
    VkDevice                                    device,
    VkAccelerationStructureBuildTypeKHR         buildType,
    const VkAccelerationStructureBuildGeometryInfoKHR* pBuildInfo,
    const uint32_t*                             pMaxPrimitiveCounts,
    VkAccelerationStructureBuildSizesInfoKHR*   pSizeInfo);
```

- `device` is the logical device that will be used for creating the acceleration structure.
- `buildType` defines whether host or device operations (or both) are being queried for.
- `pBuildInfo` is a pointer to a VkAccelerationStructureBuildGeometryInfoKHR structure describing parameters of a build operation.
- `pMaxPrimitiveCounts` is a pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values defining the number of primitives built into each geometry.
- `pSizeInfo` is a pointer to a VkAccelerationStructureBuildSizesInfoKHR structure which returns

the size required for an acceleration structure and the sizes required for the scratch buffers, given the build parameters. The size requirements for a scratch buffer **may** be zero.

The srcAccelerationStructure, dstAccelerationStructure, and mode members of pBuildInfo are ignored. Any VkDeviceOrHostAddressKHR, VkDeviceOrHostAddressConstKHR, or VkDeviceAddress members of pBuildInfo are ignored by this command, except that the hostAddress member of VkAccelerationStructureGeometryTrianglesDataKHR::transformData will be examined to check if it is NULL.

An acceleration structure created with the accelerationStructureSize returned by this command supports any build or update with a VkAccelerationStructureBuildGeometryInfoKHR structure and array of VkAccelerationStructureBuildRangeInfoKHR structures subject to the following properties:

- The build command is a host build command, and buildType is VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR or VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR
- The build command is a device build command, and buildType is VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR or VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR
- For VkAccelerationStructureBuildGeometryInfoKHR:
  - Its type and flags members are equal to pBuildInfo->type and pBuildInfo->flags, respectively.
  - geometryCount is less than or equal to pBuildInfo->geometryCount.
  - For each element of either pGeometries or ppGeometries at a given index, its geometryType member is equal to pBuildInfo->geometryType.
  - For each element of either pGeometries or ppGeometries at a given index, its flags member is equal to the corresponding member of the same element in pBuildInfo.
  - For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, the vertexFormat and indexType members of geometry.triangles are equal to the corresponding members of the same element in pBuildInfo.
  - For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, the maxVertex member of geometry.triangles is less than or equal to the corresponding member of the same element in pBuildInfo.
  - For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the applicable address in the transformData member of geometry.triangles is not NULL, the corresponding transformData.hostAddress parameter in pBuildInfo is not NULL.
  - For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_MICROMAP_KHR, the sum of usage information in either the pUsageCounts or ppUsageCounts members of the VkAccelerationStructureGeometryMicromapDataKHR structure in its pNext chain is equal to the sum of usage information in the corresponding members of pBuildInfo.

- For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the pNext chain contains VkAccelerationStructureTrianglesOpacityMicromapKHR the corresponding member of pBuildInfo also contains VkAccelerationStructureTrianglesOpacityMicromapKHR and with an equivalent micromap.
- For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_DENSE_GEOMETRY_FORMAT_TRIANGLES_AMDX, the numTriangles member of the VkAccelerationStructureDenseGeometryFormatTrianglesDataAMDX structure in the pNext chain is less than or equal to the corresponding member of the same element in pBuildInfo.
- For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_DENSE_GEOMETRY_FORMAT_TRIANGLES_AMDX, the numVertices member of the VkAccelerationStructureDenseGeometryFormatTrianglesDataAMDX structure in the pNext chain is less than or equal to the corresponding member of the same element in pBuildInfo.
- For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_DENSE_GEOMETRY_FORMAT_TRIANGLES_AMDX, the maxPrimitiveIndex member of the VkAccelerationStructureDenseGeometryFormatTrianglesDataAMDX structure in the pNext chain is less than or equal to the corresponding member of the same element in pBuildInfo.
- For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_DENSE_GEOMETRY_FORMAT_TRIANGLES_AMDX, the maxGeometryIndex member of the VkAccelerationStructureDenseGeometryFormatTrianglesDataAMDX structure in the pNext chain is less than or equal to the corresponding member of the same element in pBuildInfo.
- For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_DENSE_GEOMETRY_FORMAT_TRIANGLES_AMDX, the format member of the VkAccelerationStructureDenseGeometryFormatTrianglesDataAMDX structure in the pNext chain is equal to the corresponding member of the same element in pBuildInfo.

- For each VkAccelerationStructureBuildRangeInfoKHR corresponding to the VkAccelerationStructureBuildGeometryInfoKHR:
  - Its primitiveCount member is less than or equal to the corresponding element of pMaxPrimitiveCounts.
  - For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the pNext chain contains VkAccelerationStructureTrianglesOpacityMicromapEXT the corresponding member of pBuildInfo also contains VkAccelerationStructureTrianglesOpacityMicromapEXT and with an equivalent micromap.
  - For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the pNext chain contains VkAccelerationStructureTrianglesDisplacementMicromapNV the corresponding member of pBuildInfo also contains VkAccelerationStructureTrianglesDisplacementMicromapNV and with an equivalent micromap.

- For each VkAccelerationStructureBuildRangeInfoKHR corresponding to the VkAccelerationStructureBuildGeometryInfoKHR:
  - Its `primitiveCount` member is less than or equal to the corresponding element of `pMaxPrimitiveCounts`.

Similarly, the `updateScratchSize` value will support any build command specifying the VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR `mode` under the above conditions, and the `buildScratchSize` value will support any build command specifying the VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR `mode` under the above conditions.

Valid Usage

- VUID-vkGetAccelerationStructureBuildSizesKHR-accelerationStructure-08933
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled
- VUID-vkGetAccelerationStructureBuildSizesKHR-device-03618
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled
- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-11612
  If `pBuildInfo->geometryCount` is not `0` and `pBuildInfo->type` is not VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR , `pMaxPrimitiveCounts` **must** be a valid pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values
- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-11613
  If `pBuildInfo->type` is VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR, `pMaxPrimitiveCounts` **must** equal `NULL`
- VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-11614
  If `pBuildInfo->type` is VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR, `buildType` **must** equal VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR
- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03785
  If `pBuildInfo->pGeometries` or `pBuildInfo->ppGeometries` has a `geometryType` of VK_GEOMETRY_TYPE_INSTANCES_KHR, each `pMaxPrimitiveCounts`[i] **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::`maxInstanceCount`

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-parameter
  `buildType` **must** be a valid VkAccelerationStructureBuildTypeKHR value
- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-parameter
  `pBuildInfo` **must** be a valid pointer to a valid VkAccelerationStructureBuildGeometryInfoKHR structure
- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-parameter

If `pMaxPrimitiveCounts` is not `NULL`, `pMaxPrimitiveCounts` **must** be a valid pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pSizeInfo-parameter
  `pSizeInfo` **must** be a valid pointer to a VkAccelerationStructureBuildSizesInfoKHR structure

The `VkAccelerationStructureBuildSizesInfoKHR` structure describes the required build sizes for an acceleration structure and scratch buffers and is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildSizesInfoKHR {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       accelerationStructureSize;
    VkDeviceSize       updateScratchSize;
    VkDeviceSize       buildScratchSize;
} VkAccelerationStructureBuildSizesInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructureSize` is the size in bytes required in a VkAccelerationStructureKHR for a build or update operation.
- `updateScratchSize` is the size in bytes required in a scratch buffer for an update operation.
- `buildScratchSize` is the size in bytes required in a scratch buffer for a build operation.

Acceleration structure objects that represent micromaps **cannot** be the target for update commands. Implementations **must** set `updateScratchSize` equal to `0` if the `pBuildInfo->type` is VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildSizesInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR
- VUID-VkAccelerationStructureBuildSizesInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`

Acceleration structures for the `VK_NV_ray_tracing` extension are represented by the similar `VkAccelerationStructureNV` handles:

```
// Provided by VK_NV_ray_tracing
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureNV)
```

To create acceleration structures, call:

```
// Provided by VK_NV_ray_tracing
VkResult vkCreateAccelerationStructureNV(
    VkDevice                                    device,
    const VkAccelerationStructureCreateInfoNV*  pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkAccelerationStructureNV*                  pAccelerationStructure);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a VkAccelerationStructureCreateInfoNV structure containing parameters affecting creation of the acceleration structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pAccelerationStructure` is a pointer to a VkAccelerationStructureNV handle in which the resulting acceleration structure object is returned.

Similarly to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific "shape" as specified by the information in VkAccelerationStructureInfoNV and `compactedSize` in `pCreateInfo`.

Once memory has been bound to the acceleration structure using vkBindAccelerationStructureMemoryNV, that memory is populated by calls to vkCmdBuildAccelerationStructureNV and vkCmdCopyAccelerationStructureNV.

Acceleration structure creation uses the count and type information from the geometries, but does not use the data references in the structures.

Valid Usage (Implicit)

- VUID-vkCreateAccelerationStructureNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateAccelerationStructureNV-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkAccelerationStructureCreateInfoNV structure
- VUID-vkCreateAccelerationStructureNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateAccelerationStructureNV-pAccelerationStructure-parameter
  `pAccelerationStructure` **must** be a valid pointer to a VkAccelerationStructureNV handle
- VUID-vkCreateAccelerationStructureNV-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkAccelerationStructureCreateInfoNV structure is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureCreateInfoNV {
    VkStructureType                 sType;
    const void*                     pNext;
    VkDeviceSize                    compactedSize;
    VkAccelerationStructureInfoNV   info;
} VkAccelerationStructureCreateInfoNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- compactedSize is the size from the result of vkCmdWriteAccelerationStructuresPropertiesNV if this acceleration structure is going to be the target of a compacting copy.
- info is the VkAccelerationStructureInfoNV structure specifying further parameters of the created acceleration structure.

Valid Usage

- VUID-VkAccelerationStructureCreateInfoNV-compactedSize-02421
  If compactedSize is not 0 then both info.geometryCount and info.instanceCount **must** be 0

Valid Usage (Implicit)

- VUID-VkAccelerationStructureCreateInfoNV-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV
- VUID-VkAccelerationStructureCreateInfoNV-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkOpaqueCaptureDescriptorDataCreateInfoEXT
- VUID-VkAccelerationStructureCreateInfoNV-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkAccelerationStructureCreateInfoNV-info-parameter

`info` **must** be a valid VkAccelerationStructureInfoNV structure

The `VkAccelerationStructureInfoNV` structure is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureInfoNV {
    VkStructureType                          sType;
    const void*                              pNext;
    VkAccelerationStructureTypeNV            type;
    VkBuildAccelerationStructureFlagsKHR     flags;
    uint32_t                                 instanceCount;
    uint32_t                                 geometryCount;
    const VkGeometryNV*                      pGeometries;
} VkAccelerationStructureInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is a VkAccelerationStructureTypeNV value specifying the type of acceleration structure that will be created.
- `flags` is a bitmask of VkBuildAccelerationStructureFlagBitsNV specifying additional parameters of the acceleration structure.
- `instanceCount` specifies the number of instances that will be in the new acceleration structure.
- `geometryCount` specifies the number of geometries that will be in the new acceleration structure.
- `pGeometries` is a pointer to an array of `geometryCount` VkGeometryNV structures containing the scene data being passed into the acceleration structure.

`VkAccelerationStructureInfoNV` contains information that is used both for acceleration structure creation with vkCreateAccelerationStructureNV and in combination with the actual geometric data to build the acceleration structure with vkCmdBuildAccelerationStructureNV.

Valid Usage

- VUID-VkAccelerationStructureInfoNV-geometryCount-02422
  `geometryCount` **must** be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::`maxGeometryCount`
- VUID-VkAccelerationStructureInfoNV-instanceCount-02423
  `instanceCount` **must** be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::`maxInstanceCount`
- VUID-VkAccelerationStructureInfoNV-maxTriangleCount-02424
  The total number of triangles in all geometries **must** be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::`maxTriangleCount`
- VUID-VkAccelerationStructureInfoNV-type-02425
  If `type` is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV then `geometryCount` **must**

be 0

- VUID-VkAccelerationStructureInfoNV-type-02426
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV then instanceCount **must** be 0
- VUID-VkAccelerationStructureInfoNV-type-02786
  If type is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV then the geometryType member of each geometry in pGeometries **must** be the same
- VUID-VkAccelerationStructureInfoNV-type-04623
  type **must** not be VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-VkAccelerationStructureInfoNV-flags-02592
  If flags has the VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV bit set, then it **must** not have the VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV bit set
- VUID-VkAccelerationStructureInfoNV-scratch-02781
  scratch **must** have been created with the VK_BUFFER_USAGE_RAY_TRACING_BIT_NV usage flag set
- VUID-VkAccelerationStructureInfoNV-instanceData-02782
  If instanceData is not VK_NULL_HANDLE, instanceData **must** have been created with the VK_BUFFER_USAGE_RAY_TRACING_BIT_NV usage flag set

Valid Usage (Implicit)

- VUID-VkAccelerationStructureInfoNV-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_INFO_NV
- VUID-VkAccelerationStructureInfoNV-pNext-pNext
  pNext **must** be NULL
- VUID-VkAccelerationStructureInfoNV-type-parameter
  type **must** be a valid VkAccelerationStructureTypeNV value
- VUID-VkAccelerationStructureInfoNV-flags-parameter
  If flags is not 0, flags **must** be a valid combination of VkBuildAccelerationStructureFlagBitsKHR values
- VUID-VkAccelerationStructureInfoNV-pGeometries-parameter
  If geometryCount is not 0, pGeometries **must** be a valid pointer to an array of geometryCount valid VkGeometryNV structures

Values which **can** be set in VkAccelerationStructureCreateInfoKHR::type or VkAccelerationStructureInfoNV::type specifying the type of acceleration structure, are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureTypeKHR {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR = 2,
  // Provided by VK_KHR_opacity_micromap
    VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR = 1000623000,
  // Provided by VK_NV_ray_tracing
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV =
VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR,
  // Provided by VK_NV_ray_tracing
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV =
VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR,
} VkAccelerationStructureTypeKHR;
```

```
// Provided by VK_NV_ray_tracing
// Equivalent to VkAccelerationStructureTypeKHR
typedef VkAccelerationStructureTypeKHR VkAccelerationStructureTypeNV;
```

- VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR is a top-level acceleration structure containing instance data referring to bottom-level acceleration structures.
- VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR is a bottom-level acceleration structure containing the AABBs or geometry to be intersected.
- VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR is an acceleration structure whose type is determined at build time used for special circumstances. In these cases, the acceleration structure type is not known at creation time, but **must** be specified at build time as micromap, top, or bottom.
- VK_ACCELERATION_STRUCTURE_TYPE_OPACITY_MICROMAP_KHR is a micromap containing opacity information, which **can** be referenced by geometry in bottom-level acceleration structures.

Bits which **can** be set in VkAccelerationStructureCreateInfoKHR::`createFlags`, specifying additional creation parameters for acceleration structures, are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCreateFlagBitsKHR {
    VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR =
0x00000001,
  // Provided by VK_EXT_descriptor_buffer
    VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT =
0x00000008,
  // Provided by VK_NV_ray_tracing_motion_blur
    VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV = 0x00000004,
} VkAccelerationStructureCreateFlagBitsKHR;
```

- VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR specifies that the acceleration structure's address **can** be saved and reused on a subsequent run.
- VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT specifies that the acceleration structure **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.
- VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV specifies that the acceleration structure will be used with motion information, see VkAccelerationStructureMotionInfoNV for more detail.

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkAccelerationStructureCreateFlagsKHR;
```

VkAccelerationStructureCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkAccelerationStructureCreateFlagBitsKHR.

Bits which **can** be set in VkAccelerationStructureBuildGeometryInfoKHR::flags or VkAccelerationStructureInfoNV::flags specifying additional parameters for acceleration structure builds, are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureFlagBitsKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR = 0x00000004,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR = 0x00000008,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR = 0x00000010,
  // Provided by VK_NV_ray_tracing_motion_blur
    VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV = 0x00000020,
  // Provided by VK_EXT_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_BIT_EXT =
0x00000100,
#ifdef VK_ENABLE_BETA_EXTENSIONS
  // Provided by VK_NV_displacement_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_BIT_NV =
0x00000200,
#endif
  // Provided by VK_KHR_ray_tracing_position_fetch
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_BIT_KHR = 0x00000800,
  // Provided by VK_NV_cluster_acceleration_structure
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_CLUSTER_OPACITY_MICROMAPS_BIT_NV =
0x00001000,
  // Provided by VK_KHR_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_BIT_KHR =
0x00000040,
  // Provided by VK_KHR_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_BIT_KHR =
0x00000080,
```

```
  // Provided by VK_KHR_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_MICROMAP_LOSSY_BIT_KHR = 0x00000400,
  // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_NV =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV =
VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV =
VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_NV =
VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR,
  // Provided by VK_EXT_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_BIT_EXT =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_BIT_KHR,
  // Provided by VK_EXT_opacity_micromap
  // VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT is a legacy
alias
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_BIT_EXT,
  // Provided by VK_EXT_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_BIT_EXT =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_BIT_KHR,
  // Provided by VK_EXT_opacity_micromap
  // VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_EXT is a legacy
alias
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_EXT =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_BIT_EXT,
  // Provided by VK_EXT_opacity_micromap
  // VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT is a
legacy alias
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_BIT_EXT,
#ifdef VK_ENABLE_BETA_EXTENSIONS
  // Provided by VK_NV_displacement_micromap
  // VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV is a legacy
alias
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_BIT_NV,
#endif
  // Provided by VK_KHR_ray_tracing_position_fetch
  // VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR is a legacy alias
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR =
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_BIT_KHR,
} VkBuildAccelerationStructureFlagBitsKHR;
```

```
// Provided by VK_NV_ray_tracing
// Equivalent to VkBuildAccelerationStructureFlagBitsKHR
typedef VkBuildAccelerationStructureFlagBitsKHR
VkBuildAccelerationStructureFlagBitsNV;
```

- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR specifies that the specified acceleration structure **can** be updated with a `mode` of VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR in VkAccelerationStructureBuildGeometryInfoKHR or an `update` of VK_TRUE in vkCmdBuildAccelerationStructureNV . For sphere and LSS primitives, only positions and radii may be updated, the provided index buffers and flags **must** remain unchanged from the initial build.
- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR specifies that the specified acceleration structure **can** act as the source for a copy acceleration structure command with `mode` of VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR to produce a compacted acceleration structure.
- VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR specifies that the given acceleration structure build **should** prioritize trace performance over build time.
- VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR specifies that the given acceleration structure build **should** prioritize build time over trace performance.
- VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR specifies that this acceleration structure **should** minimize the size of the scratch memory and the final result acceleration structure, potentially at the expense of build time or trace performance.
- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_BIT_KHR specifies that the opacity micromaps associated with the specified acceleration structure **may** change with an acceleration structure update.
- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_BIT_EXT specifies that the data of the opacity micromaps associated with the specified acceleration structure **may** change with an acceleration structure update.
- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_BIT_KHR specifies that the specified acceleration structure **may** be referenced in an instance with VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_BIT_KHR set.
- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_CLUSTER_OPACITY_MICROMAPS_BIT_NV specifies that opacity micromaps **may** be associated with the given cluster acceleration structure.
- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_BIT_KHR specifies that the specified acceleration structure **can** be used when fetching the vertex and radius positions of a hit LSS or sphere primitive, or vertex positions of a hit triangle.
- VK_BUILD_ACCELERATION_STRUCTURE_MICROMAP_LOSSY_BIT_KHR specifies that micromaps **can** be compressed with a lossy encoding as described in Ray Opacity Micromap, which **may** support additional subdivision levels.
- VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_BIT_N

V specifies that the displacement micromaps associated with the specified acceleration structure **may** change with an acceleration structure update.

NOTE VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR **may** take more time and memory than a normal build, and so **should** only be used when those features are needed.

NOTE VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR are allowed to be used together. In that case, the result of the compaction copy is used as the source of a build with `mode` of VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR to perform the compacted update.

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkBuildAccelerationStructureFlagsKHR;
```

```
// Provided by VK_NV_ray_tracing
// Equivalent to VkBuildAccelerationStructureFlagsKHR
typedef VkBuildAccelerationStructureFlagsKHR VkBuildAccelerationStructureFlagsNV;
```

`VkBuildAccelerationStructureFlagsKHR` is a bitmask type for setting a mask of zero or more VkBuildAccelerationStructureFlagBitsKHR.

The `VkGeometryNV` structure describes geometry in a bottom-level acceleration structure and is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryNV {
    VkStructureType       sType;
    const void*           pNext;
    VkGeometryTypeKHR     geometryType;
    VkGeometryDataNV      geometry;
    VkGeometryFlagsKHR    flags;
} VkGeometryNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `geometryType` specifies the VkGeometryTypeKHR which this geometry refers to.
- `geometry` contains the geometry data as described in VkGeometryDataNV.
- `flags` has VkGeometryFlagBitsKHR describing options for this geometry.

Valid Usage

- VUID-VkGeometryNV-geometryType-03503
  `geometryType` **must** be VK_GEOMETRY_TYPE_TRIANGLES_NV or VK_GEOMETRY_TYPE_AABBS_NV

Valid Usage (Implicit)

- VUID-VkGeometryNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_GEOMETRY_NV
- VUID-VkGeometryNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkGeometryNV-geometryType-parameter
  `geometryType` **must** be a valid VkGeometryTypeKHR value
- VUID-VkGeometryNV-geometry-parameter
  `geometry` **must** be a valid VkGeometryDataNV structure
- VUID-VkGeometryNV-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkGeometryFlagBitsKHR values

Geometry types are specified by VkGeometryTypeKHR, which takes values:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryTypeKHR {
    VK_GEOMETRY_TYPE_TRIANGLES_KHR = 0,
    VK_GEOMETRY_TYPE_AABBS_KHR = 1,
    VK_GEOMETRY_TYPE_INSTANCES_KHR = 2,
  // Provided by VK_NV_ray_tracing_linear_swept_spheres
    VK_GEOMETRY_TYPE_SPHERES_NV = 1000429004,
  // Provided by VK_NV_ray_tracing_linear_swept_spheres
    VK_GEOMETRY_TYPE_LINEAR_SWEPT_SPHERES_NV = 1000429005,
#ifdef VK_ENABLE_BETA_EXTENSIONS
  // Provided by VK_AMDX_dense_geometry_format
    VK_GEOMETRY_TYPE_DENSE_GEOMETRY_FORMAT_TRIANGLES_AMDX = 1000478000,
#endif
  // Provided by VK_KHR_opacity_micromap
    VK_GEOMETRY_TYPE_MICROMAP_KHR = 1000623000,
  // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_TYPE_TRIANGLES_NV = VK_GEOMETRY_TYPE_TRIANGLES_KHR,
  // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_TYPE_AABBS_NV = VK_GEOMETRY_TYPE_AABBS_KHR,
} VkGeometryTypeKHR;
```

```
// Provided by VK_NV_ray_tracing
// Equivalent to VkGeometryTypeKHR
typedef VkGeometryTypeKHR VkGeometryTypeNV;
```

- VK_GEOMETRY_TYPE_TRIANGLES_KHR specifies a geometry type consisting of triangles.
- VK_GEOMETRY_TYPE_AABBS_KHR specifies a geometry type consisting of axis-aligned bounding boxes.
- VK_GEOMETRY_TYPE_INSTANCES_KHR specifies a geometry type consisting of acceleration structure instances.
- VK_GEOMETRY_TYPE_DENSE_GEOMETRY_FORMAT_TRIANGLES_AMDX specifies a geometry type consisting of triangles from compressed data.
- VK_GEOMETRY_TYPE_SPHERES_NV specifies a geometry type consisting of spheres.
- VK_GEOMETRY_TYPE_LINEAR_SWEPT_SPHERES_NV specifies a geometry type consisting of linear swept spheres.
- VK_GEOMETRY_TYPE_MICROMAP_KHR specifies a geometry type consisting of a micromap array.

Bits specifying additional parameters for geometries in acceleration structure builds, are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryFlagBitsKHR {
    VK_GEOMETRY_OPAQUE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR = 0x00000002,
  // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_OPAQUE_BIT_NV = VK_GEOMETRY_OPAQUE_BIT_KHR,
  // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_NV =
VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR,
} VkGeometryFlagBitsKHR;
```

```
// Provided by VK_NV_ray_tracing
// Equivalent to VkGeometryFlagBitsKHR
typedef VkGeometryFlagBitsKHR VkGeometryFlagBitsNV;
```

- VK_GEOMETRY_OPAQUE_BIT_KHR specifies that this geometry does not invoke the any-hit shaders even if present in a hit group.
- VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR specifies that the implementation **must** only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent an implementation **may** invoke the any-hit shader more than once for this geometry.

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryFlagsKHR;
```

```
// Provided by VK_NV_ray_tracing
// Equivalent to VkGeometryFlagsKHR
typedef VkGeometryFlagsKHR VkGeometryFlagsNV;
```

VkGeometryFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryFlagBitsKHR.

The VkGeometryDataNV structure specifies geometry in a bottom-level acceleration structure and is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryDataNV {
    VkGeometryTrianglesNV    triangles;
    VkGeometryAABBNV         aabbs;
} VkGeometryDataNV;
```

- triangles contains triangle data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_TRIANGLES_NV.
- aabbs contains axis-aligned bounding box data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_AABBS_NV.

Valid Usage (Implicit)

- VUID-VkGeometryDataNV-triangles-parameter
  triangles **must** be a valid VkGeometryTrianglesNV structure
- VUID-VkGeometryDataNV-aabbs-parameter
  aabbs **must** be a valid VkGeometryAABBNV structure

The VkGeometryTrianglesNV structure specifies triangle geometry in a bottom-level acceleration structure and is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryTrianglesNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           vertexData;
    VkDeviceSize       vertexOffset;
    uint32_t           vertexCount;
    VkDeviceSize       vertexStride;
    VkFormat           vertexFormat;
    VkBuffer           indexData;
    VkDeviceSize       indexOffset;
    uint32_t           indexCount;
    VkIndexType        indexType;
    VkBuffer           transformData;
    VkDeviceSize       transformOffset;
} VkGeometryTrianglesNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexData` is the buffer containing vertex data for this geometry.
- `vertexOffset` is the offset in bytes within `vertexData` containing vertex data for this geometry.
- `vertexCount` is the number of valid vertices.
- `vertexStride` is the stride in bytes between each vertex.
- `vertexFormat` is a VkFormat describing the format of each vertex element.
- `indexData` is the buffer containing index data for this geometry.
- `indexOffset` is the offset in bytes within `indexData` containing index data for this geometry.
- `indexCount` is the number of indices to include in this geometry.
- `indexType` is a VkIndexType describing the format of each index.
- `transformData` is an optional buffer containing a VkTransformMatrixNV structure defining a transformation to be applied to this geometry.
- `transformOffset` is the offset in bytes in `transformData` of the transform information described above.

If `indexType` is VK_INDEX_TYPE_NONE_NV, then this structure describes a set of triangles determined by `vertexCount`. Otherwise, this structure describes a set of indexed triangles determined by `indexCount`.

Valid Usage

- VUID-VkGeometryTrianglesNV-vertexOffset-02428
  `vertexOffset` **must** be less than the size of `vertexData`
- VUID-VkGeometryTrianglesNV-vertexOffset-02429

vertexOffset **must** be a multiple of the component size of vertexFormat

- VUID-VkGeometryTrianglesNV-vertexFormat-02430
  vertexFormat **must** be one of VK_FORMAT_R32G32B32_SFLOAT, VK_FORMAT_R32G32_SFLOAT, VK_FORMAT_R16G16B16_SFLOAT, VK_FORMAT_R16G16_SFLOAT, VK_FORMAT_R16G16_SNORM, or VK_FORMAT_R16G16B16_SNORM
- VUID-VkGeometryTrianglesNV-vertexStride-03818
  vertexStride **must** be less than or equal to 2^{32}-1
- VUID-VkGeometryTrianglesNV-indexOffset-02431
  indexOffset **must** be less than the size of indexData
- VUID-VkGeometryTrianglesNV-indexOffset-02432
  indexOffset **must** be a multiple of the element size of indexType
- VUID-VkGeometryTrianglesNV-indexType-02433
  indexType **must** be VK_INDEX_TYPE_UINT16, VK_INDEX_TYPE_UINT32, or VK_INDEX_TYPE_NONE_NV
- VUID-VkGeometryTrianglesNV-indexData-02434
  indexData **must** be VK_NULL_HANDLE if indexType is VK_INDEX_TYPE_NONE_NV
- VUID-VkGeometryTrianglesNV-indexData-02435
  indexData **must** be a valid VkBuffer handle if indexType is not VK_INDEX_TYPE_NONE_NV
- VUID-VkGeometryTrianglesNV-indexCount-02436
  indexCount **must** be 0 if indexType is VK_INDEX_TYPE_NONE_NV
- VUID-VkGeometryTrianglesNV-transformOffset-02437
  transformOffset **must** be less than the size of transformData
- VUID-VkGeometryTrianglesNV-transformOffset-02438
  transformOffset **must** be a multiple of 16

Valid Usage (Implicit)

- VUID-VkGeometryTrianglesNV-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_GEOMETRY_TRIANGLES_NV
- VUID-VkGeometryTrianglesNV-pNext-pNext
  pNext **must** be NULL
- VUID-VkGeometryTrianglesNV-vertexData-parameter
  If vertexData is not VK_NULL_HANDLE, vertexData **must** be a valid VkBuffer handle
- VUID-VkGeometryTrianglesNV-vertexFormat-parameter
  vertexFormat **must** be a valid VkFormat value
- VUID-VkGeometryTrianglesNV-indexData-parameter
  If indexData is not VK_NULL_HANDLE, indexData **must** be a valid VkBuffer handle
- VUID-VkGeometryTrianglesNV-indexType-parameter
  indexType **must** be a valid VkIndexType value

- VUID-VkGeometryTrianglesNV-transformData-parameter
  If `transformData` is not VK_NULL_HANDLE, `transformData` **must** be a valid VkBuffer handle
- VUID-VkGeometryTrianglesNV-commonparent
  Each of `indexData`, `transformData`, and `vertexData` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

The `VkGeometryAABBNV` structure specifies axis-aligned bounding box geometry in a bottom-level acceleration structure, and is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryAABBNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           aabbData;
    uint32_t           numAABBs;
    uint32_t           stride;
    VkDeviceSize       offset;
} VkGeometryAABBNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `aabbData` is the buffer containing axis-aligned bounding box data.
- `numAABBs` is the number of AABBs in this geometry.
- `stride` is the stride in bytes between AABBs in `aabbData`.
- `offset` is the offset in bytes of the first AABB in `aabbData`.

The AABB data in memory is six 32-bit floats consisting of the minimum x, y, and z values followed by the maximum x, y, and z values.

Valid Usage

- VUID-VkGeometryAABBNV-offset-02439
  `offset` **must** be less than the size of `aabbData`
- VUID-VkGeometryAABBNV-offset-02440
  `offset` **must** be a multiple of 8
- VUID-VkGeometryAABBNV-stride-02441
  `stride` **must** be a multiple of 8

Valid Usage (Implicit)

- VUID-VkGeometryAABBNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_GEOMETRY_AABB_NV

- VUID-VkGeometryAABBNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkGeometryAABBNV-aabbData-parameter
  If `aabbData` is not VK_NULL_HANDLE, `aabbData` **must** be a valid VkBuffer handle

To destroy an acceleration structure, call:

```
// Provided by VK_KHR_acceleration_structure
void vkDestroyAccelerationStructureKHR(
    VkDevice                                    device,
    VkAccelerationStructureKHR                  accelerationStructure,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the acceleration structure.
- `accelerationStructure` is the acceleration structure to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-08934
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02442
  All submitted commands that refer to `accelerationStructure` **must** have completed execution
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02443
  If `VkAllocationCallbacks` were provided when `accelerationStructure` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02444
  If no `VkAllocationCallbacks` were provided when `accelerationStructure` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyAccelerationStructureKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parameter
  If `accelerationStructure` is not VK_NULL_HANDLE, `accelerationStructure` **must** be a valid VkAccelerationStructureKHR handle
- VUID-vkDestroyAccelerationStructureKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parent
  If `accelerationStructure` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `accelerationStructure` **must** be externally synchronized

To destroy an acceleration structure, call:

```
// Provided by VK_NV_ray_tracing
void vkDestroyAccelerationStructureNV(
    VkDevice                                    device,
    VkAccelerationStructureNV                   accelerationStructure,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the buffer.
- `accelerationStructure` is the acceleration structure to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03752
  All submitted commands that refer to `accelerationStructure` **must** have completed execution
- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03753
  If `VkAllocationCallbacks` were provided when `accelerationStructure` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03754
  If no `VkAllocationCallbacks` were provided when `accelerationStructure` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyAccelerationStructureNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-parameter
  If `accelerationStructure` is not VK_NULL_HANDLE, `accelerationStructure` **must** be a valid VkAccelerationStructureNV handle
- VUID-vkDestroyAccelerationStructureNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyAccelerationStructureNV-accelerationStructure-parent
  If `accelerationStructure` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `accelerationStructure` **must** be externally synchronized

An acceleration structure has memory requirements for the structure object itself, scratch space for the build, and scratch space for the update.

Scratch space is allocated as a `VkBuffer`, so for VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV and VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV the `pMemoryRequirements->alignment` and `pMemoryRequirements->memoryTypeBits` values returned by this call **must** be filled with zero, and **should** be ignored by the application.

To query the memory requirements, call:

```
// Provided by VK_NV_ray_tracing
void vkGetAccelerationStructureMemoryRequirementsNV(
    VkDevice                                    device,
    const VkAccelerationStructureMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- `device` is the logical device on which the acceleration structure was created.
- `pInfo` is a pointer to a VkAccelerationStructureMemoryRequirementsInfoNV structure specifying the acceleration structure to get memory requirements for.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2KHR structure in which the requested acceleration structure memory requirements are returned.

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureMemoryRequirementsNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetAccelerationStructureMemoryRequirementsNV-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkAccelerationStructureMemoryRequirementsInfoNV structure
- VUID-vkGetAccelerationStructureMemoryRequirementsNV-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements2 structure

The `VkAccelerationStructureMemoryRequirementsInfoNV` structure is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureMemoryRequirementsInfoNV {
    VkStructureType                                    sType;
    const void*                                        pNext;
    VkAccelerationStructureMemoryRequirementsTypeNV    type;
    VkAccelerationStructureNV                          accelerationStructure;
} VkAccelerationStructureMemoryRequirementsInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` selects the type of memory requirement being queried. VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV returns the memory requirements for the object itself. VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV returns the memory requirements for the scratch memory when doing a build. VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV returns the memory requirements for the scratch memory when doing an update.
- `accelerationStructure` is the acceleration structure to be queried for memory requirements.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMemoryRequirementsInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_INFO_NV
- VUID-VkAccelerationStructureMemoryRequirementsInfoNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkAccelerationStructureMemoryRequirementsInfoNV-type-parameter
  `type` **must** be a valid VkAccelerationStructureMemoryRequirementsTypeNV value
- VUID-VkAccelerationStructureMemoryRequirementsInfoNV-accelerationStructure-parameter
  `accelerationStructure` **must** be a valid VkAccelerationStructureNV handle

Possible values of `type` in `VkAccelerationStructureMemoryRequirementsInfoNV` are:

```
// Provided by VK_NV_ray_tracing
typedef enum VkAccelerationStructureMemoryRequirementsTypeNV {
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV = 0,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV = 1,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV = 2,
} VkAccelerationStructureMemoryRequirementsTypeNV;
```

- VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV requests the memory requirement for the `VkAccelerationStructureNV` backing store.

- VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV requests the memory requirement for scratch space during the initial build.
- VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV requests the memory requirement for scratch space during an update.

Possible values of `buildType` in vkGetAccelerationStructureBuildSizesKHR are:

```
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureBuildTypeKHR {
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR = 0,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR = 1,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR = 2,
} VkAccelerationStructureBuildTypeKHR;
```

- VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR requests the memory requirement for operations performed by the host.
- VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR requests the memory requirement for operations performed by the device.
- VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR requests the memory requirement for operations performed by either the host, or the device.

To attach memory to one or more acceleration structures at a time, call:

```
// Provided by VK_NV_ray_tracing
VkResult vkBindAccelerationStructureMemoryNV(
    VkDevice                                    device,
    uint32_t                                    bindInfoCount,
    const VkBindAccelerationStructureMemoryInfoNV* pBindInfos);
```

- `device` is the logical device that owns the acceleration structures and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of VkBindAccelerationStructureMemoryInfoNV structures describing acceleration structures and memory to bind.

Valid Usage (Implicit)

- VUID-vkBindAccelerationStructureMemoryNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkBindAccelerationStructureMemoryNV-pBindInfos-parameter
  `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid VkBindAccelerationStructureMemoryInfoNV structures
- VUID-vkBindAccelerationStructureMemoryNV-bindInfoCount-arraylength
  `bindInfoCount` **must** be greater than `0`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkBindAccelerationStructureMemoryInfoNV structure is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkBindAccelerationStructureMemoryInfoNV {
    VkStructureType              sType;
    const void*                  pNext;
    VkAccelerationStructureNV    accelerationStructure;
    VkDeviceMemory               memory;
    VkDeviceSize                 memoryOffset;
    uint32_t                     deviceIndexCount;
    const uint32_t*              pDeviceIndices;
} VkBindAccelerationStructureMemoryInfoNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- accelerationStructure is the acceleration structure to be attached to memory.
- memory is a VkDeviceMemory object describing the device memory to attach.
- memoryOffset is the start offset of the region of memory that is to be bound to the acceleration structure. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified acceleration structure.
- deviceIndexCount is the number of elements in pDeviceIndices.
- pDeviceIndices is a pointer to an array of device indices.

Valid Usage

- VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-03620
  accelerationStructure **must** not already be backed by a memory object
- VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03621
  memoryOffset **must** be less than the size of memory
- VUID-VkBindAccelerationStructureMemoryInfoNV-memory-03622
  memory **must** have been allocated using one of the memory types allowed in the

`memoryTypeBits` member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with `accelerationStructure` and `type` of VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV

- VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03623
  `memoryOffset` **must** be an integer multiple of the `alignment` member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with `accelerationStructure` and `type` of VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV
- VUID-VkBindAccelerationStructureMemoryInfoNV-size-03624
  The `size` member of the `VkMemoryRequirements` structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with `accelerationStructure` and `type` of VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV **must** be less than or equal to the size of `memory` minus `memoryOffset`

Valid Usage (Implicit)

- VUID-VkBindAccelerationStructureMemoryInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BIND_ACCELERATION_STRUCTURE_MEMORY_INFO_NV
- VUID-VkBindAccelerationStructureMemoryInfoNV-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-parameter
  `accelerationStructure` **must** be a valid VkAccelerationStructureNV handle
- VUID-VkBindAccelerationStructureMemoryInfoNV-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-VkBindAccelerationStructureMemoryInfoNV-pDeviceIndices-parameter
  If `deviceIndexCount` is not `0`, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount` `uint32_t` values
- VUID-VkBindAccelerationStructureMemoryInfoNV-commonparent
  Both of `accelerationStructure`, and `memory` **must** have been created, allocated, or retrieved from the same VkDevice

To allow constructing geometry instances with device code if desired, we need to be able to query an opaque handle for an acceleration structure. This handle is a value of 8 bytes. To get this handle, call:

```
// Provided by VK_NV_ray_tracing
VkResult vkGetAccelerationStructureHandleNV(
    VkDevice                                    device,
    VkAccelerationStructureNV                   accelerationStructure,
    size_t                                      dataSize,
    void*                                       pData);
```

- `device` is the logical device that owns the acceleration structures.
- `accelerationStructure` is the acceleration structure.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to an application-allocated buffer where the results will be written.

Valid Usage

- VUID-vkGetAccelerationStructureHandleNV-dataSize-02240
  `dataSize` **must** be large enough to contain the result of the query, as described above
- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-02787
  `accelerationStructure` **must** be bound completely and contiguously to a single `VkDeviceMemory` object via vkBindAccelerationStructureMemoryNV

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureHandleNV-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parameter
  `accelerationStructure` **must** be a valid VkAccelerationStructureNV handle
- VUID-vkGetAccelerationStructureHandleNV-pData-parameter
  `pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-vkGetAccelerationStructureHandleNV-dataSize-arraylength
  `dataSize` **must** be greater than `0`
- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parent
  `accelerationStructure` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To query the 64-bit device address for an acceleration structure, call:

```
// Provided by VK_KHR_acceleration_structure
VkDeviceAddress vkGetAccelerationStructureDeviceAddressKHR(
    VkDevice                                    device,
    const VkAccelerationStructureDeviceAddressInfoKHR* pInfo);
```

- `device` is the logical device that the acceleration structure was created on.
- `pInfo` is a pointer to a VkAccelerationStructureDeviceAddressInfoKHR structure specifying the acceleration structure to retrieve an address for.

The 64-bit return value is an address of the acceleration structure, which can be used for device and shader operations that involve acceleration structures, such as ray traversal and acceleration structure building.

If the acceleration structure was created with vkCreateAccelerationStructure2KHR, the return value will be the same address as `addressRange.address`.

If the acceleration structure was created with vkCreateAccelerationStructureKHR with a non-zero value of VkAccelerationStructureCreateInfoKHR::`deviceAddress`, the return value will be the same address.

Otherwise, if the acceleration structure was created with a `type` of VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR, the returned address **must** be consistent with the relative offset to other acceleration structures with `type` VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR allocated with the same VkBuffer. That is, the difference in returned addresses between the two **must** be the same as the difference in offsets provided at acceleration structure creation.

The returned address **must** be aligned to 256 bytes.

NOTE For acceleration structures created with vkCreateAccelerationStructureKHR, their device address **may** be different from the buffer device address corresponding to the acceleration structure's start offset in its storage buffer for acceleration structure types other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

Valid Usage

- VUID-vkGetAccelerationStructureDeviceAddressKHR-accelerationStructure-08935
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled
- VUID-vkGetAccelerationStructureDeviceAddressKHR-device-03504
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled
- VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-09541
  If the buffer on which `pInfo->accelerationStructure` was placed is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-09542

The buffer on which `pInfo->accelerationStructure` was placed **must** have been created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT usage flag set

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureDeviceAddressKHR-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkAccelerationStructureDeviceAddressInfoKHR structure

The `VkAccelerationStructureDeviceAddressInfoKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureDeviceAddressInfoKHR {
    VkStructureType               sType;
    const void*                   pNext;
    VkAccelerationStructureKHR    accelerationStructure;
} VkAccelerationStructureDeviceAddressInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructure` specifies the acceleration structure whose address is being queried.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR
- VUID-VkAccelerationStructureDeviceAddressInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkAccelerationStructureDeviceAddressInfoKHR-accelerationStructure-parameter
  `accelerationStructure` **must** be a valid VkAccelerationStructureKHR handle

12.8. Micromaps

Micromaps are opaque data structures that are built by the implementation to encode sub-triangle data to be included in an acceleration structure.

Micromaps are represented by VkAccelerationStructureKHR handles for use with `VK_KHR_opacity_micromap` commands.

Micromaps are represented by `VkMicromapEXT` handles for use with `VK_EXT_opacity_micromap`

commands:

```
// Provided by VK_EXT_opacity_micromap
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkMicromapEXT)
```

To create a micromap, call:

```
// Provided by VK_EXT_opacity_micromap
VkResult vkCreateMicromapEXT(
    VkDevice                                    device,
    const VkMicromapCreateInfoEXT*              pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkMicromapEXT*                              pMicromap);
```

- `device` is the logical device that creates the micromap structure object.
- `pCreateInfo` is a pointer to a VkMicromapCreateInfoEXT structure containing parameters affecting creation of the micromap.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pMicromap` is a pointer to a VkMicromapEXT handle in which the resulting micromap object is returned.

Similar to other objects in Vulkan, the micromap creation merely creates an object with a specific "shape". The type and quantity of geometry that can be built into a micromap is determined by the parameters of VkMicromapCreateInfoEXT.

The micromap data is stored in the object referred to by `VkMicromapCreateInfoEXT`::`buffer`. Once memory has been bound to that buffer, it must be populated by micromap build or micromap copy commands such as vkCmdBuildMicromapsEXT, vkBuildMicromapsEXT, vkCmdCopyMicromapEXT, and vkCopyMicromapEXT.

NOTE

The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the micromap data using micromap copy commands. During capture the tool will set VkCopyMicromapToMemoryInfoEXT::`mode` to VK_COPY_MICROMAP_MODE_SERIALIZE_EXT, and during replay the tool will set VkCopyMemoryToMicromapInfoEXT::`mode` to VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT.

Valid Usage

- VUID-vkCreateMicromapEXT-micromap-11615
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT`::`micromap` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateMicromapEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateMicromapEXT-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkMicromapCreateInfoEXT structure
- VUID-vkCreateMicromapEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateMicromapEXT-pMicromap-parameter
  `pMicromap` **must** be a valid pointer to a VkMicromapEXT handle
- VUID-vkCreateMicromapEXT-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkMicromapCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapCreateInfoEXT {
    VkStructureType             sType;
    const void*                 pNext;
    VkMicromapCreateFlagsEXT    createFlags;
    VkBuffer                    buffer;
    VkDeviceSize                offset;
    VkDeviceSize                size;
    VkMicromapTypeEXT           type;
    VkDeviceAddress             deviceAddress;
} VkMicromapCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `createFlags` is a bitmask of VkMicromapCreateFlagBitsEXT specifying additional creation

parameters of the micromap.

- `buffer` is the buffer on which the micromap will be stored.
- `offset` is an offset in bytes from the base address of the buffer at which the micromap will be stored, and **must** be a multiple of `256`.
- `size` is the size required for the micromap.
- `type` is a VkMicromapTypeEXT value specifying the type of micromap that will be created.
- `deviceAddress` is the device address requested for the micromap if the `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapCaptureReplay` feature is being used.

If `deviceAddress` is zero, no specific address is requested.

If `deviceAddress` is not zero, `deviceAddress` **must** be an address retrieved from an identically created micromap on the same implementation. The micromap **must** also be placed on an identically created `buffer` and at the same `offset`.

Applications **should** avoid creating micromaps with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR errors.

NOTE

The expected usage for this is that a trace capture/replay tool will add the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag and VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT to all buffers used as storage for a micromap with VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT included in `createFlags`. This also means that the tool will need to add VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT to memory allocations to allow the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Applications and tools should avoid mixing application-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

If the micromap will be the target of a build operation, the required size for a micromap **can** be queried with vkGetMicromapBuildSizesEXT.

Valid Usage

- VUID-VkMicromapCreateInfoEXT-deviceAddress-07433
  If `deviceAddress` is not zero, `createFlags` **must** include

VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT

- VUID-VkMicromapCreateInfoEXT-micromapCaptureReplay-11616
  If `createFlags` includes VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT, `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapCaptureReplay` **must** be VK_TRUE
- VUID-VkMicromapCreateInfoEXT-bufferDeviceAddressMultiDevice-11617
  If `createFlags` includes VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT and `device` was created with multiple physical devices, the `bufferDeviceAddressMultiDevice` feature **must** be enabled
- VUID-VkMicromapCreateInfoEXT-buffer-07435
  `buffer` **must** have been created with the VK_BUFFER_USAGE_MICROMAP_STORAGE_BIT_EXT usage flag set
- VUID-VkMicromapCreateInfoEXT-buffer-07436
  `buffer` **must** not have been created with VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT
- VUID-VkMicromapCreateInfoEXT-offset-07437
  The sum of `offset` and `size` **must** be less than or equal to the size of `buffer`
- VUID-VkMicromapCreateInfoEXT-offset-07438
  `offset` **must** be a multiple of `256` bytes

Valid Usage (Implicit)

- VUID-VkMicromapCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MICROMAP_CREATE_INFO_EXT
- VUID-VkMicromapCreateInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkMicromapCreateInfoEXT-createFlags-parameter
  If `createFlags` is not `0`, `createFlags` **must** be a valid combination of VkMicromapCreateFlagBitsEXT values
- VUID-VkMicromapCreateInfoEXT-buffer-parameter
  `buffer` **must** be a valid VkBuffer handle
- VUID-VkMicromapCreateInfoEXT-type-parameter
  `type` **must** be a valid VkMicromapTypeEXT value
- VUID-VkMicromapCreateInfoEXT-deviceAddress-parameter
  If `deviceAddress` is not `0`, `deviceAddress` **must** be a valid VkDeviceAddress value

To get the build sizes for a micromap, call:

```
// Provided by VK_EXT_opacity_micromap
void vkGetMicromapBuildSizesEXT(
    VkDevice                                    device,
    VkAccelerationStructureBuildTypeKHR         buildType,
    const VkMicromapBuildInfoEXT*               pBuildInfo,
    VkMicromapBuildSizesInfoEXT*                pSizeInfo);
```

- `device` is the logical device that will be used for creating the micromap.
- `buildType` defines whether host or device operations (or both) are being queried for.
- `pBuildInfo` is a pointer to a VkMicromapBuildInfoEXT structure describing parameters of a build operation.
- `pSizeInfo` is a pointer to a VkMicromapBuildSizesInfoEXT structure which returns the size required for a micromap and the sizes required for the scratch buffers, given the build parameters. The size requirements for a scratch buffer **may** be zero.

The `dstMicromap`, `mode`, `data`, `scratchData`, and `triangleArray` members of `pBuildInfo` are ignored by this command.

A micromap created with the `micromapSize` returned by this command supports any build with a VkMicromapBuildInfoEXT structure subject to the following properties:

- The build command is a host build command, and `buildType` is VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR or VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR
- The build command is a device build command, and `buildType` is VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR or VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR
- For VkMicromapBuildInfoEXT:
  - Its `type` and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags`, respectively.
  - The sum of usage information in either `pUsageCounts` or `ppUsageCounts` is equal to the sum of usage information in either `pBuildInfo->pUsageCounts` or `pBuildInfo->ppUsageCounts`.

Similarly, the `buildScratchSize` value will support any build command specifying the VK_BUILD_MICROMAP_MODE_BUILD_EXT `mode` under the above conditions.

Valid Usage

- VUID-vkGetMicromapBuildSizesEXT-micromap-11618
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromap` feature **must** be enabled
- VUID-vkGetMicromapBuildSizesEXT-device-07440
  If `device` was created with multiple physical devices, the `bufferDeviceAddressMultiDevice` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetMicromapBuildSizesEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetMicromapBuildSizesEXT-buildType-parameter
  `buildType` **must** be a valid VkAccelerationStructureBuildTypeKHR value
- VUID-vkGetMicromapBuildSizesEXT-pBuildInfo-parameter
  `pBuildInfo` **must** be a valid pointer to a valid VkMicromapBuildInfoEXT structure
- VUID-vkGetMicromapBuildSizesEXT-pSizeInfo-parameter
  `pSizeInfo` **must** be a valid pointer to a VkMicromapBuildSizesInfoEXT structure

The `VkMicromapBuildSizesInfoEXT` structure describes the required build sizes for a micromap and scratch buffers and is defined as:

```
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildSizesInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize       micromapSize;
    VkDeviceSize       buildScratchSize;
    VkBool32           discardable;
} VkMicromapBuildSizesInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `micromapSize` is the size in bytes required in a VkMicromapEXT for a build or update operation.
- `buildScratchSize` is the size in bytes required in a scratch buffer for a build operation.
- `discardable` indicates whether or not the micromap object may be destroyed after an acceleration structure build or update. A false value means that acceleration structures built with this micromap **may** contain references to the data contained therein, and the application **must** not destroy the micromap until ray traversal has concluded. A true value means that the information in the micromap will be copied by value into the acceleration structure, and the micromap **can** be destroyed after the acceleration structure build concludes.

Valid Usage (Implicit)

- VUID-VkMicromapBuildSizesInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MICROMAP_BUILD_SIZES_INFO_EXT
- VUID-VkMicromapBuildSizesInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`

Values which **can** be set in VkMicromapCreateInfoEXT::`type` specifying the type of micromap, are:

```
// Provided by VK_EXT_opacity_micromap
typedef enum VkMicromapTypeEXT {
    VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT = 0,
#ifdef VK_ENABLE_BETA_EXTENSIONS
  // Provided by VK_NV_displacement_micromap
    VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV = 1000397000,
#endif
} VkMicromapTypeEXT;
```

- VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT is a micromap containing data to control the opacity of a triangle.
- VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV is a micromap containing data to control the displacement of subtriangles within a triangle.

Bits which **can** be set in VkMicromapCreateInfoEXT::createFlags, specifying additional creation parameters for micromaps, are:

```
// Provided by VK_EXT_opacity_micromap
typedef enum VkMicromapCreateFlagBitsEXT {
    VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT = 0x00000001,
} VkMicromapCreateFlagBitsEXT;
```

- VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT specifies that the micromap's address **can** be saved and reused on a subsequent run.

```
// Provided by VK_EXT_opacity_micromap
typedef VkFlags VkMicromapCreateFlagsEXT;
```

VkMicromapCreateFlagsEXT is a bitmask type for setting a mask of zero or more VkMicromapCreateFlagBitsEXT.

To destroy a micromap, call:

```
// Provided by VK_EXT_opacity_micromap
void vkDestroyMicromapEXT(
    VkDevice                                    device,
    VkMicromapEXT                               micromap,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the logical device that destroys the micromap.
- micromap is the micromap to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyMicromapEXT-micromap-11619
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromap feature **must** be enabled
- VUID-vkDestroyMicromapEXT-micromap-07441
  All submitted commands that refer to micromap **must** have completed execution
- VUID-vkDestroyMicromapEXT-micromap-07442
  If VkAllocationCallbacks were provided when micromap was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyMicromapEXT-micromap-07443
  If no VkAllocationCallbacks were provided when micromap was created, pAllocator **must** be NULL

Valid Usage (Implicit)

- VUID-vkDestroyMicromapEXT-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkDestroyMicromapEXT-micromap-parameter
  If micromap is not VK_NULL_HANDLE, micromap **must** be a valid VkMicromapEXT handle
- VUID-vkDestroyMicromapEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyMicromapEXT-micromap-parent
  If micromap is a valid handle, it **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to micromap **must** be externally synchronized

12.9. Resource Memory Association

Resources are initially created as *virtual allocations* with no backing memory. Device memory is allocated separately (see Device Memory) and then associated with the resource. This association is done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources are described in Sparse Resources.

Non-sparse resources **must** be bound completely and contiguously to a single VkDeviceMemory object before the resource is passed as a parameter to any of the following operations:

- creating buffer, image, or tensor views
- updating descriptor sets
- recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but **can** be bound to memory differently on each. Each such replicated resource is an *instance* of the resource. For sparse resources, each instance **can** be bound to memory arbitrarily differently. For non-sparse resources, each instance **can** either be bound to the local or a peer instance of the memory, or for images **can** be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance's binding to memory.

NOTE	There are no new copy commands to transfer data between physical devices. Instead, an application **can** create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    VkDevice                                    device,
    VkBuffer                                    buffer,
    VkMemoryRequirements*                       pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `buffer` is the buffer to query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements structure in which the memory requirements of the buffer object are returned.

Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetBufferMemoryRequirements-buffer-parameter
  `buffer` **must** be a valid VkBuffer handle
- VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements structure
- VUID-vkGetBufferMemoryRequirements-buffer-parent
  `buffer` **must** have been created, allocated, or retrieved from `device`

To determine the memory requirements for an image resource which is not created with the

VK_IMAGE_CREATE_DISJOINT_BIT flag set, call:

```
// Provided by VK_VERSION_1_0
void vkGetImageMemoryRequirements(
    VkDevice                                    device,
    VkImage                                     image,
    VkMemoryRequirements*                       pMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `image` is the image to query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements structure in which the memory requirements of the image object are returned.

Valid Usage

- VUID-vkGetImageMemoryRequirements-image-01588
  `image` **must** not have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag set
- VUID-vkGetImageMemoryRequirements-image-04004
  If `image` was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then `image` **must** be bound to memory
- VUID-vkGetImageMemoryRequirements-image-08960
  If `image` was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX external memory handle type, then `image` **must** be bound to memory

Valid Usage (Implicit)

- VUID-vkGetImageMemoryRequirements-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageMemoryRequirements-image-parameter
  `image` **must** be a valid VkImage handle
- VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements structure
- VUID-vkGetImageMemoryRequirements-image-parent
  `image` **must** have been created, allocated, or retrieved from `device`

To determine the memory requirements for a tensor resource, call:

```
// Provided by VK_ARM_tensors
void vkGetTensorMemoryRequirementsARM(
    VkDevice                                    device,
    const VkTensorMemoryRequirementsInfoARM*    pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- `device` is the logical device that owns the tensor.
- `pInfo` is a pointer to a VkTensorMemoryRequirementsInfoARM structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the tensor object are returned.

Valid Usage (Implicit)

- VUID-vkGetTensorMemoryRequirementsARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetTensorMemoryRequirementsARM-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkTensorMemoryRequirementsInfoARM structure
- VUID-vkGetTensorMemoryRequirementsARM-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements2 structure

The `VkTensorMemoryRequirementsInfoARM` structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkTensorMemoryRequirementsInfoARM {
    VkStructureType    sType;
    const void*        pNext;
    VkTensorARM        tensor;
} VkTensorMemoryRequirementsInfoARM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tensor` is the tensor to query.

Valid Usage (Implicit)

- VUID-VkTensorMemoryRequirementsInfoARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_TENSOR_MEMORY_REQUIREMENTS_INFO_ARM
- VUID-VkTensorMemoryRequirementsInfoARM-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkTensorMemoryRequirementsInfoARM-tensor-parameter

`tensor` **must** be a valid VkTensorARM handle

To determine the memory requirements for a tensor resource without creating an object, call:

```
// Provided by VK_ARM_tensors
void vkGetDeviceTensorMemoryRequirementsARM(
    VkDevice                                    device,
    const VkDeviceTensorMemoryRequirementsARM*  pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- `device` is the logical device intended to own the tensor.
- `pInfo` is a pointer to a VkDeviceTensorMemoryRequirementsARM structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the tensor object are returned.

Valid Usage

- VUID-vkGetDeviceTensorMemoryRequirementsARM-tensors-09831
  The `tensors` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceTensorMemoryRequirementsARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceTensorMemoryRequirementsARM-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkDeviceTensorMemoryRequirementsARM structure
- VUID-vkGetDeviceTensorMemoryRequirementsARM-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements2 structure

The `VkDeviceTensorMemoryRequirementsARM` structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkDeviceTensorMemoryRequirementsARM {
    VkStructureType                sType;
    const void*                    pNext;
    const VkTensorCreateInfoARM*   pCreateInfo;
} VkDeviceTensorMemoryRequirementsARM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `pCreateInfo` is a pointer to a VkTensorCreateInfoARM structure containing parameters affecting the creation of the tensor to query.

Valid Usage (Implicit)

- VUID-VkDeviceTensorMemoryRequirementsARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_DEVICE_TENSOR_MEMORY_REQUIREMENTS_ARM
- VUID-VkDeviceTensorMemoryRequirementsARM-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDeviceTensorMemoryRequirementsARM-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkTensorCreateInfoARM structure

The `VkMemoryRequirements` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryRequirements {
    VkDeviceSize    size;
    VkDeviceSize    alignment;
    uint32_t        memoryTypeBits;
} VkMemoryRequirements;
```

- `size` is the size, in bytes, of the memory allocation **required** for the resource.
- `alignment` is the alignment, in bytes, of the offset within the allocation **required** for the resource.
- `memoryTypeBits` is a bitmask and contains one bit set for every supported memory type for the resource. Bit `i` is set if and only if the memory type `i` in the `VkPhysicalDeviceMemoryProperties` structure for the physical device is supported for the resource.

The precise size of images that will be bound to external Android hardware buffer memory is unknown until the memory has been imported or allocated, so applications **must** not call vkGetImageMemoryRequirements or vkGetImageMemoryRequirements2 with such a VkImage before it has been bound to memory. For this reason, applications also **must** not call vkGetDeviceImageMemoryRequirements with a VkImageCreateInfo describing an external Android hardware buffer. When importing Android hardware buffer memory, the `allocationSize` **can** be determined by calling vkGetAndroidHardwareBufferPropertiesANDROID. When allocating new memory for a VkImage that **can** be exported to an Android hardware buffer, the memory's `allocationSize` **must** be zero; the actual size will be determined by the dedicated image's parameters. After the memory has been allocated, the amount of space allocated from the memory's heap **can** be obtained by getting the image's memory requirements or by calling vkGetAndroidHardwareBufferPropertiesANDROID with the Android hardware buffer exported from the memory.

When allocating new memory for a VkBuffer that **can** be exported to an Android hardware buffer an application **may** still call vkGetBufferMemoryRequirements or vkGetBufferMemoryRequirements2 with VkBuffer before it has been bound to memory.

The value of size has no meaning and **should** be ignored if the resource being queried was created with any of the following external memory handle types:

- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT
- VK_EXTERNAL_MEMORY_HANDLE_TYPE_MTLTEXTURE_BIT_EXT

The implementation guarantees certain properties about the memory requirements returned by vkGetBufferMemoryRequirements2, vkGetImageMemoryRequirements2, vkGetDeviceBufferMemoryRequirements, vkGetDeviceImageMemoryRequirements, vkGetDeviceTensorMemoryRequirementsARM, vkGetTensorMemoryRequirementsARM, vkGetBufferMemoryRequirements and vkGetImageMemoryRequirements:

- The memoryTypeBits member always contains at least one bit set.
- If buffer is a VkBuffer not created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_BUFFER_CREATE_PROTECTED_BIT bits set, or if image is a linear image that was not created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, or if tensor is a VkTensorARM not created with the VK_TENSOR_CREATE_PROTECTED_BIT_ARM, then the memoryTypeBits member always contains at least one bit set corresponding to a VkMemoryType with a propertyFlags that has both the VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT bit and the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bit set. In other words, mappable coherent memory **can** always be attached to these objects.
- If buffer was created with VkExternalMemoryBufferCreateInfo::handleTypes set to 0 or image was created with VkExternalMemoryImageCreateInfo::handleTypes set to 0, or tensor was created with VkExternalMemoryTensorCreateInfoARM::handleTypes set to 0, the memoryTypeBits member always contains at least one bit set corresponding to a VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit set.
- The memoryTypeBits member is identical for all VkBuffer objects created with the same value for the flags and usage members in the VkBufferCreateInfo structure and the handleTypes member of the VkExternalMemoryBufferCreateInfo structure passed to vkCreateBuffer. Further, if usage1 and usage2 of type VkBufferUsageFlags are such that the bits set in usage2 are a subset of the bits set in usage1, and they have the same flags and VkExternalMemoryBufferCreateInfo::handleTypes, then the bits set in memoryTypeBits returned for usage1 **must** be a subset of the bits set in memoryTypeBits returned for usage2, for all values of flags.
- The alignment member is a power of two.
- The alignment member is identical for all VkBuffer objects created with the same combination of values for the usage and flags members in the VkBufferCreateInfo structure passed to vkCreateBuffer.
- If the maintenance4 feature is enabled, then the alignment member is identical for all VkImage objects created with the same combination of values for the flags, imageType, format, extent, mipLevels, arrayLayers, samples, tiling and usage members in the VkImageCreateInfo structure , and the tilingControl member of the VkImageTilingControlCreateInfoEXT structure if in the pNext chain, passed to vkCreateImage.

- The `alignment` member satisfies the buffer descriptor offset alignment requirements associated with the `VkBuffer`'s `usage`:
  - If `usage` included VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, `alignment` **must** be an integer multiple of `VkPhysicalDeviceLimits`::`minTexelBufferOffsetAlignment`.
  - If `usage` included VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT, `alignment` **must** be an integer multiple of `VkPhysicalDeviceLimits`::`minUniformBufferOffsetAlignment`.
  - If `usage` included VK_BUFFER_USAGE_STORAGE_BUFFER_BIT, `alignment` **must** be an integer multiple of `VkPhysicalDeviceLimits`::`minStorageBufferOffsetAlignment`.
- For images created with a color format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the `tiling` member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit and VK_IMAGE_CREATE_PROTECTED_BIT bit of the `flags` member, the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the `flags` member, the VK_IMAGE_USAGE_HOST_TRANSFER_BIT bit of the `usage` member if the VkPhysicalDeviceHostImageCopyProperties::`identicalMemoryTypeRequirements` property is VK_FALSE, `handleTypes` member of VkExternalMemoryImageCreateInfo, and the VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the `usage` member in the VkImageCreateInfo structure passed to vkCreateImage.
- For images created with a depth/stencil format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the `format` member, the `tiling` member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit and VK_IMAGE_CREATE_PROTECTED_BIT bit of the `flags` member, the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the `flags` member, the VK_IMAGE_USAGE_HOST_TRANSFER_BIT bit of the `usage` member if the VkPhysicalDeviceHostImageCopyProperties::`identicalMemoryTypeRequirements` property is VK_FALSE, `handleTypes` member of VkExternalMemoryImageCreateInfo, and the VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the `usage` member in the VkImageCreateInfo structure passed to vkCreateImage.
- If the memory requirements are for a `VkImage`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set if the `image` did not have VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT bit set in the `usage` member of the VkImageCreateInfo structure passed to vkCreateImage.
- If the memory requirements are for a `VkBuffer`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set.
- If the memory requirements are for a `VkTensorARM`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set.

> **NOTE** The implication of this requirement is that lazily allocated memory is disallowed for buffers in all cases.

- The `size` member is identical for all `VkBuffer` objects created with the same combination of

creation parameters specified in VkBufferCreateInfo and its pNext chain.

- The size member is identical for all VkImage objects created with the same combination of creation parameters specified in VkImageCreateInfo and its pNext chain.
- The size member is identical for all VkTensorARM objects created with the same combination of creation parameters specified in VkTensorCreateInfoARM and its pNext chain.

> **NOTE** This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, **can** be explicitly requested using VK_IMAGE_CREATE_ALIAS_BIT.

- If the maintenance4 feature is enabled, these additional guarantees apply:
  - For a VkBuffer, the size memory requirement is never greater than that of another VkBuffer created with a greater or equal size specified in VkBufferCreateInfo, all other creation parameters being identical.
  - For a VkBuffer, the size memory requirement is never greater than the result of aligning VkBufferCreateInfo::size with the alignment memory requirement.
  - For a VkImage, the size memory requirement is never greater than that of another VkImage created with a greater or equal value in each of extent.width, extent.height, and extent.depth; all other creation parameters being identical.
  - The memory requirements returned by vkGetDeviceBufferMemoryRequirements are identical to those that would be returned by vkGetBufferMemoryRequirements2 if it were called with a VkBuffer created with the same VkBufferCreateInfo values.
  - The memory requirements returned by vkGetDeviceImageMemoryRequirements are identical to those that would be returned by vkGetImageMemoryRequirements2 if it were called with a VkImage created with the same VkImageCreateInfo values.
  - The memory requirements returned by vkGetDeviceTensorMemoryRequirementsARM are identical to those that would be returned by vkGetTensorMemoryRequirementsARM if it were called with a VkTensorARM created with the same VkTensorCreateInfoARM values, including additional values provided via a VkExternalMemoryTensorCreateInfoARM structure.

To determine the memory requirements for a buffer resource, call:

```
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(
    VkDevice                                    device,
    const VkBufferMemoryRequirementsInfo2*      pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

```
// Provided by VK_KHR_get_memory_requirements2
// Equivalent to vkGetBufferMemoryRequirements2
void vkGetBufferMemoryRequirements2KHR(
    VkDevice                                    device,
    const VkBufferMemoryRequirementsInfo2*      pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a VkBufferMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the buffer object are returned.

Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements2-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetBufferMemoryRequirements2-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkBufferMemoryRequirementsInfo2 structure
- VUID-vkGetBufferMemoryRequirements2-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements2 structure

To determine the memory requirements for a buffer resource without creating an object, call:

```
// Provided by VK_VERSION_1_3
void vkGetDeviceBufferMemoryRequirements(
    VkDevice                                    device,
    const VkDeviceBufferMemoryRequirements*     pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

```
// Provided by VK_KHR_maintenance4
// Equivalent to vkGetDeviceBufferMemoryRequirements
void vkGetDeviceBufferMemoryRequirementsKHR(
    VkDevice                                    device,
    const VkDeviceBufferMemoryRequirements*     pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- `device` is the logical device intended to own the buffer.
- `pInfo` is a pointer to a VkDeviceBufferMemoryRequirements structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the buffer object are returned.

Valid Usage (Implicit)

- VUID-vkGetDeviceBufferMemoryRequirements-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceBufferMemoryRequirements-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkDeviceBufferMemoryRequirements structure
- VUID-vkGetDeviceBufferMemoryRequirements-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements2 structure

The `VkBufferMemoryRequirementsInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           buffer;
} VkBufferMemoryRequirementsInfo2;
```

```
// Provided by VK_KHR_get_memory_requirements2
// Equivalent to VkBufferMemoryRequirementsInfo2
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to query.

Valid Usage (Implicit)

- VUID-VkBufferMemoryRequirementsInfo2-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2
- VUID-VkBufferMemoryRequirementsInfo2-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter
  `buffer` **must** be a valid VkBuffer handle

The `VkDeviceBufferMemoryRequirements` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkDeviceBufferMemoryRequirements {
    VkStructureType              sType;
    const void*                  pNext;
    const VkBufferCreateInfo*    pCreateInfo;
} VkDeviceBufferMemoryRequirements;
```

```
// Provided by VK_KHR_maintenance4
// Equivalent to VkDeviceBufferMemoryRequirements
typedef VkDeviceBufferMemoryRequirements VkDeviceBufferMemoryRequirementsKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pCreateInfo` is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer to query.

Valid Usage (Implicit)

- VUID-VkDeviceBufferMemoryRequirements-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_DEVICE_BUFFER_MEMORY_REQUIREMENTS
- VUID-VkDeviceBufferMemoryRequirements-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDeviceBufferMemoryRequirements-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkBufferCreateInfo structure

To determine the memory requirements for an image resource, call:

```
// Provided by VK_VERSION_1_1
void vkGetImageMemoryRequirements2(
    VkDevice                                    device,
    const VkImageMemoryRequirementsInfo2*       pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

```
// Provided by VK_KHR_get_memory_requirements2
// Equivalent to vkGetImageMemoryRequirements2
void vkGetImageMemoryRequirements2KHR(
    VkDevice                                    device,
    const VkImageMemoryRequirementsInfo2*       pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `pInfo` is a pointer to a VkImageMemoryRequirementsInfo2 structure containing parameters

required for the memory requirements query.

- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the image object are returned.

Valid Usage (Implicit)

- VUID-vkGetImageMemoryRequirements2-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetImageMemoryRequirements2-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkImageMemoryRequirementsInfo2 structure
- VUID-vkGetImageMemoryRequirements2-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements2 structure

To determine the memory requirements for an image resource without creating an object, call:

```
// Provided by VK_VERSION_1_3
void vkGetDeviceImageMemoryRequirements(
    VkDevice                                    device,
    const VkDeviceImageMemoryRequirements*      pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

```
// Provided by VK_KHR_maintenance4
// Equivalent to vkGetDeviceImageMemoryRequirements
void vkGetDeviceImageMemoryRequirementsKHR(
    VkDevice                                    device,
    const VkDeviceImageMemoryRequirements*      pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

- `device` is the logical device intended to own the image.
- `pInfo` is a pointer to a VkDeviceImageMemoryRequirements structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the image object are returned.

Valid Usage (Implicit)

- VUID-vkGetDeviceImageMemoryRequirements-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkGetDeviceImageMemoryRequirements-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid VkDeviceImageMemoryRequirements structure
- VUID-vkGetDeviceImageMemoryRequirements-pMemoryRequirements-parameter
  `pMemoryRequirements` **must** be a valid pointer to a VkMemoryRequirements2 structure

The VkImageMemoryRequirementsInfo2 structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
} VkImageMemoryRequirementsInfo2;
```

```
// Provided by VK_KHR_get_memory_requirements2
// Equivalent to VkImageMemoryRequirementsInfo2
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- image is the image to query.

Valid Usage

- VUID-VkImageMemoryRequirementsInfo2-image-01589
  If image was created with a *multi-planar* format and the VK_IMAGE_CREATE_DISJOINT_BIT flag, there **must** be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure
- VUID-VkImageMemoryRequirementsInfo2-image-02279
  If image was created with VK_IMAGE_CREATE_DISJOINT_BIT and with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then there **must** be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure
- VUID-VkImageMemoryRequirementsInfo2-image-01590
  If image was not created with the VK_IMAGE_CREATE_DISJOINT_BIT flag, there **must** not be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure
- VUID-VkImageMemoryRequirementsInfo2-image-02280
  If image was created with a single-plane format and with any tiling other than VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then there **must** not be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure
- VUID-VkImageMemoryRequirementsInfo2-image-01897
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image **must** be bound to memory
- VUID-VkImageMemoryRequirementsInfo2-image-08961
  If image was created with the

VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX external memory handle type, then `image` **must** be bound to memory

Valid Usage (Implicit)

- VUID-VkImageMemoryRequirementsInfo2-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2
- VUID-VkImageMemoryRequirementsInfo2-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkImagePlaneMemoryRequirementsInfo
- VUID-VkImageMemoryRequirementsInfo2-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkImageMemoryRequirementsInfo2-image-parameter
  `image` **must** be a valid VkImage handle

The `VkDeviceImageMemoryRequirements` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkDeviceImageMemoryRequirements {
    VkStructureType             sType;
    const void*                 pNext;
    const VkImageCreateInfo*    pCreateInfo;
    VkImageAspectFlagBits       planeAspect;
} VkDeviceImageMemoryRequirements;
```

```
// Provided by VK_KHR_maintenance4
// Equivalent to VkDeviceImageMemoryRequirements
typedef VkDeviceImageMemoryRequirements VkDeviceImageMemoryRequirementsKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pCreateInfo` is a pointer to a VkImageCreateInfo structure containing parameters affecting creation of the image to query.
- `planeAspect` is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query. This parameter is ignored unless `pCreateInfo->tiling` is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, or `pCreateInfo->flags` has VK_IMAGE_CREATE_DISJOINT_BIT set.

Valid Usage

- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06416
  The `pCreateInfo->pNext` chain **must** not contain a VkImageSwapchainCreateInfoKHR

structure

- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-12489
  `pCreateInfo->tiling` **must** not be VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT
- VUID-VkDeviceImageMemoryRequirements-pNext-06996
  Applications also **must** not call vkGetDeviceImageMemoryRequirements with a VkImageCreateInfo whose `pNext` chain includes a VkExternalFormatANDROID structure with non-zero `externalFormat`
- VUID-VkDeviceImageMemoryRequirements-pNext-08962
  Applications also **must** not call vkGetDeviceImageMemoryRequirements with a VkImageCreateInfo whose `pNext` chain includes a VkExternalFormatQNX structure with non-zero `externalFormat`
- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06417
  If `pCreateInfo->format` specifies a *multi-planar* format and `pCreateInfo->flags` has VK_IMAGE_CREATE_DISJOINT_BIT set then `planeAspect` **must** not be VK_IMAGE_ASPECT_NONE_KHR
- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06419
  If `pCreateInfo->flags` has VK_IMAGE_CREATE_DISJOINT_BIT set and if the `pCreateInfo->tiling` is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then `planeAspect` **must** be a single valid multi-planar aspect mask bit
- VUID-VkDeviceImageMemoryRequirements-planeAspect-12399
  If `planeAspect` is not 0 and `pCreateInfo->flags` does not have VK_IMAGE_CREATE_DISJOINT_BIT set, then `planeAspect` must be a valid VkImageAspectFlagBits value

Valid Usage (Implicit)

- VUID-VkDeviceImageMemoryRequirements-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_DEVICE_IMAGE_MEMORY_REQUIREMENTS
- VUID-VkDeviceImageMemoryRequirements-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkImageCreateInfo structure

To determine the memory requirements for a plane of a disjoint image, add a `VkImagePlaneMemoryRequirementsInfo` structure to the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure.

The `VkImagePlaneMemoryRequirementsInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkImageAspectFlagBits    planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to VkImagePlaneMemoryRequirementsInfo
typedef VkImagePlaneMemoryRequirementsInfo VkImagePlaneMemoryRequirementsInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `planeAspect` is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query.

Valid Usage

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281
  If the image's `tiling` is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then `planeAspect` **must** be a single valid multi-planar aspect mask bit
- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02282
  If the image's `tiling` is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then `planeAspect` **must** be a single valid *memory plane* for the image (that is, `planeAspect` **must** specify a plane index that is less than the VkDrmFormatModifierPropertiesEXT::`drmFormatModifierPlaneCount` associated with the image's `format` and VkImageDrmFormatModifierPropertiesEXT::`drmFormatModifier`)

Valid Usage (Implicit)

- VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO
- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter
  `planeAspect` **must** be a valid VkImageAspectFlagBits value

Structure Chaining

Extends the structure

- VkImageMemoryRequirementsInfo2

To determine the tile memory allocation requirements of a buffer or image resource, add a

VkTileMemoryRequirementsQCOM structure to the pNext chain of the VkMemoryRequirements2 structure passed as the pMemoryRequirements parameter of vkGetBufferMemoryRequirements2 or vkGetImageMemoryRequirements2, respectively. The VkTileMemoryRequirementsQCOM structure is defined as:

```
// Provided by VK_QCOM_tile_memory_heap
typedef struct VkTileMemoryRequirementsQCOM {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       size;
    VkDeviceSize       alignment;
} VkTileMemoryRequirementsQCOM;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- size is the size, in bytes, of the tile memory allocation required for the resource.
- alignment is the alignment, in bytes, of the offset within the tile memory allocation required for the resource.

The size and alignment **must** be used when the resource is bound to a VkDeviceMemory object that was allocated from a VkMemoryType that has a heapIndex that corresponds to a VkMemoryHeap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property.

If the resource cannot be bound to tile memory, then size and alignment are filled with zero by the implementation.

Valid Usage (Implicit)

- VUID-VkTileMemoryRequirementsQCOM-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_TILE_MEMORY_REQUIREMENTS_QCOM

Structure Chaining

Extends the structure

- VkMemoryRequirements2

The VkMemoryRequirements2 structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryRequirements2 {
    VkStructureType         sType;
    void*                   pNext;
    VkMemoryRequirements    memoryRequirements;
} VkMemoryRequirements2;
```

```
// Provided by VK_KHR_get_memory_requirements2, VK_NV_ray_tracing with
VK_KHR_get_memory_requirements2 or VK_VERSION_1_1
// Equivalent to VkMemoryRequirements2
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a VkMemoryRequirements structure describing the memory requirements of the resource.

Valid Usage (Implicit)

- VUID-VkMemoryRequirements2-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2
- VUID-VkMemoryRequirements2-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkMemoryDedicatedRequirements or VkTileMemoryRequirementsQCOM
- VUID-VkMemoryRequirements2-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique

The `VkMemoryDedicatedRequirements` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedRequirements {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           prefersDedicatedAllocation;
    VkBool32           requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```

```
// Provided by VK_KHR_dedicated_allocation
// Equivalent to VkMemoryDedicatedRequirements
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `prefersDedicatedAllocation` specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it **may** get better performance if a dedicated allocation is used.
- `requiresDedicatedAllocation` specifies that a dedicated allocation is required for this resource.

To determine the dedicated allocation requirements of a buffer or image or tensor resource, add a VkMemoryDedicatedRequirements structure to the pNext chain of the VkMemoryRequirements2 structure passed as the pMemoryRequirements parameter of vkGetBufferMemoryRequirements2, vkGetTensorMemoryRequirementsARM, vkGetDeviceBufferMemoryRequirements, vkGetDeviceImageMemoryRequirements, or vkGetImageMemoryRequirements2 respectively.

Constraints on the values returned for buffer resources are:

- requiresDedicatedAllocation **may** be VK_TRUE if the pNext chain of VkBufferCreateInfo for the call to vkCreateBuffer used to create the buffer being queried included a VkExternalMemoryBufferCreateInfo structure, and any of the handle types specified in VkExternalMemoryBufferCreateInfo::handleTypes requires dedicated allocation, as reported by vkGetPhysicalDeviceExternalBufferProperties in VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures. Otherwise, requiresDedicatedAllocation will be VK_FALSE.
- When the implementation sets requiresDedicatedAllocation to VK_TRUE, it **must** also set prefersDedicatedAllocation to VK_TRUE.
- If VK_BUFFER_CREATE_SPARSE_BINDING_BIT was set in VkBufferCreateInfo::flags when buffer was created, then both prefersDedicatedAllocation and requiresDedicatedAllocation will be VK_FALSE.

Constraints on the values returned for image resources are:

- requiresDedicatedAllocation **may** be VK_TRUE if the pNext chain of VkImageCreateInfo for the call to vkCreateImage used to create the image being queried included a VkExternalMemoryImageCreateInfo structure, and any of the handle types specified in VkExternalMemoryImageCreateInfo::handleTypes requires dedicated allocation, as reported by vkGetPhysicalDeviceImageFormatProperties2 in VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures.
- requiresDedicatedAllocation **may** be VK_TRUE if the image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT.
- requiresDedicatedAllocation will otherwise be VK_FALSE.
- If VK_IMAGE_CREATE_SPARSE_BINDING_BIT was set in VkImageCreateInfo::flags when image was created, then both prefersDedicatedAllocation and requiresDedicatedAllocation will be VK_FALSE.

Constraints on the values returned for tensor resources are:

- requiresDedicatedAllocation **may** be VK_TRUE if the pNext chain of VkTensorCreateInfoARM for the call to vkCreateTensorARM used to create the tensor being queried included a VkExternalMemoryTensorCreateInfoARM structure, and any of the handle types specified in VkExternalMemoryTensorCreateInfoARM::handleTypes requires dedicated allocation, as reported by vkGetPhysicalDeviceExternalTensorPropertiesARM in VkExternalTensorPropertiesARM::externalMemoryProperties.externalMemoryFeatures.
- requiresDedicatedAllocation will be VK_TRUE if the VkTensorDescriptionARM::tiling provided via the VkTensorCreateInfoARM structure for the call to vkCreateTensorARM used to create the tensor being queried was VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_64K_ARM.

- `requiresDedicatedAllocation` will otherwise be VK_FALSE.
- When the implementation sets `requiresDedicatedAllocation` to VK_TRUE, it **must** also set `prefersDedicatedAllocation` to VK_TRUE.

Valid Usage (Implicit)

- VUID-VkMemoryDedicatedRequirements-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS

Structure Chaining

Extends the structure

- VkMemoryRequirements2

To attach memory to a buffer object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(
    VkDevice                                    device,
    VkBuffer                                    buffer,
    VkDeviceMemory                              memory,
    VkDeviceSize                                memoryOffset);
```

- `device` is the logical device that owns the buffer and memory.
- `buffer` is the buffer to be attached to memory.
- `memory` is a VkDeviceMemory object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements`::`size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

`vkBindBufferMemory` is equivalent to passing the same parameters through VkBindBufferMemoryInfo to vkBindBufferMemory2.

Valid Usage

- VUID-vkBindBufferMemory-buffer-07459
  `buffer` **must** not have been bound to a memory object
- VUID-vkBindBufferMemory-buffer-01030
  `buffer` **must** not have been created with any sparse memory binding flags
- VUID-vkBindBufferMemory-memoryOffset-01031
  `memoryOffset` **must** be less than the size of `memory`
- VUID-vkBindBufferMemory-memory-01035

`memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`

- VUID-vkBindBufferMemory-None-10739
  If `memory` was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- VUID-vkBindBufferMemory-memory-10740
  If `memory` was allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkTileMemoryRequirementsQCOM` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- VUID-vkBindBufferMemory-None-10741
  If `memory` was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-vkBindBufferMemory-memory-10742
  If `memory` was allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, the `size` member of the `VkTileMemoryRequirementsQCOM` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-vkBindBufferMemory-buffer-01444
  If `buffer` requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::`requiresDedicatedAllocation` for `buffer`), `memory` **must** have been allocated with VkMemoryDedicatedAllocateInfo::`buffer` equal to `buffer`
- VUID-vkBindBufferMemory-memory-01508
  If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a VkMemoryDedicatedAllocateInfo structure in its `pNext` chain, and VkMemoryDedicatedAllocateInfo::`buffer` was not VK_NULL_HANDLE, then `buffer` **must** equal VkMemoryDedicatedAllocateInfo::`buffer`, and `memoryOffset` **must** be zero
- VUID-vkBindBufferMemory-memory-10925
  If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a VkMemoryDedicatedAllocateInfo structure in its `pNext` chain, VkMemoryDedicatedAllocateInfo::`image` **must** have been VK_NULL_HANDLE
- VUID-vkBindBufferMemory-None-01898
  If `buffer` was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer **must** be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-vkBindBufferMemory-None-01899
  If `buffer` was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer

must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindBufferMemory-buffer-01038
  If `buffer` was created with VkDedicatedAllocationBufferCreateInfoNV::`dedicatedAllocation` equal to VK_TRUE, `memory` **must** have been allocated with VkDedicatedAllocationMemoryAllocateInfoNV::`buffer` equal to a buffer handle created with identical creation parameters to `buffer` and `memoryOffset` **must** be zero
- VUID-vkBindBufferMemory-apiVersion-07920
  If the VK_KHR_dedicated_allocation extension is not enabled, VkPhysicalDeviceProperties::`apiVersion` is less than Vulkan 1.1, and `buffer` was not created with VkDedicatedAllocationBufferCreateInfoNV::`dedicatedAllocation` equal to VK_TRUE, `memory` **must** not have been allocated dedicated for a specific buffer or image
- VUID-vkBindBufferMemory-memory-02726
  If the value of VkExportMemoryAllocateInfo::`handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in VkExternalMemoryBufferCreateInfo::`handleTypes` when `buffer` was created
- VUID-vkBindBufferMemory-memory-02985
  If `memory` was allocated by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-`NULL` `buffer` value, the external handle type of the imported memory **must** also have been set in VkExternalMemoryBufferCreateInfo::`handleTypes` when `buffer` was created
- VUID-vkBindBufferMemory-memory-02986
  If `memory` was allocated with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-`NULL` `buffer` value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID **must** also have been set in VkExternalMemoryBufferCreateInfo::`handleTypes` when `buffer` was created
- VUID-vkBindBufferMemory-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::`bufferDeviceAddress` feature is enabled and `buffer` was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT usage flag set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set
- VUID-vkBindBufferMemory-bufferDeviceAddressCaptureReplay-09200
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::`bufferDeviceAddressCaptureReplay` feature is enabled and `buffer` was created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set
- VUID-vkBindBufferMemory-buffer-06408
  If `buffer` was created with VkBufferCollectionBufferCreateInfoFUCHSIA chained to VkBufferCreateInfo::`pNext`, `memory` **must** be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::`pNext`
- VUID-vkBindBufferMemory-descriptorBufferCaptureReplay-08112
  If the `buffer` was created with the

VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

- VUID-vkBindBufferMemory-buffer-09201
  If the `buffer` was created with the VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set
- VUID-vkBindBufferMemory-buffer-11408
  If the `buffer` was created with the VK_BUFFER_USAGE_DESCRIPTOR_HEAP_BIT_EXT or VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

Valid Usage (Implicit)

- VUID-vkBindBufferMemory-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkBindBufferMemory-buffer-parameter
  `buffer` **must** be a valid VkBuffer handle
- VUID-vkBindBufferMemory-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-vkBindBufferMemory-buffer-parent
  `buffer` **must** have been created, allocated, or retrieved from `device`
- VUID-vkBindBufferMemory-memory-parent
  `memory` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `buffer` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To attach memory to buffer objects for one or more buffers at a time, call:

```
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
    VkDevice                                    device,
    uint32_t                                    bindInfoCount,
    const VkBindBufferMemoryInfo*               pBindInfos);
```

```
// Provided by VK_KHR_bind_memory2
// Equivalent to vkBindBufferMemory2
VkResult vkBindBufferMemory2KHR(
    VkDevice                                    device,
    uint32_t                                    bindInfoCount,
    const VkBindBufferMemoryInfo*               pBindInfos);
```

- `device` is the logical device that owns the buffers and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `bindInfoCount` VkBindBufferMemoryInfo structures describing buffers and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

If the `maintenance6` feature is enabled, this command **must** attempt to perform all of the memory binding operations described by `pBindInfos`, and **must** not early exit on the first failure.

If any of the memory binding operations described by `pBindInfos` fail, the VkResult returned by this command **must** be the return value of any one of the memory binding operations which did not return VK_SUCCESS.

NOTE

If the `vkBindBufferMemory2` command failed, VkBindMemoryStatus structures were not included in the `pNext` chains of each element of `pBindInfos`, and `bindInfoCount` was greater than one, then the buffers referenced by `pBindInfos` will be in an indeterminate state, and must not be used.

Applications should destroy these buffers.

Valid Usage (Implicit)

- VUID-vkBindBufferMemory2-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkBindBufferMemory2-pBindInfos-parameter
  `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid VkBindBufferMemoryInfo structures
- VUID-vkBindBufferMemory2-bindInfoCount-arraylength

- `bindInfoCount` **must** be greater than `0`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

`VkBindBufferMemoryInfo` contains members corresponding to the parameters of vkBindBufferMemory.

The `VkBindBufferMemoryInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           buffer;
    VkDeviceMemory     memory;
    VkDeviceSize       memoryOffset;
} VkBindBufferMemoryInfo;
```

```
// Provided by VK_KHR_bind_memory2
// Equivalent to VkBindBufferMemoryInfo
typedef VkBindBufferMemoryInfo VkBindBufferMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to be attached to memory.
- `memory` is a VkDeviceMemory object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements`::`size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

Valid Usage

- VUID-VkBindBufferMemoryInfo-buffer-07459
  `buffer` **must** not have been bound to a memory object
- VUID-VkBindBufferMemoryInfo-buffer-01030
  `buffer` **must** not have been created with any sparse memory binding flags
- VUID-VkBindBufferMemoryInfo-memoryOffset-01031
  `memoryOffset` **must** be less than the size of `memory`
- VUID-VkBindBufferMemoryInfo-memory-01035
  `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- VUID-VkBindBufferMemoryInfo-None-10739
  If `memory` was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- VUID-VkBindBufferMemoryInfo-memory-10740
  If `memory` was allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkTileMemoryRequirementsQCOM` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- VUID-VkBindBufferMemoryInfo-None-10741
  If `memory` was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-VkBindBufferMemoryInfo-memory-10742
  If `memory` was allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, the `size` member of the `VkTileMemoryRequirementsQCOM` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-VkBindBufferMemoryInfo-buffer-01444
  If `buffer` requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::`requiresDedicatedAllocation` for `buffer`), `memory` **must** have been allocated with VkMemoryDedicatedAllocateInfo::`buffer` equal `buffer`
- VUID-VkBindBufferMemoryInfo-memory-01508
  If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a VkMemoryDedicatedAllocateInfo structure in its `pNext` chain, and VkMemoryDedicatedAllocateInfo::`buffer` was not VK_NULL_HANDLE, then `buffer` **must** equal VkMemoryDedicatedAllocateInfo::`buffer`, and `memoryOffset` **must** be zero

- VUID-VkBindBufferMemoryInfo-memory-10925
  If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, VkMemoryDedicatedAllocateInfo::image **must** have been VK_NULL_HANDLE
- VUID-VkBindBufferMemoryInfo-None-01898
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer **must** be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-VkBindBufferMemoryInfo-None-01899
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer **must** not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-VkBindBufferMemoryInfo-buffer-01038
  If buffer was created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory **must** have been allocated with VkDedicatedAllocationMemoryAllocateInfoNV::buffer equal to a buffer handle created with identical creation parameters to buffer and memoryOffset **must** be zero
- VUID-VkBindBufferMemoryInfo-apiVersion-07920
  If the VK_KHR_dedicated_allocation extension is not enabled, VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and buffer was not created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory **must** not have been allocated dedicated for a specific buffer or image
- VUID-VkBindBufferMemoryInfo-memory-02726
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it **must** include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created
- VUID-VkBindBufferMemoryInfo-memory-02985
  If memory was allocated by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory **must** also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created
- VUID-VkBindBufferMemoryInfo-memory-02986
  If memory was allocated with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID **must** also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created
- VUID-VkBindBufferMemoryInfo-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT usage flag set, memory **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set
- VUID-VkBindBufferMemoryInfo-bufferDeviceAddressCaptureReplay-09200
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddressCaptureReplay

feature is enabled and buffer was created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set, memory **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set

- VUID-VkBindBufferMemoryInfo-buffer-06408
  If buffer was created with VkBufferCollectionBufferCreateInfoFUCHSIA chained to VkBufferCreateInfo::pNext, memory **must** be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::pNext
- VUID-VkBindBufferMemoryInfo-descriptorBufferCaptureReplay-08112
  If the buffer was created with the VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, memory **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set
- VUID-VkBindBufferMemoryInfo-buffer-09201
  If the buffer was created with the VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT bit set, memory **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set
- VUID-VkBindBufferMemoryInfo-buffer-11408
  If the buffer was created with the VK_BUFFER_USAGE_DESCRIPTOR_HEAP_BIT_EXT or VK_BUFFER_USAGE_2_DESCRIPTOR_HEAP_BIT_EXT bit set, memory **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set
- VUID-VkBindBufferMemoryInfo-pNext-01605
  If the pNext chain includes a VkBindBufferMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices **must** have been allocated

Valid Usage (Implicit)

- VUID-VkBindBufferMemoryInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO
- VUID-VkBindBufferMemoryInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkBindBufferMemoryDeviceGroupInfo or VkBindMemoryStatus
- VUID-VkBindBufferMemoryInfo-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkBindBufferMemoryInfo-buffer-parameter
  buffer **must** be a valid VkBuffer handle
- VUID-VkBindBufferMemoryInfo-memory-parameter
  memory **must** be a valid VkDeviceMemory handle
- VUID-VkBindBufferMemoryInfo-commonparent
  Both of buffer, and memory **must** have been created, allocated, or retrieved from the same

VkDevice

Host Synchronization

- Host access to `buffer` **must** be externally synchronized

The `VkBindBufferMemoryDeviceGroupInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryDeviceGroupInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceIndexCount;
    const uint32_t*    pDeviceIndices;
} VkBindBufferMemoryDeviceGroupInfo;
```

```
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
// Equivalent to VkBindBufferMemoryDeviceGroupInfo
typedef VkBindBufferMemoryDeviceGroupInfo VkBindBufferMemoryDeviceGroupInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.

If the `pNext` chain of VkBindBufferMemoryInfo includes a `VkBindBufferMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

If `deviceIndexCount` is greater than zero, then on device index i the buffer is attached to the instance of `memory` on the physical device with device index `pDeviceIndices`[i].

If `deviceIndexCount` is zero and `memory` comes from a memory heap with the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of `memory`.

If `deviceIndexCount` is zero and `memory` comes from a memory heap without the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

Valid Usage

- VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606

`deviceIndexCount` **must** either be zero or equal to the number of physical devices in the logical device

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-01607
  All elements of `pDeviceIndices` **must** be valid device indices

Valid Usage (Implicit)

- VUID-VkBindBufferMemoryDeviceGroupInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO
- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-parameter
  If `deviceIndexCount` is not `0`, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount` `uint32_t` values

Structure Chaining

Extends the structure

- VkBindBufferMemoryInfo

The `VkBindMemoryStatus` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkBindMemoryStatus {
    VkStructureType    sType;
    const void*        pNext;
    VkResult*          pResult;
} VkBindMemoryStatus;
```

```
// Provided by VK_KHR_maintenance6
// Equivalent to VkBindMemoryStatus
typedef VkBindMemoryStatus VkBindMemoryStatusKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pResult` is a pointer to a VkResult value.

If the `pNext` chain of VkBindBufferMemoryInfo or VkBindImageMemoryInfo includes a `VkBindMemoryStatus` structure, then the `VkBindMemoryStatus`::`pResult` will be populated with a value describing the result of the corresponding memory binding operation.

Valid Usage (Implicit)

- VUID-VkBindMemoryStatus-sType-sType

sType **must** be VK_STRUCTURE_TYPE_BIND_MEMORY_STATUS

- VUID-VkBindMemoryStatus-pResult-parameter
  pResult **must** be a valid pointer to a VkResult value

Structure Chaining

Extends the structures

- VkBindBufferMemoryInfo
- VkBindImageMemoryInfo

To attach memory to a VkImage object created without the VK_IMAGE_CREATE_DISJOINT_BIT set, call:

```
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice                                    device,
    VkImage                                     image,
    VkDeviceMemory                              memory,
    VkDeviceSize                                memoryOffset);
```

- device is the logical device that owns the image and memory.
- image is the image.
- memory is the VkDeviceMemory object describing the device memory to attach.
- memoryOffset is the start offset of the region of memory which is to be bound to the image. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified image.

vkBindImageMemory is equivalent to passing the same parameters through VkBindImageMemoryInfo to vkBindImageMemory2.

Valid Usage

- VUID-vkBindImageMemory-image-07460
  image **must** not have been bound to a memory object
- VUID-vkBindImageMemory-image-01045
  image **must** not have been created with any sparse memory binding flags
- VUID-vkBindImageMemory-memoryOffset-01046
  memoryOffset **must** be less than the size of memory
- VUID-vkBindImageMemory-image-01445
  If image requires a dedicated allocation (as reported by vkGetImageMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for image), memory **must** have been created with

VkMemoryDedicatedAllocateInfo::image equal to image

- VUID-vkBindImageMemory-memory-02628
  If the dedicatedAllocationImageAliasing feature is not enabled, and the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then image **must** equal VkMemoryDedicatedAllocateInfo::image and memoryOffset **must** be zero
- VUID-vkBindImageMemory-memory-02629
  If the dedicatedAllocationImageAliasing feature is enabled, and the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then memoryOffset **must** be zero, and image **must** be either equal to VkMemoryDedicatedAllocateInfo::image or an image that was created using the same parameters in VkImageCreateInfo, with the exception that extent and arrayLayers **may** differ subject to the following restrictions: every dimension in the extent parameter of the image being bound **must** be less than or equal to the original image for which the allocation was created; and the arrayLayers parameter of the image being bound **must** be less than or equal to the original image for which the allocation was created
- VUID-vkBindImageMemory-memory-10926
  If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, VkMemoryDedicatedAllocateInfo::buffer **must** have been VK_NULL_HANDLE
- VUID-vkBindImageMemory-None-01901
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, the image **must** be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-vkBindImageMemory-None-01902
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit not set, the image **must** not be bound to a memory object created with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-vkBindImageMemory-image-01050
  If image was created with VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory **must** have been created with VkDedicatedAllocationMemoryAllocateInfoNV::image equal to an image handle created with identical creation parameters to image and memoryOffset **must** be zero
- VUID-vkBindImageMemory-apiVersion-07921
  If the VK_KHR_dedicated_allocation extension is not enabled, VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and image was not created with VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory **must** not have been allocated dedicated for a specific buffer or image
- VUID-vkBindImageMemory-memory-02728
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it **must** include at least one of the handles set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

- VUID-vkBindImageMemory-memory-02989
  If `memory` was created by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-`NULL` `buffer` value, the external handle type of the imported memory **must** also have been set in VkExternalMemoryImageCreateInfo::`handleTypes` when `image` was created
- VUID-vkBindImageMemory-memory-02990
  If `memory` was created with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-`NULL` `buffer` value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID **must** also have been set in VkExternalMemoryImageCreateInfo::`handleTypes` when `image` was created
- VUID-vkBindImageMemory-image-08113
  If the `image` was created with the VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set
- VUID-vkBindImageMemory-image-09202
  If the `image` was created with the VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set
- VUID-vkBindImageMemory-image-01608
  `image` **must** not have been created with the VK_IMAGE_CREATE_DISJOINT_BIT set
- VUID-vkBindImageMemory-memory-01047
  `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to vkGetImageMemoryRequirements with `image`
- VUID-vkBindImageMemory-None-10735
  If `memory` was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to vkGetImageMemoryRequirements with `image`
- VUID-vkBindImageMemory-memory-10736
  If `memory` was allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkTileMemoryRequirementsQCOM` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`
- VUID-vkBindImageMemory-None-10737
  If `memory` was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-vkBindImageMemory-memory-10738
  If `memory` was allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, `size` member of the

VkTileMemoryRequirementsQCOM structure returned from a call to vkGetImageMemoryRequirements2 with image **must** be less than or equal to the size of memory minus memoryOffset

- VUID-vkBindImageMemory-image-06392
  If image was created with VkBufferCollectionImageCreateInfoFUCHSIA chained to VkImageCreateInfo::pNext, memory **must** be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::pNext

Valid Usage (Implicit)

- VUID-vkBindImageMemory-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkBindImageMemory-image-parameter
  image **must** be a valid VkImage handle
- VUID-vkBindImageMemory-memory-parameter
  memory **must** be a valid VkDeviceMemory handle
- VUID-vkBindImageMemory-image-parent
  image **must** have been created, allocated, or retrieved from device
- VUID-vkBindImageMemory-memory-parent
  memory **must** have been created, allocated, or retrieved from device

Host Synchronization

- Host access to image **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To attach memory to image objects for one or more images at a time, call:

```
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
    VkDevice                                    device,
    uint32_t                                    bindInfoCount,
    const VkBindImageMemoryInfo*                pBindInfos);
```

```
// Provided by VK_KHR_bind_memory2
// Equivalent to vkBindImageMemory2
VkResult vkBindImageMemory2KHR(
    VkDevice                                    device,
    uint32_t                                    bindInfoCount,
    const VkBindImageMemoryInfo*                pBindInfos);
```

- `device` is the logical device that owns the images and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of VkBindImageMemoryInfo structures, describing images and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

If the `maintenance6` feature is enabled, this command **must** attempt to perform all of the memory binding operations described by `pBindInfos`, and **must** not early exit on the first failure.

If any of the memory binding operations described by `pBindInfos` fail, the VkResult returned by this command **must** be the return value of any one of the memory binding operations which did not return VK_SUCCESS.

NOTE

If the `vkBindImageMemory2` command failed, VkBindMemoryStatus structures were not included in the `pNext` chains of each element of `pBindInfos`, and `bindInfoCount` was greater than one, then the images referenced by `pBindInfos` will be in an indeterminate state, and must not be used.

Applications should destroy these images.

Valid Usage

- VUID-vkBindImageMemory2-pBindInfos-02858
  If any VkBindImageMemoryInfo::`image` was created with VK_IMAGE_CREATE_DISJOINT_BIT then all planes of VkBindImageMemoryInfo::`image` **must** be bound individually in separate `pBindInfos`
- VUID-vkBindImageMemory2-pBindInfos-04006
  `pBindInfos` **must** not refer to the same image subresource more than once

Valid Usage (Implicit)

- VUID-vkBindImageMemory2-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkBindImageMemory2-pBindInfos-parameter
  `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid VkBindImageMemoryInfo structures
- VUID-vkBindImageMemory2-bindInfoCount-arraylength
  `bindInfoCount` **must** be greater than `0`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

`VkBindImageMemoryInfo` contains members corresponding to the parameters of vkBindImageMemory.

The `VkBindImageMemoryInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
    VkDeviceMemory     memory;
    VkDeviceSize       memoryOffset;
} VkBindImageMemoryInfo;
```

```
// Provided by VK_KHR_bind_memory2
// Equivalent to VkBindImageMemoryInfo
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to be attached to memory.

- `memory` is a VkDeviceMemory object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements`::`size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

Valid Usage

- VUID-VkBindImageMemoryInfo-image-07460
  `image` **must** not have been bound to a memory object
- VUID-VkBindImageMemoryInfo-image-01045
  `image` **must** not have been created with any sparse memory binding flags
- VUID-VkBindImageMemoryInfo-memoryOffset-01046
  `memoryOffset` **must** be less than the size of `memory`
- VUID-VkBindImageMemoryInfo-image-01445
  If `image` requires a dedicated allocation (as reported by vkGetImageMemoryRequirements2 in VkMemoryDedicatedRequirements::`requiresDedicatedAllocation` for `image`), `memory` **must** have been created with VkMemoryDedicatedAllocateInfo::`image` equal to `image`
- VUID-VkBindImageMemoryInfo-memory-02628
  If the `dedicatedAllocationImageAliasing` feature is not enabled, and the `VkMemoryAllocateInfo` provided when `memory` was allocated included a VkMemoryDedicatedAllocateInfo structure in its `pNext` chain, and VkMemoryDedicatedAllocateInfo::`image` was not VK_NULL_HANDLE, then `image` **must** equal VkMemoryDedicatedAllocateInfo::`image` and `memoryOffset` **must** be zero
- VUID-VkBindImageMemoryInfo-memory-02629
  If the `dedicatedAllocationImageAliasing` feature is enabled, and the `VkMemoryAllocateInfo` provided when `memory` was allocated included a VkMemoryDedicatedAllocateInfo structure in its `pNext` chain, and VkMemoryDedicatedAllocateInfo::`image` was not VK_NULL_HANDLE, then `memoryOffset` **must** be zero, and `image` **must** be either equal to VkMemoryDedicatedAllocateInfo::`image` or an image that was created using the same parameters in VkImageCreateInfo, with the exception that `extent` and `arrayLayers` **may** differ subject to the following restrictions: every dimension in the `extent` parameter of the image being bound **must** be less than or equal to the original image for which the allocation was created; and the `arrayLayers` parameter of the image being bound **must** be less than or equal to the original image for which the allocation was created
- VUID-VkBindImageMemoryInfo-memory-10926
  If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a VkMemoryDedicatedAllocateInfo structure in its `pNext` chain, VkMemoryDedicatedAllocateInfo::`buffer` **must** have been VK_NULL_HANDLE
- VUID-VkBindImageMemoryInfo-None-01901
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, the image **must** be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-VkBindImageMemoryInfo-None-01902

If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit not set, the image **must** not be bound to a memory object created with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindImageMemoryInfo-image-01050
  If `image` was created with VkDedicatedAllocationImageCreateInfoNV::`dedicatedAllocation` equal to VK_TRUE, `memory` **must** have been created with VkDedicatedAllocationMemoryAllocateInfoNV::`image` equal to an image handle created with identical creation parameters to `image` and `memoryOffset` **must** be zero
- VUID-VkBindImageMemoryInfo-apiVersion-07921
  If the VK_KHR_dedicated_allocation extension is not enabled, VkPhysicalDeviceProperties::`apiVersion` is less than Vulkan 1.1, and `image` was not created with VkDedicatedAllocationImageCreateInfoNV::`dedicatedAllocation` equal to VK_TRUE, `memory` **must** not have been allocated dedicated for a specific buffer or image
- VUID-VkBindImageMemoryInfo-memory-02728
  If the value of VkExportMemoryAllocateInfo::`handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in VkExternalMemoryImageCreateInfo::`handleTypes` when `image` was created
- VUID-VkBindImageMemoryInfo-memory-02989
  If `memory` was created by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-`NULL` `buffer` value, the external handle type of the imported memory **must** also have been set in VkExternalMemoryImageCreateInfo::`handleTypes` when `image` was created
- VUID-VkBindImageMemoryInfo-memory-02990
  If `memory` was created with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-`NULL` `buffer` value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID **must** also have been set in VkExternalMemoryImageCreateInfo::`handleTypes` when `image` was created
- VUID-VkBindImageMemoryInfo-image-08113
  If the `image` was created with the VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set
- VUID-VkBindImageMemoryInfo-image-09202
  If the `image` was created with the VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set
- VUID-VkBindImageMemoryInfo-pNext-01615
  If the `pNext` chain does not include a VkBindImagePlaneMemoryInfo structure, and `memory` was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, then `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with `image`

- VUID-VkBindImageMemoryInfo-pNext-01616
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, and memory was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, then memoryOffset **must** be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image
- VUID-VkBindImageMemoryInfo-pNext-01617
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, and memory was not allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, then the difference of the size of memory and memoryOffset **must** be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image
- VUID-VkBindImageMemoryInfo-pNext-12329
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, and memory was allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, then memoryOffset **must** be an integer multiple of the alignment member of the VkTileMemoryRequirementsQCOM structure returned from a call to vkGetImageMemoryRequirements2 with image
- VUID-VkBindImageMemoryInfo-pNext-12330
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, and memory was allocated from a memory heap with the VK_MEMORY_HEAP_TILE_MEMORY_BIT_QCOM property set, then size member of the VkTileMemoryRequirementsQCOM structure returned from a call to vkGetImageMemoryRequirements2 with image **must** be less than or equal to the size of memory minus memoryOffset
- VUID-VkBindImageMemoryInfo-pNext-01618
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, image **must** have been created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set
- VUID-VkBindImageMemoryInfo-image-07736
  If image was created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set, then the pNext chain **must** include a VkBindImagePlaneMemoryInfo structure
- VUID-VkBindImageMemoryInfo-pNext-01619
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memory **must** have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure's pNext chain
- VUID-VkBindImageMemoryInfo-pNext-01620
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memoryOffset **must** be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the

VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure's pNext chain

- VUID-VkBindImageMemoryInfo-pNext-01621
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, the difference of the size of memory and memoryOffset **must** be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure's pNext chain
- VUID-VkBindImageMemoryInfo-pNext-01626
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindImageMemoryDeviceGroupInfo::pDeviceIndices **must** have been allocated
- VUID-VkBindImageMemoryInfo-pNext-01627
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, and VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount is not zero, then image **must** have been created with the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit set
- VUID-VkBindImageMemoryInfo-pNext-01628
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, all elements of VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions **must** be valid rectangles contained within the dimensions of image
- VUID-VkBindImageMemoryInfo-pNext-01629
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, the union of the areas of all elements of VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions that correspond to the same instance of image **must** cover the entire image
- VUID-VkBindImageMemoryInfo-image-01630
  If image was created with a valid swapchain handle in VkImageSwapchainCreateInfoKHR::swapchain, then the pNext chain **must** include a VkBindImageMemorySwapchainInfoKHR structure containing the same swapchain handle
- VUID-VkBindImageMemoryInfo-pNext-01631
  If the pNext chain includes a VkBindImageMemorySwapchainInfoKHR structure, memory **must** be VK_NULL_HANDLE
- VUID-VkBindImageMemoryInfo-pNext-01632
  If the pNext chain does not include a VkBindImageMemorySwapchainInfoKHR structure, memory **must** be a valid VkDeviceMemory handle

Valid Usage (Implicit)

- VUID-VkBindImageMemoryInfo-sType-sType

sType **must** be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO

- VUID-VkBindImageMemoryInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain **must** be either NULL or a pointer to a valid instance of VkBindImageMemoryDeviceGroupInfo, VkBindImageMemorySwapchainInfoKHR, VkBindImagePlaneMemoryInfo, or VkBindMemoryStatus
- VUID-VkBindImageMemoryInfo-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkBindImageMemoryInfo-image-parameter
  image **must** be a valid VkImage handle
- VUID-VkBindImageMemoryInfo-commonparent
  Both of image, and memory that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to image **must** be externally synchronized

The VkBindImageMemoryDeviceGroupInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceIndexCount;
    const uint32_t*    pDeviceIndices;
    uint32_t           splitInstanceBindRegionCount;
    const VkRect2D*    pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;
```

```
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
// Equivalent to VkBindImageMemoryDeviceGroupInfo
typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- deviceIndexCount is the number of elements in pDeviceIndices.
- pDeviceIndices is a pointer to an array of device indices.
- splitInstanceBindRegionCount is the number of elements in pSplitInstanceBindRegions.
- pSplitInstanceBindRegions is a pointer to an array of VkRect2D structures describing which regions of the image are attached to each instance of memory.

If the pNext chain of VkBindImageMemoryInfo includes a VkBindImageMemoryDeviceGroupInfo structure, then that structure determines how memory is bound to images across multiple devices in a device group.

If deviceIndexCount is greater than zero, then on device index i image is attached to the instance of the memory on the physical device with device index pDeviceIndices[i].

Let N be the number of physical devices in the logical device. If splitInstanceBindRegionCount is greater than zero, then pSplitInstanceBindRegions is a pointer to an array of N^2 rectangles, where the image region specified by the rectangle at element i*N+j in resource instance i is bound to the memory instance j. The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to memoryOffset, computed as if the whole image was being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks use consecutive blocks of memory, vertically adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of image, and the block at (0,0) corresponds to memory starting at memoryOffset.

If splitInstanceBindRegionCount and deviceIndexCount are zero and the memory comes from a memory heap with the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If splitInstanceBindRegionCount and deviceIndexCount are zero and the memory comes from a memory heap without the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains an array of zeros. In other words, by default each physical device attaches to instance zero.

Valid Usage

- VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01633
  At least one of deviceIndexCount and splitInstanceBindRegionCount **must** be zero
- VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01634
  deviceIndexCount **must** either be zero or equal to the number of physical devices in the logical device
- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-01635
  All elements of pDeviceIndices **must** be valid device indices
- VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-01636
  splitInstanceBindRegionCount **must** either be zero or equal to the number of physical devices in the logical device squared
- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-01637
  Elements of pSplitInstanceBindRegions that correspond to the same instance of an image **must** not overlap
- VUID-VkBindImageMemoryDeviceGroupInfo-offset-01638
  The offset.x member of any element of pSplitInstanceBindRegions **must** be a multiple of the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of

all non-metadata aspects of the image

- VUID-VkBindImageMemoryDeviceGroupInfo-offset-01639
  The `offset.y` member of any element of `pSplitInstanceBindRegions` **must** be a multiple of the sparse image block height (`VkSparseImageFormatProperties`::`imageGranularity.height`) of all non-metadata aspects of the image
- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01640
  The `extent.width` member of any element of `pSplitInstanceBindRegions` **must** either be a multiple of the sparse image block width of all non-metadata aspects of the image, or else `extent.width` + `offset.x` **must** equal the width of the image subresource
- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01641
  The `extent.height` member of any element of `pSplitInstanceBindRegions` **must** either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else `extent.height` + `offset.y` **must** equal the height of the image subresource

Valid Usage (Implicit)

- VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO
- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter
  If `deviceIndexCount` is not `0`, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount` `uint32_t` values
- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter
  If `splitInstanceBindRegionCount` is not `0`, `pSplitInstanceBindRegions` **must** be a valid pointer to an array of `splitInstanceBindRegionCount` VkRect2D structures

Structure Chaining

Extends the structure

- VkBindImageMemoryInfo

If the `pNext` chain of VkBindImageMemoryInfo includes a `VkBindImageMemorySwapchainInfoKHR` structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The `VkBindImageMemorySwapchainInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
    uint32_t           imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is VK_NULL_HANDLE or a swapchain handle.
- `imageIndex` is an image index within `swapchain`.

If `swapchain` is not `NULL`, the `swapchain` and `imageIndex` are used to determine the memory that the image is bound to, instead of `memory` and `memoryOffset`.

Memory **can** be bound to a swapchain and use the `pDeviceIndices` or `pSplitInstanceBindRegions` members of VkBindImageMemoryDeviceGroupInfo.

Valid Usage

- VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644
  `imageIndex` **must** be less than the number of images in `swapchain`
- VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-07756
  If the `swapchain` has been created with VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR, `imageIndex` **must** be one that has previously been returned by vkAcquireNextImageKHR or vkAcquireNextImage2KHR

Valid Usage (Implicit)

- VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR
- VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter
  `swapchain` **must** be a valid VkSwapchainKHR handle

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

Structure Chaining

Extends the structure

- VkBindImageMemoryInfo

In order to bind *planes* of a *disjoint image*, add a `VkBindImagePlaneMemoryInfo` structure to the `pNext` chain of VkBindImageMemoryInfo.

The `VkBindImagePlaneMemoryInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkImageAspectFlagBits    planeAspect;
} VkBindImagePlaneMemoryInfo;
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to VkBindImagePlaneMemoryInfo
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `planeAspect` is a VkImageAspectFlagBits value specifying the aspect of the disjoint image plane to bind.

Valid Usage

- VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283
  If the image's `tiling` is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then `planeAspect` **must** be a single valid multi-planar aspect mask bit
- VUID-VkBindImagePlaneMemoryInfo-planeAspect-02284
  If the image's `tiling` is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then `planeAspect` **must** be a single valid *memory plane* for the image (that is, `planeAspect` **must** specify a plane index that is less than the VkDrmFormatModifierPropertiesEXT::`drmFormatModifierPlaneCount` associated with the image's `format` and VkImageDrmFormatModifierPropertiesEXT::`drmFormatModifier`)

Valid Usage (Implicit)

- VUID-VkBindImagePlaneMemoryInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO

- VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter
  `planeAspect` **must** be a valid VkImageAspectFlagBits value

Structure Chaining

Extends the structure

- VkBindImageMemoryInfo

To attach memory to tensor objects, call:

```
// Provided by VK_ARM_tensors
VkResult vkBindTensorMemoryARM(
    VkDevice                                    device,
    uint32_t                                    bindInfoCount,
    const VkBindTensorMemoryInfoARM*            pBindInfos);
```

- `device` is the logical device that owns the buffers and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of structures of type VkBindTensorMemoryInfoARM, describing tensors and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

Valid Usage (Implicit)

- VUID-vkBindTensorMemoryARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkBindTensorMemoryARM-pBindInfos-parameter
  `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid VkBindTensorMemoryInfoARM structures
- VUID-vkBindTensorMemoryARM-bindInfoCount-arraylength
  `bindInfoCount` **must** be greater than `0`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkBindTensorMemoryInfoARM structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkBindTensorMemoryInfoARM {
    VkStructureType    sType;
    const void*        pNext;
    VkTensorARM        tensor;
    VkDeviceMemory     memory;
    VkDeviceSize       memoryOffset;
} VkBindTensorMemoryInfoARM;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- tensor is the tensor to be attached to memory.
- memory is a VkDeviceMemory object describing the device memory to attach.
- memoryOffset is the start offset of the region of memory which is to be bound to the tensor. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified tensor.

Valid Usage

- VUID-VkBindTensorMemoryInfoARM-tensor-09712
  tensor **must** not already be backed by a memory object
- VUID-VkBindTensorMemoryInfoARM-memoryOffset-09713
  memoryOffset **must** be less than the size of memory
- VUID-VkBindTensorMemoryInfoARM-memory-09714
  memory **must** have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetTensorMemoryRequirementsARM with tensor
- VUID-VkBindTensorMemoryInfoARM-memoryOffset-09715
  memoryOffset **must** be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetTensorMemoryRequirementsARM with tensor
- VUID-VkBindTensorMemoryInfoARM-size-09716
  The size member of the VkMemoryRequirements structure returned from a call to vkGetTensorMemoryRequirementsARM with tensor **must** be less than or equal to the size of memory minus memoryOffset
- VUID-VkBindTensorMemoryInfoARM-tensor-09717
  If tensor requires a dedicated allocation (as reported by vkGetTensorMemoryRequirementsARM in VkMemoryDedicatedRequirements

::requiresDedicatedAllocation for tensor), memory **must** have been created with VkMemoryDedicatedAllocateInfoTensorARM::tensor equal to tensor

- VUID-VkBindTensorMemoryInfoARM-memory-09806
  If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfoTensorARM structure in its pNext chain, and VkMemoryDedicatedAllocateInfoTensorARM::tensor was not VK_NULL_HANDLE, then tensor **must** equal VkMemoryDedicatedAllocateInfoTensorARM::tensor, and memoryOffset **must** be zero
- VUID-VkBindTensorMemoryInfoARM-memory-09895
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it **must** include at least one of the handles set in VkExternalMemoryTensorCreateInfoARM ::handleTypes when tensor was created
- VUID-VkBindTensorMemoryInfoARM-memory-09896
  If memory was allocated by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory **must** also have been set in VkExternalMemoryTensorCreateInfoARM::handleTypes when tensor was created
- VUID-VkBindTensorMemoryInfoARM-memory-09897
  If memory was allocated with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID **must** also have been set in VkExternalMemoryTensorCreateInfoARM::handleTypes when tensor was created
- VUID-VkBindTensorMemoryInfoARM-tensor-09718
  If tensor was created with the VK_TENSOR_CREATE_PROTECTED_BIT_ARM bit set, the tensor **must** be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-VkBindTensorMemoryInfoARM-tensor-09719
  If tensor was created with the VK_TENSOR_CREATE_PROTECTED_BIT_ARM bit not set, the tensor **must** not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT
- VUID-VkBindTensorMemoryInfoARM-tensor-09943
  If tensor was created with the VK_TENSOR_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM bit set, memory **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set
- VUID-VkBindTensorMemoryInfoARM-tensor-09944
  If tensor was created with the VK_TENSOR_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM bit set, memory **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set
- VUID-VkBindTensorMemoryInfoARM-tensor-11406
  If tensor was created with the VK_TENSOR_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_ARM bit set, memory

must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

- VUID-VkBindTensorMemoryInfoARM-tensor-11407
  If `tensor` was created with the VK_TENSOR_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_ARM bit set, `memory` **must** have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set

Valid Usage (Implicit)

- VUID-VkBindTensorMemoryInfoARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BIND_TENSOR_MEMORY_INFO_ARM
- VUID-VkBindTensorMemoryInfoARM-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkBindTensorMemoryInfoARM-tensor-parameter
  `tensor` **must** be a valid VkTensorARM handle
- VUID-VkBindTensorMemoryInfoARM-memory-parameter
  `memory` **must** be a valid VkDeviceMemory handle
- VUID-VkBindTensorMemoryInfoARM-commonparent
  Both of `memory`, and `tensor` **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to `tensor` **must** be externally synchronized

12.9.1. Buffer-Image Granularity

The implementation-dependent limit `bufferImageGranularity` specifies a page-like granularity at which linear and non-linear resources **must** be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to alias. `bufferImageGranularity` is specified in bytes, and **must** be a power of two. Implementations which do not impose a granularity restriction **may** report a `bufferImageGranularity` value of one.

NOTE Despite its name, `bufferImageGranularity` is really a granularity between “linear” and “non-linear” resources. The limit `bufferImageGranularity` also applies to tensor resources.

Given resourceA at the lower memory offset and resourceB at the higher memory offset in the same `VkDeviceMemory` object, where one resource is linear and the other is non-linear (as defined in the Glossary), and the following:

```
resourceA.end       = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage   = resourceA.end & ~(bufferImageGranularity-1)
resourceB.start     = resourceB.memoryOffset
resourceB.startPage = resourceB.start & ~(bufferImageGranularity-1)
```

The following property **must** hold:

```
resourceA.endPage < resourceB.startPage
```

That is, the end of the first resource (A) and the beginning of the second resource (B) **must** be on separate "pages" of size `bufferImageGranularity`. `bufferImageGranularity` **may** be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources **can** be closer than `bufferImageGranularity`, provided they meet the `alignment` requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments **must** all be multiples of the `bufferImageGranularity`. Therefore, memory bound to sparse resources naturally satisfies the `bufferImageGranularity`.

NOTE The implementation-dependent limit `bufferImageGranularity` also applies to tensor resources.

12.10. Resource Sharing Mode

Buffer and image objects are created with a *sharing mode* controlling how they **can** be accessed from queues. The supported sharing modes are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- VK_SHARING_MODE_EXCLUSIVE specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.
- VK_SHARING_MODE_CONCURRENT specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

NOTE VK_SHARING_MODE_CONCURRENT **may** result in lower performance access to the buffer or image than VK_SHARING_MODE_EXCLUSIVE.

Ranges of buffers and image subresources of image objects created using VK_SHARING_MODE_EXCLUSIVE **must** only be accessed by queues in the queue family that has

ownership of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using VK_SHARING_MODE_EXCLUSIVE is owned by some queue family, unless the `maintenance9` feature is enabled, the application **must** perform a queue family ownership transfer if it wishes to make the memory contents of a range or image subresource accessible to a different queue family. VK_SHARING_MODE_EXCLUSIVE resources that are already owned by a queue family **may** be acquired by a different queue family without a queue family ownership transfer, but unless the `maintenance9` feature is enabled, their contents become undefined.

If the `maintenance9` feature is enabled, the contents of buffer resources, and of linear image resources (i.e., those created with `tiling` set to VK_IMAGE_TILING_LINEAR) are always preserved when they are implicitly acquired by a different queue family on the same logical device (i.e., neither queue family is VK_QUEUE_FAMILY_FOREIGN_EXT or VK_QUEUE_FAMILY_EXTERNAL). This means that whenever the `maintenance9` feature is enabled, explicit queue family ownership transfers of buffer and linear image resources between different queue families on the same logical device are **optional**.

Additionally, if the `maintenance9` feature is enabled, the contents of some optimal image resources (i.e., those created with VK_IMAGE_TILING_OPTIMAL) are always preserved when they are implicitly acquired by a different queue family on the same logical device (i.e., neither queue family is VK_QUEUE_FAMILY_FOREIGN_EXT or VK_QUEUE_FAMILY_EXTERNAL). This applies only to optimal images that are being implicitly acquired by a queue family whose index bit is set in the current queue family's VkQueueFamilyOwnershipTransferPropertiesKHR ::`optimalImageTransferToQueueFamilies`, and that were created without any of the following bits set in `usage`:

- VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT
- VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT
- VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT
- VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT
- VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT
- VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

This means that whenever the `maintenance9` feature is enabled, explicit queue family ownership transfers of such image resources between such combinations of queue families are **optional**. For all other optimal images and/or combinations of queue families, the application **must** still perform an explicit queue family ownership transfer if it wishes to make the memory contents of an optimal image subresource already owned by a queue family accessible to a different queue family.

NOTE	Applications are allowed to perform explicit queue family ownership transfers in circumstances where they are not required, but there is no functional nor performance advantage in doing so. Performing explicit transfers in such cases remains supported for backward compatibility and is not recommended for new applications.

NOTE	Before being used on the first queue, images still require a layout transition from

these layouts:

- VK_IMAGE_LAYOUT_UNDEFINED
- VK_IMAGE_LAYOUT_PREINITIALIZED
- VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT

A queue family **can** take ownership of an image subresource, tensor subresource, or buffer range of a resource created with VK_SHARING_MODE_EXCLUSIVE, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers, tensor subresources of tensor objects, and image subresources of image objects created using VK_SHARING_MODE_CONCURRENT **must** only be accessed by queues from the queue families specified through the `queueFamilyIndexCount` and `pQueueFamilyIndices` members of the corresponding create info structures.

12.10.1. External Resource Sharing

Resources **should** only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource's underlying memory at a given time, regardless of whether the resource was created using VK_SHARING_MODE_EXCLUSIVE or VK_SHARING_MODE_CONCURRENT. Applications can transfer ownership of a resource's underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of VK_SHARING_MODE_EXCLUSIVE resources between queues, and is also accomplished using VkBufferMemoryBarrier or VkImageMemoryBarrier operations. To make the contents of the underlying memory accessible in the destination instance or API, applications **must**

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API.

Unlike queue family ownership transfers, the destination instance or API is not specified explicitly when releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier's `dstQueueFamilyIndex` or `srcQueueFamilyIndex` parameters are set to the reserved queue family index VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. An entity **can** also implicitly take ownership from another entity in the same way without an explicit ownership transfer. However, taking ownership in this way has the effect that the contents of the underlying memory are undefined.

Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a VK_SHARING_MODE_EXCLUSIVE resource, with one exception: Implementations **must** ensure layout transitions performed on one member of a set of identical

subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set **must** not make the contents of memory used by other subresources in the set undefined. An application **can** define the content of a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications **may** also add resources to such a set after the content of the existing set members has been defined without making the content undefined by creating a new image with the initial layout VK_IMAGE_LAYOUT_UNDEFINED and binding it to the same region of external memory as the existing images.

NOTE Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.

When sharing resources with other APIs, it is generally left to those APIs to define how they interact with the Vulkan concepts of image layouts and fine-grained synchronization. However, some external memory handle types require use of specific image layouts when transitioning to or from external usage, as defined in the external image implied layouts table.

12.11. Memory Aliasing

A range of a `VkDeviceMemory` allocation is *aliased* if it is bound to multiple resources simultaneously, as described below, via vkBindImageMemory, vkBindBufferMemory, vkBindAccelerationStructureMemoryNV, vkBindTensorMemoryARM, via sparse memory bindings, or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources, resource_A and resource_B, bound respectively to memory range_A and range_B. Let paddedRange_A and paddedRange_B be, respectively, range_A and range_B aligned to `bufferImageGranularity`. If the resources are both linear or both non-linear (as defined in the Glossary), then the resources *alias* the memory in the intersection of range_A and range_B. If one resource is linear and the other is non-linear, then the resources *alias* the memory in the intersection of paddedRange_A and paddedRange_B.

Applications **can** alias memory, but use of multiple aliases is subject to several constraints.

NOTE The implementation-dependent limit `bufferImageGranularity` also applies to tensor resources.

NOTE Memory aliasing **can** be useful to reduce the total device memory footprint of an application, if some large resources are used for disjoint periods of time.

When a non-linear, non-VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image is bound to an aliased range, all image subresources of the image *overlap* the range. When a linear image is bound to an aliased range, the image subresources that (according to the image's advertised layout) include bytes from the aliased range overlap the range. When a VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image's mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, linear tensors, and linear image subresources are considered *host-accessible subresources* when they are in any of these layouts:

- VK_IMAGE_LAYOUT_PREINITIALIZED
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT

That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory **can** be consistently interpreted across aliases if each of those aliases is a host-accessible subresource. Non-linear images, non-linear tensors, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

For an acceleration structure `AS_2` that is an alias of another acceleration structure `AS_1`, `AS_2` **can** be used in place of `AS_1` for operations acting on acceleration structures if the following conditions are met:

- The buffer referred to by the `buffer` member of the VkAccelerationStructureCreateInfoKHR that `AS_2` was created with **must** be bound to the same VkDeviceMemory as the buffer referred to by the `buffer` member of the VkAccelerationStructureCreateInfoKHR that `AS_1` was created with.
- The start of the memory range occupied by `AS_2`, defined by the sum of the `offset` member of the VkAccelerationStructureCreateInfoKHR that `AS_2` was created with and the offset at which the buffer associated with `AS_2` is bound to a VkDeviceMemory, **must** match the start of the memory range occupied by `AS_1`.
- If the `deviceAddress` member of the VkAccelerationStructureCreateInfoKHR that `AS_2` was created with is non-zero, it **must** match the `deviceAddress` member of the VkAccelerationStructureCreateInfoKHR that `AS_1` was created with.
- The `createFlags` member of the VkAccelerationStructureCreateInfoKHR that `AS_2` was created with **must** match the `createFlags` member of the VkAccelerationStructureCreateInfoKHR that `AS_1` was created with.
- The `type` member of the VkAccelerationStructureCreateInfoKHR that `AS_2` was created with **must** match the `type` member of the VkAccelerationStructureCreateInfoKHR that `AS_1` was created with.
- The `size` member of the VkAccelerationStructureCreateInfoKHR that `AS_2` was created with **must** be greater than or equal to the `size` returned by

vkGetAccelerationStructureBuildSizesKHR for the build parameters AS_1 was built with.

After an acceleration structure object is destroyed, aliased acceleration structures **may** continue being used to refer to that acceleration structure for operations acting on acceleration structures.

If two aliases are both images that were created with identical creation parameters, both were created with the VK_IMAGE_CREATE_ALIAS_BIT flag set, and both are bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions, then they interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both **must** have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag.
- The single-plane image **must** have a VkFormat that is equivalent to that of the multi-planar image's individual plane.
- The single-plane image and the individual plane of the multi-planar image **must** be bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions.
- The width and height of the single-plane image are derived from the multi-planar image's dimensions in the manner listed for plane compatibility for the aliased plane.
- If either image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then both images **must** be linear.
- All other creation parameters **must** be identical.

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

Aliases created by binding the same memory to a tensor and an image subresource interpret the contents of the memory in consistent ways if and only if:

- The image was created with VK_IMAGE_TILING_LINEAR and the tensor was created with VK_TENSOR_TILING_LINEAR_ARM. The strides for the image subresource, as reported by vkGetImageSubresourceLayout, are compatible with strides passed when creating the tensor, i.e. VkTensorDescriptionARM::pStrides[dimensionCount-3] must be equal to VkSubresourceLayout::rowPitch if VkTensorDescriptionARM::dimensionCount is greater than 2 and VkTensorDescriptionARM::pStrides[dimensionCount-4] must be equal to VkSubresourceLayout::depthPitch if VkTensorDescriptionARM::dimensionCount is greater than 3.
- The image was created with VK_IMAGE_TILING_OPTIMAL and the tensor was created with VK_TENSOR_TILING_OPTIMAL_ARM. The image was created with the VK_IMAGE_USAGE_TENSOR_ALIASING_BIT_ARM usage flag set and the tensor was created with VK_TENSOR_USAGE_IMAGE_ALIASING_BIT_ARM.
- The format of the tensor must be compatible with that of the individual components of the format of the image.

- The number of dimensions of the tensor (VkTensorDescriptionARM::dimensionCount) is greater than or equal to the number of dimensions of the image (as specified by VkImageCreateInfo ::imageType) plus 1.
- The size of the tensor along its innermost dimension (VkTensorDescriptionARM::pDimensions [dimensionCount-1]) is equal to the number of components of the format of the image (VkImageCreateInfo::format).
- The size of the tensor along all dimensions other than the N innermost dimensions necessary to represent the image (i.e. the number of dimensions of the image plus 1) must be 1.
- The image subresource is in the VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM layout if the image was created with VK_IMAGE_TILING_OPTIMAL and the unifiedImageLayouts feature is not enabled. If the unifiedImageLayouts feature is not enabled, the image **must** be transitioned to VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM prior to any reads via the tensor resource for those reads to return data consistent with that provided to the image writes. If the unifiedImageLayouts feature is not enabled, the image **must** be transitioned to VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM prior to any writes performed via the tensor resource for reads performed via the image resource to return data consistent with that provided to the tensor writes.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources **must** have its layout transitioned from VK_IMAGE_LAYOUT_UNDEFINED to a valid layout before it is used, from VK_IMAGE_LAYOUT_ZERO_INITIALIZED_EXT if it is zeroed, or from VK_IMAGE_LAYOUT_PREINITIALIZED if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them **must** be transitioned.

Use of an overlapping range by two aliases **must** be separated by a memory dependency using the appropriate access types if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier **must** contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass **must** declare the attachments using the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, and follow the other rules listed in that section.

NOTE Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region

> of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements.

12.11.1. Resource Memory Overlap

Applications **can** safely access resources concurrently via separate device and host operations as long as the accessed memory locations are guaranteed to not overlap, as defined in Memory Location, and the operation, resource, and access are otherwise independently valid.

Some operations have alignment requirements or access ambiguous memory locations, so the semantics of a particular operation **should** be considered when determining the overlap. Such requirements will be described alongside the operation. Operations between host and device when using non-coherent memory are aligned to `nonCoherentAtomSize`, as defined by vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges.

> **NOTE** The intent is that buffers (or linear images) can be accessed concurrently, even when they share cache lines, but otherwise do not access the same memory range. The concept of a device cache line size is not exposed in the memory model.

12.12. Buffer Collections

Fuchsia's FIDL-based Sysmem service interoperates with Vulkan via the `VK_FUCHSIA_buffer_collection` extension.

A buffer collection is a set of one or more buffers which were allocated together as a group and which all have the same properties. These properties describe the buffers' internal representation, such as its dimensions and memory layout. This ensures that all of the buffers can be used interchangeably by tasks that require swapping among multiple buffers, such as double-buffered graphics rendering.

On Fuchsia, the Sysmem service uses buffer collections as a core construct in its design.

Buffer collections are represented by `VkBufferCollectionFUCHSIA` handles:

```
// Provided by VK_FUCHSIA_buffer_collection
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferCollectionFUCHSIA)
```

12.12.1. Definitions

- FIDL - Fuchsia Interface Definition Language. The declarative language used to define FIDL interprocess communication interfaces on Fuchsia. FIDL files use the `fidl` extension. FIDL is also used to refer to the services defined by interfaces declared in the FIDL language
- Sysmem - The FIDL service that facilitates optimal buffer sharing and reuse on Fuchsia
- client - Any participant of the buffer collection e.g. the Vulkan application
- token - A `zx_handle_t` Zircon channel object that allows participation in the buffer collection

12.12.2. Platform Initialization for Buffer Collections

To initialize a buffer collection on Fuchsia:

- Connect to the Sysmem service to initialize a Sysmem allocator
- Create an initial buffer collection token using the Sysmem allocator
- Duplicate the token for each participant beyond the initiator
- See the Sysmem Overview and fuchsia.sysmem FIDL documentation on fuchsia.dev for more detailed information

12.12.3. Create the Buffer Collection

To create a VkBufferCollectionFUCHSIA for Vulkan to participate in the buffer collection:

```
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkCreateBufferCollectionFUCHSIA(
    VkDevice                                    device,
    const VkBufferCollectionCreateInfoFUCHSIA*  pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkBufferCollectionFUCHSIA*                  pCollection);
```

- `device` is the logical device that creates the `VkBufferCollectionFUCHSIA`
- `pCreateInfo` is a pointer to a VkBufferCollectionCreateInfoFUCHSIA structure containing parameters affecting creation of the buffer collection
- `pAllocator` is a pointer to a VkAllocationCallbacks structure controlling host memory allocation as described in the Memory Allocation chapter
- `pCollection` is a pointer to a VkBufferCollectionFUCHSIA handle in which the resulting buffer collection object is returned

Valid Usage (Implicit)

- VUID-vkCreateBufferCollectionFUCHSIA-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateBufferCollectionFUCHSIA-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkBufferCollectionCreateInfoFUCHSIA structure
- VUID-vkCreateBufferCollectionFUCHSIA-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateBufferCollectionFUCHSIA-pCollection-parameter
  `pCollection` **must** be a valid pointer to a VkBufferCollectionFUCHSIA handle
- VUID-vkCreateBufferCollectionFUCHSIA-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Host Access

All functions referencing a VkBufferCollectionFUCHSIA **must** be externally synchronized with the exception of `vkCreateBufferCollectionFUCHSIA`.

The `VkBufferCollectionCreateInfoFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionCreateInfoFUCHSIA {
    VkStructureType    sType;
    const void*        pNext;
    zx_handle_t        collectionToken;
} VkBufferCollectionCreateInfoFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `collectionToken` is a `zx_handle_t` containing the Sysmem client's buffer collection token

Valid Usage

- VUID-VkBufferCollectionCreateInfoFUCHSIA-collectionToken-06393
  `collectionToken` **must** be a valid `zx_handle_t` to a Zircon channel allocated from Sysmem (`fuchsia.sysmem.Allocator`/AllocateSharedCollection) with `ZX_DEFAULT_CHANNEL_RIGHTS` rights

Valid Usage (Implicit)

- VUID-VkBufferCollectionCreateInfoFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CREATE_INFO_FUCHSIA

- VUID-VkBufferCollectionCreateInfoFUCHSIA-pNext-pNext
  `pNext` **must** be `NULL`

12.12.4. Set the Constraints

Buffer collections can be established for VkImage allocations or VkBuffer allocations.

Set Image-Based Buffer Collection Constraints

Setting the constraints on the buffer collection initiates the format negotiation and allocation of the buffer collection. To set the constraints on a VkImage buffer collection, call:

```
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkSetBufferCollectionImageConstraintsFUCHSIA(
    VkDevice                                    device,
    VkBufferCollectionFUCHSIA                   collection,
    const VkImageConstraintsInfoFUCHSIA*        pImageConstraintsInfo);
```

- `device` is the logical device
- `collection` is the VkBufferCollectionFUCHSIA handle
- `pImageConstraintsInfo` is a pointer to a VkImageConstraintsInfoFUCHSIA structure

`vkSetBufferCollectionImageConstraintsFUCHSIA` **may** fail if `pImageConstraintsInfo->formatConstraintsCount` is larger than the implementation-defined limit. If that occurs, vkSetBufferCollectionImageConstraintsFUCHSIA will return VK_ERROR_INITIALIZATION_FAILED.

`vkSetBufferCollectionImageConstraintsFUCHSIA` **may** fail if the implementation does not support any of the formats described by the `pImageConstraintsInfo` structure. If that occurs, vkSetBufferCollectionImageConstraintsFUCHSIA will return VK_ERROR_FORMAT_NOT_SUPPORTED.

Valid Usage

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-06394
  `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA` **must** not have already been called on `collection`

Valid Usage (Implicit)

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-parameter
  `collection` **must** be a valid VkBufferCollectionFUCHSIA handle

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-pImageConstraintsInfo-parameter `pImageConstraintsInfo` **must** be a valid pointer to a valid VkImageConstraintsInfoFUCHSIA structure
- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-parent `collection` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_FORMAT_NOT_SUPPORTED
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkImageConstraintsInfoFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImageConstraintsInfoFUCHSIA {
    VkStructureType                                sType;
    const void*                                    pNext;
    uint32_t                                       formatConstraintsCount;
    const VkImageFormatConstraintsInfoFUCHSIA*     pFormatConstraints;
    VkBufferCollectionConstraintsInfoFUCHSIA       bufferCollectionConstraints;
    VkImageConstraintsInfoFlagsFUCHSIA             flags;
} VkImageConstraintsInfoFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `formatConstraintsCount` is the number of elements in `pFormatConstraints`.
- `pFormatConstraints` is a pointer to an array of VkImageFormatConstraintsInfoFUCHSIA structures of size `formatConstraintsCount` that is used to further constrain buffer collection format selection for image-based buffer collections.
- `bufferCollectionConstraints` is a VkBufferCollectionConstraintsInfoFUCHSIA structure used to supply parameters for the negotiation and allocation for buffer-based buffer collections.
- `flags` is a VkImageConstraintsInfoFlagBitsFUCHSIA value specifying hints about the type of memory Sysmem should allocate for the buffer collection.

Valid Usage

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06395
  All elements of `pFormatConstraints` **must** have at least one bit set in its VkImageFormatConstraintsInfoFUCHSIA::`requiredFormatFeatures`
- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06396
  If `pFormatConstraints->imageCreateInfo->usage` contains VK_IMAGE_USAGE_SAMPLED_BIT, then `pFormatConstraints->requiredFormatFeatures` **must** contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT
- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06397
  If `pFormatConstraints->imageCreateInfo->usage` contains VK_IMAGE_USAGE_STORAGE_BIT, then `pFormatConstraints->requiredFormatFeatures` **must** contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT
- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06398
  If `pFormatConstraints->imageCreateInfo->usage` contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then `pFormatConstraints->requiredFormatFeatures` **must** contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT
- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06399
  If `pFormatConstraints->imageCreateInfo->usage` contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then `pFormatConstraints->requiredFormatFeatures` **must** contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06400
  If `pFormatConstraints->imageCreateInfo->usage` contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, then `pFormatConstraints->requiredFormatFeatures` **must** contain at least one of VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT
- VUID-VkImageConstraintsInfoFUCHSIA-attachmentFragmentShadingRate-06401
  If the `attachmentFragmentShadingRate` feature is enabled, and `pFormatConstraints->imageCreateInfo->usage` contains VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then `pFormatConstraints->requiredFormatFeatures` **must** contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

Valid Usage (Implicit)

- VUID-VkImageConstraintsInfoFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_CONSTRAINTS_INFO_FUCHSIA
- VUID-VkImageConstraintsInfoFUCHSIA-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-parameter
  `pFormatConstraints` **must** be a valid pointer to an array of `formatConstraintsCount` valid

VkImageFormatConstraintsInfoFUCHSIA structures

- VUID-VkImageConstraintsInfoFUCHSIA-bufferCollectionConstraints-parameter
  `bufferCollectionConstraints` **must** be a valid VkBufferCollectionConstraintsInfoFUCHSIA structure
- VUID-VkImageConstraintsInfoFUCHSIA-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkImageConstraintsInfoFlagBitsFUCHSIA values
- VUID-VkImageConstraintsInfoFUCHSIA-formatConstraintsCount-arraylength
  `formatConstraintsCount` **must** be greater than `0`

```
// Provided by VK_FUCHSIA_buffer_collection
typedef VkFlags VkImageConstraintsInfoFlagsFUCHSIA;
```

`VkImageConstraintsInfoFlagsFUCHSIA` is a bitmask type for setting a mask of zero or more VkImageConstraintsInfoFlagBitsFUCHSIA bits.

Bits which **can** be set in VkImageConstraintsInfoFUCHSIA::`flags` include:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef enum VkImageConstraintsInfoFlagBitsFUCHSIA {
    VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_RARELY_FUCHSIA = 0x00000001,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_OFTEN_FUCHSIA = 0x00000002,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_RARELY_FUCHSIA = 0x00000004,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_OFTEN_FUCHSIA = 0x00000008,
    VK_IMAGE_CONSTRAINTS_INFO_PROTECTED_OPTIONAL_FUCHSIA = 0x00000010,
} VkImageConstraintsInfoFlagBitsFUCHSIA;
```

General hints about the type of memory that should be allocated by Sysmem based on the expected usage of the images in the buffer collection include:

- VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_RARELY_FUCHSIA
- VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_OFTEN_FUCHSIA
- VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_RARELY_FUCHSIA
- VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_OFTEN_FUCHSIA

For protected memory:

- VK_IMAGE_CONSTRAINTS_INFO_PROTECTED_OPTIONAL_FUCHSIA specifies that protected memory is optional for the buffer collection.

Note that if all participants in the buffer collection (Vulkan or otherwise) specify that protected memory is optional, Sysmem will not allocate protected memory.

The `VkImageFormatConstraintsInfoFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImageFormatConstraintsInfoFUCHSIA {
    VkStructureType                           sType;
    const void*                               pNext;
    VkImageCreateInfo                         imageCreateInfo;
    VkFormatFeatureFlags                      requiredFormatFeatures;
    VkImageFormatConstraintsFlagsFUCHSIA      flags;
    uint64_t                                  sysmemPixelFormat;
    uint32_t                                  colorSpaceCount;
    const VkSysmemColorSpaceFUCHSIA*          pColorSpaces;
} VkImageFormatConstraintsInfoFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `imageCreateInfo` is the VkImageCreateInfo used to create a VkImage that is to use memory from the VkBufferCollectionFUCHSIA
- `requiredFormatFeatures` is a bitmask of VkFormatFeatureFlagBits specifying required features of the buffers in the buffer collection
- `flags` is reserved for future use
- `sysmemPixelFormat` is a `PixelFormatType` value from the `fuchsia.sysmem/image_formats.fidl` FIDL interface
- `colorSpaceCount` is the element count of `pColorSpaces`
- `pColorSpaces` is a pointer to an array of VkSysmemColorSpaceFUCHSIA structs of size `colorSpaceCount`

Valid Usage (Implicit)

- VUID-VkImageFormatConstraintsInfoFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_FORMAT_CONSTRAINTS_INFO_FUCHSIA
- VUID-VkImageFormatConstraintsInfoFUCHSIA-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkImageFormatConstraintsInfoFUCHSIA-imageCreateInfo-parameter
  `imageCreateInfo` **must** be a valid VkImageCreateInfo structure
- VUID-VkImageFormatConstraintsInfoFUCHSIA-requiredFormatFeatures-parameter
  `requiredFormatFeatures` **must** be a valid combination of VkFormatFeatureFlagBits values
- VUID-VkImageFormatConstraintsInfoFUCHSIA-flags-zerobitmask
  `flags` **must** be `0`
- VUID-VkImageFormatConstraintsInfoFUCHSIA-pColorSpaces-parameter
  `pColorSpaces` **must** be a valid pointer to an array of `colorSpaceCount` valid VkSysmemColorSpaceFUCHSIA structures
- VUID-VkImageFormatConstraintsInfoFUCHSIA-colorSpaceCount-arraylength
  `colorSpaceCount` **must** be greater than `0`

```
// Provided by VK_FUCHSIA_buffer_collection
typedef VkFlags VkImageFormatConstraintsFlagsFUCHSIA;
```

`VkImageFormatConstraintsFlagsFUCHSIA` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkBufferCollectionConstraintsInfoFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionConstraintsInfoFUCHSIA {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           minBufferCount;
    uint32_t           maxBufferCount;
    uint32_t           minBufferCountForCamping;
    uint32_t           minBufferCountForDedicatedSlack;
    uint32_t           minBufferCountForSharedSlack;
} VkBufferCollectionConstraintsInfoFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `minBufferCount` is the minimum number of buffers available in the collection
- `maxBufferCount` is the maximum number of buffers allowed in the collection
- `minBufferCountForCamping` is the per-participant minimum buffers for camping
- `minBufferCountForDedicatedSlack` is the per-participant minimum buffers for dedicated slack
- `minBufferCountForSharedSlack` is the per-participant minimum buffers for shared slack

Sysmem uses all buffer count parameters in combination to determine the number of buffers it will allocate. Sysmem defines buffer count constraints in `fuchsia.sysmem/constraints.fidl`.

Camping as referred to by `minBufferCountForCamping`, is the number of buffers that should be available for the participant that are not for transient use. This number of buffers is required for the participant to logically operate.

Slack as referred to by `minBufferCountForDedicatedSlack` and `minBufferCountForSharedSlack`, refers to the number of buffers desired by participants for optimal performance. `minBufferCountForDedicatedSlack` refers to the current participant. `minBufferCountForSharedSlack` refers to buffer slack for all participants in the collection.

Valid Usage (Implicit)

- VUID-VkBufferCollectionConstraintsInfoFUCHSIA-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CONSTRAINTS_INFO_FUCHSIA`

- VUID-VkBufferCollectionConstraintsInfoFUCHSIA-pNext-pNext
  `pNext` **must** be `NULL`

The `VkSysmemColorSpaceFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkSysmemColorSpaceFUCHSIA {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           colorSpace;
} VkSysmemColorSpaceFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `colorSpace` is the value of the Sysmem `ColorSpaceType`

Valid Usage

- VUID-VkSysmemColorSpaceFUCHSIA-colorSpace-06402
  `colorSpace` **must** be a `ColorSpaceType` as defined in `fuchsia.sysmem/image_formats.fidl`

Valid Usage (Implicit)

- VUID-VkSysmemColorSpaceFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SYSMEM_COLOR_SPACE_FUCHSIA
- VUID-VkSysmemColorSpaceFUCHSIA-pNext-pNext
  `pNext` **must** be `NULL`

Set Buffer-Based Buffer Collection Constraints

To set the constraints on a VkBuffer buffer collection, call:

```
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkSetBufferCollectionBufferConstraintsFUCHSIA(
    VkDevice                                    device,
    VkBufferCollectionFUCHSIA                   collection,
    const VkBufferConstraintsInfoFUCHSIA*       pBufferConstraintsInfo);
```

- `device` is the logical device
- `collection` is the VkBufferCollectionFUCHSIA handle
- `pBufferConstraintsInfo` is a pointer to a VkBufferConstraintsInfoFUCHSIA structure

`vkSetBufferCollectionBufferConstraintsFUCHSIA` **may** fail if the implementation does not support the constraints specified in the `bufferCollectionConstraints` structure. If that occurs, vkSetBufferCollectionBufferConstraintsFUCHSIA will return VK_ERROR_FORMAT_NOT_SUPPORTED.

Valid Usage

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-06403
  `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA` **must** not have already been called on `collection`

Valid Usage (Implicit)

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-parameter
  `collection` **must** be a valid VkBufferCollectionFUCHSIA handle
- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-pBufferConstraintsInfo-parameter
  `pBufferConstraintsInfo` **must** be a valid pointer to a valid VkBufferConstraintsInfoFUCHSIA structure
- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-parent
  `collection` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_FORMAT_NOT_SUPPORTED
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkBufferConstraintsInfoFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferConstraintsInfoFUCHSIA {
    VkStructureType                               sType;
    const void*                                   pNext;
    VkBufferCreateInfo                            createInfo;
    VkFormatFeatureFlags                          requiredFormatFeatures;
    VkBufferCollectionConstraintsInfoFUCHSIA      bufferCollectionConstraints;
} VkBufferConstraintsInfoFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `createInfo` is a pointer to a VkBufferCreateInfo struct describing the buffer attributes for the buffer collection
- `requiredFormatFeatures` is a bitmask of VkFormatFeatureFlagBits required features of the buffers in the buffer collection
- `bufferCollectionConstraints` is used to supply parameters for the negotiation and allocation of the buffer collection

Valid Usage

- VUID-VkBufferConstraintsInfoFUCHSIA-requiredFormatFeatures-06404
  The `requiredFormatFeatures` bitmask of VkFormatFeatureFlagBits **must** be chosen from among the buffer compatible format features listed in buffer compatible format features

Valid Usage (Implicit)

- VUID-VkBufferConstraintsInfoFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BUFFER_CONSTRAINTS_INFO_FUCHSIA
- VUID-VkBufferConstraintsInfoFUCHSIA-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkBufferConstraintsInfoFUCHSIA-createInfo-parameter
  `createInfo` **must** be a valid VkBufferCreateInfo structure
- VUID-VkBufferConstraintsInfoFUCHSIA-requiredFormatFeatures-parameter
  If `requiredFormatFeatures` is not `0`, `requiredFormatFeatures` **must** be a valid combination of VkFormatFeatureFlagBits values
- VUID-VkBufferConstraintsInfoFUCHSIA-bufferCollectionConstraints-parameter
  `bufferCollectionConstraints` **must** be a valid VkBufferCollectionConstraintsInfoFUCHSIA structure

12.12.5. Retrieve Buffer Collection Properties

After constraints have been set on the buffer collection by calling

vkSetBufferCollectionImageConstraintsFUCHSIA or vkSetBufferCollectionBufferConstraintsFUCHSIA, call vkGetBufferCollectionPropertiesFUCHSIA to retrieve the negotiated and finalized properties of the buffer collection.

The call to vkGetBufferCollectionPropertiesFUCHSIA is synchronous. It waits for the Sysmem format negotiation and buffer collection allocation to complete before returning.

```
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkGetBufferCollectionPropertiesFUCHSIA(
    VkDevice                                    device,
    VkBufferCollectionFUCHSIA                   collection,
    VkBufferCollectionPropertiesFUCHSIA*        pProperties);
```

- device is the logical device handle
- collection is the VkBufferCollectionFUCHSIA handle
- pProperties is a pointer to the retrieved VkBufferCollectionPropertiesFUCHSIA struct

For image-based buffer collections, upon calling vkGetBufferCollectionPropertiesFUCHSIA, Sysmem will choose an element of the VkImageConstraintsInfoFUCHSIA::pFormatConstraints established by the preceding call to vkSetBufferCollectionImageConstraintsFUCHSIA. The index of the element chosen is stored in and can be retrieved from VkBufferCollectionPropertiesFUCHSIA ::createInfoIndex.

For buffer-based buffer collections, a single VkBufferCreateInfo is specified as VkBufferConstraintsInfoFUCHSIA::createInfo. VkBufferCollectionPropertiesFUCHSIA ::createInfoIndex will therefore always be zero.

vkGetBufferCollectionPropertiesFUCHSIA **may** fail if Sysmem is unable to resolve the constraints of all of the participants in the buffer collection. If that occurs, vkGetBufferCollectionPropertiesFUCHSIA will return VK_ERROR_INITIALIZATION_FAILED.

Valid Usage

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-None-06405
  Prior to calling vkGetBufferCollectionPropertiesFUCHSIA, the constraints on the buffer collection **must** have been set by either vkSetBufferCollectionImageConstraintsFUCHSIA or vkSetBufferCollectionBufferConstraintsFUCHSIA

Valid Usage (Implicit)

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetBufferCollectionPropertiesFUCHSIA-collection-parameter
  collection **must** be a valid VkBufferCollectionFUCHSIA handle
- VUID-vkGetBufferCollectionPropertiesFUCHSIA-pProperties-parameter

`pProperties` **must** be a valid pointer to a VkBufferCollectionPropertiesFUCHSIA structure

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-collection-parent
`collection` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkBufferCollectionPropertiesFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionPropertiesFUCHSIA {
    VkStructureType                 sType;
    void*                           pNext;
    uint32_t                        memoryTypeBits;
    uint32_t                        bufferCount;
    uint32_t                        createInfoIndex;
    uint64_t                        sysmemPixelFormat;
    VkFormatFeatureFlags            formatFeatures;
    VkSysmemColorSpaceFUCHSIA       sysmemColorSpaceIndex;
    VkComponentMapping              samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion   suggestedYcbcrModel;
    VkSamplerYcbcrRange             suggestedYcbcrRange;
    VkChromaLocation                suggestedXChromaOffset;
    VkChromaLocation                suggestedYChromaOffset;
} VkBufferCollectionPropertiesFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the buffer collection can be imported as buffer collection
- `bufferCount` is the number of buffers in the collection
- `createInfoIndex` as described in Sysmem chosen create infos
- `sysmemPixelFormat` is the Sysmem `PixelFormatType` as defined in `fuchsia.sysmem/image_formats.fidl`
- `formatFeatures` is a bitmask of VkFormatFeatureFlagBits shared by the buffer collection

- `sysmemColorSpaceIndex` is a VkSysmemColorSpaceFUCHSIA struct specifying the color space
- `samplerYcbcrConversionComponents` is a VkComponentMapping structure specifying the component mapping
- `suggestedYcbcrModel` is a VkSamplerYcbcrModelConversion value specifying the suggested $Y'C_BC_R$ model
- `suggestedYcbcrRange` is a VkSamplerYcbcrRange value specifying the suggested $Y'C_BC_R$ range
- `suggestedXChromaOffset` is a VkChromaLocation value specifying the suggested X chroma offset
- `suggestedYChromaOffset` is a VkChromaLocation value specifying the suggested Y chroma offset

`sysmemColorSpace` is only set for image-based buffer collections where the constraints were specified using VkImageConstraintsInfoFUCHSIA in a call to vkSetBufferCollectionImageConstraintsFUCHSIA.

For image-based buffer collections, `createInfoIndex` will identify both the VkImageConstraintsInfoFUCHSIA::`pImageCreateInfos` element and the VkImageConstraintsInfoFUCHSIA::`pFormatConstraints` element chosen by Sysmem when vkSetBufferCollectionImageConstraintsFUCHSIA was called. The value of `sysmemColorSpaceIndex` will be an index to one of the color spaces provided in the VkImageFormatConstraintsInfoFUCHSIA ::`pColorSpaces` array.

The implementation **must** have `formatFeatures` with all bits set that were set in VkImageFormatConstraintsInfoFUCHSIA::`requiredFormatFeatures`, by the call to vkSetBufferCollectionImageConstraintsFUCHSIA, at `createInfoIndex` (other bits could be set as well).

Valid Usage (Implicit)

- VUID-VkBufferCollectionPropertiesFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_BUFFER_COLLECTION_PROPERTIES_FUCHSIA
- VUID-VkBufferCollectionPropertiesFUCHSIA-pNext-pNext
  `pNext` **must** be `NULL`

12.12.6. Memory Allocation

To import memory from a buffer collection into a VkImage or a VkBuffer, chain a VkImportMemoryBufferCollectionFUCHSIA structure to the `pNext` member of the VkMemoryAllocateInfo in the call to vkAllocateMemory.

The `VkImportMemoryBufferCollectionFUCHSIA` structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImportMemoryBufferCollectionFUCHSIA {
    VkStructureType             sType;
    const void*                 pNext;
    VkBufferCollectionFUCHSIA   collection;
    uint32_t                    index;
} VkImportMemoryBufferCollectionFUCHSIA;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `collection` is the VkBufferCollectionFUCHSIA handle
- `index` is the index of the buffer to import from `collection`

Valid Usage

- VUID-VkImportMemoryBufferCollectionFUCHSIA-index-06406
  `index` **must** be less than the value retrieved as VkBufferCollectionPropertiesFUCHSIA ::`bufferCount`

Valid Usage (Implicit)

- VUID-VkImportMemoryBufferCollectionFUCHSIA-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMPORT_MEMORY_BUFFER_COLLECTION_FUCHSIA
- VUID-VkImportMemoryBufferCollectionFUCHSIA-collection-parameter
  `collection` **must** be a valid VkBufferCollectionFUCHSIA handle

Structure Chaining

Extends the structure

- VkMemoryAllocateInfo

To release a VkBufferCollectionFUCHSIA:

```
// Provided by VK_FUCHSIA_buffer_collection
void vkDestroyBufferCollectionFUCHSIA(
    VkDevice                                    device,
    VkBufferCollectionFUCHSIA                   collection,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that creates the `VkBufferCollectionFUCHSIA`
- `collection` is the VkBufferCollectionFUCHSIA handle
- `pAllocator` is a pointer to a VkAllocationCallbacks structure controlling host memory allocation as described in the Memory Allocation chapter

Valid Usage

- VUID-vkDestroyBufferCollectionFUCHSIA-collection-06407
  VkImage and VkBuffer objects that referenced `collection` upon creation by inclusion of a VkBufferCollectionImageCreateInfoFUCHSIA or

VkBufferCollectionBufferCreateInfoFUCHSIA chained to their VkImageCreateInfo or VkBufferCreateInfo structures respectively, **may** outlive `collection`

Valid Usage (Implicit)

- VUID-vkDestroyBufferCollectionFUCHSIA-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyBufferCollectionFUCHSIA-collection-parameter
  `collection` **must** be a valid VkBufferCollectionFUCHSIA handle
- VUID-vkDestroyBufferCollectionFUCHSIA-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyBufferCollectionFUCHSIA-collection-parent
  `collection` **must** have been created, allocated, or retrieved from `device`

12.13. Tensors

Tensors are similar to images, in that they have multi-dimensional access as documented in the Tensor Operations chapter, but a tensor's dimensions are not predefined. A tensor can have an arbitrary number of dimensions, up to `maxTensorDimensionCount`, with one index per dimension used to access the tensor.

Tensors **can** be used by binding them to pipelines via descriptor sets, or by directly specifying them as parameters to certain commands.

Tensors are represented by `VkTensorARM` handles:

```
// Provided by VK_EXT_descriptor_heap, VK_ARM_tensors
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkTensorARM)
```

To create tensors, call:

```
// Provided by VK_ARM_tensors
VkResult vkCreateTensorARM(
    VkDevice                                    device,
    const VkTensorCreateInfoARM*                pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkTensorARM*                                pTensor);
```

- `device` is the logical device that creates the tensor.
- `pCreateInfo` is a pointer to a VkTensorCreateInfoARM structure containing parameters to be used to create the tensor.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

- `pTensor` is a pointer to a VkTensorARM handle in which the resulting tensor object is returned.

Valid Usage

- VUID-vkCreateTensorARM-tensors-09832
  The `tensors` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateTensorARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateTensorARM-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkTensorCreateInfoARM structure
- VUID-vkCreateTensorARM-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateTensorARM-pTensor-parameter
  `pTensor` **must** be a valid pointer to a VkTensorARM handle
- VUID-vkCreateTensorARM-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkTensorCreateInfoARM structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkTensorCreateInfoARM {
    VkStructureType                  sType;
    const void*                      pNext;
    VkTensorCreateFlagsARM           flags;
    const VkTensorDescriptionARM*    pDescription;
    VkSharingMode                    sharingMode;
    uint32_t                         queueFamilyIndexCount;
    const uint32_t*                  pQueueFamilyIndices;
} VkTensorCreateInfoARM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkTensorCreateFlagBitsARM describing additional parameters of the tensor.
- `pDescription` is a pointer to an instance of VkTensorDescriptionARM describing the tensor.
- `sharingMode` is a VkSharingMode value specifying the sharing mode of the tensor when it will be accessed by multiple queue families.
- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a list of queue families that will access this tensor (ignored if `sharingMode` is not VK_SHARING_MODE_CONCURRENT).

To determine the set of valid `usage` bits for a given tensor format, call vkGetPhysicalDeviceFormatProperties2 with VkTensorFormatPropertiesARM in the `pNext` chain.

Tensor Creation Limits

Valid values for some tensor creation parameters are limited by a numerical upper bound or by inclusion in a bitset.

Several limiting values are defined below. The limiting values are referenced by the relevant valid usage statements of `VkTensorCreateInfoARM`.

- Let the uint64_t tensorElements define the number of data elements in the tensor computed as the product of all `VkTensorCreateInfoARM`::`pDescription->pDimensions`[i] for i between 0 and `VkTensorCreateInfoARM`::`pDescription->dimensionCount` - 1.

Valid Usage

- VUID-VkTensorCreateInfoARM-pDescription-09720
  If `pDescription->tiling` is VK_TENSOR_TILING_OPTIMAL_ARM, `pDescription->pStrides` **must** be `NULL`
- VUID-VkTensorCreateInfoARM-tensorElements-09721
  `tensorElements` (as defined in Tensor Creation Limits) **must** not be greater than

VkPhysicalDeviceTensorPropertiesARM::maxTensorElements

- VUID-VkTensorCreateInfoARM-sharingMode-09722
  If sharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices **must** be a valid pointer to an array of queueFamilyIndexCount uint32_t values
- VUID-VkTensorCreateInfoARM-maintenance11-13358
  If the maintenance11 feature is enabled and sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount **must** be greater than 0
- VUID-VkTensorCreateInfoARM-sharingMode-09723
  If the maintenance11 feature is not enabled and sharingMode is VK_SHARING_MODE_CONCURRENT, then queueFamilyIndexCount **must** be greater than 1
- VUID-VkTensorCreateInfoARM-sharingMode-09725
  If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices **must** be unique and **must** be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device
- VUID-VkTensorCreateInfoARM-pNext-09864
  If the pNext chain includes a VkExternalMemoryTensorCreateInfoARM structure, its handleTypes member **must** only contain bits that are also in VkExternalTensorPropertiesARM::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceExternalTensorPropertiesARM with pExternalTensorInfo->handleType equal to any one of the handle types specified in VkExternalMemoryTensorCreateInfoARM::handleTypes
- VUID-VkTensorCreateInfoARM-flags-09726
  If flags includes VK_TENSOR_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM, the descriptorBufferCaptureReplay feature **must** be enabled
- VUID-VkTensorCreateInfoARM-pNext-09727
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, flags **must** contain VK_TENSOR_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM
- VUID-VkTensorCreateInfoARM-pDescription-09728
  If pDescription->usage does not have any of the following bits set (i.e. if it is not possible to create a tensor view for this tensor), then the format features **must** contain the format feature flags required by the usage flags for pDescription->format as indicated in the Format Feature Dependent Usage Flags section
  - VK_TENSOR_USAGE_SHADER_BIT_ARM
  - VK_TENSOR_USAGE_DATA_GRAPH_BIT_ARM
- VUID-VkTensorCreateInfoARM-protectedMemory-09729
  If the protectedMemory feature is not enabled, flags **must** not contain VK_TENSOR_CREATE_PROTECTED_BIT_ARM
- VUID-VkTensorCreateInfoARM-flags-11395
  If VkOpaqueCaptureDataCreateInfoEXT::pData is not NULL, flags **must** contain

VK_TENSOR_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_ARM

- VUID-VkTensorCreateInfoARM-flags-11396
  If `flags` contains VK_TENSOR_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_ARM, VkOpaqueCaptureDataCreateInfoEXT::`pData->size` **must** be equal to `tensorCaptureReplayOpaqueDataSize`
- VUID-VkTensorCreateInfoARM-pNext-09833
  If a VkTensorRollingBackingCreateInfoARM structure is included in the `pNext` chain of VkTensorCreateInfoARM, then `pDescription->tiling` **must** be VK_TENSOR_TILING_LINEAR_ARM, VK_TENSOR_TILING_BRICK_16_WIDE_ARM, VK_TENSOR_TILING_BRICK_8_WIDE_ARM, or VK_TENSOR_TILING_BRICK_4_WIDE_ARM
- VUID-VkTensorCreateInfoARM-pNext-09834
  If a VkTensorRollingBackingCreateInfoARM structure is included in the `pNext` chain of VkTensorCreateInfoARM, then `pDescription->dimensionCount` **must** be less than or equal to `4`

Valid Usage (Implicit)

- VUID-VkTensorCreateInfoARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_TENSOR_CREATE_INFO_ARM
- VUID-VkTensorCreateInfoARM-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkExternalMemoryTensorCreateInfoARM, VkOpaqueCaptureDataCreateInfoEXT, VkOpaqueCaptureDescriptorDataCreateInfoEXT, or VkTensorRollingBackingCreateInfoARM
- VUID-VkTensorCreateInfoARM-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkTensorCreateInfoARM-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkTensorCreateFlagBitsARM values
- VUID-VkTensorCreateInfoARM-pDescription-parameter
  `pDescription` **must** be a valid pointer to a valid VkTensorDescriptionARM structure
- VUID-VkTensorCreateInfoARM-sharingMode-parameter
  `sharingMode` **must** be a valid VkSharingMode value

Bits which **can** be set in VkTensorCreateInfoARM::`flags`, specifying additional parameters of a tensor, are:

```
// Provided by VK_ARM_tensors
// Flag bits for VkTensorCreateFlagBitsARM
typedef VkFlags64 VkTensorCreateFlagBitsARM;
static const VkTensorCreateFlagBitsARM VK_TENSOR_CREATE_MUTABLE_FORMAT_BIT_ARM =
0x00000001ULL;
static const VkTensorCreateFlagBitsARM VK_TENSOR_CREATE_PROTECTED_BIT_ARM =
0x00000002ULL;
// Provided by VK_EXT_descriptor_heap with VK_ARM_tensors
static const VkTensorCreateFlagBitsARM
VK_TENSOR_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_ARM = 0x00000008ULL;
// Provided by VK_EXT_descriptor_buffer with VK_ARM_tensors
static const VkTensorCreateFlagBitsARM
VK_TENSOR_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM = 0x00000004ULL;
```

- VK_TENSOR_CREATE_MUTABLE_FORMAT_BIT_ARM specifies that the tensor **can** be used to create a VkTensorViewARM with a different format from the tensor.
- VK_TENSOR_CREATE_PROTECTED_BIT_ARM specifies that the tensor is a protected tensor.
- VK_TENSOR_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM specifies that the tensor **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.

```
// Provided by VK_ARM_tensors
typedef VkFlags64 VkTensorCreateFlagsARM;
```

VkTensorCreateFlagsARM is a bitmask type for setting a mask of zero or more VkTensorCreateFlagBitsARM.

To define a set of external memory handle types that **may** be used as backing store for a tensor, add a VkExternalMemoryTensorCreateInfoARM structure to the pNext chain of the VkTensorCreateInfoARM structure.

The VkExternalMemoryTensorCreateInfoARM structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkExternalMemoryTensorCreateInfoARM {
    VkStructureType                    sType;
    const void*                        pNext;
    VkExternalMemoryHandleTypeFlags    handleTypes;
} VkExternalMemoryTensorCreateInfoARM;
```

NOTE A VkExternalMemoryTensorCreateInfoARM structure with a non-zero handleTypes field must be included in the creation parameters for a tensor that will be bound to memory that is either exported or imported.

- sType is a VkStructureType value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of VkExternalMemoryHandleTypeFlagBits specifying one or more external memory handle types.

Valid Usage (Implicit)

- VUID-VkExternalMemoryTensorCreateInfoARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_TENSOR_CREATE_INFO_ARM
- VUID-VkExternalMemoryTensorCreateInfoARM-handleTypes-parameter
  If `handleTypes` is not `0`, `handleTypes` **must** be a valid combination of VkExternalMemoryHandleTypeFlagBits values

Structure Chaining

Extends the structure

- VkTensorCreateInfoARM

To create a tensor for which only a rolling window is backed by memory, add a VkTensorRollingBackingCreateInfoARM structure to the `pNext` chain of the VkTensorCreateInfoARM structure.

The VkTensorRollingBackingCreateInfoARM structure is defined as:

```
// Provided by VK_ARM_tensor_controls
typedef struct VkTensorRollingBackingCreateInfoARM {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           wraps[
VK_MAX_TENSOR_CREATE_INFO_ROLLING_BACKING_WRAP_COUNT_ARM];
} VkTensorRollingBackingCreateInfoARM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `wraps` is an array of VK_MAX_TENSOR_CREATE_INFO_ROLLING_BACKING_WRAP_COUNT_ARM 32-bit integers specifying the size of the rolling window for the tensor along each of its dimensions.

Rolling backing common parameters

Valid values for some rolling backing creation parameters are calculated from others that are a function of tensor creation parameters. To improve the readability of Valid Usage rules for VkTensorRollingBackingCreateInfoARM, these latter values are defined once in this inset.

- Let uint32_t `brickOuterSize` define the size of a brick along its outermost dimension.

- If VkTensorDescriptionARM::tiling is VK_TENSOR_TILING_BRICK_16_WIDE_ARM, then brickOuterSize = 16.
- If VkTensorDescriptionARM::tiling is VK_TENSOR_TILING_BRICK_8_WIDE_ARM, then brickOuterSize = 8.
- If VkTensorDescriptionARM::tiling is VK_TENSOR_TILING_BRICK_4_WIDE_ARM, then brickOuterSize = 4.
- Otherwise, brickOuterSize = 1.

- Let uint32_t elementSize define the size of individual elements of the tensor.

Valid Usage

- VUID-VkTensorRollingBackingCreateInfoARM-wraps-09835
  For each i where i < VkTensorDescriptionARM::dimensionCount, wraps[i] **must** be less than or equal to VkTensorDescriptionARM::pDimensions[i]
- VUID-VkTensorRollingBackingCreateInfoARM-wraps-09836
  For each i where i < VkTensorDescriptionARM::dimensionCount, wraps[i] **must** either be equal to VkTensorDescriptionARM::pDimensions[i] or **must** be less than 2^16
- VUID-VkTensorRollingBackingCreateInfoARM-wraps-09837
  For each i where i < VkTensorDescriptionARM::dimensionCount, if wraps[i] is not equal to VkTensorDescriptionARM::pDimensions[i] and one element wraps[j] with j < i is not a power of two, then wraps[i] **must** be a power of two
- VUID-VkTensorRollingBackingCreateInfoARM-wraps-09838
  If VkTensorDescriptionARM::dimensionCount is greater than 1, then wraps[dimensionCount - 2] **must** be a multiple of brickOuterSize or **must** be equal to VkTensorDescriptionARM::pDimensions[dimensionCount - 2]
- VUID-VkTensorRollingBackingCreateInfoARM-wraps-09839
  If brickOuterSize is not equal to 1, then wraps[dimensionCount - 1] **must** be a multiple of 64 / brickOuterSize / elementSize or be equal to VkTensorDescriptionARM::pDimensions[dimensionCount - 1]

Valid Usage (Implicit)

- VUID-VkTensorRollingBackingCreateInfoARM-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_TENSOR_ROLLING_BACKING_CREATE_INFO_ARM

Structure Chaining

Extends the structure

- VkTensorCreateInfoARM

VK_MAX_TENSOR_CREATE_INFO_ROLLING_BACKING_WRAP_COUNT_ARM is the maximum

number of tensor rolling backing wraps.

```
#define VK_MAX_TENSOR_CREATE_INFO_ROLLING_BACKING_WRAP_COUNT_ARM 4U
```

To destroy a tensor, call:

```
// Provided by VK_ARM_tensors
void vkDestroyTensorARM(
    VkDevice                                    device,
    VkTensorARM                                 tensor,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the tensor.
- `tensor` is the tensor to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyTensorARM-tensor-09730
  All submitted commands that refer to `tensor`, either directly or via a `VkTensorViewARM`, **must** have completed execution
- VUID-vkDestroyTensorARM-tensor-09731
  If `VkAllocationCallbacks` were provided when `tensor` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyTensorARM-tensor-09732
  If no `VkAllocationCallbacks` were provided when `tensor` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyTensorARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyTensorARM-tensor-parameter
  If `tensor` is not VK_NULL_HANDLE, `tensor` **must** be a valid VkTensorARM handle
- VUID-vkDestroyTensorARM-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyTensorARM-tensor-parent
  If `tensor` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `tensor` **must** be externally synchronized

12.13.1. Tensor Description

The `VkTensorDescriptionARM` structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkTensorDescriptionARM {
    VkStructureType          sType;
    const void*              pNext;
    VkTensorTilingARM        tiling;
    VkFormat                 format;
    uint32_t                 dimensionCount;
    const int64_t*           pDimensions;
    const int64_t*           pStrides;
    VkTensorUsageFlagsARM    usage;
} VkTensorDescriptionARM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tiling` is a VkTensorTilingARM value specifying the tiling of the tensor.
- `format` is a one component VkFormat describing the format and type of the data elements that will be contained in the tensor.
- `dimensionCount` is the number of dimensions for the tensor.
- `pDimensions` is a pointer to an array of integers of size `dimensionCount` providing the number of data elements in each dimension.
- `pStrides` is either `NULL` or is an array of size `dimensionCount` providing the strides in bytes for the tensor in each dimension.
- `usage` is a bitmask of VkTensorUsageFlagBitsARM specifying the usage of the tensor.

When describing a tensor created with VK_TENSOR_TILING_OPTIMAL_ARM, `pStrides` must be equal to `NULL`. When describing a tensor created with VK_TENSOR_TILING_LINEAR_ARM, `pStrides` is either an array of size `dimensionCount` or `NULL`.

The formats that **must** be supported for `format` are documented in Mandatory tensor format support.

Each element in the `pStrides` array describes the offset in bytes between increments of the given dimension. For example, `pStrides`[0] describes the offset between element [x0,x1,x2,x3] and element [x0+1,x1,x2,x3]. The `pStrides` array **can** be used to determine whether a tensor is *packed* or not. If `pStrides`[`dimensionCount`-1] is equal to the size of a tensor element and for each dimension `n` greater than 0 and less than `dimensionCount`, `pStrides`[n-1] is equal to `pStrides`[n] * `pDimensions`[n],

then the tensor is a packed tensor. If the tensorNonPacked feature is not enabled, the tensor **must** be a packed tensor.

When a tensor is created with VK_TENSOR_TILING_LINEAR_ARM and pStrides equal to NULL the tensor strides are calculated by the Vulkan implementation such that the resulting tensor is a packed tensor.

Expressed as an addressing formula, the starting byte of an element in a 4-dimensional, for example, linear tensor has address:

```
// Assume (x0,x1,x2,x3) are in units of elements.

address(x0,x1,x2,x3) = x0*pStrides[0] + x1*pStrides[1] + x2*pStrides[2] + x3*pStrides
[3]
```

Valid Usage

- VUID-VkTensorDescriptionARM-dimensionCount-09733
  dimensionCount **must** be less than or equal to VkPhysicalDeviceTensorPropertiesARM::maxTensorDimensionCount
- VUID-VkTensorDescriptionARM-pDimensions-09734
  For each i where i ≤ dimensionCount-1, pDimensions[i] **must** be greater than 0
- VUID-VkTensorDescriptionARM-pDimensions-09883
  For each i where i ≤ dimensionCount-1, pDimensions[i] **must** be less than or equal to VkPhysicalDeviceTensorPropertiesARM::maxPerDimensionTensorElements
- VUID-VkTensorDescriptionARM-format-09735
  format **must** not be VK_FORMAT_UNDEFINED and **must** be a one-component VkFormat
- VUID-VkTensorDescriptionARM-pStrides-09736
  pStrides[dimensionCount-1] **must** equal the size in bytes of a tensor element
- VUID-VkTensorDescriptionARM-pStrides-09737
  For each i, pStrides[i] **must** be a multiple of the element size
- VUID-VkTensorDescriptionARM-pStrides-09738
  For each i, pStrides[i] **must** be greater than 0 and less than or equal to VkPhysicalDeviceTensorPropertiesARM::maxTensorStride
- VUID-VkTensorDescriptionARM-pStrides-09884
  pStrides[0] × pDimensions[0] **must** be less than or equal to VkPhysicalDeviceTensorPropertiesARM::maxTensorSize
- VUID-VkTensorDescriptionARM-pStrides-09739
  For each i greater than 0, pStrides[i-1] **must** be greater than or equal to pStrides[i] × pDimensions[i] so that no two elements of the tensor reference the same memory address
- VUID-VkTensorDescriptionARM-None-09740
  If the tensorNonPacked feature is not enabled, then the members of VkTensorDescriptionARM **must** describe a packed tensor

- VUID-VkTensorDescriptionARM-tiling-09741
  If `tiling` is VK_TENSOR_TILING_OPTIMAL_ARM and `usage` is VK_TENSOR_USAGE_IMAGE_ALIASING_BIT_ARM then the size of the tensor along its innermost dimension, i.e. `pDimensions`[`dimensionCount` - 1], **must** be less than or equal to `4`
- VUID-VkTensorDescriptionARM-tiling-09742
  If `tiling` is VK_TENSOR_TILING_LINEAR_ARM then VK_TENSOR_USAGE_IMAGE_ALIASING_BIT_ARM **must** not be set in `usage`
- VUID-VkTensorDescriptionARM-tiling-09842
  If `tiling` is VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_ARM or VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_64K_ARM then `pDimensions`[`dimensionCount` -1] **must** be less than or equal to `4`
- VUID-VkTensorDescriptionARM-tiling-09843
  If `tiling` is VK_TENSOR_TILING_BRICK_16_WIDE_ARM, VK_TENSOR_TILING_BRICK_8_WIDE_ARM, VK_TENSOR_TILING_BRICK_4_WIDE_ARM, VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_ARM, or VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_64K_ARM, then `pStrides` **must** be `NULL`

Valid Usage (Implicit)

- VUID-VkTensorDescriptionARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_TENSOR_DESCRIPTION_ARM
- VUID-VkTensorDescriptionARM-tiling-parameter
  `tiling` **must** be a valid VkTensorTilingARM value
- VUID-VkTensorDescriptionARM-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-VkTensorDescriptionARM-pDimensions-parameter
  `pDimensions` **must** be a valid pointer to an array of `dimensionCount` `int64_t` values
- VUID-VkTensorDescriptionARM-pStrides-parameter
  If `pStrides` is not `NULL`, `pStrides` **must** be a valid pointer to an array of `dimensionCount` `int64_t` values
- VUID-VkTensorDescriptionARM-usage-parameter
  `usage` **must** be a valid combination of VkTensorUsageFlagBitsARM values
- VUID-VkTensorDescriptionARM-dimensionCount-arraylength
  `dimensionCount` **must** be greater than `0`

Structure Chaining

Extends the structures

- VkDataGraphPipelineConstantARM
- VkDataGraphPipelineResourceInfoARM

Bits which **can** be set in VkTensorDescriptionARM::usage, specifying usage behavior of a tensor, are:

```
// Provided by VK_ARM_tensors
// Flag bits for VkTensorUsageFlagBitsARM
typedef VkFlags64 VkTensorUsageFlagBitsARM;
static const VkTensorUsageFlagBitsARM VK_TENSOR_USAGE_SHADER_BIT_ARM = 0x00000002ULL;
static const VkTensorUsageFlagBitsARM VK_TENSOR_USAGE_TRANSFER_SRC_BIT_ARM =
0x00000004ULL;
static const VkTensorUsageFlagBitsARM VK_TENSOR_USAGE_TRANSFER_DST_BIT_ARM =
0x00000008ULL;
static const VkTensorUsageFlagBitsARM VK_TENSOR_USAGE_IMAGE_ALIASING_BIT_ARM =
0x00000010ULL;
// Provided by VK_ARM_data_graph
static const VkTensorUsageFlagBitsARM VK_TENSOR_USAGE_DATA_GRAPH_BIT_ARM =
0x00000020ULL;
```

- VK_TENSOR_USAGE_SHADER_BIT_ARM specifies that the tensor **can** be used to create a VkTensorViewARM suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_TENSOR_ARM accessed by shader stages.
- VK_TENSOR_USAGE_TRANSFER_SRC_BIT_ARM specifies that the tensor **can** be used as the source of a *transfer command* (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT).
- VK_TENSOR_USAGE_TRANSFER_DST_BIT_ARM specifies that the tensor **can** be used as the destination of a transfer command.
- VK_TENSOR_USAGE_IMAGE_ALIASING_BIT_ARM specifies that the tensor **can** be bound to a range of memory aliased with an image created with VK_IMAGE_TILING_OPTIMAL. See Memory Aliasing for a complete set of rules for tensor/image aliasing.
- VK_TENSOR_USAGE_DATA_GRAPH_BIT_ARM specifies that the tensor **can** be used to create a VkTensorViewARM suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_TENSOR_ARM accessed by data graph pipelines.

```
// Provided by VK_ARM_tensors
typedef VkFlags64 VkTensorUsageFlagsARM;
```

VkTensorUsageFlagsARM is a bitmask type for setting a mask of zero or more VkTensorUsageFlagBitsARM.

Possible values of VkTensorDescriptionARM::tiling, specifying the tiling arrangement of elements in the tensor, are:

```
// Provided by VK_ARM_tensors
typedef enum VkTensorTilingARM {
    VK_TENSOR_TILING_OPTIMAL_ARM = 0,
    VK_TENSOR_TILING_LINEAR_ARM = 1,
  // Provided by VK_ARM_tensor_controls
    VK_TENSOR_TILING_BRICK_16_WIDE_ARM = 1000565000,
  // Provided by VK_ARM_tensor_controls
    VK_TENSOR_TILING_BRICK_8_WIDE_ARM = 1000565001,
  // Provided by VK_ARM_tensor_controls
    VK_TENSOR_TILING_BRICK_4_WIDE_ARM = 1000565002,
  // Provided by VK_ARM_tensor_controls
    VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_ARM = 1000565003,
  // Provided by VK_ARM_tensor_controls
    VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_64K_ARM = 1000565004,
} VkTensorTilingARM;
```

- VK_TENSOR_TILING_OPTIMAL_ARM specifies optimal tiling (elements are laid out in an implementation-dependent arrangement, for more efficient memory access).
- VK_TENSOR_TILING_LINEAR_ARM specifies linear tiling (elements are laid out linearly and the offset between each element is determined by the strides of the tensor).
- VK_TENSOR_TILING_BRICK_16_WIDE_ARM specifies that the data is laid out in 64-byte blocks of 16 x N elements where N depends on the size of the elements in the tensor.
- VK_TENSOR_TILING_BRICK_8_WIDE_ARM specifies that the data is laid out in 64-byte blocks of 8 x N elements where N depends on the size of the elements in the tensor.
- VK_TENSOR_TILING_BRICK_4_WIDE_ARM specifies that the data is laid out in 64-byte blocks of 4 x N elements where N depends on the size of the elements in the tensor.
- VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_ARM specifies that the data is laid out using blocks of size 16 x 16 x C where C is the size of the tensor along the innermost dimension.
- VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_64K_ARM specifies that the data is laid out using 64kiB groups of blocks of size 16 x 16 x C, where C is the size of the tensor along the innermost dimension.

12.14. Tensor Views

Tensor objects are not directly accessed by pipelines for reading or writing tensor data. Instead, *tensor views* representing the tensor subresources and containing additional metadata are used for that purpose. Views **must** be created on tensors of compatible types.

Tensor views are represented by VkTensorViewARM handles:

```
// Provided by VK_ARM_tensors
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkTensorViewARM)
```

To create a tensor view, call:

```
// Provided by VK_ARM_tensors
VkResult vkCreateTensorViewARM(
    VkDevice                                    device,
    const VkTensorViewCreateInfoARM*            pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkTensorViewARM*                            pView);
```

- `device` is the logical device that creates the tensor view.
- `pCreateInfo` is a pointer to an instance of the `VkTensorViewCreateInfoARM` structure containing parameters to be used to create the tensor view.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pView` is a pointer to a VkTensorViewARM handle in which the resulting tensor view object is returned.

Some of the tensor creation parameters are inherited by the view. In particular, other than format, the tensor view creation inherits all other parameters from the tensor.

The remaining parameters are contained in `pCreateInfo`.

Valid Usage (Implicit)

- VUID-vkCreateTensorViewARM-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateTensorViewARM-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkTensorViewCreateInfoARM structure
- VUID-vkCreateTensorViewARM-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateTensorViewARM-pView-parameter
  `pView` **must** be a valid pointer to a VkTensorViewARM handle
- VUID-vkCreateTensorViewARM-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN

- VK_ERROR_VALIDATION_FAILED

The VkTensorViewCreateInfoARM structure is defined as:

```
// Provided by VK_EXT_descriptor_heap, VK_ARM_tensors
typedef struct VkTensorViewCreateInfoARM {
    VkStructureType               sType;
    const void*                   pNext;
    VkTensorViewCreateFlagsARM    flags;
    VkTensorARM                   tensor;
    VkFormat                      format;
} VkTensorViewCreateInfoARM;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- tensor is a VkTensorARM on which the view will be created.
- format is a VkFormat describing the format and type used to interpret elements in the tensor.

If tensor was created with the VK_TENSOR_CREATE_MUTABLE_FORMAT_BIT_ARM flag, format **can** be different from the tensor's format, but if they are not equal they **must** be *compatible*. Tensor format compatibility is defined in the Format Compatibility Classes section. Views of compatible formats will have the same mapping between element locations irrespective of the format, with only the interpretation of the bit pattern changing.

NOTE

Values intended to be used with one view format **may** not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating-point denorm or NaN **may** be flushed or canonicalized when written or read through a view with a floating-point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to -2^b **may** be changed to $-2^b + 1$ as described in Conversion from Normalized Fixed-Point to Floating-Point.

Valid Usage

- VUID-VkTensorViewCreateInfoARM-tensor-09743
  If tensor was not created with VK_TENSOR_CREATE_MUTABLE_FORMAT_BIT_ARM flag, format **must** be identical to the format used to create tensor
- VUID-VkTensorViewCreateInfoARM-tensor-09744
  If tensor was created with VK_TENSOR_CREATE_MUTABLE_FORMAT_BIT_ARM flag, format **must** be compatible with the format used to create tensor, as defined in Format Compatibility Classes
- VUID-VkTensorViewCreateInfoARM-flags-09745
  If flags includes

VK_TENSOR_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM, the descriptorBufferCaptureReplay feature **must** be enabled

- VUID-VkTensorViewCreateInfoARM-pNext-09746
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, flags **must** contain VK_TENSOR_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM
- VUID-VkTensorViewCreateInfoARM-usage-09747
  The usage flags of tensor **must** have at least one of the following bits set:
  - VK_TENSOR_USAGE_SHADER_BIT_ARM
  - VK_TENSOR_USAGE_DATA_GRAPH_BIT_ARM
- VUID-VkTensorViewCreateInfoARM-usage-09748
  The tensor view's format features **must** contain the format feature flags required by the usage flags of tensor for format as indicated in the Format Feature Dependent Usage Flags section
- VUID-VkTensorViewCreateInfoARM-tensor-09749
  If tensor is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

Valid Usage (Implicit)

- VUID-VkTensorViewCreateInfoARM-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_TENSOR_VIEW_CREATE_INFO_ARM
- VUID-VkTensorViewCreateInfoARM-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkOpaqueCaptureDescriptorDataCreateInfoEXT
- VUID-VkTensorViewCreateInfoARM-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkTensorViewCreateInfoARM-flags-parameter
  If flags is not 0, flags **must** be a valid combination of VkTensorViewCreateFlagBitsARM values
- VUID-VkTensorViewCreateInfoARM-tensor-parameter
  tensor **must** be a valid VkTensorARM handle
- VUID-VkTensorViewCreateInfoARM-format-parameter
  format **must** be a valid VkFormat value

Bits which **can** be set in VkTensorViewCreateInfoARM::flags, specifying additional parameters of a tensor view, are:

```
// Provided by VK_ARM_tensors
// Flag bits for VkTensorViewCreateFlagBitsARM
typedef VkFlags64 VkTensorViewCreateFlagBitsARM;
// Provided by VK_EXT_descriptor_buffer with VK_ARM_tensors
static const VkTensorViewCreateFlagBitsARM
VK_TENSOR_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM = 0x00000001ULL;
```

- VK_TENSOR_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_ARM specifies that the tensor view **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.

```
// Provided by VK_EXT_descriptor_heap, VK_ARM_tensors
typedef VkFlags64 VkTensorViewCreateFlagsARM;
```

VkTensorViewCreateFlagsARM is a bitmask type for setting a mask of zero or more VkTensorViewCreateFlagBitsARM.

To destroy a tensor view, call:

```
// Provided by VK_ARM_tensors
void vkDestroyTensorViewARM(
    VkDevice                                    device,
    VkTensorViewARM                             tensorView,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the logical device that destroys the tensor view.
- tensorView is the tensor view to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyTensorViewARM-tensorView-09750
  All submitted commands that refer to tensorView **must** have completed execution
- VUID-vkDestroyTensorViewARM-tensorView-09751
  If VkAllocationCallbacks were provided when tensorView was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyTensorViewARM-tensorView-09752
  If no VkAllocationCallbacks were provided when tensorView was created, pAllocator **must** be NULL

Valid Usage (Implicit)

- VUID-vkDestroyTensorViewARM-device-parameter

`device` **must** be a valid VkDevice handle

- VUID-vkDestroyTensorViewARM-tensorView-parameter
  If `tensorView` is not VK_NULL_HANDLE, `tensorView` **must** be a valid VkTensorViewARM handle
- VUID-vkDestroyTensorViewARM-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyTensorViewARM-tensorView-parent
  If `tensorView` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `tensorView` **must** be externally synchronized

12.14.1. Tensor View Format Features

Valid usage of a VkTensorViewARM **may** be constrained by the tensor view's format features, defined below. Such constraints are documented in the affected valid usage statement.

- If the view's tensor was created with VK_TENSOR_TILING_LINEAR_ARM, then the tensor view's set of *format features* is the value of VkTensorFormatPropertiesARM::`linearTilingTensorFeatures` found by calling vkGetPhysicalDeviceFormatProperties2 on the same `format` as VkTensorViewCreateInfoARM::`format`.
- If the view's tensor was created with VK_TENSOR_TILING_OPTIMAL_ARM, then the tensor view's set of *format features* is the value of VkTensorFormatPropertiesARM::`optimalTilingTensorFeatures` found by calling vkGetPhysicalDeviceFormatProperties2 on the same `format` as VkTensorViewCreateInfoARM::`format`.
- If the view's tensor was created with VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_ARM, then the tensor view's set of *format features* is the value of VkTensorExplicitTilingFormatPropertiesARM::`blockUTilingTensorFeatures` found by calling vkGetPhysicalDeviceFormatProperties2 on the same `format` as VkTensorViewCreateInfoARM::`format`.
- If the view's tensor was created with VK_TENSOR_TILING_BLOCK_U_INTERLEAVED_64K_ARM, then the tensor view's set of *format features* is the value of VkTensorExplicitTilingFormatPropertiesARM::`blockU64kTilingTensorFeatures` found by calling vkGetPhysicalDeviceFormatProperties2 on the same `format` as VkTensorViewCreateInfoARM::`format`.
- If the view's tensor was created with VK_TENSOR_TILING_BRICK_4_WIDE_ARM, then the tensor view's set of *format features* is the value of VkTensorExplicitTilingFormatPropertiesARM::`brick4TilingTensorFeatures` found by calling vkGetPhysicalDeviceFormatProperties2 on the same `format` as VkTensorViewCreateInfoARM::`format`.
- If the view's tensor was created with VK_TENSOR_TILING_BRICK_8_WIDE_ARM, then the tensor

view's set of *format features* is the value of VkTensorExplicitTilingFormatPropertiesARM::`brick8TilingTensorFeatures` found by calling vkGetPhysicalDeviceFormatProperties2 on the same `format` as VkTensorViewCreateInfoARM::`format`.

- If the view's tensor was created with VK_TENSOR_TILING_BRICK_16_WIDE_ARM, then the tensor view's set of *format features* is the value of VkTensorExplicitTilingFormatPropertiesARM::`brick16TilingTensorFeatures` found by calling vkGetPhysicalDeviceFormatProperties2 on the same `format` as VkTensorViewCreateInfoARM::`format`.

Chapter 13. Images

Images are specialized resources that have multi-dimensional access rather than the typical linear access to memory. These resources allow implementations to optimize the memory layout for common access patterns, by mapping multi-dimensional coordinates to an implementation-dependent offset in the underlying memory.

Additionally, images are homogeneous, with every discrete coordinate associated with data that is in the same format as the data associated with any other coordinate. Each set of data associated with one of these coordinates is referred to in this specification as a *texel*. A texel can consist of up to 4 separate components, labeled as (R,G,B,A) in this chapter. Each texel block in an image maps to a distinct set of memory locations within the memory they are bound to. Unless otherwise noted by the specification, the mapping from texels to memory is implementation-defined.

NOTE

This terminology is historical; texel is a combination of the words "**tex**ture" and "**el**ement", and (R,G,B,A) are abbreviations for **R**ed, **G**reen, **B**lue, and **A**lpha. Early interactive computer graphics only supported operations that allowed image data to be used to add color "texture" to rendered objects, which is just a small subset of what the image operations on images described here enable. These terms are deeply embedded in the industry, and so are still used here by convention, despite images being used in far more varied ways than they were in the past.

Some image formats identify components as D for **d**epth, S for **s**tencil, or X for padding elements. Image format components identified as D are treated as R, and S components are treated as G for the purpose of image accesses. X components are ignored when reading, and **may** be modified in implementation-dependent ways when writing to that texel.

The coordinates used to identify a texel are six-dimensional, made up of the following integer indices:

- x - The first spatial index
- y - The second spatial index
- z - The third spatial index
- layer - The array index for arrayed images
- sample - The sample index
- level - The detail level

Each image is constructed with a number of texels in each dimension, with the integer size in each dimension for that image identified as:

- width - The number of x indices
- height - The number of y indices
- depth - The number of z indices
- layers - The number of layers
- samples - The number of samples

- levels - The number of detail levels

Of these sizes, the number of levels is somewhat unique - each further level reduces the number of indices in each of the x, y, and z dimensions by half, according to these formulae:

- $width_{level}$ = max(1, ⌊width / 2^{level}⌋)
- $height_{level}$ = max(1, ⌊height / 2^{level}⌋)
- $depth_{level}$ = max(1, ⌊depth / 2^{level}⌋)

An image will have no more than one level where all of the above dimensions are set to 1. See Image Mip Level Sizing for more details.

The Vulkan specification allows the creation of resources with fewer dimensions than this (e.g. texel buffers); these can be considered equivalent to an image with all dimensions specified, with the missing dimensions having a size of 1, and an implicit coordinate value of 0.

These parameters are set for an image during image creation, and are adjusted when accessing an image through an image view.

13.1. Image Coordinate Validation

When accessing an image, a set of (x,y,z,layer,sample,level) coordinates are used to indicate which texel is accessed. These coordinates are first checked to see if they refer to texels within the image dimensions, according to the following equations:

- x < $width_{level}$
- y < $height_{level}$
- z < $depth_{level}$
- layer < layers
- sample < samples
- level < levels

If any of these equations evaluates to false, the coordinate is considered out of bounds, otherwise they are *in bounds*.

13.2. Image Reads

Image reads use a set of (x,y,z,layer,sample,level) coordinates, validated as per Image Coordinate Validation, and return a converted value for the texel at that coordinate. If the coordinates are out of bounds, behavior of the read is as described in Shader Out-of-Bounds Memory Access. If the coordinates are in bounds, but the texel is not backed by memory, behavior of the read is as described in Accessing Unbound Regions. Otherwise, the read proceeds as follows.

13.2.1. Texel Decode

The formatted value of the texel at the (x,y,z,layer,sample,level) coordinate is read and decoded

according to the procedures outlined in the Khronos Data Format Specification.

For sRGB formats, the (R,G,B,A) components are first converted as if they are UNORM formats, and then sRGB to linear conversion is performed on the converted (R,G,B) components, as described in the “sRGB EOTF” section of the Khronos Data Format Specification.

13.2.2. Component Substitution

If after conversion, less than four of the (R,G,B,A) components are present, missing components are substituted by the components of (0,0,0,1) for missing (R,G,B,A) components, respectively.

13.2.3. Numeric Encoding

The values are encoded according to the bit width and numeric format of each component:

- Components with a fixed-point numeric format or with a floating-point numeric format and a bit width less than or equal to 32 are encoded into the IEEE-754 binary32 format.
- Components with a floating-point numeric format and a bit width greater than 32 are encoded into the IEEE-754 binary64 format.
- Components with an integer numeric format and a bit width less than or equal to 32 are directly encoded as 32-bit integer values with the same signedness.
- Components with an integer numeric format and a bit width greater than 32 are directly encoded as 64-bit integer values with the same signedness.

These values are then returned as the result of the image read.

13.3. Image Writes

Image writes also use a set of (x,y,z,layer,sample,level) coordinates, validated as per Image Coordinate Validation, and with a value to be written. If the coordinates are out of bounds, the write is discarded. If the coordinates are in bounds, but the texel is not backed by memory, the write is silently discarded. Otherwise, an image write is performed as follows:

13.3.1. Texel Encode

If the image format is sRGB, a linear to sRGB conversion is applied to the (R,G,B) components of value as described in the “sRGB EOTF” section of the Khronos Data Format Specification.

The converted (R,G,B) and original A values are then encoded to the image format according to the procedures outlined in the Khronos Data Format Specification. Components not present in the image format are discarded.

The final value is then written to the texel at (x,y,z,layer,sample,level).

13.4. SPIR-V Image Access

Images are represented in SPIR-V by variables with the OpTypeImage type, and operated on by

image instructions.

Images are mapped to a shader using image views, which define access to a subset of the base image resource, specified by VkImageSubresourceRange.

13.4.1. SPIR-V Image Read Instructions

Texels **can** be read from an image using OpImageRead or OpImageSparseRead. The elements of the *Coordinate* operand and the optional `Sample` image operand map to image coordinates, modified by the parameters of the image view used, as:

- x = `u`
- y = `v`
- z = `w`
- layer = `array_layer`
- sample = `Sample`
- level = 0

Any index missing in the instruction is implicitly set to 0.

After the coordinates are validated, some indices are offset before performing the access as follows:

- layer += VkImageSubresourceRange::`baseArrayLayer`
- level += VkImageSubresourceRange::`baseMipLevel`
- z += VkImageViewSlicedCreateInfoEXT::`sliceOffset`

13.4.2. SPIR-V Image Write Instructions

Texels **can** be written to an image using OpImageWrite. The elements of the *Coordinate* operand and the optional `Sample` image operand map to image coordinates, modified by the parameters of the image view used, in the same ways as for image reads.

13.4.3. SPIR-V Image Atomic Instructions

SPIR-V atomic instructions operate on pointers rather than texels, but **can** be used with texels via OpImageTexelPointer. OpImageTexelPointer **can** be used to obtain a valid pointer to a specific texel in an image. The elements of the *Coordinate* operand and the optional `Sample` image operand map to image coordinates, modified by the parameters of the image view used, in the same ways as for image reads. The resulting pointer **can** be used to access the identified texel, with atomic operations potentially reading and writing to that texel.

13.4.4. SPIR-V Image Query Instructions

Query operations return properties of an image, allowing the accessible size of each dimension of an image to be queried from within a shader. Query operations do not access any texels in the image.

- `OpImageQuerySizeLod` returns the values of $width_{level}$, $height_{level}$, $depth_{level}$, and layers for the image at a specified level, where level is equal to the sum of the `Level of Detail` operand and VkImageSubresourceRange::`baseMipLevel`. If the image is not a sampled image and VkImageViewSlicedCreateInfoEXT::`sliceCount` is not set to VK_REMAINING_3D_SLICES_EXT, `sliceCount` will be returned in place of $depth_{level}$. If the image is not a sampled image and VkImageViewSlicedCreateInfoEXT::`sliceCount` is set to VK_REMAINING_3D_SLICES_EXT, the value returned will be equal to $depth_{level}$:minus: VkImageViewSlicedCreateInfoEXT::`sliceOffset`. If `Level of Detail` is greater than or equal to VkImageSubresourceRange::`levelCount`, the result is undefined.
- `OpImageQuerySize` is equivalent to `OpImageQuerySizeLod` with level set to VkImageSubresourceRange::`baseMipLevel`.
- `OpImageQueryLevels` returns the value of VkImageSubresourceRange::`levelCount` specified for the image view used.
- `OpImageQuerySamples` returns the value of samples for the image.

> **NOTE** `OpImageQueryLod` is performed as a sampling operation, so is not included here.

If the descriptor bound to the image is a null descriptor, all values returned by the above queries are replaced with 0.

If the image is a weight image, all values returned by the above queries are undefined.

13.4.5. SPIR-V Image Sampling Instructions

Sampling operations **can** also be performed on images, typically in conjunction with a sampler, as defined in the Sampling chapter.

Chapter 14. Samplers

VkSampler objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by VkSampler handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(
    VkDevice                                    device,
    const VkSamplerCreateInfo*                  pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSampler*                                  pSampler);
```

- device is the logical device that creates the sampler.
- pCreateInfo is a pointer to a VkSamplerCreateInfo structure specifying the state of the sampler object.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pSampler is a pointer to a VkSampler handle in which the resulting sampler object is returned.

Valid Usage

- VUID-vkCreateSampler-device-09668
  device **must** support at least one queue family with one of the VK_QUEUE_COMPUTE_BIT or VK_QUEUE_GRAPHICS_BIT capabilities
- VUID-vkCreateSampler-maxSamplerAllocationCount-04110
  There **must** be less than VkPhysicalDeviceLimits::maxSamplerAllocationCount VkSampler objects currently created on the device
- VUID-vkCreateSampler-maxSamplerAllocationCount-11412
  If there are any pipelines or shaders with embedded samplers currently created on the device, there **must** be less than (maxSamplerAllocationCount - (minSamplerHeapReservedRangeWithEmbedded / samplerDescriptorSize)) VkSampler objects currently created on the device

Valid Usage (Implicit)

- VUID-vkCreateSampler-device-parameter
  device **must** be a valid VkDevice handle

- VUID-vkCreateSampler-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkSamplerCreateInfo structure
- VUID-vkCreateSampler-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSampler-pSampler-parameter
  `pSampler` **must** be a valid pointer to a VkSampler handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkSamplerCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType         sType;
    const void*             pNext;
    VkSamplerCreateFlags    flags;
    VkFilter                magFilter;
    VkFilter                minFilter;
    VkSamplerMipmapMode     mipmapMode;
    VkSamplerAddressMode    addressModeU;
    VkSamplerAddressMode    addressModeV;
    VkSamplerAddressMode    addressModeW;
    float                   mipLodBias;
    VkBool32                anisotropyEnable;
    float                   maxAnisotropy;
    VkBool32                compareEnable;
    VkCompareOp             compareOp;
    float                   minLod;
    float                   maxLod;
    VkBorderColor           borderColor;
    VkBool32                unnormalizedCoordinates;
} VkSamplerCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkSamplerCreateFlagBits describing additional parameters of the sampler.
- `magFilter` is a VkFilter value specifying the magnification filter to apply to lookups.
- `minFilter` is a VkFilter value specifying the minification filter to apply to lookups.
- `mipmapMode` is a VkSamplerMipmapMode value specifying the mipmap filter to apply to lookups.
- `addressModeU` is a VkSamplerAddressMode value specifying the wrapping operation used when the i coordinate used to sample the image would be out of bounds.
- `addressModeV` is a VkSamplerAddressMode value specifying the wrapping operation used when the j coordinate used to sample the image would be out of bounds.
- `addressModeW` is a VkSamplerAddressMode value specifying the wrapping operation used when the k coordinate used to sample the image would be out of bounds. If `unnormalizedCoordinates` is VK_TRUE, `addressModeW` is ignored.
- `mipLodBias` is the bias to be added to mipmap LOD calculation and bias provided by image sampling functions in SPIR-V, as described in the LOD Operation section.
- `anisotropyEnable` is VK_TRUE to enable anisotropic filtering, as described in the Texel Anisotropic Filtering section, or VK_FALSE otherwise.
- `maxAnisotropy` is the anisotropy value clamp used by the sampler when `anisotropyEnable` is VK_TRUE. If `anisotropyEnable` is VK_FALSE, `maxAnisotropy` is ignored.
- `compareEnable` is VK_TRUE to enable comparison against a reference value during lookups, or VK_FALSE otherwise.
  - Note: Some implementations will default to shader state if this member does not match.
- `compareOp` is a VkCompareOp value specifying the comparison operator to apply to fetched data before filtering as described in the Depth Compare Operation section.
- `minLod` is used to clamp the minimum of the computed LOD value.
- `maxLod` is used to clamp the maximum of the computed LOD value. To avoid clamping the maximum value, set `maxLod` to the constant VK_LOD_CLAMP_NONE.
- `borderColor` is a VkBorderColor value specifying the predefined border color to use.
- `unnormalizedCoordinates` controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When `unnormalizedCoordinates` is VK_TRUE, the range of the image coordinates used to lookup the texel is in the range of zero to the image size in each dimension. When `unnormalizedCoordinates` is VK_FALSE, the range of image coordinates is zero to one.

  When `unnormalizedCoordinates` is VK_TRUE, images the sampler is used with in the shader have the following requirements:

  - The `viewType` **must** be either VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D.
  - The image view **must** have a single layer and a single mip level.

    When `unnormalizedCoordinates` is VK_TRUE, image built-in functions in the shader that use

the sampler have the following requirements:

- The functions **must** not use projection.
- The functions **must** not use offsets.

Mapping of OpenGL to Vulkan Filter Modes

`magFilter` values of VK_FILTER_NEAREST and VK_FILTER_LINEAR directly correspond to `GL_NEAREST` and `GL_LINEAR` magnification filters. `minFilter` and `mipmapMode` combine to correspond to the similarly named OpenGL minification filter of `GL_minFilter_MIPMAP_mipmapMode` (e.g. `minFilter` of VK_FILTER_LINEAR and `mipmapMode` of VK_SAMPLER_MIPMAP_MODE_NEAREST correspond to `GL_LINEAR_MIPMAP_NEAREST`).

NOTE

There are no Vulkan filter modes that directly correspond to OpenGL minification filters of `GL_LINEAR` or `GL_NEAREST`, but they **can** be emulated using VK_SAMPLER_MIPMAP_MODE_NEAREST, `minLod` = 0, and `maxLod` = 0.25, and using `minFilter` = VK_FILTER_LINEAR or `minFilter` = VK_FILTER_NEAREST, respectively.

Note that using a `maxLod` of zero would cause magnification to always be performed, and the `magFilter` to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the λ value to be non-zero and minification to be performed, while still always rounding down to the base level. If the `minFilter` and `magFilter` are equal, then using a `maxLod` of zero also works.

The maximum number of sampler objects which **can** be simultaneously created on a device is implementation-dependent and specified by the `maxSamplerAllocationCount` member of the VkPhysicalDeviceLimits structure.

NOTE

For historical reasons, if `maxSamplerAllocationCount` is exceeded, some implementations may return VK_ERROR_TOO_MANY_OBJECTS. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Since VkSampler is a non-dispatchable handle type, implementations **may** return the same handle for sampler state vectors that are identical. In such cases, all such objects would only count once against the `maxSamplerAllocationCount` limit.

When this structure is used to write a descriptor via vkWriteSamplerDescriptorsEXT, applications **can** give the descriptor a debug name in a similar way to naming an object, via the VkDebugUtilsObjectNameInfoEXT structure. However, as there is no actual object, VkDebugUtilsObjectNameInfoEXT **must** be passed via the `pNext` chain of this structure, with a `objectType` of VK_OBJECT_TYPE_UNKNOWN and a `objectHandle` of VK_NULL_HANDLE. The name is attached to the unique set of descriptor bits written by the implementation, and writing the same bits again with new debug info **may** rename the original descriptor.

NOTE

Implementations are not prevented from returning the same bits for different descriptors. This can result in multiple different samplers mapping to the same

name.

VkDebugUtilsObjectNameInfoEXT **can** also be chained in the same way when defining an embedded sampler via VkDescriptorSetAndBindingMappingEXT, naming the embedded sampler.

Valid Usage

- VUID-VkSamplerCreateInfo-mipLodBias-01069
  The absolute value of `mipLodBias` **must** be less than or equal to `VkPhysicalDeviceLimits::maxSamplerLodBias`
- VUID-VkSamplerCreateInfo-samplerMipLodBias-04467
  If the `VK_KHR_portability_subset` extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::`samplerMipLodBias` is VK_FALSE, `mipLodBias` **must** be zero
- VUID-VkSamplerCreateInfo-maxLod-01973
  `maxLod` **must** be greater than or equal to `minLod`
- VUID-VkSamplerCreateInfo-anisotropyEnable-01070
  If the `samplerAnisotropy` feature is not enabled, `anisotropyEnable` **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-anisotropyEnable-01071
  If `anisotropyEnable` is VK_TRUE, `maxAnisotropy` **must** be between `1.0` and `VkPhysicalDeviceLimits::maxSamplerAnisotropy`, inclusive
- VUID-VkSamplerCreateInfo-minFilter-01645
  If sampler $Y'C_BC_R$ conversion is enabled and the potential format features of the sampler $Y'C_BC_R$ conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT, `minFilter` and `magFilter` **must** be equal to the sampler $Y'C_BC_R$ conversion's `chromaFilter`
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01072
  If `unnormalizedCoordinates` is VK_TRUE, `minFilter` and `magFilter` **must** be equal
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01073
  If `unnormalizedCoordinates` is VK_TRUE, `mipmapMode` **must** be VK_SAMPLER_MIPMAP_MODE_NEAREST
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01074
  If `unnormalizedCoordinates` is VK_TRUE, `minLod` and `maxLod` **must** be zero
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01075
  If `unnormalizedCoordinates` is VK_TRUE, `addressModeU` and `addressModeV` **must** each be either VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01076
  If `unnormalizedCoordinates` is VK_TRUE, `anisotropyEnable` **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01077
  If `unnormalizedCoordinates` is VK_TRUE, `compareEnable` **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-addressModeU-01078

If any of addressModeU, addressModeV or addressModeW are VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER, borderColor **must** be a valid VkBorderColor value

- VUID-VkSamplerCreateInfo-addressModeU-01646
  If sampler $Y'C_BC_R$ conversion is enabled, addressModeU, addressModeV, and addressModeW **must** be VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE, anisotropyEnable **must** be VK_FALSE, and unnormalizedCoordinates **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-None-01647
  If sampler $Y'C_BC_R$ conversion is enabled and the pNext chain includes a VkSamplerReductionModeCreateInfo structure, then the sampler reduction mode **must** be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE
- VUID-VkSamplerCreateInfo-pNext-06726
  If the samplerFilterMinmax feature is not enabled and the pNext chain includes a VkSamplerReductionModeCreateInfo structure, then the sampler reduction mode **must** be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE
- VUID-VkSamplerCreateInfo-addressModeU-01079
  If the samplerMirrorClampToEdge feature is not enabled, and if the VK_KHR_sampler_mirror_clamp_to_edge extension is not enabled, addressModeU, addressModeV and addressModeW **must** not be VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE
- VUID-VkSamplerCreateInfo-compareEnable-01080
  If compareEnable is VK_TRUE, compareOp **must** be a valid VkCompareOp value
- VUID-VkSamplerCreateInfo-magFilter-01081
  If either magFilter or minFilter is VK_FILTER_CUBIC_EXT, anisotropyEnable **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-magFilter-07911
  If the VK_EXT_filter_cubic extension is not enabled and either magFilter or minFilter is VK_FILTER_CUBIC_IMG, the reductionMode member of VkSamplerReductionModeCreateInfo **must** be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE
- VUID-VkSamplerCreateInfo-compareEnable-01423
  If compareEnable is VK_TRUE, the reductionMode member of VkSamplerReductionModeCreateInfo **must** be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE
- VUID-VkSamplerCreateInfo-flags-02574
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then minFilter and magFilter **must** be equal
- VUID-VkSamplerCreateInfo-flags-02575
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then mipmapMode **must** be VK_SAMPLER_MIPMAP_MODE_NEAREST
- VUID-VkSamplerCreateInfo-flags-02576
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then minLod and maxLod **must** be zero
- VUID-VkSamplerCreateInfo-flags-02577

If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then addressModeU and addressModeV **must** each be either VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER

- VUID-VkSamplerCreateInfo-flags-02578
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then anisotropyEnable **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-flags-02579
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then compareEnable **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-flags-02580
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then unnormalizedCoordinates **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-nonSeamlessCubeMap-06788
  If the nonSeamlessCubeMap feature is not enabled, flags **must** not include VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT
- VUID-VkSamplerCreateInfo-borderColor-04011
  If borderColor is one of VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT, then a VkSamplerCustomBorderColorCreateInfoEXT **must** be included in the pNext chain
- VUID-VkSamplerCreateInfo-customBorderColors-04085
  If the customBorderColors feature is not enabled, borderColor **must** not be VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT
- VUID-VkSamplerCreateInfo-borderColor-04442
  If borderColor is one of VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT, and VkSamplerCustomBorderColorCreateInfoEXT::format is not VK_FORMAT_UNDEFINED, VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor **must** be within the range of values representable in format
- VUID-VkSamplerCreateInfo-None-04012
  The maximum number of samplers with custom border colors which **can** be simultaneously created on a device is implementation-dependent and specified by the maxCustomBorderColorSamplers member of the VkPhysicalDeviceCustomBorderColorPropertiesEXT structure
- VUID-VkSamplerCreateInfo-flags-08110
  If flags includes VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT, the descriptorBufferCaptureReplay feature **must** be enabled
- VUID-VkSamplerCreateInfo-pNext-08111
  If the pNext chain includes a VkOpaqueCaptureDescriptorDataCreateInfoEXT structure, flags **must** contain VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT
- VUID-VkSamplerCreateInfo-flags-06964
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then minFilter

and `magFilter` **must** be VK_FILTER_NEAREST

- VUID-VkSamplerCreateInfo-flags-06965
  If `flags` includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then `mipmapMode` **must** be VK_SAMPLER_MIPMAP_MODE_NEAREST
- VUID-VkSamplerCreateInfo-flags-06966
  If `flags` includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then `minLod` and `maxLod` **must** be zero
- VUID-VkSamplerCreateInfo-flags-06967
  If `flags` includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then `addressModeU` and `addressModeV` **must** each be either VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER
- VUID-VkSamplerCreateInfo-flags-06968
  If `flags` includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, and if `addressModeU` or `addressModeV` is VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER, then `borderColor` **must** be VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK
- VUID-VkSamplerCreateInfo-flags-06969
  If `flags` includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then `anisotropyEnable` **must** be VK_FALSE
- VUID-VkSamplerCreateInfo-flags-06970
  If `flags` includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then `compareEnable` **must** be VK_FALSE

Valid Usage (Implicit)

- VUID-VkSamplerCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO
- VUID-VkSamplerCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkDebugUtilsObjectNameInfoEXT, VkOpaqueCaptureDescriptorDataCreateInfoEXT, VkSamplerBlockMatchWindowCreateInfoQCOM, VkSamplerBorderColorComponentMappingCreateInfoEXT, VkSamplerCubicWeightsCreateInfoQCOM, VkSamplerCustomBorderColorCreateInfoEXT, VkSamplerCustomBorderColorIndexCreateInfoEXT, VkSamplerReductionModeCreateInfo, or VkSamplerYcbcrConversionInfo
- VUID-VkSamplerCreateInfo-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSamplerCreateInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkSamplerCreateFlagBits values
- VUID-VkSamplerCreateInfo-magFilter-parameter
  `magFilter` **must** be a valid VkFilter value

- VUID-VkSamplerCreateInfo-minFilter-parameter
  `minFilter` **must** be a valid VkFilter value
- VUID-VkSamplerCreateInfo-mipmapMode-parameter
  `mipmapMode` **must** be a valid VkSamplerMipmapMode value
- VUID-VkSamplerCreateInfo-addressModeU-parameter
  `addressModeU` **must** be a valid VkSamplerAddressMode value
- VUID-VkSamplerCreateInfo-addressModeV-parameter
  `addressModeV` **must** be a valid VkSamplerAddressMode value
- VUID-VkSamplerCreateInfo-addressModeW-parameter
  `addressModeW` **must** be a valid VkSamplerAddressMode value

VK_LOD_CLAMP_NONE is a special constant value used for VkSamplerCreateInfo::`maxLod` to indicate that maximum LOD clamping should not be performed.

```
#define VK_LOD_CLAMP_NONE                 1000.0F
```

Bits which **can** be set in VkSamplerCreateInfo::`flags`, specifying additional parameters of a sampler, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSamplerCreateFlagBits {
  // Provided by VK_EXT_fragment_density_map
    VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT = 0x00000001,
  // Provided by VK_EXT_fragment_density_map
    VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT = 0x00000002,
  // Provided by VK_EXT_descriptor_buffer
    VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT = 0x00000008,
  // Provided by VK_EXT_non_seamless_cube_map
    VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT = 0x00000004,
  // Provided by VK_QCOM_image_processing
    VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM = 0x00000010,
} VkSamplerCreateFlagBits;
```

- VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT specifies that the sampler will read from an image created with `flags` containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.
- VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT specifies that the implementation **may** use approximations when reconstructing a full color value for texture access from a subsampled image.
- VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT specifies that cube map edge handling is not performed.
- VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM specifies that the sampler will read from images using only `OpImageSampleWeightedQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`,

OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM.

NOTE	The approximations used when VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT is specified are implementation defined. Some implementations **may** interpolate between fragment density levels in a subsampled image. In that case, this bit **may** be used to decide whether the interpolation factors are calculated per fragment or at a coarser granularity.

- VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT specifies that the sampler **can** be used with descriptor buffers when capturing and replaying (e.g. for trace capture and replay), see VkOpaqueCaptureDescriptorDataCreateInfoEXT for more detail.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSamplerCreateFlags;
```

VkSamplerCreateFlags is a bitmask type for setting a mask of zero or more VkSamplerCreateFlagBits.

The VkSamplerReductionModeCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSamplerReductionModeCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkSamplerReductionMode    reductionMode;
} VkSamplerReductionModeCreateInfo;
```

```
// Provided by VK_EXT_sampler_filter_minmax
// Equivalent to VkSamplerReductionModeCreateInfo
typedef VkSamplerReductionModeCreateInfo VkSamplerReductionModeCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- reductionMode is a VkSamplerReductionMode value controlling how texture filtering combines texel values.

If the pNext chain of VkSamplerCreateInfo includes a VkSamplerReductionModeCreateInfo structure, then that structure includes a mode controlling how texture filtering combines texel values.

If this structure is not present, reductionMode is considered to be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE.

Valid Usage (Implicit)

- VUID-VkSamplerReductionModeCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO
- VUID-VkSamplerReductionModeCreateInfo-reductionMode-parameter
  `reductionMode` **must** be a valid VkSamplerReductionMode value

Structure Chaining

Extends the structure

- VkSamplerCreateInfo

Reduction modes are specified by VkSamplerReductionMode, which takes values:

```
// Provided by VK_VERSION_1_2
typedef enum VkSamplerReductionMode {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX = 2,
  // Provided by VK_QCOM_filter_cubic_clamp
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM = 1000521000,
  // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT =
VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE,
  // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_MIN_EXT = VK_SAMPLER_REDUCTION_MODE_MIN,
  // Provided by VK_EXT_sampler_filter_minmax
    VK_SAMPLER_REDUCTION_MODE_MAX_EXT = VK_SAMPLER_REDUCTION_MODE_MAX,
} VkSamplerReductionMode;
```

```
// Provided by VK_EXT_sampler_filter_minmax
// Equivalent to VkSamplerReductionMode
typedef VkSamplerReductionMode VkSamplerReductionModeEXT;
```

- VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in the image operations chapter.
- VK_SAMPLER_REDUCTION_MODE_MIN specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.
- VK_SAMPLER_REDUCTION_MODE_MAX specifies that texel values are combined by taking the component-wise maximum of values in the footprint with non-zero weights.
- VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM specifies that values are combined as described by VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE,

followed by a texel range clamp.

The VkSamplerCubicWeightsCreateInfoQCOM structure is defined as:

```
// Provided by VK_QCOM_filter_cubic_weights
typedef struct VkSamplerCubicWeightsCreateInfoQCOM {
    VkStructureType             sType;
    const void*                 pNext;
    VkCubicFilterWeightsQCOM    cubicWeights;
} VkSamplerCubicWeightsCreateInfoQCOM;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- cubicWeights is a VkCubicFilterWeightsQCOM value controlling which cubic weights are used.

If the pNext chain of VkSamplerCreateInfo includes a VkSamplerCubicWeightsCreateInfoQCOM structure, then that structure specifies which cubic weights are used.

If that structure is not present, cubicWeights is considered to be VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM.

Valid Usage (Implicit)

- VUID-VkSamplerCubicWeightsCreateInfoQCOM-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SAMPLER_CUBIC_WEIGHTS_CREATE_INFO_QCOM
- VUID-VkSamplerCubicWeightsCreateInfoQCOM-cubicWeights-parameter
  cubicWeights **must** be a valid VkCubicFilterWeightsQCOM value

Structure Chaining

Extends the structure

- VkSamplerCreateInfo

Possible values of the VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights, specifying cubic weights used in Texel Cubic Filtering are:

```
// Provided by VK_QCOM_filter_cubic_weights
typedef enum VkCubicFilterWeightsQCOM {
    VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM = 0,
    VK_CUBIC_FILTER_WEIGHTS_ZERO_TANGENT_CARDINAL_QCOM = 1,
    VK_CUBIC_FILTER_WEIGHTS_B_SPLINE_QCOM = 2,
    VK_CUBIC_FILTER_WEIGHTS_MITCHELL_NETRAVALI_QCOM = 3,
} VkCubicFilterWeightsQCOM;
```

- VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM specifies Catmull-Rom weights.
- VK_CUBIC_FILTER_WEIGHTS_ZERO_TANGENT_CARDINAL_QCOM specifies Zero Tangent Cardinal weights.
- VK_CUBIC_FILTER_WEIGHTS_B_SPLINE_QCOM specifies B-Spline weights.
- VK_CUBIC_FILTER_WEIGHTS_MITCHELL_NETRAVALI_QCOM specifies Mitchell-Netravali weights.

Possible values of the VkSamplerCreateInfo::`magFilter` and `minFilter` parameters, specifying filters used for texture lookups, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
  // Provided by VK_EXT_filter_cubic
    VK_FILTER_CUBIC_EXT = 1000015000,
  // Provided by VK_IMG_filter_cubic
    VK_FILTER_CUBIC_IMG = VK_FILTER_CUBIC_EXT,
} VkFilter;
```

- VK_FILTER_NEAREST specifies nearest filtering.
- VK_FILTER_LINEAR specifies linear filtering.
- VK_FILTER_CUBIC_EXT specifies cubic filtering.

These filters are described in detail in Texel Filtering.

Possible values of the VkSamplerCreateInfo::`mipmapMode`, specifying the mipmap mode used for texture lookups, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
} VkSamplerMipmapMode;
```

- VK_SAMPLER_MIPMAP_MODE_NEAREST specifies nearest filtering.
- VK_SAMPLER_MIPMAP_MODE_LINEAR specifies linear filtering.

These modes are described in detail in Texel Filtering.

Possible values of the VkSamplerCreateInfo::`addressMode*` parameters, corresponding to different wrapping operations used during sampling, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
  // Provided by VK_VERSION_1_2, VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE = 4,
  // Provided by VK_KHR_sampler_mirror_clamp_to_edge
  // VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR is a legacy alias
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR =
VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE,
} VkSamplerAddressMode;
```

- VK_SAMPLER_ADDRESS_MODE_REPEAT specifies that the repeat wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT specifies that the mirrored repeat wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE specifies that the clamp to edge wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER specifies that the clamp to border wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE specifies that the mirror clamp to edge wrap mode will be used. This is only valid if the `samplerMirrorClampToEdge` feature is enabled, or if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is enabled.

Comparison operators compare a *reference* and a *test* value, and return a true (“passed”) or false (“failed”) value depending on the comparison operator chosen. The supported operators are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCompareOp {
    VK_COMPARE_OP_NEVER = 0,
    VK_COMPARE_OP_LESS = 1,
    VK_COMPARE_OP_EQUAL = 2,
    VK_COMPARE_OP_LESS_OR_EQUAL = 3,
    VK_COMPARE_OP_GREATER = 4,
    VK_COMPARE_OP_NOT_EQUAL = 5,
    VK_COMPARE_OP_GREATER_OR_EQUAL = 6,
    VK_COMPARE_OP_ALWAYS = 7,
} VkCompareOp;
```

- VK_COMPARE_OP_NEVER specifies that the comparison always evaluates false.
- VK_COMPARE_OP_LESS specifies that the comparison evaluates *reference* < *test*.
- VK_COMPARE_OP_EQUAL specifies that the comparison evaluates *reference* = *test*.
- VK_COMPARE_OP_LESS_OR_EQUAL specifies that the comparison evaluates *reference* ≤ *test*.

- VK_COMPARE_OP_GREATER specifies that the comparison evaluates *reference* > *test*.
- VK_COMPARE_OP_NOT_EQUAL specifies that the comparison evaluates *reference* ≠ *test*.
- VK_COMPARE_OP_GREATER_OR_EQUAL specifies that the comparison evaluates *reference* ≥ *test*.
- VK_COMPARE_OP_ALWAYS specifies that the comparison always evaluates true.

Comparison operators are used for:

- The Depth Compare Operation operator for a sampler, specified by VkSamplerCreateInfo ::compareOp.
- The stencil comparison operator for the stencil test, specified by vkCmdSetStencilOp::compareOp or VkStencilOpState::compareOp.
- The Depth Comparison operator for the depth test, specified by vkCmdSetDepthCompareOp ::depthCompareOp or VkPipelineDepthStencilStateCreateInfo::depthCompareOp.

Each such use describes how the *reference* and *test* values for that comparison are determined.

Possible values of VkSamplerCreateInfo::borderColor, specifying the border color used for texture lookups, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
  // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_FLOAT_CUSTOM_EXT = 1000287003,
  // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_INT_CUSTOM_EXT = 1000287004,
} VkBorderColor;
```

- VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK specifies a transparent, floating-point format, black color.
- VK_BORDER_COLOR_INT_TRANSPARENT_BLACK specifies a transparent, integer format, black color.
- VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK specifies an opaque, floating-point format, black color.
- VK_BORDER_COLOR_INT_OPAQUE_BLACK specifies an opaque, integer format, black color.
- VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE specifies an opaque, floating-point format, white color.
- VK_BORDER_COLOR_INT_OPAQUE_WHITE specifies an opaque, integer format, white color.
- VK_BORDER_COLOR_FLOAT_CUSTOM_EXT specifies that a

VkSamplerCustomBorderColorCreateInfoEXT structure is included in the VkSamplerCreateInfo::pNext chain containing the color data in floating-point format.

- VK_BORDER_COLOR_INT_CUSTOM_EXT specifies that a VkSamplerCustomBorderColorCreateInfoEXT structure is included in the VkSamplerCreateInfo::pNext chain containing the color data in integer format.

These colors are described in detail in Border Replacement.

To destroy a sampler, call:

```
// Provided by VK_VERSION_1_0
void vkDestroySampler(
    VkDevice                                    device,
    VkSampler                                   sampler,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the sampler.
- `sampler` is the sampler to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroySampler-sampler-01082
  All submitted commands that refer to `sampler` **must** have completed execution
- VUID-vkDestroySampler-sampler-01083
  If `VkAllocationCallbacks` were provided when `sampler` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroySampler-sampler-01084
  If no `VkAllocationCallbacks` were provided when `sampler` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroySampler-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroySampler-sampler-parameter
  If `sampler` is not VK_NULL_HANDLE, `sampler` **must** be a valid VkSampler handle
- VUID-vkDestroySampler-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroySampler-sampler-parent
  If `sampler` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `sampler` **must** be externally synchronized

14.1. Sampler $Y'C_BC_R$ Conversion

To create a sampler with $Y'C_BC_R$ conversion enabled, add a VkSamplerYcbcrConversionInfo structure to the `pNext` chain of the VkSamplerCreateInfo structure. To create a sampler $Y'C_BC_R$ conversion, the `samplerYcbcrConversion` feature **must** be enabled. Conversion **must** be fixed at pipeline creation time, through use of a combined embedded sampler and image mapping if using descriptor heaps, or a combined image sampler with an immutable sampler in `VkDescriptorSetLayoutBinding`.

A VkSamplerYcbcrConversionInfo **must** be provided for samplers to be used with image views that access VK_IMAGE_ASPECT_COLOR_BIT if the format is one of the formats that require a sampler $Y'C_BC_R$ conversion , or if the image view has an external format .

The `VkSamplerYcbcrConversionInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType             sType;
    const void*                 pNext;
    VkSamplerYcbcrConversion    conversion;
} VkSamplerYcbcrConversionInfo;
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to VkSamplerYcbcrConversionInfo
typedef VkSamplerYcbcrConversionInfo VkSamplerYcbcrConversionInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conversion` is a VkSamplerYcbcrConversion handle created with vkCreateSamplerYcbcrConversion.

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_INFO
- VUID-VkSamplerYcbcrConversionInfo-conversion-parameter
  `conversion` **must** be a valid VkSamplerYcbcrConversion handle

Structure Chaining

Extends the structures

- VkImageViewCreateInfo
- VkSamplerCreateInfo

A sampler $Y'C_BC_R$ conversion is an opaque representation of a device-specific sampler $Y'C_BC_R$ conversion description, represented as a `VkSamplerYcbcrConversion` handle:

```
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSamplerYcbcrConversion)
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to VkSamplerYcbcrConversion
typedef VkSamplerYcbcrConversion VkSamplerYcbcrConversionKHR;
```

To create a VkSamplerYcbcrConversion, call:

```
// Provided by VK_VERSION_1_1
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice                                    device,
    const VkSamplerYcbcrConversionCreateInfo*   pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSamplerYcbcrConversion*                   pYcbcrConversion);
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to vkCreateSamplerYcbcrConversion
VkResult vkCreateSamplerYcbcrConversionKHR(
    VkDevice                                    device,
    const VkSamplerYcbcrConversionCreateInfo*   pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkSamplerYcbcrConversion*                   pYcbcrConversion);
```

- `device` is the logical device that creates the sampler $Y'C_BC_R$ conversion.
- `pCreateInfo` is a pointer to a VkSamplerYcbcrConversionCreateInfo structure specifying the requested sampler $Y'C_BC_R$ conversion.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pYcbcrConversion` is a pointer to a VkSamplerYcbcrConversion handle in which the resulting sampler $Y'C_BC_R$ conversion is returned.

The interpretation of the configured sampler $Y'C_BC_R$ conversion is described in more detail in the description of sampler $Y'C_BC_R$ conversion in the Image Operations chapter.

Valid Usage

- VUID-vkCreateSamplerYcbcrConversion-None-01648
  The `samplerYcbcrConversion` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateSamplerYcbcrConversion-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateSamplerYcbcrConversion-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkSamplerYcbcrConversionCreateInfo structure
- VUID-vkCreateSamplerYcbcrConversion-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSamplerYcbcrConversion-pYcbcrConversion-parameter
  `pYcbcrConversion` **must** be a valid pointer to a VkSamplerYcbcrConversion handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkSamplerYcbcrConversionCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionCreateInfo {
    VkStructureType                 sType;
    const void*                     pNext;
    VkFormat                        format;
    VkSamplerYcbcrModelConversion   ycbcrModel;
    VkSamplerYcbcrRange             ycbcrRange;
    VkComponentMapping              components;
    VkChromaLocation                xChromaOffset;
    VkChromaLocation                yChromaOffset;
    VkFilter                        chromaFilter;
    VkBool32                        forceExplicitReconstruction;
} VkSamplerYcbcrConversionCreateInfo;
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to VkSamplerYcbcrConversionCreateInfo
typedef VkSamplerYcbcrConversionCreateInfo VkSamplerYcbcrConversionCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the format of the image from which color information will be retrieved.
- `ycbcrModel` describes the color matrix for conversion between color models.
- `ycbcrRange` describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.
- `components` applies a *swizzle* based on VkComponentSwizzle enums prior to range expansion and color model conversion.
- `xChromaOffset` describes the sample location associated with downsampled chroma components in the x dimension. `xChromaOffset` has no effect for formats in which chroma components are not downsampled horizontally.
- `yChromaOffset` describes the sample location associated with downsampled chroma components in the y dimension. `yChromaOffset` has no effect for formats in which the chroma components are not downsampled vertically.
- `chromaFilter` is the filter for chroma reconstruction.
- `forceExplicitReconstruction` **can** be used to ensure that reconstruction is done explicitly, if supported.

NOTE

Setting `forceExplicitReconstruction` to VK_TRUE **may** have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.

If `format` supports VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT the `forceExplicitReconstruction` value behaves as if it

were VK_TRUE.

If the pNext chain includes a VkExternalFormatANDROID structure with non-zero externalFormat member, the sampler $Y'C_BC_R$ conversion object represents an *external format conversion*, and format **must** be VK_FORMAT_UNDEFINED. Such conversions **must** only be used to sample image views with a matching external format. When creating an external format conversion, the value of components is ignored.

Valid Usage

- VUID-VkSamplerYcbcrConversionCreateInfo-format-01904
  If an external format conversion is being created, format **must** be VK_FORMAT_UNDEFINED
- VUID-VkSamplerYcbcrConversionCreateInfo-format-04061
  If an external format conversion is not being created, format **must** represent unsigned normalized values (i.e. the format **must** be a UNORM format)
- VUID-VkSamplerYcbcrConversionCreateInfo-format-01650
  The potential format features of the sampler $Y'C_BC_R$ conversion **must** support VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT or VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT
- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01651
  If the potential format features of the sampler $Y'C_BC_R$ conversion do not support VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset **must** not be VK_CHROMA_LOCATION_COSITED_EVEN if the corresponding components are downsampled
- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01652
  If the potential format features of the sampler $Y'C_BC_R$ conversion do not support VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset **must** not be VK_CHROMA_LOCATION_MIDPOINT if the corresponding components are downsampled
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02581
  If the format has a _422 or _420 suffix, then components.g **must** be the identity swizzle
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02582
  If the format has a _422 or _420 suffix, then components.a **must** be the identity swizzle, VK_COMPONENT_SWIZZLE_ONE, or VK_COMPONENT_SWIZZLE_ZERO
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02583
  If the format has a _422 or _420 suffix, then components.r **must** be the identity swizzle or VK_COMPONENT_SWIZZLE_B
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02584
  If the format has a _422 or _420 suffix, then components.b **must** be the identity swizzle or VK_COMPONENT_SWIZZLE_R
- VUID-VkSamplerYcbcrConversionCreateInfo-components-02585
  If the format has a _422 or _420 suffix, and if either components.r or components.b is the identity swizzle, both values **must** be the identity swizzle

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-01655
  If `ycbcrModel` is not VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY, then `components.r`, `components.g`, and `components.b` **must** correspond to components of the `format`; that is, `components.r`, `components.g`, and `components.b` **must** not be VK_COMPONENT_SWIZZLE_ZERO or VK_COMPONENT_SWIZZLE_ONE, and **must** not correspond to a component containing zero or one as a consequence of component substitution
- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-02748
  If `ycbcrRange` is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW, then the R, G, and B components obtained by applying the `component` swizzle to `format` **must** each have a bit-depth greater than or equal to 8
- VUID-VkSamplerYcbcrConversionCreateInfo-forceExplicitReconstruction-01656
  If the potential format features of the sampler $Y'C_BC_R$ conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT `forceExplicitReconstruction` **must** be VK_FALSE
- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-01657
  If the potential format features of the sampler $Y'C_BC_R$ conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT, `chromaFilter` **must** not be VK_FILTER_LINEAR
- VUID-VkSamplerYcbcrConversionCreateInfo-pNext-09207
  If the `pNext` chain includes a VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM structure, and if the `ycbcrDegamma` feature is not enabled, then VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM::`enableYDegamma` **must** be VK_FALSE
- VUID-VkSamplerYcbcrConversionCreateInfo-pNext-09208
  If the `pNext` chain includes a VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM structure, and if the `ycbcrDegamma` feature is not enabled, then VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM::`enableCbCrDegamma` **must** be VK_FALSE
- VUID-VkSamplerYcbcrConversionCreateInfo-pNext-09209
  If the `pNext` chain includes a VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM structure, `format` **must** be a format with 8-bit R, G, and B components

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO
- VUID-VkSamplerYcbcrConversionCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkExternalFormatANDROID, VkExternalFormatOHOS, VkExternalFormatQNX, or VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM
- VUID-VkSamplerYcbcrConversionCreateInfo-sType-unique

The `sType` value of each structure in the `pNext` chain **must** be unique

- VUID-VkSamplerYcbcrConversionCreateInfo-format-parameter
  `format` **must** be a valid VkFormat value
- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-parameter
  `ycbcrModel` **must** be a valid VkSamplerYcbcrModelConversion value
- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-parameter
  `ycbcrRange` **must** be a valid VkSamplerYcbcrRange value
- VUID-VkSamplerYcbcrConversionCreateInfo-components-parameter
  `components` **must** be a valid VkComponentMapping structure
- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-parameter
  `xChromaOffset` **must** be a valid VkChromaLocation value
- VUID-VkSamplerYcbcrConversionCreateInfo-yChromaOffset-parameter
  `yChromaOffset` **must** be a valid VkChromaLocation value
- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-parameter
  `chromaFilter` **must** be a valid VkFilter value

If `chromaFilter` is VK_FILTER_NEAREST, chroma samples are reconstructed to luma component resolution using nearest-neighbor sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in the description of sampler $Y'C_BC_R$ conversion in the Image Operations chapter.

VkSamplerYcbcrModelConversion defines the conversion from the source color model to the shader color model. Possible values are:

```
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrModelConversion {
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY = 0,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY = 1,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 = 2,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 = 3,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 = 4,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020,
} VkSamplerYcbcrModelConversion;
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to VkSamplerYcbcrModelConversion
typedef VkSamplerYcbcrModelConversion VkSamplerYcbcrModelConversionKHR;
```

- VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY specifies that the input values to the conversion are unmodified.
- VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY specifies no model conversion but the inputs are range expanded as for $Y'C_BC_R$.
- VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 specifies the color model conversion from $Y'C_BC_R$ to R'G'B' defined in BT.709 and described in the “BT.709 $Y'C_BC_R$ conversion” section of the Khronos Data Format Specification.
- VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 specifies the color model conversion from $Y'C_BC_R$ to R'G'B' defined in BT.601 and described in the “BT.601 $Y'C_BC_R$ conversion” section of the Khronos Data Format Specification.
- VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 specifies the color model conversion from $Y'C_BC_R$ to R'G'B' defined in BT.2020 and described in the “BT.2020 $Y'C_BC_R$ conversion” section of the Khronos Data Format Specification.

In the VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_* color models, for the input to the sampler $Y'C_BC_R$ range expansion and model conversion:

- the Y (Y' luma) component corresponds to the G component of an RGB image.

- the CB (C_B or "U" blue color difference) component corresponds to the B component of an RGB image.
- the CR (C_R or "V" red color difference) component corresponds to the R component of an RGB image.
- the alpha component, if present, is not modified by color model conversion.

These rules reflect the mapping of components after the component swizzle operation (controlled by VkSamplerYcbcrConversionCreateInfo::components).

NOTE

For example, a "YUVA" 32-bit format comprising four 8-bit components can be implemented as VK_FORMAT_R8G8B8A8_UNORM with a component mapping:

- components.a = VK_COMPONENT_SWIZZLE_IDENTITY
- components.r = VK_COMPONENT_SWIZZLE_B
- components.g = VK_COMPONENT_SWIZZLE_R
- components.b = VK_COMPONENT_SWIZZLE_G

The VkSamplerYcbcrRange enum describes whether color components are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. VkSamplerYcbcrRange is defined as:

```
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_NARROW,
} VkSamplerYcbcrRange;
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to VkSamplerYcbcrRange
typedef VkSamplerYcbcrRange VkSamplerYcbcrRangeKHR;
```

- VK_SAMPLER_YCBCR_RANGE_ITU_FULL specifies that the full range of the encoded values are valid and interpreted according to the ITU "full range" quantization rules.
- VK_SAMPLER_YCBCR_RANGE_ITU_NARROW specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU "narrow range" quantization rules.

The formulae for these conversions are described in the Sampler $Y'C_BC_R$ Range Expansion section of the Image Operations chapter.

No range modification takes place if ycbcrModel is

VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY; the ycbcrRange field of VkSamplerYcbcrConversionCreateInfo is ignored in this case.

The VkChromaLocation enum defines the location of downsampled chroma component samples relative to the luma samples, and is defined as:

```
// Provided by VK_VERSION_1_1
typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_CHROMA_LOCATION_COSITED_EVEN_KHR = VK_CHROMA_LOCATION_COSITED_EVEN,
  // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_CHROMA_LOCATION_MIDPOINT_KHR = VK_CHROMA_LOCATION_MIDPOINT,
} VkChromaLocation;
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to VkChromaLocation
typedef VkChromaLocation VkChromaLocationKHR;
```

- VK_CHROMA_LOCATION_COSITED_EVEN specifies that downsampled chroma samples are aligned with luma samples with even coordinates.
- VK_CHROMA_LOCATION_MIDPOINT specifies that downsampled chroma samples are located half way between each even luma sample and the nearest higher odd luma sample.

Applications **can** enable sRGB to linear conversion for the R, G, and B components of a $Y'C_BC_R$ image during sampling by including a VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM structure in the pNext chain of VkSamplerYcbcrConversionCreateInfo.

The VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM structure is defined as:

```
// Provided by VK_QCOM_ycbcr_degamma
typedef struct VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           enableYDegamma;
    VkBool32           enableCbCrDegamma;
} VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- enableYDegamma indicates sRGB to linear conversion is enabled for the G component.
- enableCbCrDegamma indicates sRGB to linear conversion is enabled for the R and B components.

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionYcbcrDegammaCreateInfoQCOM-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_YCBCR_DEGAMMA_CREATE_INFO_QCOM`

Structure Chaining

Extends the structure

- VkSamplerYcbcrConversionCreateInfo

To destroy a sampler $Y'C_BC_R$ conversion, call:

```
// Provided by VK_VERSION_1_1
void vkDestroySamplerYcbcrConversion(
    VkDevice                                    device,
    VkSamplerYcbcrConversion                    ycbcrConversion,
    const VkAllocationCallbacks*                pAllocator);
```

```
// Provided by VK_KHR_sampler_ycbcr_conversion
// Equivalent to vkDestroySamplerYcbcrConversion
void vkDestroySamplerYcbcrConversionKHR(
    VkDevice                                    device,
    VkSamplerYcbcrConversion                    ycbcrConversion,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the $Y'C_BC_R$ conversion.
- `ycbcrConversion` is the conversion to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage (Implicit)

- VUID-vkDestroySamplerYcbcrConversion-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parameter
  If `ycbcrConversion` is not VK_NULL_HANDLE, `ycbcrConversion` **must** be a valid VkSamplerYcbcrConversion handle
- VUID-vkDestroySamplerYcbcrConversion-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parent

If `ycbcrConversion` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `ycbcrConversion` **must** be externally synchronized

14.2. Custom Border Colors

In addition to the predefined border color values, applications **can** provide a custom border color value by including the `VkSamplerCustomBorderColorCreateInfoEXT` structure in the VkSamplerCreateInfo::`pNext` chain.

The `VkSamplerCustomBorderColorCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_custom_border_color
typedef struct VkSamplerCustomBorderColorCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkClearColorValue    customBorderColor;
    VkFormat             format;
} VkSamplerCustomBorderColorCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `customBorderColor` is a VkClearColorValue representing the desired custom sampler border color.
- `format` is a VkFormat representing the format of the sampled image view(s). This field may be VK_FORMAT_UNDEFINED if the `customBorderColorWithoutFormat` feature is enabled.

NOTE

If `format` is a depth/stencil format, the aspect is determined by the value of VkSamplerCreateInfo::`borderColor`. If VkSamplerCreateInfo::`borderColor` is VK_BORDER_COLOR_FLOAT_CUSTOM_EXT, the depth aspect is considered. If VkSamplerCreateInfo::`borderColor` is VK_BORDER_COLOR_INT_CUSTOM_EXT, the stencil aspect is considered.

If `format` is VK_FORMAT_UNDEFINED, the VkSamplerCreateInfo::`borderColor` is VK_BORDER_COLOR_INT_CUSTOM_EXT, and the sampler is used with an image with a stencil format, then the implementation **must** source the custom border color from either the first or second components of VkSamplerCreateInfo::`borderColor` and **should** source it from the first component.

In some cases, implementations **may** return undefined values instead of the specified custom border color when used on VK_QUEUE_COMPUTE_BIT queues that do not also support

VK_QUEUE_GRAPHICS_BIT. Undefined: values **may** also be returned in task shaders.

NOTE Tests added in 2026 revealed issues around custom border colors on AMD in compute-only queues and with task shaders, that were not fixable in software. While this will be fixed in future hardware, there is no reasonable workaround for existing hardware. Use of standard border colors is unaffected.

Valid Usage

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-07605
  If `format` is not VK_FORMAT_UNDEFINED and `format` is not a depth/stencil format then the VkSamplerCreateInfo::`borderColor` type **must** match the sampled type of the provided `format`, as shown in the *SPIR-V Type* column of the Interpretation of Numeric Format table
- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04014
  If the `customBorderColorWithoutFormat` feature is not enabled then `format` **must** not be VK_FORMAT_UNDEFINED
- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04015
  If the sampler is used to sample an image view of VK_FORMAT_B4G4R4A4_UNORM_PACK16, VK_FORMAT_B5G6R5_UNORM_PACK16, VK_FORMAT_A1B5G5R5_UNORM_PACK16, or VK_FORMAT_B5G5R5A1_UNORM_PACK16 format then `format` **must** not be VK_FORMAT_UNDEFINED

Valid Usage (Implicit)

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT
- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-parameter
  `format` **must** be a valid VkFormat value

Structure Chaining

Extends the structure

- VkSamplerCreateInfo

If the sampler is created with VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK, VK_BORDER_COLOR_INT_OPAQUE_BLACK, VK_BORDER_COLOR_FLOAT_CUSTOM_EXT, or VK_BORDER_COLOR_INT_CUSTOM_EXT `borderColor`, and that sampler will be combined with an image view that does not have an identity swizzle, and VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::`borderColorSwizzleFromImage` is not enabled, then it is necessary to specify the component mapping of the border color, by including the `VkSamplerBorderColorComponentMappingCreateInfoEXT` structure in the VkSamplerCreateInfo::`pNext` chain, to get defined results.

The VkSamplerBorderColorComponentMappingCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_border_color_swizzle
typedef struct VkSamplerBorderColorComponentMappingCreateInfoEXT {
    VkStructureType       sType;
    const void*           pNext;
    VkComponentMapping    components;
    VkBool32              srgb;
} VkSamplerBorderColorComponentMappingCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- components is a VkComponentMapping structure specifying a remapping of the border color components.
- srgb indicates that the sampler will be combined with an image view that has an image format which is sRGB encoded.

The VkComponentMapping components member describes a remapping from components of the border color to components of the vector returned by shader image instructions when the border color is used.

Valid Usage

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-borderColorSwizzle-06437
  The borderColorSwizzle feature **must** be enabled

Valid Usage (Implicit)

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_SAMPLER_BORDER_COLOR_COMPONENT_MAPPING_CREATE_INFO_EXT
- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-components-parameter
  components **must** be a valid VkComponentMapping structure

Structure Chaining

Extends the structure

- VkSamplerCreateInfo

14.2.1. Custom Border Color Registration

When using descriptor heaps, it is possible to create a sampler descriptor without creating a sampler object. Without this object, implementations using a fixed palette of border colors have no way to know which custom border colors are active or not.

In order to use custom border colors with descriptor heaps, border colors **must** instead be registered with the implementation and unregistered when they are no longer in use, and the registered index provided when writing the sampler descriptor.

To register a custom border color, call:

```
// Provided by VK_EXT_custom_border_color with VK_EXT_descriptor_heap
VkResult vkRegisterCustomBorderColorEXT(
    VkDevice                                    device,
    const VkSamplerCustomBorderColorCreateInfoEXT* pBorderColor,
    VkBool32                                    requestIndex,
    uint32_t*                                   pIndex);
```

- `device` is the logical device where the border color is registered.
- `pBorderColor` is a pointer to a VkSamplerCustomBorderColorCreateInfoEXT structure specifying the custom border color value to register.
- `requestIndex` is a Boolean value indicating if a specific index is requested or not.
- `pIndex` is a pointer to a `uint32_t` index value that will be written by the command upon success.

If `requestIndex` is VK_TRUE, the value present in `pIndex` when passed to the command is a requested index, and rather than returning a new index, the implementation will attempt to register that index, leaving the value intact. If the implementation is unable to register a requested index, VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS will be returned. If an index has not been registered (either explicitly or implicitly by creating a sampler object), or if it has been subsequently unregistered, the implementation **must** register that index successfully.

If `requestIndex` is VK_FALSE, the value stored in `pIndex` is ignored, and a new index will be returned if the implementation is able to register a new index. If the implementation is unable to register a new index, VK_ERROR_TOO_MANY_OBJECTS will be returned.

If an index is successfully registered, it **can** be used when writing a sampler descriptor or creating a sampler object to use with the custom border color, via VkSamplerCustomBorderColorIndexCreateInfoEXT.

NOTE	The type of border color is not specified by this command (VK_BORDER_COLOR_FLOAT_CUSTOM_EXT vs. VK_BORDER_COLOR_INT_CUSTOM_EXT); the data will be interpreted at the point the border color is sampled with an actual sampler. Implementations are expected to store the data as raw bytes if they do not need the format to be specified.

Valid Usage

- VUID-vkRegisterCustomBorderColorEXT-requestIndex-11287
  If `requestIndex` is VK_TRUE, the value stored in `pIndex` **must** be less than maxCustomBorderColorSamplers

Valid Usage (Implicit)

- VUID-vkRegisterCustomBorderColorEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkRegisterCustomBorderColorEXT-pBorderColor-parameter
  `pBorderColor` **must** be a valid pointer to a valid VkSamplerCustomBorderColorCreateInfoEXT structure
- VUID-vkRegisterCustomBorderColorEXT-pIndex-parameter
  `pIndex` **must** be a valid pointer to a `uint32_t` value

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To unregister a custom border color, call:

```
// Provided by VK_EXT_custom_border_color with VK_EXT_descriptor_heap
void vkUnregisterCustomBorderColorEXT(
    VkDevice                                    device,
    uint32_t                                    index);
```

- `device` is the logical device where the border color is registered.
- `index` is the `uint32_t` index value to unregister.

Valid Usage

- VUID-vkUnregisterCustomBorderColorEXT-index-11288
  `index` **must** be less than `maxCustomBorderColorSamplers`

Valid Usage (Implicit)

- VUID-vkUnregisterCustomBorderColorEXT-device-parameter
  `device` **must** be a valid VkDevice handle

The `VkSamplerCustomBorderColorIndexCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_custom_border_color with VK_EXT_descriptor_heap
typedef struct VkSamplerCustomBorderColorIndexCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           index;
} VkSamplerCustomBorderColorIndexCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `index` is the `uint32_t` index value to use with the sampler.

If this structure is included in the `pNext` chain of VkSamplerCreateInfo, the value of `index` will be used for the custom border color registration. `index` does not need to be registered at the point that a sampler object is created or a sampler descriptor is written; as long as it is registered when any use of the sampler is recorded to a command, and remains registered while the sampler is in use. The color registered with the index and the color specified in the sampler **must** be identically defined.

If this structure is not provided when creating a sampler object with a custom border color, it is equivalent to registering a new custom border color by calling vkRegisterCustomBorderColorEXT with that custom border color value, and using that value as `index` in this structure. This implicit registration will be implicitly unregistered when the sampler is destroyed.

If this structure is not provided when creating a sampler object without a custom border color, it is equivalent to setting `index` to 0.

Valid Usage

- VUID-VkSamplerCustomBorderColorIndexCreateInfoEXT-index-11289
  `index` **must** be less than `maxCustomBorderColorSamplers`

Valid Usage (Implicit)

- VUID-VkSamplerCustomBorderColorIndexCreateInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_INDEX_CREATE_INFO_EXT

Structure Chaining

Extends the structure

- VkSamplerCreateInfo

14.3. Sampler block matching

The `VkSamplerBlockMatchWindowCreateInfoQCOM` structure is defined as:

```
// Provided by VK_QCOM_image_processing2
typedef struct VkSamplerBlockMatchWindowCreateInfoQCOM {
    VkStructureType                      sType;
    const void*                          pNext;
    VkExtent2D                           windowExtent;
    VkBlockMatchWindowCompareModeQCOM    windowCompareMode;
} VkSamplerBlockMatchWindowCreateInfoQCOM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `windowExtent` is a VkExtent2D specifying the width and height of the block match window.
- `windowCompareMode` is a VkBlockMatchWindowCompareModeQCOM specifying the compare mode.

Valid Usage

- VUID-VkSamplerBlockMatchWindowCreateInfoQCOM-WindowExtent-09210
  `windowExtent` **must** not be larger than VkPhysicalDeviceImageProcessing2PropertiesQCOM::`maxBlockMatchWindow`

Valid Usage (Implicit)

- VUID-VkSamplerBlockMatchWindowCreateInfoQCOM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SAMPLER_BLOCK_MATCH_WINDOW_CREATE_INFO_QCOM
- VUID-VkSamplerBlockMatchWindowCreateInfoQCOM-windowCompareMode-parameter

`windowCompareMode` **must** be a valid VkBlockMatchWindowCompareModeQCOM value

Structure Chaining

Extends the structure

- VkSamplerCreateInfo

The VkBlockMatchWindowCompareModeQCOM enum describes how block match values within the window are compared. VkBlockMatchWindowCompareModeQCOM is defined as:

```
// Provided by VK_QCOM_image_processing2
typedef enum VkBlockMatchWindowCompareModeQCOM {
    VK_BLOCK_MATCH_WINDOW_COMPARE_MODE_MIN_QCOM = 0,
    VK_BLOCK_MATCH_WINDOW_COMPARE_MODE_MAX_QCOM = 1,
} VkBlockMatchWindowCompareModeQCOM;
```

- VK_BLOCK_MATCH_WINDOW_COMPARE_MODE_MIN_QCOM specifies that windowed block match operations return the minimum error within the window.
- VK_BLOCK_MATCH_WINDOW_COMPARE_MODE_MAX_QCOM specifies that windowed block match operations return the maximum error within the window.

Chapter 15. Resource Descriptors

A *descriptor* is an opaque data structure used to access shader resources such as buffers, images, or samplers. Rather than existing as distinct objects, descriptors are handled as opaque data, which can be accessed by a shader through descriptor heaps, descriptor buffers, or descriptor sets.

Shaders access descriptors via the `ResourceHeapEXT` and `SamplerHeapEXT` built-ins, or through variables decorated with `DescriptorSet` and `Binding` values linking them to the API. Details of the shader interface mapping are described in the Shader Resource Interface section.

NOTE	Shaders can also access buffers without going through descriptors by using Physical Storage Buffer Access to access them through 64-bit addresses.

15.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the Shader Resource and Descriptor Type Correspondence and Shader Resource and Storage Class Correspondence tables in the Shader Interfaces chapter.

Possible descriptor types are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
  // Provided by VK_VERSION_1_3
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK = 1000138000,
  // Provided by VK_KHR_acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
  // Provided by VK_NV_ray_tracing
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV = 1000165000,
  // Provided by VK_QCOM_image_processing
    VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM = 1000440000,
  // Provided by VK_QCOM_image_processing
    VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM = 1000440001,
  // Provided by VK_ARM_tensors
    VK_DESCRIPTOR_TYPE_TENSOR_ARM = 1000460000,
  // Provided by VK_EXT_mutable_descriptor_type
    VK_DESCRIPTOR_TYPE_MUTABLE_EXT = 1000351000,
  // Provided by VK_NV_partitioned_acceleration_structure
    VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV = 1000570000,
  // Provided by VK_EXT_inline_uniform_block
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT =
VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK,
  // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_TYPE_MUTABLE_VALVE = VK_DESCRIPTOR_TYPE_MUTABLE_EXT,
} VkDescriptorType;
```

- VK_DESCRIPTOR_TYPE_SAMPLER specifies a sampler descriptor.
- VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER specifies a combined image sampler descriptor.
- VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE specifies a sampled image descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_IMAGE specifies a storage image descriptor.
- VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER specifies a uniform texel buffer descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER specifies a storage texel buffer descriptor.
- VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER specifies a uniform buffer descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_BUFFER specifies a storage buffer descriptor.
- VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC specifies a dynamic uniform buffer

descriptor.

- VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC specifies a dynamic storage buffer descriptor.
- VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT specifies an input attachment descriptor.
- VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK specifies an inline uniform block.
- VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR specifies an acceleration structure descriptor.
- VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV specifies an acceleration structure descriptor.
- VK_DESCRIPTOR_TYPE_MUTABLE_EXT specifies a descriptor of mutable type.
- VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV specifies a partitioned acceleration structure descriptor.
- VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM specifies a sampled weight image descriptor.
- VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM specifies a block matching image descriptor.
- VK_DESCRIPTOR_TYPE_TENSOR_ARM specifies a storage tensor descriptor.

15.1.1. Storage Image

A *storage image* (VK_DESCRIPTOR_TYPE_STORAGE_IMAGE) is a descriptor type associated with an image resource via an image view that load, store, and atomic operations **can** be performed on.

Storage image loads are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Stores to storage images are supported in task, mesh and compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Atomic operations on storage images are supported in task, mesh and compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

When the `fragmentStoresAndAtomics` feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image **must** be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

When the `tileShadingColorAttachments` feature is enabled, loads using `OpImageRead` or `OpImageSparseRead` are supported for color tile attachments in fragment and compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Additionally, when the `tileShadingColorAttachments` feature is enabled, stores using `OpImageWrite` are supported for color attachments in compute shaders with the same set of image formats as for loads. When the `tileShadingAtomicOps` feature is enabled, tile atomic operations are supported for color attachments in compute shaders with the same set of image formats as for loads.

When the `tileShadingInputAttachments` feature is enabled, loads using `OpImageRead` are supported for input tile attachments in fragment and compute shaders with the same set of image formats as for color attachments. Stores to input attachments are not supported.

When the `tileShadingDepthAttachments` or `tileShadingStencilAttachments` feature is enabled, loads using `OpImageRead` or `OpImageSparseRead` are supported for depth or stencil aspects of a depth/stencil tile attachment in fragment and compute shaders with the same set of image formats as for color attachments. Stores to depth/stencil attachments are not supported.

15.1.2. Sampler

A *sampler descriptor* (VK_DESCRIPTOR_TYPE_SAMPLER) is a descriptor type associated with a sampler object, used to control the behavior of sampling operations performed on a sampled image.

15.1.3. Sampled Image

A *sampled image* (VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE) is a descriptor type associated with an image resource via an image view that sampling operations **can** be performed on.

Shaders combine a sampled image variable and a sampler variable to perform sampling operations.

Sampled images are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

The image subresources for a sampled image **must** be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT
- VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM

15.1.4. Combined Image Sampler

A *combined image sampler* (VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER) is a single descriptor type associated with both a sampler and an image resource, combining both a sampler and sampled image descriptor into a single descriptor.

If the descriptor refers to a sampler that performs $Y'C_BC_R$ conversion or samples a subsampled image, the sampler **must** only be used to sample the image in the same descriptor. Otherwise, the sampler and image in this type of descriptor **can** be used freely with any other samplers and images.

The image subresources for a combined image sampler **must** be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT
- VK_IMAGE_LAYOUT_TENSOR_ALIASING_ARM

NOTE	On some implementations, it **may** be more efficient to sample from an image using a combination of sampler and sampled image that are stored together in the descriptor set in a combined descriptor.

15.1.5. Uniform Texel Buffer

A *uniform texel buffer* (VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER) is a descriptor type associated with a buffer resource via a buffer view that image sampling operations **can** be performed on.

Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image.

Load operations from uniform texel buffers are supported in all shader stages for buffer view formats which report format features support for VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT.

15.1.6. Storage Texel Buffer

A *storage texel buffer* (VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER) is a descriptor type

associated with a buffer resource via a buffer view that image load, store, and atomic operations **can** be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike uniform texel buffers, these buffers can also be written to in the same way as for storage images.

Storage texel buffer loads are supported in all shader stages for texel buffer view formats which report format features support for VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT.

Stores to storage texel buffers are supported in task, mesh and compute shaders for texel buffer formats which report format features support for VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT.

Atomic operations on storage texel buffers are supported in task, mesh and compute shaders for texel buffer formats which report format features support for VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT.

When the `fragmentStoresAndAtomics` feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of texel buffer formats as supported in compute shaders.

15.1.7. Storage Buffer

A *storage buffer* (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load, store, and atomic operations **can** be performed on.

NOTE Atomic operations **can** only be performed on members of certain types as defined in the SPIR-V environment appendix.

15.1.8. Uniform Buffer

A *uniform buffer* (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load operations **can** be performed on.

15.1.9. Dynamic Uniform Buffer

A *dynamic uniform buffer* (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC) is almost identical to a uniform buffer, and differs only in how the offset into the buffer is specified. This descriptor type is only valid when using descriptor sets. The base offset calculated by VkDescriptorBufferInfo when initially updating a descriptor set is added to a dynamic offset when binding a descriptor set.

15.1.10. Dynamic Storage Buffer

A *dynamic storage buffer* (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC) is almost identical

to a storage buffer, and differs only in how the offset into the buffer is specified. This descriptor type is only valid when using descriptor sets. The base offset calculated by VkDescriptorBufferInfo when initially updating a descriptor set is added to a dynamic offset when binding a descriptor set.

15.1.11. Inline Uniform Block

An *inline uniform block* (VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK) is almost identical to a uniform buffer in how it is accessed in the shader. Where it differs is that its storage is taken directly from a containing descriptor set or descriptor buffer, instead of being backed by a separate buffer object. This descriptor type is not valid when using descriptor heaps; applications **can** directly access the heap pointer in a shader or use the VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT mapping.

Inline uniform blocks are typically used to access a small set of constant data that does not require the additional flexibility provided by the indirection enabled when using a uniform buffer where the descriptor and the referenced buffer memory are decoupled. Compared to push constants, they allow reusing the same set of constant data across multiple disjoint sets of drawing and dispatching commands.

Inline uniform block descriptors **cannot** be aggregated into arrays. Instead, the array size specified for an inline uniform block descriptor binding specifies the binding's capacity in bytes.

15.1.12. Sample Weight Image

A *sample weight image* (VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM) is a descriptor type associated with an image resource via an image view that **can** be used in weight image sampling. The image view **must** have been created with VkImageViewSampleWeightCreateInfoQCOM.

Shaders **can** combine a weight image variable, a sampled image variable, and a sampler variable to perform weight image sampling.

Weight image sampling is supported in all shader stages if the weight image view specifies a format that supports format feature VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM and the sampled image view specifies a format that supports format feature VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

The image subresources for the weight image **must** be in the VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

15.1.13. Block Matching Image

A *block matching image* (VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM) is a descriptor type associated with an image resource via an image view that **can** be used in block matching.

Shaders **can** combine a target image variable, a reference image variable, and a sampler variable to perform block matching.

Block matching is supported in all shader stages if both the target view and reference view specify

a format that supports format feature VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

For `opImageBlockMatchWindowSAD`, `opImageBlockMatchWindowSSD`, `opImageBlockMatchGatherSAD`, and `opImageBlockMatchGatherSSD` operations, only the single-component formats with the VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM flag set are supported.

For `OpImageBlockMatchSSDQCOM` and `OpImageBlockMatchSADQCOM` operations, additional formats for target view and reference view are specified with the VK_FORMAT_FEATURE_2_BLOCK_MATCHING_SXD_BIT_QCOM format feature flag.

NOTE	Applications **should** use VK_FORMAT_FEATURE_2_BLOCK_MATCHING_SXD_BIT_QCOM to determine the full format support with `OpImageBlockMatchSSDQCOM` and `OpImageBlockMatchSADQCOM`. Applications **can** also use VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM, but it **may** specify a reduced set of formats that are also compatible with the `OpImageBlockMatchWindow*QCOM` and `OpImageBlockMatchGather*QCOM` operations.

The image subresources for block matching **must** be in the VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

15.1.14. Input Attachment

An *input attachment* (VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT) is a descriptor type associated with an image resource via an image view that **can** be used for framebuffer local load operations in fragment shaders.

All image formats that are supported for color attachments (VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV) or depth/stencil attachments (VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT) for a given image tiling mode are also supported for input attachments.

An image view used as an input attachment **must** be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

- VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ

15.1.15. Acceleration Structure

An *acceleration structure* (VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV) is a descriptor type that is used to retrieve scene geometry from within shaders that are used for ray traversal. Shaders have read-only access to the memory.

15.1.16. Partitioned Acceleration Structure

A *partitioned acceleration structure* (VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV) is a descriptor type that references a built partitioned top-level acceleration structure (PTLAS), as defined in Partitioned Top Level Acceleration Structures. It is used to retrieve scene geometry from within shaders that are used for ray traversal. From the perspective of ray tracing shaders, a PTLAS descriptor behaves identically to a conventional top-level acceleration structure descriptor. Shaders have read-only access to the memory.

15.1.17. Mutable

A descriptor of *mutable* (VK_DESCRIPTOR_TYPE_MUTABLE_EXT) type indicates that this descriptor **can** mutate to a number of different types. This descriptor type is not valid when using descriptor heaps, as the elements of a descriptor heap **can** be manually adjusted to hold different descriptor types already. When specified in a descriptor set layout, any of the descriptor types given in the VkMutableDescriptorTypeListEXT::`pDescriptorTypes` list of descriptor types in the `pNext` chain of VkDescriptorSetLayoutCreateInfo for this binding. At any point, each individual descriptor of mutable type has an active descriptor type. The active descriptor type **can** be any one of the declared types in `pDescriptorTypes`. Additionally, a mutable descriptor's active descriptor type **can** be of the VK_DESCRIPTOR_TYPE_MUTABLE_EXT type, which is the initial active descriptor type. The active descriptor type **can** change when the descriptor is updated. When a descriptor is consumed by binding a descriptor buffer or set, the active descriptor type is considered, not VK_DESCRIPTOR_TYPE_MUTABLE_EXT.

An active descriptor type of VK_DESCRIPTOR_TYPE_MUTABLE_EXT is considered an undefined descriptor. If a descriptor is consumed where the active descriptor type does not match what the shader expects, the descriptor is considered an undefined descriptor.

NOTE

To find which descriptor types are supported as VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the application **can** use vkGetDescriptorSetLayoutSupport with a VK_DESCRIPTOR_TYPE_MUTABLE_EXT binding, with the list of descriptor types to query in the VkMutableDescriptorTypeCreateInfoEXT::`pMutableDescriptorTypeLists` array for that binding.

NOTE

The intention of a mutable descriptor type is that implementations allocate N bytes per descriptor, where N is determined by the maximum descriptor size for a given descriptor binding. Implementations are not expected to keep track of the active

descriptor type, and it should be considered a C-like union type.

A mutable descriptor type is not considered as efficient in terms of runtime performance as using a non-mutable descriptor type, and applications are not encouraged to use them outside API layering efforts. Mutable descriptor types can be more efficient if the alternative is using many different descriptors to emulate mutable descriptor types.

15.1.18. Storage Tensor

A *storage tensor* (VK_DESCRIPTOR_TYPE_TENSOR_ARM) is a descriptor type associated with a tensor resource via a tensor view that read and write operations **can** be performed on.

Storage tensor reads and writes are supported in shaders for tensor views whose format features contain VK_FORMAT_FEATURE_2_TENSOR_SHADER_BIT_ARM.

Storage tensor reads and writes are supported in graph pipelines for tensor views whose format features contain VK_FORMAT_FEATURE_2_TENSOR_DATA_GRAPH_BIT_ARM.

15.2. Physical Storage Buffer Access

Buffer device addresses **can** also be used to access buffer memory in a shader, using the `SPV_KHR_physical_storage_buffer` extension or the equivalent `SPV_EXT_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value **can** be stored in a uniform buffer, and the shader **can** read the value from the uniform buffer and use it to do a dependent read/write to this buffer. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers **must** access addresses in the address range of some buffer.

Chapter 16. Descriptor Heaps

When the descriptorHeap feature is enabled, applications can use descriptor heaps to specify the descriptors that they will be accessing from shaders. Descriptor heaps are not objects, rather they are state that is bound to a command buffer indicating the device address of descriptors that can be accessed from a shader. There are two heaps available to the application - the sampler heap and the resource heap. The sampler heap contains sampler descriptors, the resource heap contains image, acceleration structure, tensor, and buffer descriptors.

16.1. Writing Descriptors

Descriptors can be obtained for the different heaps with commands that write descriptors to a host address, with the application responsible for transferring those descriptors into device memory for access via heaps.

To write sampler descriptors to memory, call:

```
// Provided by VK_EXT_descriptor_heap
VkResult vkWriteSamplerDescriptorsEXT(
    VkDevice                                    device,
    uint32_t                                    samplerCount,
    const VkSamplerCreateInfo*                  pSamplers,
    const VkHostAddressRangeEXT*                pDescriptors);
```

- device is the logical device that the descriptors are for.
- samplerCount is the number of elements in pSamplers and pDescriptors.
- pSamplers is a pointer to an array of VkSamplerCreateInfo structures defining properties of the sampler descriptors that will be written.
- pDescriptors is a pointer to an array of VkHostAddressRangeEXT structures defining the host address ranges that will be written to for each descriptor.

Each descriptor will be written to pDescriptors[i].address where i is the index of its create info in pSamplers.

Descriptors written using a fully identical VkSamplerCreateInfo structure on the same VkDevice will always return the same bit pattern. If the descriptorHeapCaptureReplay feature is enabled, descriptors written using a fully identical VkSamplerCreateInfo structure on a VkDevice created from the same VkPhysicalDevice with identical parameters will always return the same bit pattern.

NOTE YC_BC_R samplers must be embedded in a shader by using VkShaderDescriptorSetAndBindingMappingInfoEXT, they cannot be specified here.

Valid Usage

- VUID-vkWriteSamplerDescriptorsEXT-descriptorHeap-11202

The descriptorHeap feature **must** be enabled

- VUID-vkWriteSamplerDescriptorsEXT-size-11203
  The size member of each element of pDescriptors **must** be greater than or equal to the value returned by vkGetPhysicalDeviceDescriptorSizeEXT with a descriptorType equal to VK_DESCRIPTOR_TYPE_SAMPLER
- VUID-vkWriteSamplerDescriptorsEXT-pSamplers-11204
  Elements of pSamplers **must** not include VkSamplerYcbcrConversionInfo structures in their pNext chains
- VUID-vkWriteSamplerDescriptorsEXT-borderColor-11444
  If the borderColor of any element of pSamplers is VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT, VkSamplerCustomBorderColorIndexCreateInfoEXT **must** be included in the pNext chain of that element
- VUID-vkWriteSamplerDescriptorsEXT-borderColor-11205
  If the borderColor of any element of pSamplers is VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT, VkSamplerCustomBorderColorIndexCreateInfoEXT::index **must** be a value less than maxCustomBorderColorSamplers
- VUID-vkWriteSamplerDescriptorsEXT-pNext-11400
  If there is a VkDebugUtilsObjectNameInfoEXT structure in the pNext chain of any element of pSamplers, its objectType **must** be VK_OBJECT_TYPE_UNKNOWN
- VUID-vkWriteSamplerDescriptorsEXT-pDescriptors-12531
  Each element of pDescriptors **must** specify a unique, non-overlapping address range

Valid Usage (Implicit)

- VUID-vkWriteSamplerDescriptorsEXT-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkWriteSamplerDescriptorsEXT-pSamplers-parameter
  pSamplers **must** be a valid pointer to an array of samplerCount valid VkSamplerCreateInfo structures
- VUID-vkWriteSamplerDescriptorsEXT-pDescriptors-parameter
  pDescriptors **must** be a valid pointer to an array of samplerCount valid VkHostAddressRangeEXT structures
- VUID-vkWriteSamplerDescriptorsEXT-samplerCount-arraylength
  samplerCount **must** be greater than 0

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To write resource descriptors to memory, call:

```
// Provided by VK_EXT_descriptor_heap
VkResult vkWriteResourceDescriptorsEXT(
    VkDevice                                    device,
    uint32_t                                    resourceCount,
    const VkResourceDescriptorInfoEXT*          pResources,
    const VkHostAddressRangeEXT*                pDescriptors);
```

- `device` is the logical device that the descriptors are for.
- `resourceCount` is the number of elements in `pResources` and `pDescriptors`.
- `pResources` is a pointer to an array of VkResourceDescriptorInfoEXT structures defining properties of the resource descriptors that will be written.
- `pDescriptors` is a pointer to an array of VkHostAddressRangeEXT structures defining the host address ranges that will be written to for each descriptor.

Each descriptor will be written to `pDescriptors`[i].address where i is the index of its create info in `pResources`.

If any image descriptor written by this command includes a VkSamplerYcbcrConversion, multiple descriptors will be written adjacent to each other for that descriptor, equal to VkSamplerYcbcrConversionImageFormatProperties::`combinedImageSamplerDescriptorCount` for the image or equal to VkPhysicalDeviceMaintenance6Properties ::`maxCombinedImageSamplerDescriptorCount` for an image with an Android external format .

If any image descriptor written by this command is for an image created with `flags` containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, multiple descriptors will be written adjacent to each other for that descriptor, equal to VkSubsampledImageFormatPropertiesEXT ::`subsampledImageDescriptorCount` for the image.

Descriptors using the same `type` and written using a fully identical VkTexelBufferDescriptorInfoEXT or VkDeviceAddressRangeKHR structure on the same VkDevice will always return the same bit pattern. If the descriptorHeapCaptureReplay feature is enabled, this applies to any VkDevice created with identical parameters from the same VkPhysicalDevice.

NOTE Recreating the same buffer descriptor during replay of a prior capture requires that the device address is the same, which requires additional data to be captured and provided during replay when creating a buffer and allocating memory for it.

Image descriptors using the same `type` and written using a fully identical VkImageDescriptorInfoEXT other than VkImageDescriptorInfoEXT::`pView->image`, where image was successfully created with VK_IMAGE_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_EXT and a VkOpaqueCaptureDataCreateInfoEXT with data captured via vkGetImageOpaqueCaptureDataEXT from an image used previously, will write a descriptor with the same bit pattern if possible; if the same bit pattern cannot be generated, VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS will be returned instead.

Tensor descriptors using the same `type` and written using a fully identical VkTensorViewCreateInfoARM other than VkTensorViewCreateInfoARM::`tensor`, where tensor was successfully created with VkOpaqueCaptureDataCreateInfoEXT with VK_TENSOR_CREATE_DESCRIPTOR_HEAP_CAPTURE_REPLAY_BIT_ARM and a VkOpaqueCaptureDataCreateInfoEXT with data captured via vkGetTensorOpaqueCaptureDataARM from a tensor used previously, will write a descriptor with the same bit pattern if possible; if the same bit pattern cannot be generated, VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS will be returned instead.

NOTE Image creation is sufficiently complex that it may not be possible to recreate all possible descriptors from an image during replay, even if the image itself was successfully recreated. The conditions for this happening will be largely the same as those which could cause allocating a buffer with the same device address during replay to fail. Replay tools are advised to recreate captured descriptors for an image immediately after recreating the image itself wherever possible. The same is true for tensors.

Valid Usage

- VUID-vkWriteResourceDescriptorsEXT-descriptorHeap-11206
  The `descriptorHeap` feature **must** be enabled
- VUID-vkWriteResourceDescriptorsEXT-size-11207
  The `size` member of each element of `pDescriptors` **must** be greater than or equal to the value returned by vkGetPhysicalDeviceDescriptorSizeEXT with a `descriptorType` equal to `type`
- VUID-vkWriteResourceDescriptorsEXT-pResources-11208
  If any element of `pResources` specifies a VkImageViewCreateInfo structure with a VkSamplerYcbcrConversionInfo structure without an Android external format in its `pNext` chain, the corresponding element of `pDescriptors` **must** have a `size` member that is greater than or equal to the product of the value returned by vkGetPhysicalDeviceDescriptorSizeEXT with a `descriptorType` equal to `type` and VkSamplerYcbcrConversionImageFormatProperties::`combinedImageSamplerDescriptorCount`, as queried from VkPhysicalDeviceImageFormatInfo2 with image format info equivalent to the image view the descriptor is being created for
- VUID-vkWriteResourceDescriptorsEXT-pResources-12522
  If any element of `pResources` specifies a VkImageViewCreateInfo structure with a VkSamplerYcbcrConversionInfo structure with an Android external format in its `pNext` chain, the corresponding element of `pDescriptors` **must** have a `size` member that is

greater than or equal to the product of the value returned by vkGetPhysicalDeviceDescriptorSizeEXT with a `descriptorType` equal to `type` and VkPhysicalDeviceMaintenance6Properties::`maxCombinedImageSamplerDescriptorCount`

- VUID-vkWriteResourceDescriptorsEXT-pResources-11209
  If any element of `pResources` specifies a VkImageViewCreateInfo structure with an `image` created with `flags` containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT, the corresponding element of `pDescriptors` **must** have a `size` member that is greater than or equal to the product of the value returned by vkGetPhysicalDeviceDescriptorSizeEXT with a `descriptorType` equal to `type` and VkSubsampledImageFormatPropertiesEXT::`subsampledImageDescriptorCount`, as queried from VkPhysicalDeviceImageFormatInfo2 with image format info equivalent to the image view the descriptor is being created for
- VUID-vkWriteResourceDescriptorsEXT-pResources-12494
  If any element of `pResources` specifies a VkImageViewCreateInfo structure, `device` **must** support at least one queue family with one of the VK_QUEUE_VIDEO_ENCODE_BIT_KHR, VK_QUEUE_VIDEO_DECODE_BIT_KHR, VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT capabilities
- VUID-vkWriteResourceDescriptorsEXT-pResources-12495
  If any element of `pResources` specifies a VkImageViewCreateInfo structure, VkImageViewCreateInfo::`image` **must** have been created from `device`
- VUID-vkWriteResourceDescriptorsEXT-pDescriptors-12532
  Each element of `pDescriptors` **must** specify a unique, non-overlapping address range

Valid Usage (Implicit)

- VUID-vkWriteResourceDescriptorsEXT-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkWriteResourceDescriptorsEXT-pResources-parameter
  `pResources` **must** be a valid pointer to an array of `resourceCount` valid VkResourceDescriptorInfoEXT structures
- VUID-vkWriteResourceDescriptorsEXT-pDescriptors-parameter
  `pDescriptors` **must** be a valid pointer to an array of `resourceCount` valid VkHostAddressRangeEXT structures
- VUID-vkWriteResourceDescriptorsEXT-resourceCount-arraylength
  `resourceCount` **must** be greater than `0`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

VkResourceDescriptorInfoEXT is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkResourceDescriptorInfoEXT {
    VkStructureType                 sType;
    const void*                     pNext;
    VkDescriptorType                type;
    VkResourceDescriptorDataEXT     data;
} VkResourceDescriptorInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- type is the type of descriptor to get.
- data is a VkResourceDescriptorDataEXT union defining the properties of a resource descriptor according to type.

If type is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, data->pTexelBuffer is used to construct the descriptor.

If type is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, data->pAddressRange is used to construct the descriptor. For acceleration structures, the size of the range is not used by the descriptor, and **can** be set to 0. If a non-zero size is provided though, it **must** be a valid range.

NOTE Applications may wish to provide a valid range as a way to check their own assumptions about the range they are binding; but it has no bearing on anything except validation. Implementations cannot make any assumptions based on the size of the provided range.

If type is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, data->pImage is used to construct the descriptor. If type is VK_DESCRIPTOR_TYPE_TENSOR_ARM, data->pTensorARM is used to construct the descriptor.

If the nullDescriptor feature is enabled, the corresponding element of data **may** be NULL to generate a null descriptor.

Applications **can** give resource descriptors a debug name in a similar way to naming an object, via the VkDebugUtilsObjectNameInfoEXT structure. However, as there is no actual object, this structure **must** be passed via the `pNext` chain of this structure, with a `objectType` of VK_OBJECT_TYPE_UNKNOWN and a `objectHandle` of VK_NULL_HANDLE. The name is attached to the unique set of descriptor bits written by the implementation, and writing the same bits again with new debug info **may** rename the original descriptor.

NOTE	Implementations are not prevented from returning the same bits for different descriptors. This can result in multiple different resources mapping to the same name. A common case for this might be something like a uniform buffer and storage buffer with the same device address range.

If a descriptor becomes invalid due to the underlying resource becoming invalid, implementations **may** remove the name association.

Valid Usage

- VUID-VkResourceDescriptorInfoEXT-type-11210
  `type` **must** be one of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV, VK_DESCRIPTOR_TYPE_TENSOR_ARM, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT
- VUID-VkResourceDescriptorInfoEXT-None-11211
  If the `nullDescriptor` feature is not enabled, and `type` is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, `data->pImage` **must** not be `NULL`
- VUID-VkResourceDescriptorInfoEXT-type-11469
  If `type` is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, `data->pImage` **must** not be `NULL`
- VUID-VkResourceDescriptorInfoEXT-None-11212
  If the `nullDescriptor` feature is not enabled, and `type` is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, `data->pTexelBuffer` **must** not be `NULL`
- VUID-VkResourceDescriptorInfoEXT-None-11213
  If the `nullDescriptor` feature is not enabled, and `type` is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV,

VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, data->pAddressRange **must** not be NULL

- VUID-VkResourceDescriptorInfoEXT-None-11457
  If the nullDescriptor feature is not enabled, and type is VK_DESCRIPTOR_TYPE_TENSOR_ARM, data->pTensorARM **must** not be NULL
- VUID-VkResourceDescriptorInfoEXT-type-12349
  If type is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, data->pTexelBuffer->addressRange.address **must** be a multiple of the effective alignment requirement of data->pTexelBuffer->format as determined by minTexelBufferOffsetAlignment
- VUID-VkResourceDescriptorInfoEXT-type-12350
  If type is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, data->pAddressRange->address **must** be a multiple of minUniformBufferOffsetAlignment
- VUID-VkResourceDescriptorInfoEXT-type-12351
  If type is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, data->pAddressRange->address **must** be a multiple of minStorageBufferOffsetAlignment
- VUID-VkResourceDescriptorInfoEXT-type-11454
  If type is one of
  - VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR
  - VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV
  - VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV

  data->pAddressRange->address **must** be a multiple of 256
- VUID-VkResourceDescriptorInfoEXT-type-12496
  If type is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, data->pAddressRange->size **must** be less than or equal to maxUniformBufferRange
- VUID-VkResourceDescriptorInfoEXT-type-12497
  If type is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, and the shader64BitIndexing feature is not enabled, data->pAddressRange->size **must** be less than or equal to maxStorageBufferRange
- VUID-VkResourceDescriptorInfoEXT-pNext-11401
  If there is a VkDebugUtilsObjectNameInfoEXT structure in the pNext chain, its objectType **must** be VK_OBJECT_TYPE_UNKNOWN
- VUID-VkResourceDescriptorInfoEXT-type-11422
  If type is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, data.pImage->pView->image **must** not have been created with an imageType of VK_IMAGE_TYPE_3D
- VUID-VkResourceDescriptorInfoEXT-type-11424
  If type is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, data.pImage->pView->viewType is VK_IMAGE_VIEW_TYPE_2D, and the image2DViewOf3D feature is not enabled, data.pImage->pView->image **must** not have been created with an imageType of VK_IMAGE_TYPE_3D

- VUID-VkResourceDescriptorInfoEXT-type-11425
  If `type` is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, `data.pImage->pView->viewType` is VK_IMAGE_VIEW_TYPE_2D, and the `sampler2DViewOf3D` feature is not enabled, `data.pImage->pView->image` **must** not have been created with an `imageType` of VK_IMAGE_TYPE_3D
- VUID-VkResourceDescriptorInfoEXT-type-11433
  If `type` is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, `data.pAddressRange->size` **must** not be 0
- VUID-VkResourceDescriptorInfoEXT-type-11458
  If `type` is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE and `data.pImage` is not `NULL`, the effective `usage` of the VkImageViewCreateInfo **must** include the VK_IMAGE_USAGE_SAMPLED_BIT usage flag
- VUID-VkResourceDescriptorInfoEXT-type-11459
  If `type` is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE and `data.pImage` is not `NULL`, the effective `usage` of the VkImageViewCreateInfo **must** include the VK_IMAGE_USAGE_STORAGE_BIT usage flag
- VUID-VkResourceDescriptorInfoEXT-type-11460
  If `type` is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT and `data.pImage` is not `NULL`, the effective `usage` of the VkImageViewCreateInfo **must** include the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT usage flag
- VUID-VkResourceDescriptorInfoEXT-type-12498
  If `type` is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM and `data.pImage` is not `NULL`, the effective `usage` of the VkImageViewCreateInfo **must** include the VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM usage flag
- VUID-VkResourceDescriptorInfoEXT-type-12499
  If `type` is VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM and `data.pImage` is not `NULL`, the effective `usage` of the VkImageViewCreateInfo **must** include the VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM usage flag
- VUID-VkResourceDescriptorInfoEXT-type-11461
  If `type` is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and `data.pAddressRange` is not `NULL`, `data.pAddressRange` **must** be a device address range allocated to the application from a buffer created with the VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT usage flag set
- VUID-VkResourceDescriptorInfoEXT-type-11462
  If `type` is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and `data.pAddressRange` is not `NULL`, `data.pAddressRange` **must** be a device address range allocated to the application from a buffer created with the VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag set
- VUID-VkResourceDescriptorInfoEXT-type-11463
  If `type` is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER and `data.pTexelBuffer` is not `NULL`, `data.pTexelBuffer->addressRange` **must** be a device address range allocated to the application from a buffer created with the VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT usage flag set
- VUID-VkResourceDescriptorInfoEXT-type-11464
  If `type` is VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER and `data.pTexelBuffer` is not `NULL`, `data.pTexelBuffer->addressRange` **must** be a device address range allocated to the

application from a buffer created with the VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT usage flag set

- VUID-VkResourceDescriptorInfoEXT-type-11483
  If `type` is VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, and `data.pAddressRange` is not `NULL`, `data.pAddressRange->address` **must** be an acceleration structure address retrieved from a VkAccelerationStructureKHR object via vkGetAccelerationStructureDeviceAddressKHR
- VUID-VkResourceDescriptorInfoEXT-type-11484
  If `type` is VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, `data.pAddressRange` is not `NULL`, and `data.pAddressRange->size` is not 0, `data.pAddressRange` **must** be a device address range allocated to the application from the buffer used to create the acceleration structure that `data.pAddressRange->address` was retrieved from, and within the buffer range bound to that acceleration structure
- VUID-VkResourceDescriptorInfoEXT-type-11467
  If `type` is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV and `data.pAddressRange` is not `NULL`, `data.pAddressRange->address` **must** be an acceleration structure handle retrieved from a VkAccelerationStructureNV object via vkGetAccelerationStructureHandleNV
- VUID-VkResourceDescriptorInfoEXT-type-11468
  If `type` is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV and `data.pAddressRange` is not `NULL`, `data.pAddressRange->size` **must** be 0

Valid Usage (Implicit)

- VUID-VkResourceDescriptorInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_RESOURCE_DESCRIPTOR_INFO_EXT
- VUID-VkResourceDescriptorInfoEXT-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of VkDebugUtilsObjectNameInfoEXT
- VUID-VkResourceDescriptorInfoEXT-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkResourceDescriptorInfoEXT-type-parameter
  `type` **must** be a valid VkDescriptorType value
- VUID-VkResourceDescriptorInfoEXT-pImage-parameter
  If `type` is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, or VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, and if `pImage` is not `NULL`, the `pImage` member of `data` **must** be a valid pointer to a valid VkImageDescriptorInfoEXT structure
- VUID-VkResourceDescriptorInfoEXT-pTexelBuffer-parameter
  If `type` is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or

VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, and if pTexelBuffer is not NULL, the pTexelBuffer member of data **must** be a valid pointer to a valid VkTexelBufferDescriptorInfoEXT structure

- VUID-VkResourceDescriptorInfoEXT-pAddressRange-parameter
  If type is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, and if pAddressRange is not NULL, the pAddressRange member of data **must** be a valid pointer to a valid VkDeviceAddressRangeEXT structure
- VUID-VkResourceDescriptorInfoEXT-pTensorARM-parameter
  If type is VK_DESCRIPTOR_TYPE_TENSOR_ARM, and if pTensorARM is not NULL, the pTensorARM member of data **must** be a valid pointer to a valid VkTensorViewCreateInfoARM structure

The VkResourceDescriptorDataEXT union is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef union VkResourceDescriptorDataEXT {
    const VkImageDescriptorInfoEXT*          pImage;
    const VkTexelBufferDescriptorInfoEXT*    pTexelBuffer;
    const VkDeviceAddressRangeEXT*           pAddressRange;
    const VkTensorViewCreateInfoARM*         pTensorARM;
} VkResourceDescriptorDataEXT;
```

- pImage is a pointer to a VkImageDescriptorInfoEXT structure.
- pTexelBuffer is a pointer to a VkTexelBufferDescriptorInfoEXT structure.
- pAddressRange is a pointer to a VkDeviceAddressRangeKHR structure.
- pTensorARM is a pointer to a VkTensorViewCreateInfoARM structure.

VkTexelBufferDescriptorInfoEXT is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkTexelBufferDescriptorInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkFormat                  format;
    VkDeviceAddressRangeEXT   addressRange;
} VkTexelBufferDescriptorInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- format is the VkFormat of the descriptor.
- addressRange is a VkDeviceAddressRangeKHR defining the range of data backing the descriptor.

Valid Usage (Implicit)

- VUID-VkTexelBufferDescriptorInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_TEXEL_BUFFER_DESCRIPTOR_INFO_EXT
- VUID-VkTexelBufferDescriptorInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkTexelBufferDescriptorInfoEXT-format-parameter
  `format` **must** be a valid VkFormat value

`VkImageDescriptorInfoEXT` is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkImageDescriptorInfoEXT {
    VkStructureType                 sType;
    const void*                     pNext;
    const VkImageViewCreateInfo*    pView;
    VkImageLayout                   layout;
} VkImageDescriptorInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pView` is an VkImageViewCreateInfo describing the descriptor.
- `layout` is the VkImageLayout that the image view will be in when accessed as a descriptor.

Valid Usage

- VUID-VkImageDescriptorInfoEXT-pView-11426
  `pView->viewType` **must** not be VK_IMAGE_VIEW_TYPE_2D_ARRAY if `pView->image` was created with an `imageType` of VK_IMAGE_TYPE_3D
- VUID-VkImageDescriptorInfoEXT-pView-11427
  If `pView->viewType` is VK_IMAGE_VIEW_TYPE_2D and `pView->image` was created with an `imageType` of VK_IMAGE_TYPE_3D, `pView->image` **must** have been created with VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set
- VUID-VkImageDescriptorInfoEXT-layout-11219
  `layout` **must** be VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR,

VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT, or VK_IMAGE_LAYOUT_GENERAL

- VUID-VkImageDescriptorInfoEXT-layout-11221
  If `layout` is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, then `pView->subresourceRange.aspectMask` **must** not include VK_IMAGE_ASPECT_COLOR_BIT
- VUID-VkImageDescriptorInfoEXT-pView-11430
  If `pView->image` is a depth/stencil image, `pView->subresourceRange.aspectMask` **must** include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT but not both

Valid Usage (Implicit)

- VUID-VkImageDescriptorInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_IMAGE_DESCRIPTOR_INFO_EXT
- VUID-VkImageDescriptorInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkImageDescriptorInfoEXT-pView-parameter
  `pView` **must** be a valid pointer to a valid VkImageViewCreateInfo structure
- VUID-VkImageDescriptorInfoEXT-layout-parameter
  `layout` **must** be a valid VkImageLayout value

16.2. Using Heaps

One descriptor heap of each type can be bound to a command buffer for use with shaders. When using descriptor heaps, pipelines **must** be created with VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT and shaders created with VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT in order to make use of the heaps.

When any heap state command is recorded to a command buffer, it immediately invalidates all descriptor set and descriptor buffer state set by vkCmdBindDescriptorSets2, vkCmdPushDescriptorSet2, vkCmdPushDescriptorSetWithTemplate2, vkCmdSetDescriptorBufferOffsets2EXT, vkCmdBindDescriptorBufferEmbeddedSamplers2EXT, vkCmdPushConstants2, vkCmdBindDescriptorSets, vkCmdPushDescriptorSet, vkCmdPushDescriptorSetWithTemplate, vkCmdBindDescriptorBuffersEXT, vkCmdSetDescriptorBufferOffsetsEXT, vkCmdBindDescriptorBufferEmbeddedSamplersEXT, or vkCmdPushConstants. Similarly, recording any of these commands immediately invalidates all state set by commands in this chapter.

Implementations **may** require storage in descriptor heaps for their own internal descriptors. Storage for these extra descriptors **must** be allocated by the application as part of each descriptor heap address range, and **must** not be accessed by the application while it is bound as a reserved

range, in any command buffer, until all such command buffers are freed or reset. The amount of storage required by an implementation is advertised by `minResourceHeapReservedRange` for the resource heap, and `minSamplerHeapReservedRange` or `minSamplerHeapReservedRangeWithEmbedded` for the sampler heap (the latter being required when using embedded samplers).

Applications **can** set different heaps to use the same address ranges, but **must** take care to ensure that the reserved ranges for each heap do not overlap with each other or with user ranges.

To bind a sampler heap to a command buffer, call:

```
// Provided by VK_EXT_descriptor_heap
void vkCmdBindSamplerHeapEXT(
    VkCommandBuffer                             commandBuffer,
    const VkBindHeapInfoEXT*                    pBindInfo);
```

- `commandBuffer` is the command buffer that the sampler heap will be bound to.
- `pBindInfo` is a VkBindHeapInfoEXT specifying the device address range used for the heap and any implementation reservations.

Addresses in the range defined by `pBindInfo->heapRange` are bound as the sampler heap. The application **can** access samplers and data through this heap anywhere except for the reserved range specified by `pBindInfo->reservedRangeOffset`. Addresses in the range [`pBindInfo->reservedRangeOffset`, `pBindInfo->reservedRangeOffset` + `pBindInfo->reservedRangeSize`) are reserved for the implementation and **must** not be accessed by the application at any time from when this command is recorded until there are no command buffers with that range bound.

The reserved range is bound to the command buffer until it has been reset.

NOTE	Implementations may require a larger sampler heap reservation to store embedded sampler descriptors when used in a mapping, as advertised by `minSamplerHeapReservedRangeWithEmbedded`.

Shaders executed by commands recorded after this command **can** use the specified sampler heap to access resources. `pBindInfo->heapRange.address` will be available to shaders to access samplers and data through the `SamplerHeapEXT BuiltIn` or via shader bindings.

When `vkCmdBindSamplerHeapEXT` is recorded, it immediately invalidates all non-heap descriptor state. Similarly, recording any non-heap descriptor state commands immediately invalidates state set by this command.

Valid Usage

- VUID-vkCmdBindSamplerHeapEXT-pBindInfo-11223
  The sum of `pBindInfo->reservedRangeOffset` and `pBindInfo->reservedRangeSize` **must** be less than or equal to `pBindInfo->heapRange.size`
- VUID-vkCmdBindSamplerHeapEXT-pBindInfo-11224
  `pBindInfo->reservedRangeSize` **must** be greater than or equal to

minSamplerHeapReservedRange

- VUID-vkCmdBindSamplerHeapEXT-pBindInfo-11225
  pBindInfo->heapRange.size **must** be less than or equal to maxSamplerHeapSize
- VUID-vkCmdBindSamplerHeapEXT-pBindInfo-11226
  pBindInfo->heapRange.address **must** be a multiple of samplerHeapAlignment
- VUID-vkCmdBindSamplerHeapEXT-pBindInfo-11434
  pBindInfo->reservedRangeOffset **must** be a multiple of samplerDescriptorAlignment
- VUID-vkCmdBindSamplerHeapEXT-pBindInfo-11228
  Memory bound to addresses in the range [pBindInfo->heapRange.address + pBindInfo->reservedRangeOffset, pBindInfo->heapRange.address + pBindInfo->reservedRangeOffset + pBindInfo->reservedRangeSize) **must** not be bound to any other command buffer as a reserved range for any heap unless the reserved range matches exactly and it is the same heap type
- VUID-vkCmdBindSamplerHeapEXT-heapRange-11230
  heapRange **must** be a device address range allocated to the application from a buffer created with the VK_BUFFER_USAGE_DESCRIPTOR_HEAP_BIT_EXT usage flag set
- VUID-vkCmdBindSamplerHeapEXT-commandBuffer-11231
  If commandBuffer is a secondary command buffer, it **must** have begun with VkCommandBufferInheritanceDescriptorHeapInfoEXT::pSamplerHeapBindInfo equal to NULL

Valid Usage (Implicit)

- VUID-vkCmdBindSamplerHeapEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBindSamplerHeapEXT-pBindInfo-parameter
  pBindInfo **must** be a valid pointer to a valid VkBindHeapInfoEXT structure
- VUID-vkCmdBindSamplerHeapEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdBindSamplerHeapEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdBindSamplerHeapEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdBindSamplerHeapEXT is not affected by conditional rendering

To bind a resource heap to a command buffer, call:

```
// Provided by VK_EXT_descriptor_heap
void vkCmdBindResourceHeapEXT(
    VkCommandBuffer                             commandBuffer,
    const VkBindHeapInfoEXT*                    pBindInfo);
```

- `commandBuffer` is the command buffer that the resource heap will be bound to.
- `pBindInfo` is a VkBindHeapInfoEXT specifying the device address range used for the heap and any implementation reservations.

Addresses in the range defined by `pBindInfo->heapRange` are bound as the resource heap. The application **can** access resources and data through this heap anywhere except for the reserved range specified by `pBindInfo->reservedRangeOffset`. Addresses in the range [`pBindInfo->reservedRangeOffset`, `pBindInfo->reservedRangeOffset` + `pBindInfo->reservedRangeSize`) are reserved for the implementation and **must** not be accessed by the application at any time from when this command is recorded until there are no command buffers with that range bound.

The reserved range is bound to the command buffer until it has been reset.

Shaders executed by commands recorded after this command **can** use the specified resource heap to access resources. `pBindInfo->heapRange.address` will be available to shaders to access resources through the `ResourceHeapEXT BuiltIn` or via shader bindings.

When `vkCmdBindResourceHeapEXT` is recorded, it immediately invalidates all non-heap descriptor state. Similarly, recording any non-heap descriptor state commands immediately invalidates state set by this command.

Valid Usage

- VUID-vkCmdBindResourceHeapEXT-pBindInfo-11232

The sum of pBindInfo->reservedRangeOffset and pBindInfo->reservedRangeSize **must** be less than or equal to pBindInfo->heapRange.size

- VUID-vkCmdBindResourceHeapEXT-pBindInfo-11233
  pBindInfo->reservedRangeSize **must** be greater than or equal to minResourceHeapReservedRange
- VUID-vkCmdBindResourceHeapEXT-pBindInfo-11234
  pBindInfo->heapRange.size **must** be less than or equal to maxResourceHeapSize
- VUID-vkCmdBindResourceHeapEXT-pBindInfo-11235
  pBindInfo->heapRange.address **must** be a multiple of resourceHeapAlignment
- VUID-vkCmdBindResourceHeapEXT-pBindInfo-11435
  pBindInfo->reservedRangeOffset **must** be a multiple of bufferDescriptorAlignment
- VUID-vkCmdBindResourceHeapEXT-pBindInfo-11436
  pBindInfo->reservedRangeOffset **must** be a multiple of imageDescriptorAlignment
- VUID-vkCmdBindResourceHeapEXT-pBindInfo-11236
  Memory bound to addresses in the range [pBindInfo->heapRange.address + pBindInfo->reservedRangeOffset, pBindInfo->heapRange.address + pBindInfo->reservedRangeOffset + pBindInfo->reservedRangeSize) **must** not be bound to any other command buffer as a reserved range for any heap unless the reserved range matches exactly and it is the same heap type
- VUID-vkCmdBindResourceHeapEXT-heapRange-11237
  heapRange **must** be a device address range allocated to the application from a buffer created with the VK_BUFFER_USAGE_DESCRIPTOR_HEAP_BIT_EXT usage flag set
- VUID-vkCmdBindResourceHeapEXT-commandBuffer-11238
  If commandBuffer is a secondary command buffer, it **must** have begun with VkCommandBufferInheritanceDescriptorHeapInfoEXT::pResourceHeapBindInfo equal to NULL

Valid Usage (Implicit)

- VUID-vkCmdBindResourceHeapEXT-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdBindResourceHeapEXT-pBindInfo-parameter
  pBindInfo **must** be a valid pointer to a valid VkBindHeapInfoEXT structure
- VUID-vkCmdBindResourceHeapEXT-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdBindResourceHeapEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdBindResourceHeapEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdBindResourceHeapEXT is not affected by conditional rendering

`VkBindHeapInfoEXT` is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkBindHeapInfoEXT {
    VkStructureType            sType;
    const void*                pNext;
    VkDeviceAddressRangeEXT    heapRange;
    VkDeviceSize               reservedRangeOffset;
    VkDeviceSize               reservedRangeSize;
} VkBindHeapInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `heapRange` is a VkDeviceAddressRangeKHR defining the device address range used for the heap, inclusive of the implementation reserved range.
- `reservedRangeOffset` is the offset within `heapRange` to the start of the reserved range for the implementation.
- `reservedRangeSize` is the size of the reserved range for the implementation within `heapRange`.

Valid Usage (Implicit)

- VUID-VkBindHeapInfoEXT-sType-sType

sType **must** be VK_STRUCTURE_TYPE_BIND_HEAP_INFO_EXT

- VUID-VkBindHeapInfoEXT-pNext-pNext
  pNext **must** be NULL

SamplerHeapEXT

Decorating a variable with the SamplerHeapEXT built-in decoration will back it with the contents of the sampler heap bound by vkCmdBindSamplerHeapEXT.

Valid Usage

- VUID-SamplerHeapEXT-SamplerHeapEXT-11239
  The variable decorated with SamplerHeapEXT **must** be declared using the UniformConstant Storage Class

ResourceHeapEXT

Decorating a variable with the ResourceHeapEXT built-in decoration will back it with the contents of the resource heap bound by vkCmdBindResourceHeapEXT.

Valid Usage

- VUID-ResourceHeapEXT-ResourceHeapEXT-11241
  The variable decorated with ResourceHeapEXT **must** be declared using the UniformConstant Storage Class

16.2.1. Push Data

Push constants specified by vkCmdPushConstants or vkCmdPushConstants2KHR rely on descriptor set layout state, and are not compatible with descriptor heaps. A new push interface is provided for use with descriptor heaps:

To update push data when using descriptor heaps, call:

```
// Provided by VK_EXT_descriptor_heap
void vkCmdPushDataEXT(
    VkCommandBuffer                             commandBuffer,
    const VkPushDataInfoEXT*                    pPushDataInfo);
```

- commandBuffer is the command buffer in which the push data update will be recorded.
- pPushDataInfo is a pointer to a VkPushDataInfoEXT structure.

When vkCmdPushDataEXT is recorded, it immediately invalidates all non-heap descriptor state. Similarly, recording any non-heap descriptor state commands immediately invalidates state set by this command.

All push data is available to all shaders using the existing `PushConstant Storage Class`.

NOTE Device addresses in push data are intended as the fast path for shader-constant data that does not fit into push data directly. These addresses can also be mapped to an existing buffer declaration in the shader using set and binding decorations, which will be the preferred path for some implementations initially, though such implementations are expected to lean less on this mechanism over time.

Valid Usage (Implicit)

- VUID-vkCmdPushDataEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid VkCommandBuffer handle
- VUID-vkCmdPushDataEXT-pPushDataInfo-parameter
  `pPushDataInfo` **must** be a valid pointer to a valid VkPushDataInfoEXT structure
- VUID-vkCmdPushDataEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdPushDataEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdPushDataEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdPushDataEXT is not affected by conditional rendering

The VkPushDataInfoEXT structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkPushDataInfoEXT {
    VkStructureType               sType;
    const void*                   pNext;
    uint32_t                      offset;
    VkHostAddressRangeConstEXT    data;
} VkPushDataInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- offset is the start offset of the push data range to update, in units of bytes.
- data is the host address range containing the push data to update.

Valid Usage

- VUID-VkPushDataInfoEXT-offset-11243
  The sum of offset and data.size **must** be less than or equal to maxPushDataSize
- VUID-VkPushDataInfoEXT-offset-11418
  offset **must** be a multiple of 4
- VUID-VkPushDataInfoEXT-data-11419
  data.size **must** be a multiple of 4

Valid Usage (Implicit)

- VUID-VkPushDataInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PUSH_DATA_INFO_EXT
- VUID-VkPushDataInfoEXT-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkPushConstantBankInfoNV
- VUID-VkPushDataInfoEXT-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkPushDataInfoEXT-data-parameter
  data **must** be a valid VkHostAddressRangeConstEXT structure

Push Data Banks

When the pushConstantBank feature is enabled, applications **can** specify the hardware bank into which data is pushed using the VkPushConstantBankInfoNV structure.

The VkPushConstantBankInfoNV structure is defined as:

```
// Provided by VK_NV_push_constant_bank
typedef struct VkPushConstantBankInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           bank;
} VkPushConstantBankInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bank` is the index of the hardware bank into which the data is pushed.

This structure **can** be chained to VkPushDataInfoEXT, VkPushConstantsInfo, VkDescriptorSetAndBindingMappingEXT, and VkIndirectCommandsLayoutTokenEXT via the `pNext` chain to specify push constant bank placement:

- When chained to VkPushDataInfoEXT, it specifies the hardware bank into which vkCmdPushDataEXT pushes the data.
- When chained to VkPushConstantsInfo, it specifies the hardware bank into which vkCmdPushConstants2 pushes the constants.
- When chained to VkDescriptorSetAndBindingMappingEXT, it specifies the hardware push data bank from which the push data is read.
- When chained to VkIndirectCommandsLayoutTokenEXT with VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT, it specifies the hardware bank into which indirect push data is placed.

This allows for more flexible push constant management in descriptor heap scenarios where shaders access different root descriptors with specific bank requirements.

Valid Usage

- VUID-VkPushConstantBankInfoNV-bank-12342
  When chained to VkPushDataInfoEXT, if the command buffer is executing graphics operations, `bank` **must** be less than VkPhysicalDevicePushConstantBankPropertiesNV::`maxGraphicsPushDataBanks`
- VUID-VkPushConstantBankInfoNV-bank-12343
  When chained to VkPushDataInfoEXT, if the command buffer is executing compute operations, `bank` **must** be less than VkPhysicalDevicePushConstantBankPropertiesNV::`maxComputePushDataBanks`
- VUID-VkPushConstantBankInfoNV-bank-12344
  When chained to VkPushConstantsInfo, if VkPushConstantsInfo::stageFlags includes a graphics stage then `bank` **must** be less than VkPhysicalDevicePushConstantBankPropertiesNV::`maxGraphicsPushConstantBanks`
- VUID-VkPushConstantBankInfoNV-bank-12345
  When chained to VkPushConstantsInfo, if VkPushConstantsInfo::stageFlags includes a

compute stage then `bank` **must** be less than VkPhysicalDevicePushConstantBankPropertiesNV::`maxComputePushConstantBanks`

- VUID-VkPushConstantBankInfoNV-bank-12346
  When chained to VkDescriptorSetAndBindingMappingEXT for a graphics shader stage, `bank` **must** be less than VkPhysicalDevicePushConstantBankPropertiesNV::`maxGraphicsPushDataBanks`
- VUID-VkPushConstantBankInfoNV-bank-12347
  When chained to VkDescriptorSetAndBindingMappingEXT for a compute shader stage, `bank` **must** be less than VkPhysicalDevicePushConstantBankPropertiesNV::`maxComputePushDataBanks`

Valid Usage (Implicit)

- VUID-VkPushConstantBankInfoNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_PUSH_CONSTANT_BANK_INFO_NV

Structure Chaining

Extends the structures

- VkDescriptorSetAndBindingMappingEXT
- VkIndirectCommandsLayoutTokenEXT
- VkPushConstantsInfo
- VkPushDataInfoEXT

16.3. Shader Bindings

While descriptor heaps can be accessed directly through the `SamplerHeapEXT` and `ResourceHeapEXT` built-ins, shaders using the existing `DescriptorSet` and `Binding` decorations **can** map these to heap offsets. In place of descriptor set layouts and pipeline layouts, information **can** be provided at pipeline or shader creation time to indicate how these bindings are mapped, through a combination of constants, push data, and indirections through device addresses. This interface provides significantly more flexibility than descriptor set layouts, enabling applications to specify precisely where they expect each descriptor to be.

The `VkShaderDescriptorSetAndBindingMappingInfoEXT` structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkShaderDescriptorSetAndBindingMappingInfoEXT {
    VkStructureType                                 sType;
    const void*                                     pNext;
    uint32_t                                        mappingCount;
    const VkDescriptorSetAndBindingMappingEXT*      pMappings;
} VkShaderDescriptorSetAndBindingMappingInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mappingCount` is the number of elements in `pMappings`.
- `pMappings` is a pointer to an array of VkDescriptorSetAndBindingMappingEXT structures specifying mappings for a set of descriptors.

Including this structure in the `pNext` chain of VkPipelineShaderStageCreateInfo will set mappings for the shader defined by that structure. Similarly, including this structure in the `pNext` chain of a VkShaderCreateInfoEXT with a `codeType` of VK_SHADER_CODE_TYPE_SPIRV_EXT will set mappings for that shader.

If this structure is not present, it is equivalent to setting `mappingCount` to 0.

Valid Usage

- VUID-VkShaderDescriptorSetAndBindingMappingInfoEXT-pMappings-11244
  Any two elements of `pMappings` **must** not have the same value of `descriptorSet`, an overlapping range specified by `firstBinding` and `bindingCount`, and any overlapping bits in `resourceMask`

Valid Usage (Implicit)

- VUID-VkShaderDescriptorSetAndBindingMappingInfoEXT-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_SHADER_DESCRIPTOR_SET_AND_BINDING_MAPPING_INFO_EXT
- VUID-VkShaderDescriptorSetAndBindingMappingInfoEXT-pMappings-parameter
  If `mappingCount` is not `0`, `pMappings` **must** be a valid pointer to an array of `mappingCount` valid VkDescriptorSetAndBindingMappingEXT structures

Structure Chaining

Extends the structures

- VkPipelineShaderStageCreateInfo
- VkShaderCreateInfoEXT

The VkDescriptorSetAndBindingMappingEXT structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkDescriptorSetAndBindingMappingEXT {
    VkStructureType                     sType;
    const void*                         pNext;
    uint32_t                            descriptorSet;
    uint32_t                            firstBinding;
    uint32_t                            bindingCount;
    VkSpirvResourceTypeFlagsEXT         resourceMask;
    VkDescriptorMappingSourceEXT        source;
    VkDescriptorMappingSourceDataEXT    sourceData;
} VkDescriptorSetAndBindingMappingEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- descriptorSet is the value of DescriptorSet for resources that this mapping affects.
- firstBinding is the first value of Binding of resources that this mapping affects.
- bindingCount is the number of consecutive Binding values of resources that this mapping affects.
- resourceMask is a mask of VkSpirvResourceTypeFlagBitsEXT values indicating which resource types are specified by this mapping.
- source is a VkDescriptorMappingSourceEXT value specifying the method of mapping specified for the affected resources.
- sourceData is a VkDescriptorMappingSourceDataEXT that provides the details of how each mapping is specified according to source.

Resources specified in a shader with a DescriptorSet decoration set to descriptorSet, a Binding decoration greater than or equal to firstBinding and less than the sum of firstBinding and bindingCount, and a resource type matching one of the bits in resourceMask will be mapped according to source and sourceData.

NOTE

Applications are free to overspecify bindings that are not present; allowing reuse of the same mapping structures with multiple shaders, even when those shaders only partially reuse those mappings. This includes things like setting binding counts higher than the number used in the shader, specifying bindings that are not present in the shader, and setting resourceMask to all possible resources that may be encountered.

If source selects an element of sourceData defined by a structure, the description of that structure defines how resources are mapped. Source mappings using a single base type are defined here.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT, the resource will be backed by heap data as specified by constantOffset.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT, the resource will

be backed by heap data as specified by pushIndex.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT, the resource will be backed by heap data as specified by indirectIndex.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, the resource will be backed by heap data as specified by indirectIndexArray.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT, the resource will be backed by heap data as specified by heapData.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, the resource will be backed by push data at a range from pushDataOffset to the size of the resource, allowing a uniform buffer to be backed by push data access push data. Accessing data in the uniform buffer at an offset of shaderOffset in the shader will access push data at an offset equal to

offset = shaderOffset + pushDataOffset.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, the resource will be backed by data pointed to by a device address in push data at an offset of pushAddressOffset. Accessing data via the mapped resource in the shader will access data backing the address specified in push data:

address = ((VkDeviceAddress*)pPushData)[pushAddressOffset/8]

where pPushData is the total set of push data specified by vkCmdPushDataEXT. If the shader resource is an acceleration structure, the address **must** be a valid acceleration structure address.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, the resource will be backed by heap data as specified by indirectAddress.

NOTE Accesses to resources using mappings to anything that is not a descriptor in a heap are not subject to robustness guarantees; resources for such mappings must not be accessed out of bounds.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT, the resource will be backed by heap data as specified by shaderRecordIndex.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT, the resource will be backed by shader record data at a range from shaderRecordDataOffset to the size of the resource, allowing a uniform buffer to be used as a way to access shader record data. Accessing data in the uniform buffer at an offset shaderOffset in the shader will access shader record data at an offset equal to

offset = shaderOffset + shaderRecordDataOffset.

If source is VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, the resource will be backed by data pointed to by a device address in the shader record at

`shaderRecordAddressOffset`. Accessing data via the mapped resource in the shader will access data backing the address specified in shader record data:

```
address = ((VkDeviceAddress*)pShaderRecordData)[shaderRecordAddressOffset/8]
```

where pShaderRecordData is the memory associated with a given shader as its shader record. If the shader resource is an acceleration structure, the address **must** be a valid acceleration structure address.

NOTE	Accesses to resources using VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT mappings are not subject to robustness guarantees; data must not be accessed outside of the allocated memory range.

Mappings must be declared for all variables with a `DescriptorSet` and `Binding` in the shader resource interface.

Valid Usage

- VUID-VkDescriptorSetAndBindingMappingEXT-source-11245
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT, `bindingCount` **must** be 1
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11246
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, `sourceData.pushDataOffset` **must** be a multiple of 4
- VUID-VkDescriptorSetAndBindingMappingEXT-source-12452
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, `sourceData.pushDataOffset` **must** be less than or equal to `maxPushDataSize` - 4
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11247
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, `sourceData.pushAddressOffset` **must** be a multiple of 8
- VUID-VkDescriptorSetAndBindingMappingEXT-source-12453
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, `sourceData.pushAddressOffset` **must** be less than or equal to `maxPushDataSize` - 8
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11248
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT or VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, `bindingCount` **must** be 1
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11249
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT, `sourceData.shaderRecordDataOffset` **must** be a multiple of 4

- VUID-VkDescriptorSetAndBindingMappingEXT-source-11250
  If `source` is `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, `sourceData.shaderRecordAddressOffset` **must** be a multiple of 8
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11251
  If `source` is `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, and `descriptorSet`, `firstBinding`, and `bindingCount` identify any `OpTypeImage` variables, any `heapOffset`, and `heapArrayStride` members of the corresponding member of `sourceData` **must** be 0 or a multiple of `imageDescriptorAlignment`
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11252
  If `source` is `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, and `descriptorSet`, `firstBinding`, and `bindingCount` identify any `OpTypeStruct` variables, any `heapOffset`, and `heapArrayStride` members of the corresponding member of `sourceData` **must** be 0 or a multiple of `bufferDescriptorAlignment`
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11253
  If `source` is `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, and `descriptorSet`, `firstBinding`, and `bindingCount` identify any `OpTypeSampler` variables, any `heapOffset` and `heapArrayStride` members of the corresponding member of `sourceData` **must** be 0 or a multiple of `samplerDescriptorAlignment`
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11254
  If `source` is `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, and `descriptorSet`, `firstBinding`, and `bindingCount` identify any `OpTypeSampledImage` variables, and `pEmbeddedSampler` is `NULL`, then any `samplerHeapOffset` and `samplerHeapArrayStride` members of the corresponding member of `sourceData` **must** be 0 or a multiple of `samplerDescriptorAlignment`
- VUID-VkDescriptorSetAndBindingMappingEXT-source-12406
  If `source` is `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, and

descriptorSet, firstBinding, and bindingCount identify any OpTypeSampledImage variables, any heapOffset and heapArrayStride members of the corresponding member of sourceData **must** be 0 or a multiple of imageDescriptorAlignment

- VUID-VkDescriptorSetAndBindingMappingEXT-source-12456
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT, and descriptorSet, firstBinding, and bindingCount identify any OpTypeSampledImage variables, and pEmbeddedSampler is NULL, samplerPushOffset **must** be a multiple of 4
- VUID-VkDescriptorSetAndBindingMappingEXT-source-12457
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT, and descriptorSet, firstBinding, and bindingCount identify any OpTypeSampledImage variables, and pEmbeddedSampler is NULL, samplerPushOffset **must** be less than or equal to maxPushDataSize - 4
- VUID-VkDescriptorSetAndBindingMappingEXT-source-12458
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT or VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, and descriptorSet, firstBinding, and bindingCount identify any OpTypeSampledImage variables, and pEmbeddedSampler is NULL, samplerPushOffset **must** be a multiple of 8
- VUID-VkDescriptorSetAndBindingMappingEXT-source-12459
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT or VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, and descriptorSet, firstBinding, and bindingCount identify any OpTypeSampledImage variables, and pEmbeddedSampler is NULL, samplerPushOffset **must** be less than or equal to maxPushDataSize - 8
- VUID-VkDescriptorSetAndBindingMappingEXT-source-12460
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT or VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, and descriptorSet, firstBinding, and bindingCount identify any OpTypeSampledImage variables, and pEmbeddedSampler is NULL, samplerAddressOffset **must** be a multiple of 4
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11356
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, resourceMask **must** include VK_SPIRV_RESOURCE_TYPE_UNIFORM_BUFFER_BIT_EXT
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11357
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT or VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, resourceMask **must** include at least one of VK_SPIRV_RESOURCE_TYPE_UNIFORM_BUFFER_BIT_EXT, VK_SPIRV_RESOURCE_TYPE_READ_ONLY_STORAGE_BUFFER_BIT_EXT, VK_SPIRV_RESOURCE_TYPE_READ_WRITE_STORAGE_BUFFER_BIT_EXT, or VK_SPIRV_RESOURCE_TYPE_ACCELERATION_STRUCTURE_BIT_EXT
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11358
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT, or

VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, and the mapping sets useCombinedImageSamplerIndex to VK_TRUE, resourceMask **must** include at least one of VK_SPIRV_RESOURCE_TYPE_COMBINED_SAMPLED_IMAGE_BIT_EXT, VK_SPIRV_RESOURCE_TYPE_SAMPLED_IMAGE_BIT_EXT, or VK_SPIRV_RESOURCE_TYPE_SAMPLER_BIT_EXT

- VUID-VkDescriptorSetAndBindingMappingEXT-source-11389
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, and bindingCount is not 1, the pEmbeddedSampler member of the corresponding mapping structure **must** be NULL
- VUID-VkDescriptorSetAndBindingMappingEXT-source-11390
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, and descriptorSet, firstBinding, and bindingCount identify any OpTypeTensorARM variables, the heapOffset, and heapArrayStride members of the corresponding member of sourceData **must** be 0 or a multiple of tensorDescriptorAlignment

Valid Usage (Implicit)

- VUID-VkDescriptorSetAndBindingMappingEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_AND_BINDING_MAPPING_EXT
- VUID-VkDescriptorSetAndBindingMappingEXT-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkPushConstantBankInfoNV
- VUID-VkDescriptorSetAndBindingMappingEXT-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkDescriptorSetAndBindingMappingEXT-resourceMask-parameter
  resourceMask **must** be a valid combination of VkSpirvResourceTypeFlagBitsEXT values
- VUID-VkDescriptorSetAndBindingMappingEXT-source-parameter
  source **must** be a valid VkDescriptorMappingSourceEXT value
- VUID-VkDescriptorSetAndBindingMappingEXT-constantOffset-parameter
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT, the constantOffset member of sourceData **must** be a valid VkDescriptorMappingSourceConstantOffsetEXT structure
- VUID-VkDescriptorSetAndBindingMappingEXT-pushIndex-parameter
  If source is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT, the pushIndex member of sourceData **must** be a valid VkDescriptorMappingSourcePushIndexEXT structure

- VUID-VkDescriptorSetAndBindingMappingEXT-indirectIndex-parameter
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT, the `indirectIndex` member of `sourceData` **must** be a valid VkDescriptorMappingSourceIndirectIndexEXT structure
- VUID-VkDescriptorSetAndBindingMappingEXT-indirectIndexArray-parameter
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, the `indirectIndexArray` member of `sourceData` **must** be a valid VkDescriptorMappingSourceIndirectIndexArrayEXT structure
- VUID-VkDescriptorSetAndBindingMappingEXT-shaderRecordIndex-parameter
  If `source` is VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT, the `shaderRecordIndex` member of `sourceData` **must** be a valid VkDescriptorMappingSourceShaderRecordIndexEXT structure

Bits which **can** be set in VkDescriptorSetAndBindingMappingEXT::`resourceMask`, are:

```
// Provided by VK_EXT_descriptor_heap
typedef enum VkSpirvResourceTypeFlagBitsEXT {
    VK_SPIRV_RESOURCE_TYPE_ALL_EXT = 0x7FFFFFFF,
    VK_SPIRV_RESOURCE_TYPE_SAMPLER_BIT_EXT = 0x00000001,
    VK_SPIRV_RESOURCE_TYPE_SAMPLED_IMAGE_BIT_EXT = 0x00000002,
    VK_SPIRV_RESOURCE_TYPE_READ_ONLY_IMAGE_BIT_EXT = 0x00000004,
    VK_SPIRV_RESOURCE_TYPE_READ_WRITE_IMAGE_BIT_EXT = 0x00000008,
    VK_SPIRV_RESOURCE_TYPE_COMBINED_SAMPLED_IMAGE_BIT_EXT = 0x00000010,
    VK_SPIRV_RESOURCE_TYPE_UNIFORM_BUFFER_BIT_EXT = 0x00000020,
    VK_SPIRV_RESOURCE_TYPE_READ_ONLY_STORAGE_BUFFER_BIT_EXT = 0x00000040,
    VK_SPIRV_RESOURCE_TYPE_READ_WRITE_STORAGE_BUFFER_BIT_EXT = 0x00000080,
  // Provided by VK_EXT_descriptor_heap with VK_KHR_ray_tracing_pipeline or
VK_NV_ray_tracing
    VK_SPIRV_RESOURCE_TYPE_ACCELERATION_STRUCTURE_BIT_EXT = 0x00000100,
  // Provided by VK_EXT_descriptor_heap with VK_ARM_tensors
    VK_SPIRV_RESOURCE_TYPE_TENSOR_BIT_ARM = 0x00000200,
} VkSpirvResourceTypeFlagBitsEXT;
```

- VK_SPIRV_RESOURCE_TYPE_ALL_EXT specifies that all resource declarations are included.
- VK_SPIRV_RESOURCE_TYPE_SAMPLER_BIT_EXT specifies `OpTypeSampler` variables.
- VK_SPIRV_RESOURCE_TYPE_SAMPLED_IMAGE_BIT_EXT specifies `OpTypeImage` variables with a `Sampled` parameter of 1.
- VK_SPIRV_RESOURCE_TYPE_READ_ONLY_IMAGE_BIT_EXT specifies `OpTypeImage` variables with a `Sampled` parameter of 2 and decorated with `NonWritable`.
- VK_SPIRV_RESOURCE_TYPE_READ_WRITE_IMAGE_BIT_EXT specifies `OpTypeImage` variables with a `Sampled` parameter of 2 and not decorated with `NonWritable`.
- VK_SPIRV_RESOURCE_TYPE_COMBINED_SAMPLED_IMAGE_BIT_EXT specifies `OpTypeSampledImage` variables.

- VK_SPIRV_RESOURCE_TYPE_UNIFORM_BUFFER_BIT_EXT specifies OpTypeStruct variables in the Uniform storage class decorated with Block.
- VK_SPIRV_RESOURCE_TYPE_READ_ONLY_STORAGE_BUFFER_BIT_EXT specifies OpTypeStruct variables either in the StorageBuffer storage class decorated with Block or in the Uniform storage class decorated with BufferBlock, and decorated with NonWritable.
- VK_SPIRV_RESOURCE_TYPE_READ_WRITE_STORAGE_BUFFER_BIT_EXT specifies OpTypeStruct variables either in the StorageBuffer storage class decorated with Block or in the Uniform storage class decorated with BufferBlock, but not decorated with NonWritable.
- VK_SPIRV_RESOURCE_TYPE_ACCELERATION_STRUCTURE_BIT_EXT specifies OpTypeAccelerationStructureKHR variables.
- VK_SPIRV_RESOURCE_TYPE_TENSOR_BIT_ARM specifies OpTypeTensorARM variables.

```
// Provided by VK_EXT_descriptor_heap
typedef VkFlags VkSpirvResourceTypeFlagsEXT;
```

VkSpirvResourceTypeFlagsEXT is a bitmask type for setting a mask of zero or more VkSpirvResourceTypeFlagBitsEXT.

The possible mapping sources for a shader binding are:

```
// Provided by VK_EXT_descriptor_heap
typedef enum VkDescriptorMappingSourceEXT {
    VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT = 0,
    VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT = 1,
    VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT = 2,
    VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT = 3,
    VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT = 4,
    VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT = 5,
    VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT = 6,
    VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT = 7,
  // Provided by VK_EXT_descriptor_heap with VK_KHR_ray_tracing_pipeline or
VK_NV_ray_tracing
    VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT = 8,
  // Provided by VK_EXT_descriptor_heap with VK_KHR_ray_tracing_pipeline or
VK_NV_ray_tracing
    VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT = 9,
  // Provided by VK_EXT_descriptor_heap with VK_KHR_ray_tracing_pipeline or
VK_NV_ray_tracing
    VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT = 10,
} VkDescriptorMappingSourceEXT;
```

- VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_CONSTANT_OFFSET_EXT specifies that the resource will be backed by a descriptor from the heap at a constant index.
- VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT specifies that the resource will be backed by a descriptor from the heap at an index sourced from push data, added to a constant index.

- VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT specifies that the resource will be backed by a descriptor from the heap at an index sourced from an address in push data, added to a constant index. If the mapping is an array, the array will be mapped to a base offset in indirect memory, and subsequent elements are mapped as offsets to that base.
- VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT specifies that the resource will be backed by a descriptor from the heap at an index sourced from an address in push data, added to a constant index. If the mapping is an array, each array element will be mapped to a separate index in indirect memory.
- VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT specifies that the resource will be backed by heap data directly.
- VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT specifies that the resource will be backed by push data directly.
- VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT specifies that the resource will be backed by an address in push data.
- VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT specifies that the resource will be backed by an address sourced via another address in push data.
- VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT specifies that the resource will be backed by a descriptor from the heap at an index sourced from shader record data, added to a constant index.
- VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT specifies that the resource will be backed by shader record data directly.
- VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT specifies that the resource will be backed by an address in shader record data.

The VkDescriptorMappingSourceDataEXT union is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef union VkDescriptorMappingSourceDataEXT {
    VkDescriptorMappingSourceConstantOffsetEXT        constantOffset;
    VkDescriptorMappingSourcePushIndexEXT             pushIndex;
    VkDescriptorMappingSourceIndirectIndexEXT         indirectIndex;
    VkDescriptorMappingSourceIndirectIndexArrayEXT    indirectIndexArray;
    VkDescriptorMappingSourceHeapDataEXT              heapData;
    uint32_t                                          pushDataOffset;
    uint32_t                                          pushAddressOffset;
    VkDescriptorMappingSourceIndirectAddressEXT       indirectAddress;
    VkDescriptorMappingSourceShaderRecordIndexEXT     shaderRecordIndex;
    uint32_t                                          shaderRecordDataOffset;
    uint32_t                                          shaderRecordAddressOffset;
} VkDescriptorMappingSourceDataEXT;
```

- constantOffset is a VkDescriptorMappingSourceConstantOffsetEXT structure specifying the mapping for resources at a constant byte offset into a heap.
- pushIndex is a VkDescriptorMappingSourcePushIndexEXT structure specifying the mapping for

resources at an index into a heap sourced from push data.

- `indirectIndex` is a VkDescriptorMappingSourceIndirectIndexEXT structure specifying the mapping for resources at an index into a heap sourced from an address in push data.
- `indirectIndexArray` is a VkDescriptorMappingSourceIndirectIndexArrayEXT structure specifying the mapping for resources to an array of indices into a heap sourced from an address in push data.
- `heapData` is a VkDescriptorMappingSourceHeapDataEXT structure specifying an offset into heap data for a uniform buffer to map to.
- `pushDataOffset` is an offset into push data for a uniform buffer to map to.
- `pushAddressOffset` is an offset into push data storing an address for a resource to map to.
- `indirectAddress` is a VkDescriptorMappingSourceIndirectAddressEXT structure specifying an address in push data containing another address for a resource to map to.
- `shaderRecordIndex` is a VkDescriptorMappingSourceShaderRecordIndexEXT structure specifying the mapping for resources at an index into a heap sourced from shader record data.
- `shaderRecordDataOffset` is an offset into shader record data for a uniform buffer to map to.
- `shaderRecordAddressOffset` is an offset into shader record data storing an address for a resource to map to.

The `VkDescriptorMappingSourceConstantOffsetEXT` structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkDescriptorMappingSourceConstantOffsetEXT {
    uint32_t                    heapOffset;
    uint32_t                    heapArrayStride;
    const VkSamplerCreateInfo*  pEmbeddedSampler;
    uint32_t                    samplerHeapOffset;
    uint32_t                    samplerHeapArrayStride;
} VkDescriptorMappingSourceConstantOffsetEXT;
```

- `heapOffset` is a constant byte offset added to the heap address for the mapped resource or sampler.
- `heapArrayStride` is a constant byte stride that multiplies the shader binding and array index.
- `pEmbeddedSampler` is an optional VkSamplerCreateInfo structure specifying a sampler to embed into the shader, in place of looking the sampler up in a heap.
- `samplerHeapOffset` is used only when mapping a combined image sampler, used in place of `heapOffset` to retrieve the sampler.
- `samplerHeapArrayStride` is used only when mapping a combined image sampler, used in place of `heapArrayStride` to retrieve the sampler.

Resources using this mapping will be backed by a descriptor in the heap, at an offset calculated as

shaderIndex = (Binding - `firstBinding`) + arrayIndex

offset = heapOffset + (shaderIndex * heapArrayStride)

where Binding is the binding value in the shader, arrayIndex is the index into the array if the shader binding is declared as an array.

If the mapped resource is a `OpTypeSampledImage`, offset is instead calculated for the sampler as

offset = samplerHeapOffset + (shaderIndex * samplerHeapArrayStride)

If the mapped resource is a `OpTypeSampler` or `OpTypeSampledImage`, and `pEmbeddedSampler` is not `NULL`, the specified embedded sampler will be used rather than accessing the sampler heap.

Valid Usage

- VUID-VkDescriptorMappingSourceConstantOffsetEXT-pEmbeddedSampler-11445
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, its `borderColor` **must** not be VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT
- VUID-VkDescriptorMappingSourceConstantOffsetEXT-pEmbeddedSampler-11415
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, and there is a VkDebugUtilsObjectNameInfoEXT structure in its `pNext` chain, its `objectType` **must** be VK_OBJECT_TYPE_UNKNOWN
- VUID-VkDescriptorMappingSourceConstantOffsetEXT-pEmbeddedSampler-12432
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, the VkSamplerCreateInfo ::`pNext` chain **must** not contain VkOpaqueCaptureDescriptorDataCreateInfoEXT

Valid Usage (Implicit)

- VUID-VkDescriptorMappingSourceConstantOffsetEXT-pEmbeddedSampler-parameter
  If `pEmbeddedSampler` is not `NULL`, `pEmbeddedSampler` **must** be a valid pointer to a valid VkSamplerCreateInfo structure

The `VkDescriptorMappingSourcePushIndexEXT` structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkDescriptorMappingSourcePushIndexEXT {
    uint32_t                        heapOffset;
    uint32_t                        pushOffset;
    uint32_t                        heapIndexStride;
    uint32_t                        heapArrayStride;
    const VkSamplerCreateInfo*      pEmbeddedSampler;
    VkBool32                        useCombinedImageSamplerIndex;
    uint32_t                        samplerHeapOffset;
    uint32_t                        samplerPushOffset;
    uint32_t                        samplerHeapIndexStride;
    uint32_t                        samplerHeapArrayStride;
} VkDescriptorMappingSourcePushIndexEXT;
```

- `heapOffset` is a constant byte offset added to the heap address for the mapped resource or sampler.
- `pushOffset` is an index into push data where an index into the heap for the mapped resource will be retrieved.
- `heapIndexStride` is a constant byte stride that multiplies the index in push data.
- `heapArrayStride` is a constant byte stride that multiplies the shader binding and array index.
- `pEmbeddedSampler` is an optional VkSamplerCreateInfo structure specifying a sampler to embed into the shader, in place of looking the sampler up in a heap.
- `useCombinedImageSamplerIndex` specifies whether the generated index value will be decoded as two packed indices if the mapped resource is an `OpTypeSampledImage`.
- `samplerHeapOffset` is used only when mapping a combined image sampler, used in place of `heapOffset` to retrieve the sampler.
- `samplerPushOffset` is used only when mapping a combined image sampler, used in place of `pushOffset` to retrieve the sampler.
- `samplerHeapIndexStride` is used only when mapping a combined image sampler, used in place of `heapIndexStride` to retrieve the sampler.
- `samplerHeapArrayStride` is used only when mapping a combined image sampler, used in place of `heapArrayStride` to retrieve the sampler.

Resources using this mapping will be backed by a descriptor in the heap, at an offset calculated as

pushIndex = ((uint32_t*)pPushData)[pushOffset/4]

shaderIndex = (Binding - firstBinding) + arrayIndex

offset = heapOffset + (pushIndex × heapIndexStride) + (shaderIndex × heapArrayStride)

where Binding is the binding value in the shader, arrayIndex is the index into the array if the shader binding is declared as an array, and pPushData is the total set of push data specified by vkCmdPushDataEXT.

If the mapped resource is a OpTypeSampledImage, offset is instead calculated for the sampler as

samplerPushIndex = ((uint32_t*)pPushData)[samplerPushOffset/4]

offset = samplerHeapOffset + (samplerPushIndex × samplerHeapIndexStride) + (shaderIndex × samplerHeapArrayStride)

If useCombinedImageSamplerIndex is VK_TRUE, and the mapped resource is a OpTypeSampledImage, pushIndex and samplerPushIndex in the above equations are instead calculated as

pushIndex = ((uint32_t*)pPushData)[pushOffset/4] & 0xFFFFF

samplerPushIndex = (((uint32_t*)pPushData)[pushOffset/4] >> 20) & 0xFFF

If the mapped resource is a OpTypeSampler or OpTypeSampledImage, and pEmbeddedSampler is not NULL, the specified embedded sampler will be used rather than accessing the sampler heap.

Valid Usage

- VUID-VkDescriptorMappingSourcePushIndexEXT-pushOffset-11258
  pushOffset **must** be a multiple of 4
- VUID-VkDescriptorMappingSourcePushIndexEXT-pushOffset-11259
  pushOffset **must** be less than or equal to maxPushDataSize - 4
- VUID-VkDescriptorMappingSourcePushIndexEXT-pEmbeddedSampler-11445
  If pEmbeddedSampler is a valid pointer to a VkSamplerCreateInfo, its borderColor **must** not be VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT
- VUID-VkDescriptorMappingSourcePushIndexEXT-pEmbeddedSampler-11415
  If pEmbeddedSampler is a valid pointer to a VkSamplerCreateInfo, and there is a VkDebugUtilsObjectNameInfoEXT structure in its pNext chain, its objectType **must** be VK_OBJECT_TYPE_UNKNOWN
- VUID-VkDescriptorMappingSourcePushIndexEXT-pEmbeddedSampler-12432
  If pEmbeddedSampler is a valid pointer to a VkSamplerCreateInfo, the VkSamplerCreateInfo ::pNext chain **must** not contain VkOpaqueCaptureDescriptorDataCreateInfoEXT

Valid Usage (Implicit)

- VUID-VkDescriptorMappingSourcePushIndexEXT-pEmbeddedSampler-parameter

If `pEmbeddedSampler` is not `NULL`, `pEmbeddedSampler` **must** be a valid pointer to a valid VkSamplerCreateInfo structure

The `VkDescriptorMappingSourceIndirectIndexEXT` structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkDescriptorMappingSourceIndirectIndexEXT {
    uint32_t                    heapOffset;
    uint32_t                    pushOffset;
    uint32_t                    addressOffset;
    uint32_t                    heapIndexStride;
    uint32_t                    heapArrayStride;
    const VkSamplerCreateInfo*  pEmbeddedSampler;
    VkBool32                    useCombinedImageSamplerIndex;
    uint32_t                    samplerHeapOffset;
    uint32_t                    samplerPushOffset;
    uint32_t                    samplerAddressOffset;
    uint32_t                    samplerHeapIndexStride;
    uint32_t                    samplerHeapArrayStride;
} VkDescriptorMappingSourceIndirectIndexEXT;
```

- `heapOffset` is a constant byte offset added to the heap address for the mapped resource or sampler.
- `pushOffset` is an offset into push data where the indirect address will be.
- `addressOffset` is an index into the address in push data where an index into the heap for the mapped resource will be retrieved.
- `heapIndexStride` is a constant byte stride that multiplies the index in indirect data.
- `heapArrayStride` is a constant byte stride that multiplies the shader binding and array index.
- `pEmbeddedSampler` is an optional VkSamplerCreateInfo structure specifying a sampler to embed into the shader, in place of looking the sampler up in a heap.
- `useCombinedImageSamplerIndex` specifies whether the generated index value will be decoded as two packed indices if the mapped resource is an `OpTypeSampledImage`.
- `samplerHeapOffset` is used only when mapping a combined image sampler, used in place of `heapOffset` to retrieve the sampler.
- `samplerPushOffset` is used only when mapping a combined image sampler, used in place of `pushOffset` to retrieve the sampler.
- `samplerAddressOffset` is used only when mapping a combined image sampler, used in place of `addressOffset` to retrieve the sampler.
- `samplerHeapIndexStride` is used only when mapping a combined image sampler, used in place of `heapIndexStride` to retrieve the sampler.
- `samplerHeapArrayStride` is used only when mapping a combined image sampler, used in place of `heapArrayStride` to retrieve the sampler.

Resources using this mapping will be backed by a descriptor in the heap, at an offset calculated as

uint32_t *indirectAddress = ((VkDeviceAddress*)pPushData)[pushOffset/8]

indirectIndex = indirectAddress[(addressOffset / 4)]

shaderIndex = (Binding - firstBinding) + arrayIndex

offset = heapOffset + (indirectIndex × heapIndexStride) + (shaderIndex × heapArrayStride)

where Binding is the binding value in the shader, arrayIndex is the index into the array if the shader binding is declared as an array, and pPushData is the total set of push data specified by vkCmdPushDataEXT. The value of the address in push data **must** be a multiple of 4. Index reads through indirectAddress are performed as non-volatile uniform buffer reads, and can be synchronized using VK_ACCESS_2_UNIFORM_READ_BIT. The value in memory **must** remain static while any shader invocation using this mapping is in flight to avoid a data race.

If the mapped resource is a `OpTypeSampledImage`, offset is instead calculated for the sampler as

uint32_t *samplerIndirectAddress = ((VkDeviceAddress*)pPushData)[samplerPushOffset/8]

samplerIndirectIndex = samplerIndirectAddress[(samplerAddressOffset / 4)]

offset = samplerHeapOffset + (samplerIndirectIndex × samplerHeapIndexStride) + (shaderIndex × samplerHeapArrayStride)

If `useCombinedImageSamplerIndex` is VK_TRUE, and the mapped resource is a `OpTypeSampledImage`, indirectIndex and samplerIndirectIndex in the above equations are instead calculated as

indirectIndex = indirectAddress[addressOffset/4] & 0xFFFFF

samplerIndirectIndex = indirectAddress[addressOffset/4] >> 20) & 0xFFF

If the mapped resource is a `OpTypeSampler` or `OpTypeSampledImage`, and `pEmbeddedSampler` is not `NULL`, the specified embedded sampler will be used rather than accessing the sampler heap.

Valid Usage

- VUID-VkDescriptorMappingSourceIndirectIndexEXT-pushOffset-11260
  `pushOffset` **must** be a multiple of 8

- VUID-VkDescriptorMappingSourceIndirectIndexEXT-pushOffset-11261
  `pushOffset` **must** be less than or equal to `maxPushDataSize` - 8
- VUID-VkDescriptorMappingSourceIndirectIndexEXT-addressOffset-11262
  `addressOffset` **must** be a multiple of 4
- VUID-VkDescriptorMappingSourceIndirectIndexEXT-pEmbeddedSampler-11445
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, its `borderColor` **must** not be VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT
- VUID-VkDescriptorMappingSourceIndirectIndexEXT-pEmbeddedSampler-11415
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, and there is a VkDebugUtilsObjectNameInfoEXT structure in its `pNext` chain, its `objectType` **must** be VK_OBJECT_TYPE_UNKNOWN
- VUID-VkDescriptorMappingSourceIndirectIndexEXT-pEmbeddedSampler-12432
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, the VkSamplerCreateInfo ::`pNext` chain **must** not contain VkOpaqueCaptureDescriptorDataCreateInfoEXT

Valid Usage (Implicit)

- VUID-VkDescriptorMappingSourceIndirectIndexEXT-pEmbeddedSampler-parameter
  If `pEmbeddedSampler` is not `NULL`, `pEmbeddedSampler` **must** be a valid pointer to a valid VkSamplerCreateInfo structure

The `VkDescriptorMappingSourceIndirectIndexArrayEXT` structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkDescriptorMappingSourceIndirectIndexArrayEXT {
    uint32_t                    heapOffset;
    uint32_t                    pushOffset;
    uint32_t                    addressOffset;
    uint32_t                    heapIndexStride;
    const VkSamplerCreateInfo*  pEmbeddedSampler;
    VkBool32                    useCombinedImageSamplerIndex;
    uint32_t                    samplerHeapOffset;
    uint32_t                    samplerPushOffset;
    uint32_t                    samplerAddressOffset;
    uint32_t                    samplerHeapIndexStride;
} VkDescriptorMappingSourceIndirectIndexArrayEXT;
```

- `heapOffset` is a constant byte offset added to the heap address for the mapped resource or sampler.
- `pushOffset` is an offset into push data where the indirect address will be.
- `addressOffset` is an index into the address in push data where an index into the heap for the mapped resource will be retrieved.
- `heapIndexStride` is a constant byte stride that multiplies the index in indirect data.

- `pEmbeddedSampler` is an optional VkSamplerCreateInfo structure specifying a sampler to embed into the shader, in place of looking the sampler up in a heap.
- `useCombinedImageSamplerIndex` specifies whether the generated index value will be decoded as two packed indices if the mapped resource is an `OpTypeSampledImage`.
- `samplerHeapOffset` is used only when mapping a combined image sampler, used in place of `heapOffset` to retrieve the sampler.
- `samplerPushOffset` is used only when mapping a combined image sampler, used in place of `pushOffset` to retrieve the sampler.
- `samplerAddressOffset` is used only when mapping a combined image sampler, used in place of `addressOffset` to retrieve the sampler.
- `samplerHeapIndexStride` is used only when mapping a combined image sampler, used in place of `heapIndexStride` to retrieve the sampler.

Resources using this mapping will be backed by a descriptor in the heap, at an offset calculated as

```
uint32_t *indirectAddress = ((VkDeviceAddress*)pPushData)[pushOffset/8]

shaderIndex = (Binding - firstBinding) + arrayIndex

indirectIndex = indirectAddress[(addressOffset / 4) + shaderIndex]

offset = heapOffset + (indirectIndex × heapIndexStride)
```

where Binding is the binding value in the shader, arrayIndex is the index into the array if the shader binding is declared as an array, and pPushData is the total set of push data specified by vkCmdPushDataEXT. The value of the address in push data **must** be a multiple of 4. Index reads through indirectAddress are performed as non-volatile uniform buffer reads, and can be synchronized using VK_ACCESS_2_UNIFORM_READ_BIT. The value in memory **must** remain static while any shader invocation using this mapping is in flight to avoid a data race.

If the mapped resource is a `OpTypeSampledImage`, offset is instead calculated for the sampler as

```
uint32_t *samplerIndirectAddress = ((VkDeviceAddress*)pPushData)[samplerPushOffset/8]

samplerIndirectIndex = samplerAddr[(samplerAddressOffset / 4) + shaderIndex]

offset = samplerHeapOffset + (samplerIndirectIndex × samplerHeapIndexStride)
```

If `useCombinedImageSamplerIndex` is VK_TRUE, and the mapped resource is a `OpTypeSampledImage`, indirectIndex and samplerIndirectIndex in the above equations are instead calculated as

indirectIndex = indirectAddress[addressOffset/4 + shaderIndex] & 0xFFFFF

samplerIndirectIndex = indirectAddress[addressOffset/4 + shaderIndex] >> 20) & 0xFFF

If the mapped resource is a `OpTypeSampler` or `OpTypeSampledImage`, and `pEmbeddedSampler` is not `NULL`, the specified embedded sampler will be used rather than accessing the sampler heap.

Valid Usage

- VUID-VkDescriptorMappingSourceIndirectIndexArrayEXT-pushOffset-11359
  `pushOffset` **must** be a multiple of 8
- VUID-VkDescriptorMappingSourceIndirectIndexArrayEXT-pushOffset-11360
  `pushOffset` **must** be less than or equal to `maxPushDataSize` - 8
- VUID-VkDescriptorMappingSourceIndirectIndexArrayEXT-addressOffset-11361
  `addressOffset` **must** be a multiple of 4
- VUID-VkDescriptorMappingSourceIndirectIndexArrayEXT-pEmbeddedSampler-11445
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, its `borderColor` **must** not be VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT
- VUID-VkDescriptorMappingSourceIndirectIndexArrayEXT-pEmbeddedSampler-11415
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, and there is a VkDebugUtilsObjectNameInfoEXT structure in its `pNext` chain, its `objectType` **must** be VK_OBJECT_TYPE_UNKNOWN
- VUID-VkDescriptorMappingSourceIndirectIndexArrayEXT-pEmbeddedSampler-12432
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, the VkSamplerCreateInfo ::`pNext` chain **must** not contain VkOpaqueCaptureDescriptorDataCreateInfoEXT

Valid Usage (Implicit)

- VUID-VkDescriptorMappingSourceIndirectIndexArrayEXT-pEmbeddedSampler-parameter
  If `pEmbeddedSampler` is not `NULL`, `pEmbeddedSampler` **must** be a valid pointer to a valid VkSamplerCreateInfo structure

The `VkDescriptorMappingSourceHeapDataEXT` structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkDescriptorMappingSourceHeapDataEXT {
    uint32_t    heapOffset;
    uint32_t    pushOffset;
} VkDescriptorMappingSourceHeapDataEXT;
```

- heapOffset is a constant byte offset added to the heap address for the mapped buffer.
- pushOffset is an index into push data where an additional offset into the heap for the mapped resource will be retrieved.

Uniform buffers using this mapping will be backed directly by data in the heap. Accessing data in the uniform buffer at an offset of shaderOffset in the shader will access heap data at an offset equal to

offset = shaderOffset + heapOffset + ((uint32_t*)pPushData)[pushOffset/4]

where pPushData is the total set of push data specified by vkCmdPushDataEXT. Shader reads through the heap mapped in this way are performed according to the mapped resource.

Valid Usage

- VUID-VkDescriptorMappingSourceHeapDataEXT-heapOffset-11263
  heapOffset **must** be a multiple of minUniformBufferOffsetAlignment
- VUID-VkDescriptorMappingSourceHeapDataEXT-pushOffset-11264
  pushOffset **must** be a multiple of 4
- VUID-VkDescriptorMappingSourceHeapDataEXT-pushOffset-11265
  pushOffset **must** be less than or equal to maxPushDataSize - 4

The VkDescriptorMappingSourceIndirectAddressEXT structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkDescriptorMappingSourceIndirectAddressEXT {
    uint32_t    pushOffset;
    uint32_t    addressOffset;
} VkDescriptorMappingSourceIndirectAddressEXT;
```

- pushOffset is a byte offset into push data where an indirect address containing the address for the mapped resource will be retrieved.
- addressOffset is a byte offset into the indirect address where the address for the mapped resource will be retrieved.

Accessing data via the mapped resource in the shader will access data backing the address specified in the indirect address at the supplied offset:

indirectAddress = ((VkDeviceAddress*)pPushData)[pushOffset/8]

resourceAddress = ((VkDeviceAddress*)indirectAddress)[addressOffset/8]

where pPushData is the total set of push data specified by vkCmdPushDataEXT. Reads through

indirectAddress are performed as non-volatile uniform buffer reads, and can be synchronized using VK_ACCESS_2_UNIFORM_READ_BIT. Shader reads through resourceAddress are performed according to the mapped resource. If the shader resource is an acceleration structure, the address **must** be a valid acceleration structure address.

Valid Usage

- VUID-VkDescriptorMappingSourceIndirectAddressEXT-pushOffset-11266
  `pushOffset` **must** be a multiple of 8
- VUID-VkDescriptorMappingSourceIndirectAddressEXT-pushOffset-11267
  `pushOffset` **must** be less than or equal to `maxPushDataSize` - 8
- VUID-VkDescriptorMappingSourceIndirectAddressEXT-addressOffset-11268
  `addressOffset` **must** be a multiple of 8

The `VkDescriptorMappingSourceShaderRecordIndexEXT` structure is defined as:

```
// Provided by VK_EXT_descriptor_heap
typedef struct VkDescriptorMappingSourceShaderRecordIndexEXT {
    uint32_t                    heapOffset;
    uint32_t                    shaderRecordOffset;
    uint32_t                    heapIndexStride;
    uint32_t                    heapArrayStride;
    const VkSamplerCreateInfo*  pEmbeddedSampler;
    VkBool32                    useCombinedImageSamplerIndex;
    uint32_t                    samplerHeapOffset;
    uint32_t                    samplerShaderRecordOffset;
    uint32_t                    samplerHeapIndexStride;
    uint32_t                    samplerHeapArrayStride;
} VkDescriptorMappingSourceShaderRecordIndexEXT;
```

- `heapOffset` is a constant byte offset added to the heap address for the mapped resource or sampler.
- `shaderRecordOffset` is an index into shader record data where an index into the heap for the mapped resource will be retrieved.
- `heapIndexStride` is a constant byte stride that multiplies the index in shader record data.
- `heapArrayStride` is a constant byte stride that multiplies the shader binding and array index.
- `pEmbeddedSampler` is an optional VkSamplerCreateInfo structure specifying a sampler to embed into the shader, in place of looking the sampler up in a heap.
- `useCombinedImageSamplerIndex` specifies whether the generated index value will be decoded as two packed indices if the mapped resource is an `OpTypeSampledImage`.
- `samplerHeapOffset` is used only when mapping a combined image sampler, used in place of `heapOffset` to retrieve the sampler.
- `samplerShaderRecordOffset` is used only when mapping a combined image sampler, used in place

of `shaderRecordOffset` to retrieve the sampler.

- `samplerHeapIndexStride` is used only when mapping a combined image sampler, used in place of `heapIndexStride` to retrieve the sampler.
- `samplerHeapArrayStride` is used only when mapping a combined image sampler, used in place of `heapArrayStride` to retrieve the sampler.

Resources using this mapping will be backed by a descriptor in the heap, at an offset calculated as

shaderRecordIndex = ((uint32_t*)pShaderRecordData)[shaderRecordOffset/4]

shaderIndex = (Binding - firstBinding) + arrayIndex

offset = heapOffset + (shaderRecordIndex × heapIndexStride) + (shaderIndex × heapArrayStride)

where Binding is the binding value in the shader, arrayIndex is the index into the array if the shader binding is declared as an array, and pShaderRecordData is the set of shader record data accessible to the shader.

If the mapped resource is a `OpTypeSampledImage`, offset is instead calculated for the sampler as

samplerShaderRecordIndex = ((uint32_t*)pShaderRecordData)[samplerShaderRecordOffset/4]

offset = samplerHeapOffset + (samplerShaderRecordIndex × samplerHeapIndexStride) + (shaderIndex × samplerHeapArrayStride)

If `useCombinedImageSamplerIndex` is VK_TRUE, and the mapped resource is a `OpTypeSampledImage`, shaderRecordIndex and samplerShaderRecordIndex in the above equations are instead calculated as

shaderRecordIndex = ((uint32_t*)pShaderRecordData)[shaderRecordOffset/4] & 0xFFFFF

samplerShaderRecordIndex = (((uint32_t*)pShaderRecordData)[shaderRecordOffset/4] >> 20) & 0xFFF

If the mapped resource is a `OpTypeSampler` or `OpTypeSampledImage`, and `pEmbeddedSampler` is not `NULL`, the specified embedded sampler will be used rather than accessing the sampler heap.

Valid Usage

- VUID-VkDescriptorMappingSourceShaderRecordIndexEXT-shaderRecordOffset-11269
  `shaderRecordOffset` **must** be a multiple of 4

- VUID-VkDescriptorMappingSourceShaderRecordIndexEXT-shaderRecordOffset-11270
  `shaderRecordOffset` **must** be less than or equal to `maxShaderGroupStride` - 4
- VUID-VkDescriptorMappingSourceShaderRecordIndexEXT-pEmbeddedSampler-11445
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, its `borderColor` **must** not be VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT
- VUID-VkDescriptorMappingSourceShaderRecordIndexEXT-pEmbeddedSampler-11415
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, and there is a VkDebugUtilsObjectNameInfoEXT structure in its `pNext` chain, its `objectType` **must** be VK_OBJECT_TYPE_UNKNOWN
- VUID-VkDescriptorMappingSourceShaderRecordIndexEXT-pEmbeddedSampler-12432
  If `pEmbeddedSampler` is a valid pointer to a VkSamplerCreateInfo, the VkSamplerCreateInfo ::`pNext` chain **must** not contain VkOpaqueCaptureDescriptorDataCreateInfoEXT

Valid Usage (Implicit)

- VUID-VkDescriptorMappingSourceShaderRecordIndexEXT-pEmbeddedSampler-parameter
  If `pEmbeddedSampler` is not `NULL`, `pEmbeddedSampler` **must** be a valid pointer to a valid VkSamplerCreateInfo structure

16.4. Packing descriptors more tightly

For simplicity, descriptor sizes are advertised and treated by default as equal to the advertised descriptor size limits:

- `samplerDescriptorSize`
- `bufferDescriptorSize`
- `imageDescriptorSize`
- `tensorDescriptorSize`

However, for some specific use cases it is useful to be able to pack specific descriptors into memory more tightly than this when the implementation allows for this.

To query the size of a heap descriptor for a specific VkDescriptorType, call:

```
// Provided by VK_EXT_descriptor_heap
VkDeviceSize vkGetPhysicalDeviceDescriptorSizeEXT(
    VkPhysicalDevice                            physicalDevice,
    VkDescriptorType                            descriptorType);
```

- `physicalDevice` is the physical device from which to query the descriptor sizes.
- `descriptorType` is a VkDescriptorType specifying the type of heap descriptor to query the size

for.

The return value of this function will be a VkDeviceSize indicating the size in bytes (N) of a heap descriptor with a type equal to `descriptorType`. When a descriptor of this type is written by vkWriteResourceDescriptorsEXT or vkWriteSamplerDescriptorsEXT, only the first N bytes are written; the rest will not be accessed and **can** be safely discarded when copying descriptors around. Additionally, those first N bytes are the only bytes that will be accessed when the descriptor is accessed in the shader. N will never be larger than the applicable limits in VkPhysicalDeviceDescriptorHeapTensorPropertiesARM or VkPhysicalDeviceDescriptorHeapPropertiesEXT.

NOTE Values returned by this function may be non power-of-two.

NOTE This command is not intended for general use, and is for tools that already take advantage of tighter packing with other similar features (e.g. `VK_EXT_descriptor_buffer`) to optimize accesses in some cases. Applications can safely ignore this function and are advised to do so, to avoid depending on non-portable packing.

Valid Usage

- VUID-vkGetPhysicalDeviceDescriptorSizeEXT-type-11362
  `descriptorType` **must** be one of VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV, VK_DESCRIPTOR_TYPE_TENSOR_ARM, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDescriptorSizeEXT-physicalDevice-parameter
  `physicalDevice` **must** be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDescriptorSizeEXT-descriptorType-parameter
  `descriptorType` **must** be a valid VkDescriptorType value

Chapter 17. Descriptor Sets

A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object **may** be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.

17.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that **can** access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by `VkDescriptorSetLayout` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSetLayout)
```

To create descriptor set layout objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorSetLayout(
    VkDevice                                    device,
    const VkDescriptorSetLayoutCreateInfo*      pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDescriptorSetLayout*                      pSetLayout);
```

- `device` is the logical device that creates the descriptor set layout.
- `pCreateInfo` is a pointer to a VkDescriptorSetLayoutCreateInfo structure specifying the state of the descriptor set layout object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSetLayout` is a pointer to a VkDescriptorSetLayout handle in which the resulting descriptor set layout object is returned.

Valid Usage

- VUID-vkCreateDescriptorSetLayout-support-09582
  If the descriptor layout exceeds the limits reported through the physical device limits, then vkGetDescriptorSetLayoutSupport **must** have returned VkDescriptorSetLayoutSupport with `supported` equal to VK_TRUE for `pCreateInfo`

Valid Usage (Implicit)

- VUID-vkCreateDescriptorSetLayout-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateDescriptorSetLayout-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkDescriptorSetLayoutCreateInfo structure
- VUID-vkCreateDescriptorSetLayout-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDescriptorSetLayout-pSetLayout-parameter
  `pSetLayout` **must** be a valid pointer to a VkDescriptorSetLayout handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

Information about the descriptor set layout is passed in a `VkDescriptorSetLayoutCreateInfo` structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutCreateInfo {
    VkStructureType                        sType;
    const void*                            pNext;
    VkDescriptorSetLayoutCreateFlags       flags;
    uint32_t                               bindingCount;
    const VkDescriptorSetLayoutBinding*    pBindings;
} VkDescriptorSetLayoutCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkDescriptorSetLayoutCreateFlagBits specifying options for descriptor set layout creation.
- `bindingCount` is the number of elements in `pBindings`.
- `pBindings` is a pointer to an array of VkDescriptorSetLayoutBinding structures.

Valid Usage

- VUID-VkDescriptorSetLayoutCreateInfo-binding-00279
  If the `perStageDescriptorSet` feature is not enabled, or `flags` does not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV, then the VkDescriptorSetLayoutBinding::`binding` members of the elements of the `pBindings` array **must** each have different values
- VUID-VkDescriptorSetLayoutCreateInfo-flags-10354
  If `flags` contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT, and the VK_KHR_push_descriptor extension is not enabled, `pushDescriptor` **must** be enabled
- VUID-VkDescriptorSetLayoutCreateInfo-flags-00280
  If `flags` contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT, then all elements of `pBindings` **must** not have a `descriptorType` of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
- VUID-VkDescriptorSetLayoutCreateInfo-flags-02208
  If `flags` contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT, then all elements of `pBindings` **must** not have a `descriptorType` of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK
- VUID-VkDescriptorSetLayoutCreateInfo-flags-00281
  If `flags` contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT, then the total number of elements of all bindings **must** be less than or equal to VkPhysicalDevicePushDescriptorProperties::`maxPushDescriptors`
- VUID-VkDescriptorSetLayoutCreateInfo-flags-04590
  If `flags` contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT, `flags` **must** not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT
- VUID-VkDescriptorSetLayoutCreateInfo-flags-04591
  If `flags` contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT, `pBindings` **must** not have a `descriptorType` of VK_DESCRIPTOR_TYPE_MUTABLE_EXT
- VUID-VkDescriptorSetLayoutCreateInfo-flags-03000
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, `flags` **must** include VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT
- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-03001
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, then all bindings **must** not have `descriptorType` of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
- VUID-VkDescriptorSetLayoutCreateInfo-flags-04592
  If `flags` contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, `flags` **must** not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT
- VUID-VkDescriptorSetLayoutCreateInfo-pBindings-07303
  If any element `pBindings`[i] has a `descriptorType` of VK_DESCRIPTOR_TYPE_MUTABLE_EXT,

then the pNext chain **must** include a VkMutableDescriptorTypeCreateInfoEXT structure, and mutableDescriptorTypeListCount **must** be greater than i

- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-04594
  If a binding has a descriptorType value of VK_DESCRIPTOR_TYPE_MUTABLE_EXT, then pImmutableSamplers **must** be NULL
- VUID-VkDescriptorSetLayoutCreateInfo-mutableDescriptorType-04595
  If VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType is not enabled, pBindings **must** not contain a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_EXT
- VUID-VkDescriptorSetLayoutCreateInfo-flags-04596
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT, VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType **must** be enabled
- VUID-VkDescriptorSetLayoutCreateInfo-flags-08000
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, then all elements of pBindings **must** not have a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
- VUID-VkDescriptorSetLayoutCreateInfo-flags-08001
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT, flags **must** also contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT
- VUID-VkDescriptorSetLayoutCreateInfo-flags-08002
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, then flags **must** not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT
- VUID-VkDescriptorSetLayoutCreateInfo-flags-08003
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, then flags **must** not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT
- VUID-VkDescriptorSetLayoutCreateInfo-flags-09463
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV, then perStageDescriptorSet **must** be enabled
- VUID-VkDescriptorSetLayoutCreateInfo-flags-09464
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV, then there **must** not be any two elements of the pBindings array with the same VkDescriptorSetLayoutBinding::binding value and their VkDescriptorSetLayoutBinding ::stageFlags containing the same bit

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutCreateInfo-sType-sType

`sType` **must** be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO

- VUID-VkDescriptorSetLayoutCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkDescriptorSetLayoutBindingFlagsCreateInfo or VkMutableDescriptorTypeCreateInfoEXT
- VUID-VkDescriptorSetLayoutCreateInfo-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkDescriptorSetLayoutCreateInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkDescriptorSetLayoutCreateFlagBits values
- VUID-VkDescriptorSetLayoutCreateInfo-pBindings-parameter
  If `bindingCount` is not `0`, `pBindings` **must** be a valid pointer to an array of `bindingCount` valid VkDescriptorSetLayoutBinding structures

If the `pNext` chain of a VkDescriptorSetLayoutCreateInfo or VkDescriptorPoolCreateInfo structure includes a VkMutableDescriptorTypeCreateInfoEXT structure, then that structure specifies information about the possible descriptor types for mutable descriptor types.

The `VkMutableDescriptorTypeCreateInfoEXT` structure is defined as:

WARNING	This functionality is superseded by VK_EXT_descriptor_heap. See Legacy Functionality for more information.

```
// Provided by VK_EXT_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeCreateInfoEXT {
    VkStructureType                          sType;
    const void*                              pNext;
    uint32_t                                 mutableDescriptorTypeListCount;
    const VkMutableDescriptorTypeListEXT*    pMutableDescriptorTypeLists;
} VkMutableDescriptorTypeCreateInfoEXT;
```

```
// Provided by VK_VALVE_mutable_descriptor_type
// Equivalent to VkMutableDescriptorTypeCreateInfoEXT
typedef VkMutableDescriptorTypeCreateInfoEXT VkMutableDescriptorTypeCreateInfoVALVE;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mutableDescriptorTypeListCount` is the number of elements in `pMutableDescriptorTypeLists`.
- `pMutableDescriptorTypeLists` is a pointer to an array of `VkMutableDescriptorTypeListEXT` structures.

If `mutableDescriptorTypeListCount` is zero or if this structure is not included in the `pNext` chain, the VkMutableDescriptorTypeListEXT for each element is considered to be zero or `NULL` for each

member. Otherwise, the descriptor set layout binding at VkDescriptorSetLayoutCreateInfo ::pBindings[i] uses the descriptor type lists in VkMutableDescriptorTypeCreateInfoEXT ::pMutableDescriptorTypeLists[i].

Valid Usage (Implicit)

- VUID-VkMutableDescriptorTypeCreateInfoEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_MUTABLE_DESCRIPTOR_TYPE_CREATE_INFO_EXT
- VUID-VkMutableDescriptorTypeCreateInfoEXT-pMutableDescriptorTypeLists-parameter
  If mutableDescriptorTypeListCount is not 0, pMutableDescriptorTypeLists **must** be a valid pointer to an array of mutableDescriptorTypeListCount valid VkMutableDescriptorTypeListEXT structures

Structure Chaining

Extends the structures

- VkDescriptorPoolCreateInfo
- VkDescriptorSetLayoutCreateInfo

The list of potential descriptor types a given mutable descriptor **can** mutate to is passed in a VkMutableDescriptorTypeListEXT structure.

The VkMutableDescriptorTypeListEXT structure is defined as:

WARNING	This functionality is superseded by VK_EXT_descriptor_heap. See Legacy Functionality for more information.

```
// Provided by VK_EXT_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeListEXT {
    uint32_t                 descriptorTypeCount;
    const VkDescriptorType*  pDescriptorTypes;
} VkMutableDescriptorTypeListEXT;
```

```
// Provided by VK_VALVE_mutable_descriptor_type
// Equivalent to VkMutableDescriptorTypeListEXT
typedef VkMutableDescriptorTypeListEXT VkMutableDescriptorTypeListVALVE;
```

- descriptorTypeCount is the number of elements in pDescriptorTypes.
- pDescriptorTypes is NULL or a pointer to an array of descriptorTypeCount VkDescriptorType values defining which descriptor types a given binding may mutate to.

Valid Usage

- VUID-VkMutableDescriptorTypeListEXT-descriptorTypeCount-04597
  `descriptorTypeCount` **must** not be `0` if the corresponding binding is of VK_DESCRIPTOR_TYPE_MUTABLE_EXT
- VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04598
  `pDescriptorTypes` **must** be a valid pointer to an array of `descriptorTypeCount` valid, unique VkDescriptorType values if the given binding is of VK_DESCRIPTOR_TYPE_MUTABLE_EXT type
- VUID-VkMutableDescriptorTypeListEXT-descriptorTypeCount-04599
  `descriptorTypeCount` **must** be `0` if the corresponding binding is not of VK_DESCRIPTOR_TYPE_MUTABLE_EXT
- VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04600
  `pDescriptorTypes` **must** not contain VK_DESCRIPTOR_TYPE_MUTABLE_EXT
- VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04601
  `pDescriptorTypes` **must** not contain VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
- VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04602
  `pDescriptorTypes` **must** not contain VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC
- VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04603
  `pDescriptorTypes` **must** not contain VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK
- VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-09696
  `pDescriptorTypes` **must** not contain VK_DESCRIPTOR_TYPE_TENSOR_ARM

Valid Usage (Implicit)

- VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-parameter
  If `descriptorTypeCount` is not `0`, `pDescriptorTypes` **must** be a valid pointer to an array of `descriptorTypeCount` valid VkDescriptorType values

Bits which **can** be set in VkDescriptorSetLayoutCreateInfo::`flags`, specifying options for descriptor set layout, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorSetLayoutCreateFlagBits {
  // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT = 0x00000002,
  // Provided by VK_VERSION_1_4
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT = 0x00000001,
  // Provided by VK_EXT_descriptor_buffer
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT = 0x00000010,
  // Provided by VK_EXT_descriptor_buffer
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT = 0x00000020,
  // Provided by VK_NV_device_generated_commands_compute
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_INDIRECT_BINDABLE_BIT_NV = 0x00000080,
  // Provided by VK_EXT_mutable_descriptor_type
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT = 0x00000004,
  // Provided by VK_NV_per_stage_descriptor_set
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV = 0x00000040,
  // Provided by VK_KHR_push_descriptor
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR =
VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT,
  // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT =
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT,
  // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE =
VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT,
} VkDescriptorSetLayoutCreateFlagBits;
```

- VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT specifies that descriptor sets **must** not be allocated using this layout, and descriptors are instead pushed by vkCmdPushDescriptorSet.
- VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT specifies that descriptor sets using this layout **must** be allocated from a descriptor pool created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The non-UpdateAfterBind limits only count descriptors in sets created without this flag. The UpdateAfterBind limits count all descriptors, but the limits **may** be higher than the non-UpdateAfterBind limits.
- VK_DESCRIPTOR_SET_LAYOUT_CREATE_INDIRECT_BINDABLE_BIT_NV specifies that descriptor sets using this layout allows them to be bound with compute pipelines that are created with VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV flag set to be used in Device-Generated Commands.
- VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT specifies that this layout **must** only be used with descriptor buffers.
- VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT specifies that this is a layout only containing immutable samplers that **can** be bound by vkCmdBindDescriptorBufferEmbeddedSamplersEXT. Unlike normal immutable samplers, embedded immutable samplers do not require the application to provide them in a descriptor

buffer.

- VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT specifies that descriptor sets using this layout **must** be allocated from a descriptor pool created with the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT bit set. Descriptor set layouts created with this bit have no expressible limit for maximum number of descriptors per-stage. Host descriptor sets are limited only by available host memory, but **may** be limited for implementation specific reasons. Implementations **may** limit the number of supported descriptors to UpdateAfterBind limits or non-UpdateAfterBind limits, whichever is larger.
- VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV specifies that binding numbers in descriptor sets using this layout **may** represent different resources and/or types of resources in each stage.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorSetLayoutCreateFlags;
```

`VkDescriptorSetLayoutCreateFlags` is a bitmask type for setting a mask of zero or more VkDescriptorSetLayoutCreateFlagBits.

The `VkDescriptorSetLayoutBinding` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutBinding {
    uint32_t              binding;
    VkDescriptorType      descriptorType;
    uint32_t              descriptorCount;
    VkShaderStageFlags    stageFlags;
    const VkSampler*      pImmutableSamplers;
} VkDescriptorSetLayoutBinding;
```

- `binding` is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.
- `descriptorType` is a VkDescriptorType specifying which type of resource descriptors are used for this binding.
- `descriptorCount` is the number of descriptors contained in the binding, accessed in a shader as an array, except if `descriptorType` is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK in which case `descriptorCount` is the size in bytes of the inline uniform block. If `descriptorCount` is zero this binding entry is reserved and the resource **must** not be accessed from any stage via this binding within any pipeline using the set layout.
- `stageFlags` member is a bitmask of VkShaderStageFlagBits specifying which pipeline shader stages **can** access a resource for this binding. VK_SHADER_STAGE_ALL is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, **can** access the resource.

  If a shader stage is not included in `stageFlags`, then a resource **must** not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments

which are limited to the fragment shader, there are no limitations on what combinations of stages **can** use a descriptor binding, and in particular a binding **can** be used by both graphics stages and the compute stage.

- `pImmutableSamplers` affects initialization of samplers. If `descriptorType` specifies a VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER type descriptor, then `pImmutableSamplers` **can** be used to initialize a set of *immutable samplers*. Immutable samplers are permanently bound into the set layout and **must** not be changed; updating a VK_DESCRIPTOR_TYPE_SAMPLER descriptor with immutable samplers is not allowed and updates to a VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER descriptor with immutable samplers do not modify the samplers (the image views are updated, but the sampler updates are ignored). If `pImmutableSamplers` is not `NULL`, then it is a pointer to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles are copied; the sampler objects **must** not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If `pImmutableSamplers` is `NULL`, then the sampler slots are dynamic and sampler handles **must** be bound into descriptor sets using this layout. If `descriptorType` is not one of these descriptor types, then `pImmutableSamplers` is ignored.

The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the `pBindings` array. Bindings that are not specified have a `descriptorCount` and `stageFlags` of zero, and the value of `descriptorType` is undefined. However, all binding numbers between 0 and the maximum binding number in the VkDescriptorSetLayoutCreateInfo::`pBindings` array **may** consume memory in the descriptor set layout even if not all descriptor bindings are used, though it **should** not consume additional memory from the descriptor pool.

NOTE	The maximum binding number specified **should** be as compact as possible to avoid wasted memory.

Valid Usage

- VUID-VkDescriptorSetLayoutBinding-descriptorType-00282
  If `descriptorType` is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and `descriptorCount` is not `0` and `pImmutableSamplers` is not `NULL`, `pImmutableSamplers` **must** be a valid pointer to an array of `descriptorCount` valid `VkSampler` handles
- VUID-VkDescriptorSetLayoutBinding-descriptorType-12200
  If `descriptorType` is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and `descriptorCount` is not `0` and `pImmutableSamplers` is not `NULL`, either each element of `pImmutableSamplers` **must** be a `VkSampler` that enables sampler $Y'C_BC_R$ conversion or none of them enable sampler $Y'C_BC_R$ conversion
- VUID-VkDescriptorSetLayoutBinding-descriptorType-12215
  If `descriptorType` is VK_DESCRIPTOR_TYPE_SAMPLER, each element of `pImmutableSamplers` **must** not be a `VkSampler` object that enables sampler $Y'C_BC_R$ conversion
- VUID-VkDescriptorSetLayoutBinding-descriptorType-04604

If the inlineUniformBlock feature is not enabled, descriptorType **must** not be VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK

- VUID-VkDescriptorSetLayoutBinding-descriptorType-02209
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount **must** be a multiple of 4
- VUID-VkDescriptorSetLayoutBinding-descriptorType-08004
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK and VkDescriptorSetLayoutCreateInfo::flags does not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT then descriptorCount **must** be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxInlineUniformBlockSize
- VUID-VkDescriptorSetLayoutBinding-flags-08005
  If VkDescriptorSetLayoutCreateInfo::flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT, descriptorType **must** be VK_DESCRIPTOR_TYPE_SAMPLER
- VUID-VkDescriptorSetLayoutBinding-flags-08006
  If VkDescriptorSetLayoutCreateInfo::flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT, descriptorCount **must** be less than or equal to 1
- VUID-VkDescriptorSetLayoutBinding-flags-08007
  If VkDescriptorSetLayoutCreateInfo::flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT, and descriptorCount is equal to 1, pImmutableSamplers **must** not be NULL
- VUID-VkDescriptorSetLayoutBinding-descriptorCount-09465
  If descriptorCount is not 0, stageFlags **must** be VK_SHADER_STAGE_ALL or a valid combination of other VkShaderStageFlagBits values
- VUID-VkDescriptorSetLayoutBinding-descriptorType-01510
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT and descriptorCount is not 0, then stageFlags **must** be 0 or VK_SHADER_STAGE_FRAGMENT_BIT
- VUID-VkDescriptorSetLayoutBinding-pImmutableSamplers-04009
  The sampler objects indicated by pImmutableSamplers **must** not have a borderColor with one of the values VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT
- VUID-VkDescriptorSetLayoutBinding-descriptorType-04605
  If descriptorType is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, then pImmutableSamplers **must** be NULL
- VUID-VkDescriptorSetLayoutBinding-flags-09466
  If VkDescriptorSetLayoutCreateInfo::flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV, and descriptorCount is not 0, then stageFlags **must** be 0 or a valid combination of VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, VK_SHADER_STAGE_FRAGMENT_BIT and VK_SHADER_STAGE_COMPUTE_BIT values

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBinding-descriptorType-parameter
  `descriptorType` **must** be a valid VkDescriptorType value

If the `pNext` chain of a VkDescriptorSetLayoutCreateInfo structure includes a VkDescriptorSetLayoutBindingFlagsCreateInfo structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The VkDescriptorSetLayoutBindingFlagsCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfo {
    VkStructureType                    sType;
    const void*                        pNext;
    uint32_t                           bindingCount;
    const VkDescriptorBindingFlags*    pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfo;
```

```
// Provided by VK_EXT_descriptor_indexing
// Equivalent to VkDescriptorSetLayoutBindingFlagsCreateInfo
typedef VkDescriptorSetLayoutBindingFlagsCreateInfo
VkDescriptorSetLayoutBindingFlagsCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bindingCount` is zero or the number of elements in `pBindingFlags`.
- `pBindingFlags` is a pointer to an array of VkDescriptorBindingFlags bitfields, one for each descriptor set layout binding.

If `bindingCount` is zero or if this structure is not included in the `pNext` chain, the VkDescriptorBindingFlags for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at VkDescriptorSetLayoutCreateInfo::`pBindings`[i] uses the flags in `pBindingFlags`[i].

Valid Usage

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-bindingCount-03002
  If `bindingCount` is not zero, `bindingCount` **must** equal VkDescriptorSetLayoutCreateInfo ::`bindingCount`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-flags-03003
  If VkDescriptorSetLayoutCreateInfo::`flags` includes VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT, then all elements of `pBindingFlags` **must** not include VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT,

VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT, or VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03004
  If an element of pBindingFlags includes VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT, then it **must** be the element with the highest binding number
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformBufferUpdateAfterBind-03005
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingSampledImageUpdateAfterBind-03006
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingSampledImageUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageImageUpdateAfterBind-03007
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageImageUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageBufferUpdateAfterBind-03008
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformTexelBufferUpdateAfterBind-03009
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTexelBufferUpdateAfterBind-03010
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-

descriptorBindingInlineUniformBlockUpdateAfterBind-02211
If VkPhysicalDeviceInlineUniformBlockFeatures::descriptorBindingInlineUniformBlockUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingAccelerationStructureUpdateAfterBind-03570
  If VkPhysicalDeviceAccelerationStructureFeaturesKHR::descriptorBindingAccelerationStructureUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-None-03011
  All bindings with descriptor type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUpdateUnusedWhilePending-03012
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending is not enabled, all elements of pBindingFlags **must** not include VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingPartiallyBound-03013
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingPartiallyBound is not enabled, all elements of pBindingFlags **must** not include VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingVariableDescriptorCount-03014
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount is not enabled, all elements of pBindingFlags **must** not include VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03015
  If an element of pBindingFlags includes VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT, that element's descriptorType **must** not be VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTensorUpdateAfterBind-09697
  If VkPhysicalDeviceTensorFeaturesARM::descriptorBindingStorageTensorUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_TENSOR_ARM **must** not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO`
- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-parameter
  If `bindingCount` is not `0`, `pBindingFlags` **must** be a valid pointer to an array of `bindingCount` valid combinations of VkDescriptorBindingFlagBits values

Structure Chaining

Extends the structure

- VkDescriptorSetLayoutCreateInfo

Bits which **can** be set in each element of VkDescriptorSetLayoutBindingFlagsCreateInfo ::`pBindingFlags`, specifying options for the corresponding descriptor set layout binding, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkDescriptorBindingFlagBits {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
  // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT =
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT,
  // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT =
VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT,
  // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT =
VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT,
  // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT =
VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT,
} VkDescriptorBindingFlagBits;
```

```
// Provided by VK_EXT_descriptor_indexing
// Equivalent to VkDescriptorBindingFlagBits
typedef VkDescriptorBindingFlagBits VkDescriptorBindingFlagBitsEXT;
```

- VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT specifies that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set

descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in vkUpdateDescriptorSetWithTemplateKHR and vkUpdateDescriptorSets. Multiple descriptors with this flag set **can** be updated concurrently in different threads, though the same descriptor **must** not be updated concurrently by two threads. Descriptors with this flag set **can** be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.

- VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT specifies that descriptors in this binding that are not *dynamically used* need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor. If a descriptor is not dynamically used, any resource referenced by the descriptor is not considered to be referenced during command execution.
- VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT specifies that descriptors in this binding **can** be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in vkUpdateDescriptorSetWithTemplateKHR and vkUpdateDescriptorSets in the same way as for VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT. If VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT is also set, then descriptors **can** be updated as long as they are not dynamically used by any shader invocations. If VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT is not set, then descriptors **can** be updated as long as they are not statically used by any shader invocations.
- VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT specifies that this is a *variable-sized descriptor binding* whose size will be specified when a descriptor set is allocated using this layout. The value of `descriptorCount` is treated as an upper bound on the size of the binding. This **must** only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of `binding`). For the purposes of counting against limits such as `maxDescriptorSet`* and `maxPerStageDescriptor`*, the full value of `descriptorCount` is counted, except for descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, when VkDescriptorSetLayoutCreateInfo::`flags` does not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT. In this case, `descriptorCount` specifies the upper bound on the byte size of the binding; thus it counts against the `maxInlineUniformBlockSize` and `maxInlineUniformTotalSize` limits instead.

NOTE

Note that while VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT and VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT both involve updates to descriptor sets after they are bound, VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT is a weaker requirement since it is only about descriptors that are not used, whereas VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT requires the implementation to observe updates to descriptors that are used.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkDescriptorBindingFlags;
```

```
// Provided by VK_EXT_descriptor_indexing
// Equivalent to VkDescriptorBindingFlags
typedef VkDescriptorBindingFlags VkDescriptorBindingFlagsEXT;
```

VkDescriptorBindingFlags is a bitmask type for setting a mask of zero or more VkDescriptorBindingFlagBits.

To query information about whether a descriptor set layout **can** be created, call:

```
// Provided by VK_VERSION_1_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice                                    device,
    const VkDescriptorSetLayoutCreateInfo*      pCreateInfo,
    VkDescriptorSetLayoutSupport*               pSupport);
```

```
// Provided by VK_KHR_maintenance3
// Equivalent to vkGetDescriptorSetLayoutSupport
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice                                    device,
    const VkDescriptorSetLayoutCreateInfo*      pCreateInfo,
    VkDescriptorSetLayoutSupport*               pSupport);
```

- device is the logical device that would create the descriptor set layout.
- pCreateInfo is a pointer to a VkDescriptorSetLayoutCreateInfo structure specifying the state of the descriptor set layout object.
- pSupport is a pointer to a VkDescriptorSetLayoutSupport structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like maxDescriptorSet*, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors limit, this command is guaranteed to return VK_TRUE in VkDescriptorSetLayoutSupport::supported. If the descriptor set layout exceeds the VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors limit, whether the descriptor set layout is supported is implementation-dependent and **may** depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as maxPerStageDescriptor*, and so a descriptor set layout that is supported according to this command **must** still satisfy the pipeline layout limits such as maxPerStageDescriptor* in order to be used in a pipeline layout.

NOTE

This is a VkDevice query rather than VkPhysicalDevice because the answer **may** depend on enabled features.

Valid Usage (Implicit)

- VUID-vkGetDescriptorSetLayoutSupport-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkDescriptorSetLayoutCreateInfo structure
- VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter
  pSupport **must** be a valid pointer to a VkDescriptorSetLayoutSupport structure

Information about support for the descriptor set layout is returned in a VkDescriptorSetLayoutSupport structure:

```
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           supported;
} VkDescriptorSetLayoutSupport;
```

```
// Provided by VK_KHR_maintenance3
// Equivalent to VkDescriptorSetLayoutSupport
typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- supported specifies whether the descriptor set layout **can** be created.

supported will be VK_TRUE if the descriptor set **can** be created, or else VK_FALSE.

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutSupport-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT
- VUID-VkDescriptorSetLayoutSupport-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkDescriptorSetVariableDescriptorCountLayoutSupport
- VUID-VkDescriptorSetLayoutSupport-sType-unique
  The sType value of each structure in the pNext chain **must** be unique

If the pNext chain of a VkDescriptorSetLayoutSupport structure includes a VkDescriptorSetVariableDescriptorCountLayoutSupport structure, then that structure returns additional information about whether the descriptor set layout is supported.

```
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;
```

```
// Provided by VK_EXT_descriptor_indexing
// Equivalent to VkDescriptorSetVariableDescriptorCountLayoutSupport
typedef VkDescriptorSetVariableDescriptorCountLayoutSupport
VkDescriptorSetVariableDescriptorCountLayoutSupportEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxVariableDescriptorCount indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then maxVariableDescriptorCount indicates the maximum byte size supported for the binding, if that binding is variable-sized.

If the VkDescriptorSetLayoutCreateInfo structure specified in vkGetDescriptorSetLayoutSupport ::pCreateInfo includes a variable-sized descriptor, then supported is determined assuming the requested size of the variable-sized descriptor, and maxVariableDescriptorCount is the maximum size of that descriptor that **can** be successfully created (which is greater than or equal to the requested size passed in). If the VkDescriptorSetLayoutCreateInfo structure does not include a variable-sized descriptor, or if the VkPhysicalDeviceDescriptorIndexingFeatures ::descriptorBindingVariableDescriptorCount feature is not enabled, then maxVariableDescriptorCount is zero. For the purposes of this command, a variable-sized descriptor binding with a descriptorCount of zero is treated as having a descriptorCount of four if descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, or one otherwise, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to maxVariableDescriptorCount is undefined.

Valid Usage (Implicit)

- VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT

Structure Chaining

Extends the structure

- VkDescriptorSetLayoutSupport

The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.

GLSL Example

```
//
// binding to a single sampled image descriptor in set 0
//
layout (set=0, binding=0) uniform texture2D mySampledImage;

//
// binding to an array of sampled image descriptors in set 0
//
layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

//
// binding to a single uniform buffer descriptor in set 1
//
layout (set=1, binding=0) uniform myUniformBuffer
{
    vec4 myElement[32];
};
```

SPIR-V Example

```
          ...
     %1 = OpExtInstImport "GLSL.std.450"
          ...
          OpName %9 "mySampledImage"
          OpName %14 "myArrayOfSampledImages"
          OpName %18 "myUniformBuffer"
          OpMemberName %18 0 "myElement"
          OpName %20 ""
          OpDecorate %9 DescriptorSet 0
          OpDecorate %9 Binding 0
          OpDecorate %14 DescriptorSet 0
          OpDecorate %14 Binding 1
          OpDecorate %17 ArrayStride 16
          OpMemberDecorate %18 0 Offset 0
          OpDecorate %18 Block
          OpDecorate %20 DescriptorSet 1
          OpDecorate %20 Binding 0
     %2 = OpTypeVoid
     %3 = OpTypeFunction %2
```

```
          %6 = OpTypeFloat 32
          %7 = OpTypeImage %6 2D 0 0 0 1 Unknown
          %8 = OpTypePointer UniformConstant %7
          %9 = OpVariable %8 UniformConstant
         %10 = OpTypeInt 32 0
         %11 = OpConstant %10 12
         %12 = OpTypeArray %7 %11
         %13 = OpTypePointer UniformConstant %12
         %14 = OpVariable %13 UniformConstant
         %15 = OpTypeVector %6 4
         %16 = OpConstant %10 32
         %17 = OpTypeArray %15 %16
         %18 = OpTypeStruct %17
         %19 = OpTypePointer Uniform %18
         %20 = OpVariable %19 Uniform
               ...
```

API Example

```
VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] =
{
    // binding to a single image descriptor
    {
        .dstBinding = 0,
        .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
        .descriptorCount = 1,
        .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        .pImmutableSamplers = NULL
    },

    // binding to an array of image descriptors
    {
        .dstBinding = 1,
        .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
        .descriptorCount = 12,
        .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        .pImmutableSamplers = NULL
    },

    // binding to a single uniform buffer descriptor
    {
        .dstBinding = 0,
        .descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
        .descriptorCount = 1,
        .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        .pImmutableSamplers = NULL
    }
};
```

```
const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] =
{
    // Information for first descriptor set with two descriptor bindings
    {
        .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
        .pNext = NULL,
        .flags = 0,
        .bindingCount = 2,
        .pBindings = &myDescriptorSetLayoutBinding[0]
    },

    // Information for second descriptor set with one descriptor binding
    {
        .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
        .pNext = NULL,
        .flags = 0,
        .bindingCount = 1,
        .pBindings = &myDescriptorSetLayoutBinding[2]
    }
};

VkDescriptorSetLayout myDescriptorSetLayout[2];

//
// Create first descriptor set layout
//
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[0],
    NULL,
    &myDescriptorSetLayout[0]);

//
// Create second descriptor set layout
//
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[1],
    NULL,
    &myDescriptorSetLayout[1]);
```

To destroy a descriptor set layout, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorSetLayout(
    VkDevice                                    device,
    VkDescriptorSetLayout                       descriptorSetLayout,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the descriptor set layout.
- `descriptorSetLayout` is the descriptor set layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00284
  If `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00285
  If no `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyDescriptorSetLayout-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parameter
  If `descriptorSetLayout` is not VK_NULL_HANDLE, `descriptorSetLayout` **must** be a valid VkDescriptorSetLayout handle
- VUID-vkDestroyDescriptorSetLayout-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parent
  If `descriptorSetLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `descriptorSetLayout` **must** be externally synchronized

17.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a *pipeline layout*. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that **can** be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by `VkPipelineLayout` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineLayout(
    VkDevice                                    device,
    const VkPipelineLayoutCreateInfo*           pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkPipelineLayout*                           pPipelineLayout);
```

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a VkPipelineLayoutCreateInfo structure specifying the state of the pipeline layout object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineLayout` is a pointer to a VkPipelineLayout handle in which the resulting pipeline layout object is returned.

Valid Usage (Implicit)

- VUID-vkCreatePipelineLayout-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreatePipelineLayout-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkPipelineLayoutCreateInfo structure
- VUID-vkCreatePipelineLayout-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreatePipelineLayout-pPipelineLayout-parameter
  `pPipelineLayout` **must** be a valid pointer to a VkPipelineLayout handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The VkPipelineLayoutCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType                 sType;
    const void*                     pNext;
    VkPipelineLayoutCreateFlags     flags;
    uint32_t                        setLayoutCount;
    const VkDescriptorSetLayout*    pSetLayouts;
    uint32_t                        pushConstantRangeCount;
    const VkPushConstantRange*      pPushConstantRanges;
} VkPipelineLayoutCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkPipelineLayoutCreateFlagBits specifying options for pipeline layout creation.
- setLayoutCount is the number of descriptor sets included in the pipeline layout.
- pSetLayouts is a pointer to an array of VkDescriptorSetLayout objects. The implementation **must** not access these objects outside of the duration of the command this structure is passed to.
- pushConstantRangeCount is the number of push constant ranges included in the pipeline layout.
- pPushConstantRanges is a pointer to an array of VkPushConstantRange structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants **can** be accessed by each stage of the pipeline.

NOTE	Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

Valid Usage

- VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286
  setLayoutCount **must** be less than or equal to VkPhysicalDeviceLimits::maxBoundDescriptorSets
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03016
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03017
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a

descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03018
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers
- VUID-VkPipelineLayoutCreateInfo-descriptorType-06939
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03020
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03021
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments
- VUID-VkPipelineLayoutCreateInfo-descriptorType-02214
  The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set and with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorInlineUniformBlocks
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03022
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of

VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers and VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSamplers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03023
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers and VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03024
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers and VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageBuffers
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03025
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages and VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSampledImages
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03026
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages and VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageImages
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03027
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments and VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindInputAttachments
- VUID-VkPipelineLayoutCreateInfo-descriptorType-02215
  The total number of bindings with a descriptorType of

VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorInlineUniformBlocks and VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03028
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSamplers
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03029
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03030
  If the maintenance7 feature is not enabled, the total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic
- VUID-VkPipelineLayoutCreateInfo-maintenance7-10003
  If the maintenance7 feature is enabled, the total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetTotalUniformBuffersDynamic
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03031
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03032
  If the maintenance7 feature is not enabled, the total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-maintenance7-10004
  If the maintenance7 feature is enabled, the total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetTotalStorageBuffersDynamic
- VUID-VkPipelineLayoutCreateInfo-None-10005
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetTotalBuffersDynamic
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-10006
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetTotalBuffersDynamic and VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetUpdateAfterBindTotalBuffersDynamic
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03033
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSampledImages
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03034
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageImages
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03035
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments
- VUID-VkPipelineLayoutCreateInfo-descriptorType-02216
  The total number of bindings in descriptor set layouts created without the

VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetInlineUniformBlocks

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03036
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxDescriptorSetSamplers and VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03037
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers and VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03038
  If the maintenance7 feature is not enabled, the total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic and VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic
- VUID-VkPipelineLayoutCreateInfo-maintenance7-10007
  If the maintenance7 feature is enabled, the total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetTotalUniformBuffersDynamic and VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetUpdateAfterBindTotalUniformBuffersDynamic
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03039
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers and VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffers
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03040
  If the maintenance7 feature is not enabled, the total number of descriptors of the type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic and VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic
- VUID-VkPipelineLayoutCreateInfo-maintenance7-10008
  If the maintenance7 feature is enabled, the total number of descriptors of the type

VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetTotalStorageBuffersDynamic and VkPhysicalDeviceMaintenance7PropertiesKHR::maxDescriptorSetUpdateAfterBindTotalStorageBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03041
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxDescriptorSetSampledImages and VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03042
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxDescriptorSetStorageImages and VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03043
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments and VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments
- VUID-VkPipelineLayoutCreateInfo-descriptorType-02217
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetInlineUniformBlocks and VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetUpdateAfterBindInlineUniformBlocks
- VUID-VkPipelineLayoutCreateInfo-descriptorType-06531
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceVulkan13Properties::maxInlineUniformTotalSize
- VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-00292
  Any two elements of pPushConstantRanges **must** not include the same stage in stageFlags
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-00293
  pSetLayouts **must** not contain more than one descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT set
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03571

The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03572
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures and VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorUpdateAfterBindAccelerationStructures
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03573
  The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetAccelerationStructures
- VUID-VkPipelineLayoutCreateInfo-descriptorType-03574
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetAccelerationStructures and VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetUpdateAfterBindAccelerationStructures
- VUID-VkPipelineLayoutCreateInfo-descriptorType-02381
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures
- VUID-VkPipelineLayoutCreateInfo-pImmutableSamplers-03566
  The total number of pImmutableSamplers created with flags containing VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT or VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxDescriptorSetSubsampledSamplers
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-04606
  Any element of pSetLayouts **must** not have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT bit set
- VUID-VkPipelineLayoutCreateInfo-graphicsPipelineLibrary-06753
  If the graphicsPipelineLibrary feature is not enabled, elements of pSetLayouts **must** be valid VkDescriptorSetLayout objects

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-08008
  If any element of pSetLayouts was created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT bit set, all elements of pSetLayouts **must** have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT bit set
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-09698
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_TENSOR_ARM accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceTensorPropertiesARM::maxPerStageDescriptorSetStorageTensors
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-09699
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_TENSOR_ARM accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to VkPhysicalDeviceTensorPropertiesARM::maxDescriptorSetStorageTensors
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-09878
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_TENSOR_ARM accessible across all shader stages and across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceTensorPropertiesARM::maxDescriptorSetStorageTensors and VkPhysicalDeviceTensorPropertiesARM::maxDescriptorSetUpdateAfterBindStorageTensors
- VUID-VkPipelineLayoutCreateInfo-descriptorType-09879
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_TENSOR_ARM accessible to any given shader stage across all elements of pSetLayouts **must** be less than or equal to the maximum of VkPhysicalDeviceTensorPropertiesARM::maxPerStageDescriptorSetStorageTensors and VkPhysicalDeviceTensorPropertiesARM::maxPerStageDescriptorUpdateAfterBindStorageTensors
- VUID-VkPipelineLayoutCreateInfo-flags-13352
  If flags has VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR set, then VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT **must** also be set

Valid Usage (Implicit)

- VUID-VkPipelineLayoutCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO
- VUID-VkPipelineLayoutCreateInfo-flags-parameter
  If flags is not 0, flags **must** be a valid combination of VkPipelineLayoutCreateFlagBits values
- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-parameter
  If setLayoutCount is not 0, pSetLayouts **must** be a valid pointer to an array of setLayoutCount valid or VK_NULL_HANDLE VkDescriptorSetLayout handles

- VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-parameter
  If `pushConstantRangeCount` is not `0`, `pPushConstantRanges` **must** be a valid pointer to an array of `pushConstantRangeCount` valid VkPushConstantRange structures

Structure Chaining

Extends the structures

- VkBindDescriptorBufferEmbeddedSamplersInfoEXT
- VkBindDescriptorSetsInfo
- VkIndirectCommandsLayoutCreateInfoEXT
- VkPushConstantsInfo
- VkPushDescriptorSetInfo
- VkPushDescriptorSetWithTemplateInfo
- VkSetDescriptorBufferOffsetsInfoEXT

```
// Provided by VK_VERSION_1_0, VK_EXT_graphics_pipeline_library
typedef enum VkPipelineLayoutCreateFlagBits {
  // Provided by VK_KHR_maintenance11 with VK_EXT_shader_object,
VK_EXT_graphics_pipeline_library
    VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT = 0x00000002,
  // Provided by VK_KHR_maintenance11 with VK_EXT_shader_object and
(VK_EXT_mesh_shader or VK_NV_mesh_shader)
    VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR = 0x00000004,
} VkPipelineLayoutCreateFlagBits;
```

- VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT specifies that implementations **must** ensure that the properties and/or absence of a particular descriptor set do not influence any other properties of the pipeline layout. This allows pipeline libraries linked without VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT to be created with a subset of the total descriptor sets.
- VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR, when used in combination with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, specifies that this pipeline layout will only be used to draw with shader objects created with VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineLayoutCreateFlags;
```

`VkPipelineLayoutCreateFlags` is a bitmask type for setting a mask of VkPipelineLayoutCreateFlagBits.

The `VkPushConstantRange` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPushConstantRange {
    VkShaderStageFlags    stageFlags;
    uint32_t              offset;
    uint32_t              size;
} VkPushConstantRange;
```

- `stageFlags` is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.
- `offset` and `size` are the start offset and size, respectively, consumed by the range. Both `offset` and `size` are in units of bytes and **must** be a multiple of 4. The layout of the push constant variables is specified in the shader.

Valid Usage

- VUID-VkPushConstantRange-offset-00294
  `offset` **must** be less than `VkPhysicalDeviceLimits`::`maxPushConstantsSize`
- VUID-VkPushConstantRange-offset-00295
  `offset` **must** be a multiple of `4`
- VUID-VkPushConstantRange-size-00296
  `size` **must** be greater than `0`
- VUID-VkPushConstantRange-size-00297
  `size` **must** be a multiple of `4`
- VUID-VkPushConstantRange-size-00298
  `size` **must** be less than or equal to `VkPhysicalDeviceLimits`::`maxPushConstantsSize` minus `offset`

Valid Usage (Implicit)

- VUID-VkPushConstantRange-stageFlags-parameter
  `stageFlags` **must** be a valid combination of VkShaderStageFlagBits values

Once created, pipeline layouts **can** be used as part of pipeline creation (see Pipelines), as part of binding descriptor sets (see Descriptor Set Binding), and as part of setting push constants (see Push Constant Updates). Pipeline creation accepts a pipeline layout as input, and the layout **may** be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables statically used in all shaders in a pipeline **must** be declared with a (set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in `stageFlags`. The

pipeline layout **can** include entries that are not used by a particular pipeline. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation **may** cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) **must** only place variables at offsets that are each included in a push constant range with `stageFlags` including the bit corresponding to the shader stage that uses it. The pipeline layout **can** include ranges or portions of ranges that are not used by a particular pipeline.

There is a limit on the total number of resources of each type that **can** be included in bindings in all descriptor set layouts in a pipeline layout as shown in Pipeline Layout Resource Limits. The "Total Resources Available" column gives the limit on the number of each type of resource that **can** be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that **can** be used in any pipeline stage as described in Shader Resource Limits.

Table 20. Pipeline Layout Resource Limits

Total Resources Available	Resource Types
`maxDescriptorSetSamplers` or `maxDescriptorSetUpdateAfterBindSamplers`	sampler
	combined image sampler
`maxDescriptorSetSampledImages` or `maxDescriptorSetUpdateAfterBindSampledImages`	sampled image
	combined image sampler
	uniform texel buffer
`maxDescriptorSetStorageImages` or `maxDescriptorSetUpdateAfterBindStorageImages`	storage image
	storage texel buffer
`maxDescriptorSetUniformBuffers` or `maxDescriptorSetUpdateAfterBindUniformBuffers`	uniform buffer
	uniform buffer dynamic
`maxDescriptorSetUniformBuffersDynamic` or `maxDescriptorSetUpdateAfterBindUniformBuffersDynamic` or `maxDescriptorSetUpdateAfterBindTotalUniformBuffersDynamic`	uniform buffer dynamic
`maxDescriptorSetStorageBuffers` or `maxDescriptorSetUpdateAfterBindStorageBuffers`	storage buffer
	storage buffer dynamic
`maxDescriptorSetStorageBuffersDynamic` or `maxDescriptorSetUpdateAfterBindStorageBuffersDynamic` or `maxDescriptorSetUpdateAfterBindTotalStorageBuffersDynamic`	storage buffer dynamic
`maxDescriptorSetInputAttachments` or `maxDescriptorSetUpdateAfterBindInputAttachments`	input attachment

Total Resources Available	Resource Types
maxDescriptorSetInlineUniformBlocks or maxDescriptorSetUpdateAfterBindInlineUniformBlocks	inline uniform block
maxDescriptorSetAccelerationStructures or maxDescriptorSetUpdateAfterBindAccelerationStructures	acceleration structure
maxDescriptorSetStorageTensors or maxDescriptorSetUpdateAfterBindStorageTensors	storage tensor

To destroy a pipeline layout, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyPipelineLayout(
    VkDevice                                    device,
    VkPipelineLayout                            pipelineLayout,
    const VkAllocationCallbacks*                pAllocator);
```

- device is the logical device that destroys the pipeline layout.
- pipelineLayout is the pipeline layout to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyPipelineLayout-pipelineLayout-00299
  If VkAllocationCallbacks were provided when pipelineLayout was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyPipelineLayout-pipelineLayout-00300
  If no VkAllocationCallbacks were provided when pipelineLayout was created, pAllocator **must** be NULL

Valid Usage (Implicit)

- VUID-vkDestroyPipelineLayout-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkDestroyPipelineLayout-pipelineLayout-parameter
  If pipelineLayout is not VK_NULL_HANDLE, pipelineLayout **must** be a valid VkPipelineLayout handle
- VUID-vkDestroyPipelineLayout-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkDestroyPipelineLayout-pipelineLayout-parent
  If pipelineLayout is a valid handle, it **must** have been created, allocated, or retrieved from

`device`

Host Synchronization

- Host access to `pipelineLayout` **must** be externally synchronized

17.2.1. Pipeline Layout Compatibility

Two pipeline layouts are defined to be “compatible for push constants” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with identically defined descriptor set layouts for sets zero through N, if both of them either were or were not created with VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT, and if they were created with identical push constant ranges.

When binding a descriptor set (see Descriptor Set Binding) to set number N, a previously bound descriptor set bound with lower index M than N is disturbed if the pipeline layouts for set M and N are not compatible for set M. Otherwise, the bound descriptor set in M is not disturbed.

If, additionally, the previously bound descriptor set for set N was bound using a pipeline layout not compatible for set N, then all bindings in sets numbered greater than N are disturbed.

When binding a pipeline, the pipeline **can** correctly access any previously bound descriptor set N if it was bound with a compatible pipeline layout for set N, and it was not disturbed.

Layout compatibility means that descriptor sets **can** be bound to a command buffer for use by any pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets **can** remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.

When a descriptor set is disturbed by binding descriptor sets, the disturbed set is considered to contain undefined descriptors bound with the same pipeline layout as the disturbing descriptor set.

Implementor’s Note

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set N **should** only be a function of sets [0..N].

NOTE Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that **can** be bound to a pipeline layout is queried from

physical device properties (see `maxBoundDescriptorSets` in Limits).

API Example

```
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };

const VkPushConstantRange ranges[] =
{
    {
        .stageFlags = VK_SHADER_STAGE_VERTEX_BIT,
        .offset = 0,
        .size = 4
    },
    {
        .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
        .offset = 4,
        .size = 4
    },
};

const VkPipelineLayoutCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .setLayoutCount = 2,
    .pSetLayouts = layouts,
    .pushConstantRangeCount = 2,
    .pPushConstantRanges = ranges
};

VkPipelineLayout myPipelineLayout;
myResult = vkCreatePipelineLayout(
    myDevice,
    &createInfo,
    NULL,
    &myPipelineLayout);
```

17.3. Allocation of Descriptor Sets

A *descriptor pool* maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application **must** not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools are represented by `VkDescriptorPool` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)
```

To create a descriptor pool object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorPool(
    VkDevice                                    device,
    const VkDescriptorPoolCreateInfo*           pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkDescriptorPool*                           pDescriptorPool);
```

- `device` is the logical device that creates the descriptor pool.
- `pCreateInfo` is a pointer to a VkDescriptorPoolCreateInfo structure specifying the state of the descriptor pool object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDescriptorPool` is a pointer to a VkDescriptorPool handle in which the resulting descriptor pool object is returned.

The created descriptor pool is returned in `pDescriptorPool`.

Valid Usage (Implicit)

- VUID-vkCreateDescriptorPool-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkCreateDescriptorPool-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid VkDescriptorPoolCreateInfo structure
- VUID-vkCreateDescriptorPool-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDescriptorPool-pDescriptorPool-parameter
  `pDescriptorPool` **must** be a valid pointer to a VkDescriptorPool handle
- VUID-vkCreateDescriptorPool-device-queuecount
  The device **must** have been created with at least 1 queue

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_FRAGMENTATION_EXT
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN

- VK_ERROR_VALIDATION_FAILED

Additional information about the pool is passed in a VkDescriptorPoolCreateInfo structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType                sType;
    const void*                    pNext;
    VkDescriptorPoolCreateFlags    flags;
    uint32_t                       maxSets;
    uint32_t                       poolSizeCount;
    const VkDescriptorPoolSize*    pPoolSizes;
} VkDescriptorPoolCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkDescriptorPoolCreateFlagBits specifying certain supported operations on the pool.
- maxSets is the maximum number of descriptor sets that **can** be allocated from the pool.
- poolSizeCount is the number of elements in pPoolSizes.
- pPoolSizes is a pointer to an array of VkDescriptorPoolSize structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple VkDescriptorPoolSize structures containing the same descriptor type appear in the pPoolSizes array then the pool will be created with enough storage for the total number of descriptors of each type.

Fragmentation of a descriptor pool is possible and **may** lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation **must** not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation **must** not cause an allocation failure (note that this is always the case for a pool created without the VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors (of each type), then fragmentation **must** not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application **can** create an additional descriptor pool to perform further descriptor set allocations.

If flags has the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit set, descriptor pool creation **may** fail with the error VK_ERROR_FRAGMENTATION if the total number of descriptors across all pools (including this one) created with this bit set exceeds

maxUpdateAfterBindDescriptorsInAllPools, or if fragmentation of the underlying hardware resources occurs.

If a pPoolSizes[i]::type is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, a VkMutableDescriptorTypeCreateInfoEXT structure in the pNext chain **can** be used to specify which mutable descriptor types **can** be allocated from the pool. If included in the pNext chain, VkMutableDescriptorTypeCreateInfoEXT::pMutableDescriptorTypeLists[i] specifies which kind of VK_DESCRIPTOR_TYPE_MUTABLE_EXT descriptors **can** be allocated from this pool entry. If VkMutableDescriptorTypeCreateInfoEXT does not exist in the pNext chain, or VkMutableDescriptorTypeCreateInfoEXT::pMutableDescriptorTypeLists[i] is out of range, the descriptor pool allocates enough memory to be able to allocate a VK_DESCRIPTOR_TYPE_MUTABLE_EXT descriptor with any supported VkDescriptorType as a mutable descriptor. A mutable descriptor **can** be allocated from a pool entry if the type list in VkDescriptorSetLayoutCreateInfo is a subset of the type list declared in the descriptor pool, or if the pool entry is created without a descriptor type list. Multiple pPoolSizes entries with VK_DESCRIPTOR_TYPE_MUTABLE_EXT **can** be declared. When multiple such pool entries are present in pPoolSizes, they specify sets of supported descriptor types which either fully overlap, partially overlap, or are disjoint. Two sets fully overlap if the sets of supported descriptor types are equal. If the sets are not disjoint they partially overlap. A pool entry without a VkMutableDescriptorTypeListEXT assigned to it is considered to partially overlap any other pool entry which has a VkMutableDescriptorTypeListEXT assigned to it. The application **must** ensure that partial overlap does not exist in pPoolSizes.

NOTE	The requirement of no partial overlap is intended to resolve ambiguity for validation as there is no confusion which pPoolSizes entries will be allocated from. An implementation is not expected to depend on this requirement.

Valid Usage

- VUID-VkDescriptorPoolCreateInfo-descriptorPoolOverallocation-09227
  If the descriptorPoolOverallocation feature is not enabled, or flags does not have VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV set, maxSets **must** be greater than 0
- VUID-VkDescriptorPoolCreateInfo-flags-09228
  If flags has the VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV or VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_POOLS_BIT_NV bits set, then descriptorPoolOverallocation **must** be enabled
- VUID-VkDescriptorPoolCreateInfo-flags-04607
  If flags has the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT bit set, then the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit **must** not be set
- VUID-VkDescriptorPoolCreateInfo-mutableDescriptorType-04608
  If VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType is not enabled, pPoolSizes **must** not contain a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_EXT
- VUID-VkDescriptorPoolCreateInfo-flags-04609

If `flags` has the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT bit set, VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::`mutableDescriptorType` **must** be enabled

- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-04787
  If `pPoolSizes` contains a `descriptorType` of VK_DESCRIPTOR_TYPE_MUTABLE_EXT, any other VK_DESCRIPTOR_TYPE_MUTABLE_EXT element in `pPoolSizes` **must** not have sets of supported descriptor types which partially overlap
- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-09424
  If `pPoolSizes` contains a `descriptorType` of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, the `pNext` chain **must** include a VkDescriptorPoolInlineUniformBlockCreateInfo structure whose `maxInlineUniformBlockBindings` member is not zero
- VUID-VkDescriptorPoolCreateInfo-pNext-09946
  If a VkDataGraphProcessingEngineCreateInfoARM structure is included in the `pNext` chain, each member of `pProcessingEngines` **must** be identical to an VkQueueFamilyDataGraphPropertiesARM::`engine` retrieved from vkGetPhysicalDeviceQueueFamilyDataGraphPropertiesARM with the `physicalDevice` that was used to create `device`

Valid Usage (Implicit)

- VUID-VkDescriptorPoolCreateInfo-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO
- VUID-VkDescriptorPoolCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkDataGraphProcessingEngineCreateInfoARM, VkDescriptorPoolInlineUniformBlockCreateInfo, or VkMutableDescriptorTypeCreateInfoEXT
- VUID-VkDescriptorPoolCreateInfo-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkDescriptorPoolCreateInfo-flags-parameter
  If `flags` is not `0`, `flags` **must** be a valid combination of VkDescriptorPoolCreateFlagBits values
- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-parameter
  If `poolSizeCount` is not `0`, `pPoolSizes` **must** be a valid pointer to an array of `poolSizeCount` valid VkDescriptorPoolSize structures

In order to be able to allocate descriptor sets having inline uniform block bindings the descriptor pool **must** be created with specifying the inline uniform block binding capacity of the descriptor pool, in addition to the total inline uniform data capacity in bytes which is specified through a VkDescriptorPoolSize structure with a `descriptorType` value of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK. This **can** be done by adding a `VkDescriptorPoolInlineUniformBlockCreateInfo` structure to the `pNext` chain of

VkDescriptorPoolCreateInfo.

The VkDescriptorPoolInlineUniformBlockCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkDescriptorPoolInlineUniformBlockCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           maxInlineUniformBlockBindings;
} VkDescriptorPoolInlineUniformBlockCreateInfo;
```

```
// Provided by VK_EXT_inline_uniform_block
// Equivalent to VkDescriptorPoolInlineUniformBlockCreateInfo
typedef VkDescriptorPoolInlineUniformBlockCreateInfo
VkDescriptorPoolInlineUniformBlockCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxInlineUniformBlockBindings is the number of inline uniform block bindings to allocate.

Valid Usage (Implicit)

- VUID-VkDescriptorPoolInlineUniformBlockCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO

Structure Chaining

Extends the structure

- VkDescriptorPoolCreateInfo

Bits which **can** be set in VkDescriptorPoolCreateInfo::flags, enabling operations on a descriptor pool, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT = 0x00000001,
  // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT = 0x00000002,
  // Provided by VK_EXT_mutable_descriptor_type
    VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT = 0x00000004,
  // Provided by VK_NV_descriptor_pool_overallocation
    VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV = 0x00000008,
  // Provided by VK_NV_descriptor_pool_overallocation
    VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_POOLS_BIT_NV = 0x00000010,
  // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT =
VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT,
  // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE =
VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT,
} VkDescriptorPoolCreateFlagBits;
```

- VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT specifies that descriptor sets **can** return their individual allocations to the pool, i.e. all of vkAllocateDescriptorSets, vkFreeDescriptorSets, and vkResetDescriptorPool are allowed. Otherwise, descriptor sets allocated from the pool **must** not be individually freed back to the pool, i.e. only vkAllocateDescriptorSets and vkResetDescriptorPool are allowed.
- VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT specifies that descriptor sets allocated from this pool **can** include bindings with the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set. It is valid to allocate descriptor sets that have bindings that do not set the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit from a pool that has VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT set.
- VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT specifies that this descriptor pool and the descriptor sets allocated from it reside entirely in host memory and cannot be bound. Similar to descriptor sets allocated without this flag, applications **can** copy-from and copy-to descriptor sets allocated from this descriptor pool. Descriptor sets allocated from this pool are partially exempt from the external synchronization requirement in vkUpdateDescriptorSetWithTemplateKHR and vkUpdateDescriptorSets. Descriptor sets and their descriptors can be updated concurrently in different threads, though the same descriptor **must** not be updated concurrently by two threads.
- VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV specifies that the implementation should allow the application to allocate more than VkDescriptorPoolCreateInfo::`maxSets` descriptor set objects from the descriptor pool as available resources allow. The implementation **may** use the `maxSets` value to allocate the initial available sets, but using zero is permitted.
- VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_POOLS_BIT_NV specifies that the implementation should allow the application to allocate more descriptors from the pool than was specified by the VkDescriptorPoolSize::`descriptorCount` for any descriptor type as specified

by VkDescriptorPoolCreateInfo::poolSizeCount and VkDescriptorPoolCreateInfo::pPoolSizes, as available resources allow. The implementation **may** use the descriptorCount for each descriptor type to allocate the initial pool, but the application is allowed to set the poolSizeCount to zero, or any of the descriptorCount values in the pPoolSizes array to zero.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolCreateFlags;
```

VkDescriptorPoolCreateFlags is a bitmask type for setting a mask of zero or more VkDescriptorPoolCreateFlagBits.

The VkDescriptorPoolSize structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolSize {
    VkDescriptorType    type;
    uint32_t            descriptorCount;
} VkDescriptorPoolSize;
```

- type is the type of descriptor.
- descriptorCount is the number of descriptors of that type to allocate. If type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount is the number of bytes to allocate for descriptors of this type.

NOTE

When creating a descriptor pool that will contain descriptors for combined image samplers with $Y'C_BC_R$ conversion, an application needs to account for non-trivial descriptor consumption when choosing the descriptorCount value, as indicated by VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount.

For simplicity, the application **can** use the VkPhysicalDeviceMaintenance6Properties::maxCombinedImageSamplerDescriptorCount property to conservatively size the descriptorCount value instead of querying combinedImageSamplerDescriptorCount for each format.

Applications **must** use maxCombinedImageSamplerDescriptorCount to size the descriptorCount value for image samplers with an Android external format as it is not possible to query combinedImageSamplerDescriptorCount for those formats.

Valid Usage

- VUID-VkDescriptorPoolSize-descriptorCount-00302
  descriptorCount **must** be greater than 0
- VUID-VkDescriptorPoolSize-type-02218
  If type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount **must** be a multiple of 4

Valid Usage (Implicit)

- VUID-VkDescriptorPoolSize-type-parameter
  `type` **must** be a valid VkDescriptorType value

To destroy a descriptor pool, call:

```
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorPool(
    VkDevice                                    device,
    VkDescriptorPool                            descriptorPool,
    const VkAllocationCallbacks*                pAllocator);
```

- `device` is the logical device that destroys the descriptor pool.
- `descriptorPool` is the descriptor pool to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all descriptor sets allocated from the pool are implicitly freed and become invalid. Descriptor sets allocated from a given pool do not need to be freed before destroying that descriptor pool.

Valid Usage

- VUID-vkDestroyDescriptorPool-descriptorPool-00303
  All submitted commands that refer to `descriptorPool` (via any allocated descriptor sets) **must** have completed execution
- VUID-vkDestroyDescriptorPool-descriptorPool-00304
  If `VkAllocationCallbacks` were provided when `descriptorPool` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyDescriptorPool-descriptorPool-00305
  If no `VkAllocationCallbacks` were provided when `descriptorPool` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyDescriptorPool-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkDestroyDescriptorPool-descriptorPool-parameter
  If `descriptorPool` is not VK_NULL_HANDLE, `descriptorPool` **must** be a valid VkDescriptorPool handle
- VUID-vkDestroyDescriptorPool-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid

VkAllocationCallbacks structure

- VUID-vkDestroyDescriptorPool-descriptorPool-parent
  If `descriptorPool` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `descriptorPool` **must** be externally synchronized

Descriptor sets are allocated from descriptor pool objects, and are represented by `VkDescriptorSet` handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSet)
```

To allocate descriptor sets from a descriptor pool, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateDescriptorSets(
    VkDevice                                    device,
    const VkDescriptorSetAllocateInfo*          pAllocateInfo,
    VkDescriptorSet*                            pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `pAllocateInfo` is a pointer to a VkDescriptorSetAllocateInfo structure describing parameters of the allocation.
- `pDescriptorSets` is a pointer to an array of VkDescriptorSet handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in `pDescriptorSets`.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined, with the exception that samplers with a non-null `pImmutableSamplers` are initialized on allocation. Descriptors also become undefined if the underlying resource or view object is destroyed. Descriptor sets containing undefined descriptors **can** still be bound and used, subject to the following conditions:

- For descriptor set bindings created with the VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT bit set, all descriptors in that binding that are dynamically used **must** have been populated before the descriptor set is consumed.
- For descriptor set bindings created without the VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT bit set, all descriptors in that binding that are statically used **must** have been populated before the descriptor set is consumed.

- Descriptor bindings with descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK **can** be undefined when the descriptor set is consumed; though values in that block will be undefined.
- Entries that are not used by a pipeline **can** have undefined descriptors.

If a call to `vkAllocateDescriptorSets` would cause the total number of descriptor sets allocated from the pool to exceed the value of VkDescriptorPoolCreateInfo::`maxSets` used to create `pAllocateInfo->descriptorPool`, then the allocation **may** fail due to lack of space in the descriptor pool. Similarly, the allocation **may** fail due to lack of space if the call to `vkAllocateDescriptorSets` would cause the number of any given descriptor type to exceed the sum of all the `descriptorCount` members of each element of VkDescriptorPoolCreateInfo::`pPoolSizes` with a `type` equal to that type.

Additionally, the allocation **may** also fail if a call to `vkAllocateDescriptorSets` would cause the total number of inline uniform block bindings allocated from the pool to exceed the value of VkDescriptorPoolInlineUniformBlockCreateInfo::`maxInlineUniformBlockBindings` used to create the descriptor pool.

If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then VK_ERROR_OUT_OF_POOL_MEMORY **must** be returned.

`vkAllocateDescriptorSets` **can** be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation **must** destroy all successfully created descriptor set objects from this command, set all entries of the `pDescriptorSets` array to VK_NULL_HANDLE and return the error.

Valid Usage (Implicit)

- VUID-vkAllocateDescriptorSets-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkAllocateDescriptorSets-pAllocateInfo-parameter
  `pAllocateInfo` **must** be a valid pointer to a valid VkDescriptorSetAllocateInfo structure
- VUID-vkAllocateDescriptorSets-pDescriptorSets-parameter
  `pDescriptorSets` **must** be a valid pointer to an array of `pAllocateInfo->descriptorSetCount` VkDescriptorSet handles
- VUID-vkAllocateDescriptorSets-device-queuecount
  The device **must** have been created with at least 1 queue
- VUID-vkAllocateDescriptorSets-pAllocateInfo::descriptorSetCount-arraylength
  `pAllocateInfo->descriptorSetCount` **must** be greater than `0`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_FRAGMENTED_POOL
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_POOL_MEMORY
- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

The `VkDescriptorSetAllocateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType                 sType;
    const void*                     pNext;
    VkDescriptorPool                descriptorPool;
    uint32_t                        descriptorSetCount;
    const VkDescriptorSetLayout*    pSetLayouts;
} VkDescriptorSetAllocateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `descriptorPool` is the pool which the sets will be allocated from.
- `descriptorSetCount` determines the number of descriptor sets to be allocated from the pool.
- `pSetLayouts` is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

Valid Usage

- VUID-VkDescriptorSetAllocateInfo-apiVersion-07895
  If the VK_KHR_maintenance1 extension is not enabled and VkPhysicalDeviceProperties::`apiVersion` is less than Vulkan 1.1, `descriptorSetCount` **must** not be greater than the number of sets that are currently available for allocation in `descriptorPool`
- VUID-VkDescriptorSetAllocateInfo-apiVersion-07896
  If the VK_KHR_maintenance1 extension is not enabled and VkPhysicalDeviceProperties::`apiVersion` is less than Vulkan 1.1, `descriptorPool` **must** have enough free descriptor capacity remaining to allocate the descriptor sets of the specified layouts
- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-00308
  Each element of `pSetLayouts` **must** not have been created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT set
- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-03044
  If any element of `pSetLayouts` was created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set,

descriptorPool **must** have been created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-09380
  If pSetLayouts[i] was created with an element of pBindingFlags that includes VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT, and VkDescriptorSetVariableDescriptorCountAllocateInfo is included in the pNext chain, and VkDescriptorSetVariableDescriptorCountAllocateInfo::descriptorSetCount is not zero, then VkDescriptorSetVariableDescriptorCountAllocateInfo::pDescriptorCounts[i] **must** be less than or equal to VkDescriptorSetLayoutBinding::descriptorCount for the corresponding binding used to create pSetLayouts[i]
- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-04610
  If any element of pSetLayouts was created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT bit set, descriptorPool **must** have been created with the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT flag set
- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-08009
  Each element of pSetLayouts **must** not have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT bit set

Valid Usage (Implicit)

- VUID-VkDescriptorSetAllocateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO
- VUID-VkDescriptorSetAllocateInfo-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkDescriptorSetVariableDescriptorCountAllocateInfo
- VUID-VkDescriptorSetAllocateInfo-sType-unique
  The sType value of each structure in the pNext chain **must** be unique
- VUID-VkDescriptorSetAllocateInfo-descriptorPool-parameter
  descriptorPool **must** be a valid VkDescriptorPool handle
- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-parameter
  pSetLayouts **must** be a valid pointer to an array of descriptorSetCount valid VkDescriptorSetLayout handles
- VUID-VkDescriptorSetAllocateInfo-descriptorSetCount-arraylength
  descriptorSetCount **must** be greater than 0
- VUID-VkDescriptorSetAllocateInfo-commonparent
  Both of descriptorPool, and the elements of pSetLayouts **must** have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to descriptorPool **must** be externally synchronized

If the pNext chain of a VkDescriptorSetAllocateInfo structure includes a VkDescriptorSetVariableDescriptorCountAllocateInfo structure, then that structure includes an array of descriptor counts for variable-sized descriptor bindings, one for each descriptor set being allocated.

The VkDescriptorSetVariableDescriptorCountAllocateInfo structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           descriptorSetCount;
    const uint32_t*    pDescriptorCounts;
} VkDescriptorSetVariableDescriptorCountAllocateInfo;
```

```
// Provided by VK_EXT_descriptor_indexing
// Equivalent to VkDescriptorSetVariableDescriptorCountAllocateInfo
typedef VkDescriptorSetVariableDescriptorCountAllocateInfo
VkDescriptorSetVariableDescriptorCountAllocateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- descriptorSetCount is zero or the number of elements in pDescriptorCounts.
- pDescriptorCounts is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable-sized descriptor binding in the corresponding descriptor set being allocated.

If descriptorSetCount is zero or this structure is not included in the pNext chain, then the variable lengths are considered to be zero. Otherwise, pDescriptorCounts[i] is the number of descriptors in the variable-sized descriptor binding in the corresponding descriptor set layout. If the variable-sized descriptor binding in the corresponding descriptor set layout has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then pDescriptorCounts[i] specifies the binding's capacity in bytes. If VkDescriptorSetAllocateInfo::pSetLayouts[i] does not include a variable-sized descriptor binding, then pDescriptorCounts[i] is ignored.

Valid Usage

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-descriptorSetCount-03045
  If descriptorSetCount is not zero, descriptorSetCount **must** equal VkDescriptorSetAllocateInfo::descriptorSetCount

Valid Usage (Implicit)

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType

sType **must** be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pDescriptorCounts-parameter
  If descriptorSetCount is not 0, pDescriptorCounts **must** be a valid pointer to an array of descriptorSetCount uint32_t values

Structure Chaining

Extends the structure

- VkDescriptorSetAllocateInfo

To free allocated descriptor sets, call:

```
// Provided by VK_VERSION_1_0
VkResult vkFreeDescriptorSets(
    VkDevice                                    device,
    VkDescriptorPool                            descriptorPool,
    uint32_t                                    descriptorSetCount,
    const VkDescriptorSet*                      pDescriptorSets);
```

- device is the logical device that owns the descriptor pool.
- descriptorPool is the descriptor pool from which the descriptor sets were allocated.
- descriptorSetCount is the number of elements in the pDescriptorSets array.
- pDescriptorSets is a pointer to an array of handles to VkDescriptorSet objects.

After calling vkFreeDescriptorSets, all descriptor sets in pDescriptorSets are invalid.

Valid Usage

- VUID-vkFreeDescriptorSets-pDescriptorSets-00309
  All submitted commands that refer to any element of pDescriptorSets **must** have completed execution
- VUID-vkFreeDescriptorSets-pDescriptorSets-00310
  pDescriptorSets **must** be a valid pointer to an array of descriptorSetCount VkDescriptorSet handles, each element of which **must** either be a valid handle or VK_NULL_HANDLE
- VUID-vkFreeDescriptorSets-descriptorPool-00312
  descriptorPool **must** have been created with the VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT flag

Valid Usage (Implicit)

- VUID-vkFreeDescriptorSets-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkFreeDescriptorSets-descriptorPool-parameter
  `descriptorPool` **must** be a valid VkDescriptorPool handle
- VUID-vkFreeDescriptorSets-descriptorSetCount-arraylength
  `descriptorSetCount` **must** be greater than `0`
- VUID-vkFreeDescriptorSets-descriptorPool-parent
  `descriptorPool` **must** have been created, allocated, or retrieved from `device`
- VUID-vkFreeDescriptorSets-pDescriptorSets-parent
  Each element of `pDescriptorSets` that is a valid handle **must** have been created, allocated, or retrieved from `descriptorPool`

Host Synchronization

- Host access to `descriptorPool` **must** be externally synchronized
- Host access to each member of `pDescriptorSets` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:

```
// Provided by VK_VERSION_1_0
VkResult vkResetDescriptorPool(
    VkDevice                                    device,
    VkDescriptorPool                            descriptorPool,
    VkDescriptorPoolResetFlags                  flags);
```

- `device` is the logical device that owns the descriptor pool.
- `descriptorPool` is the descriptor pool to be reset.
- `flags` is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

Valid Usage

- VUID-vkResetDescriptorPool-descriptorPool-00313
  All uses of `descriptorPool` (via any allocated descriptor sets) **must** have completed execution

Valid Usage (Implicit)

- VUID-vkResetDescriptorPool-device-parameter
  `device` **must** be a valid VkDevice handle
- VUID-vkResetDescriptorPool-descriptorPool-parameter
  `descriptorPool` **must** be a valid VkDescriptorPool handle
- VUID-vkResetDescriptorPool-flags-zerobitmask
  `flags` **must** be `0`
- VUID-vkResetDescriptorPool-descriptorPool-parent
  `descriptorPool` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `descriptorPool` **must** be externally synchronized
- Host access to any `VkDescriptorSet` objects allocated from `descriptorPool` **must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_UNKNOWN
- VK_ERROR_VALIDATION_FAILED

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolResetFlags;
```

`VkDescriptorPoolResetFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

17.4. Descriptor Set Updates

Once allocated, descriptor sets **can** be updated with a combination of write and copy operations. To update descriptor sets, call:

```
// Provided by VK_VERSION_1_0
void vkUpdateDescriptorSets(
    VkDevice                                    device,
    uint32_t                                    descriptorWriteCount,
    const VkWriteDescriptorSet*                 pDescriptorWrites,
    uint32_t                                    descriptorCopyCount,
    const VkCopyDescriptorSet*                  pDescriptorCopies);
```

- `device` is the logical device that updates the descriptor sets.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of VkWriteDescriptorSet structures describing the descriptor sets to write to.
- `descriptorCopyCount` is the number of elements in the `pDescriptorCopies` array.
- `pDescriptorCopies` is a pointer to an array of VkCopyDescriptorSet structures describing the descriptor sets to copy between.

The operations described by `pDescriptorWrites` are performed first, followed by the operations described by `pDescriptorCopies`. Within each array, the operations are performed in the order they appear in the array.

Each element in the `pDescriptorWrites` array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the `pDescriptorCopies` array is a VkCopyDescriptorSet structure describing an operation copying descriptors between sets.

If the `dstSet` member of any element of `pDescriptorWrites` or `pDescriptorCopies` is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the recording or executable state, and any of the descriptor bindings that are updated were not created with the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set, that command buffer becomes invalid.

Copying a descriptor from a descriptor set does not constitute a use of the referenced resource or view, as it is the reference itself that is copied. Applications **can** copy a descriptor referencing a destroyed resource, and it **can** copy an undefined descriptor. The destination descriptor becomes undefined in both cases.

Valid Usage

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06236

For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, elements of the pTexelBufferView member of pDescriptorWrites[i] **must** have been created on device

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06237
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the buffer member of any element of the pBufferInfo member of pDescriptorWrites[i] **must** have been created on device
- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06238
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was not allocated with a layout that included immutable samplers for dstBinding with descriptorType, the sampler member of any element of the pImageInfo member of pDescriptorWrites[i] **must** have been created on device
- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06239
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER the imageView member of any element of the pImageInfo member of pDescriptorWrites[i] **must** have been created on device
- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06240
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, elements of the pAccelerationStructures member of a VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of pDescriptorWrites[i] **must** have been created on device
- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06241
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, elements of the pAccelerationStructures member of a VkWriteDescriptorSetAccelerationStructureNV structure in the pNext chain of pDescriptorWrites[i] **must** have been created on device
- VUID-vkUpdateDescriptorSets-pDescriptorWrites-12324
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_TENSOR_ARM, elements of the pTensorViews member of a VkWriteDescriptorSetTensorARM structure in the pNext chain of pDescriptorWrites[i] **must** have been created on device
- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06493
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE,

VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, pDescriptorWrites[i].pImageInfo **must** be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkUpdateDescriptorSets-None-03047
  The dstSet member of each element of pDescriptorWrites or pDescriptorCopies for bindings which were created without the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set **must** not be used by any command that was recorded to a command buffer which is in the pending state
- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06993
  Host access to pDescriptorWrites[i].dstSet and pDescriptorCopies[i].dstSet **must** be externally synchronized unless explicitly denoted otherwise for specific flags

Valid Usage (Implicit)

- VUID-vkUpdateDescriptorSets-device-parameter
  device **must** be a valid VkDevice handle
- VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter
  If descriptorWriteCount is not 0, pDescriptorWrites **must** be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures
- VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter
  If descriptorCopyCount is not 0, pDescriptorCopies **must** be a valid pointer to an array of descriptorCopyCount valid VkCopyDescriptorSet structures

The VkWriteDescriptorSet structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
    VkStructureType                  sType;
    const void*                      pNext;
    VkDescriptorSet                  dstSet;
    uint32_t                         dstBinding;
    uint32_t                         dstArrayElement;
    uint32_t                         descriptorCount;
    VkDescriptorType                 descriptorType;
    const VkDescriptorImageInfo*     pImageInfo;
    const VkDescriptorBufferInfo*    pBufferInfo;
    const VkBufferView*              pTexelBufferView;
} VkWriteDescriptorSet;
```

- sType is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.
- dstSet is the destination descriptor set to update.
- dstBinding is the descriptor binding within that set.
- dstArrayElement is the starting element in that array. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then dstArrayElement specifies the starting byte offset within the binding.
- descriptorCount is the number of descriptors to update. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, then descriptorCount specifies the number of bytes to update. Otherwise, descriptorCount is one of
  - the number of elements in pImageInfo
  - the number of elements in pBufferInfo
  - the number of elements in pTexelBufferView
  - a value matching the dataSize member of a VkWriteDescriptorSetInlineUniformBlock structure in the pNext chain
  - a value matching the accelerationStructureCount of a VkWriteDescriptorSetAccelerationStructureKHR or VkWriteDescriptorSetAccelerationStructureNV structure in the pNext chain
  - a value matching the descriptorCount of a VkWriteDescriptorSetTensorARM structure in the pNext chain
- descriptorType is a VkDescriptorType specifying the type of each descriptor in pImageInfo, pBufferInfo, or pTexelBufferView, as described below. If VkDescriptorSetLayoutBinding for dstSet at dstBinding is not equal to VK_DESCRIPTOR_TYPE_MUTABLE_EXT, descriptorType **must** be the same type as the descriptorType specified in VkDescriptorSetLayoutBinding for dstSet at dstBinding. The type of the descriptor also controls which array the descriptors are taken from.
- pImageInfo is a pointer to an array of VkDescriptorImageInfo structures or is ignored, as described below.
- pBufferInfo is a pointer to an array of VkDescriptorBufferInfo structures or is ignored, as described below.
- pTexelBufferView is a pointer to an array of VkBufferView handles as described in the Buffer Views section or is ignored, as described below.

Members of pImageInfo, pBufferInfo and pTexelBufferView are only accessed by the implementation when they correspond to a descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

- For VK_DESCRIPTOR_TYPE_SAMPLER, only the sampler member of each element of VkWriteDescriptorSet::pImageInfo is accessed.
- For VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, only the imageView and imageLayout members of each element of VkWriteDescriptorSet::pImageInfo are accessed.

- For VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, all members of each element of VkWriteDescriptorSet::pImageInfo are accessed.
- For VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, all members of each element of VkWriteDescriptorSet::pBufferInfo are accessed.
- For VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of VkWriteDescriptorSet::pTexelBufferView is accessed.

When updating descriptor sets with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetInlineUniformBlock structure in the pNext chain of VkWriteDescriptorSet. When updating descriptor sets with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of VkWriteDescriptorSet. When updating descriptor sets with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetAccelerationStructureNV structure in the pNext chain of VkWriteDescriptorSet. When updating descriptor sets with a descriptorType of VK_DESCRIPTOR_TYPE_TENSOR_ARM, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the instance of VkWriteDescriptorSetTensorARM in the pNext chain of VkWriteDescriptorSet.

If the nullDescriptor feature is enabled, the buffer, acceleration structure, tensor, imageView, or bufferView **can** be VK_NULL_HANDLE. Loads from a null descriptor return zero values and stores and atomics to a null descriptor are discarded. A null acceleration structure descriptor results in the miss shader being invoked.

If the destination descriptor is a mutable descriptor, the active descriptor type for the destination descriptor becomes descriptorType.

Consecutive Binding Updates

If the dstBinding has fewer than descriptorCount array elements remaining starting from dstArrayElement, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at array element zero. If a binding has a descriptorCount of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all descriptorCount descriptors. Consecutive bindings **must** have identical VkDescriptorType, VkShaderStageFlags, VkDescriptorBindingFlagBits, and immutable samplers references. In addition, if the VkDescriptorType is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the supported descriptor types in VkMutableDescriptorTypeCreateInfoEXT **must** be equally defined.

NOTE	The same behavior applies to bindings with a descriptor type of

> VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK where descriptorCount specifies the number of bytes to update while dstArrayElement specifies the starting byte offset, thus in this case if the dstBinding has a smaller byte size than the sum of dstArrayElement and descriptorCount, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at offset zero. This falls out as a special case of the above rule.

Valid Usage

- VUID-VkWriteDescriptorSet-dstBinding-00315
  dstBinding **must** be less than or equal to the maximum value of binding of all VkDescriptorSetLayoutBinding structures specified when dstSet's descriptor set layout was created
- VUID-VkWriteDescriptorSet-dstBinding-00316
  dstBinding **must** be a binding with a non-zero descriptorCount
- VUID-VkWriteDescriptorSet-dstBinding-10009
  dstBinding **must** be a binding with a non-zero VkDescriptorSetLayoutCreateInfo ::bindingCount
- VUID-VkWriteDescriptorSet-descriptorCount-00317
  All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, **must** have identical descriptorType
- VUID-VkWriteDescriptorSet-descriptorCount-10776
  All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, **must** have identical stageFlags
- VUID-VkWriteDescriptorSet-descriptorCount-00318
  All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, **must** all either use immutable samplers or **must** all not use immutable samplers
- VUID-VkWriteDescriptorSet-descriptorCount-10777
  All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, **must** have identical VkDescriptorBindingFlagBits
- VUID-VkWriteDescriptorSet-descriptorType-00319
  descriptorType **must** match the type of dstBinding within dstSet
- VUID-VkWriteDescriptorSet-dstSet-00320
  dstSet **must** be a valid VkDescriptorSet handle
- VUID-VkWriteDescriptorSet-dstArrayElement-00321
  The sum of dstArrayElement and descriptorCount **must** be less than or equal to the number of array elements in the descriptor set binding specified by dstBinding, and all applicable consecutive bindings
- VUID-VkWriteDescriptorSet-descriptorType-02219
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement **must** be an integer multiple of 4
- VUID-VkWriteDescriptorSet-descriptorType-02220

If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount **must** be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02994
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of pTexelBufferView **must** be either a valid VkBufferView handle or VK_NULL_HANDLE
- VUID-VkWriteDescriptorSet-descriptorType-02995
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER and the nullDescriptor feature is not enabled, each element of pTexelBufferView **must** not be VK_NULL_HANDLE
- VUID-VkWriteDescriptorSet-descriptorType-00324
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, pBufferInfo **must** be a valid pointer to an array of descriptorCount valid VkDescriptorBufferInfo structures
- VUID-VkWriteDescriptorSet-descriptorType-00325
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was not allocated with a layout that included immutable samplers for dstBinding with descriptorType, the sampler member of each element of pImageInfo **must** be a valid VkSampler object
- VUID-VkWriteDescriptorSet-descriptorType-02996
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the imageView member of each element of pImageInfo **must** be either a valid VkImageView handle or VK_NULL_HANDLE
- VUID-VkWriteDescriptorSet-descriptorType-02997
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and the nullDescriptor feature is not enabled, the imageView member of each element of pImageInfo **must** not be VK_NULL_HANDLE
- VUID-VkWriteDescriptorSet-descriptorType-07683
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, then the imageView member of each element of pImageInfo **must** not be VK_NULL_HANDLE
- VUID-VkWriteDescriptorSet-descriptorType-02221
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, the pNext chain **must** include a VkWriteDescriptorSetInlineUniformBlock structure whose dataSize member equals descriptorCount
- VUID-VkWriteDescriptorSet-descriptorType-02382
  If descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, the pNext chain **must** include a VkWriteDescriptorSetAccelerationStructureKHR structure whose accelerationStructureCount member equals descriptorCount

- VUID-VkWriteDescriptorSet-descriptorType-03817
  If descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, the pNext chain **must** include a VkWriteDescriptorSetAccelerationStructureNV structure whose accelerationStructureCount member equals descriptorCount
- VUID-VkWriteDescriptorSet-descriptorType-09945
  If descriptorType is VK_DESCRIPTOR_TYPE_TENSOR_ARM, the pNext chain **must** include a VkWriteDescriptorSetTensorARM structure whose tensorViewCount member equals descriptorCount
- VUID-VkWriteDescriptorSet-descriptorType-01946
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, then the imageView member of each pImageInfo element **must** have been created without a VkSamplerYcbcrConversionInfo structure in its pNext chain
- VUID-VkWriteDescriptorSet-descriptorType-02738
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and if any element of pImageInfo has an imageView member that was created with a VkSamplerYcbcrConversionInfo structure in its pNext chain, then dstSet **must** have been allocated with a layout that included immutable samplers for dstBinding, and the corresponding immutable sampler **must** have been created with an identically defined VkSamplerYcbcrConversionInfo object
- VUID-VkWriteDescriptorSet-descriptorType-01948
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was allocated with a layout that included immutable samplers for dstBinding, then the imageView member of each element of pImageInfo which corresponds to an immutable sampler that enables sampler $Y'C_BC_R$ conversion **must** have been created with a VkSamplerYcbcrConversionInfo structure in its pNext chain with an identically defined VkSamplerYcbcrConversionInfo to the corresponding immutable sampler
- VUID-VkWriteDescriptorSet-descriptorType-09506
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, dstSet was allocated with a layout that included immutable samplers for dstBinding, and those samplers enable sampler $Y'C_BC_R$ conversion, then imageView **must** not be VK_NULL_HANDLE
- VUID-VkWriteDescriptorSet-descriptorType-00327
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the offset member of each element of pBufferInfo **must** be a multiple of VkPhysicalDeviceLimits ::minUniformBufferOffsetAlignment
- VUID-VkWriteDescriptorSet-descriptorType-00328
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the offset member of each element of pBufferInfo **must** be a multiple of VkPhysicalDeviceLimits ::minStorageBufferOffsetAlignment
- VUID-VkWriteDescriptorSet-descriptorType-00329
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, or

VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, and the buffer member of any element of pBufferInfo is the handle of a non-sparse buffer, then that buffer **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkWriteDescriptorSet-descriptorType-00330
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo **must** have been created with the VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT usage flag set
- VUID-VkWriteDescriptorSet-descriptorType-00331
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo **must** have been created with the VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag set
- VUID-VkWriteDescriptorSet-descriptorType-00332
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, **must** be less than or equal to VkPhysicalDeviceLimits::maxUniformBufferRange
- VUID-VkWriteDescriptorSet-descriptorType-00333
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, and the shader64BitIndexing feature is not enabled, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, **must** be less than or equal to VkPhysicalDeviceLimits ::maxStorageBufferRange
- VUID-VkWriteDescriptorSet-descriptorType-08765
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, the pTexelBufferView buffer view usage **must** include VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
- VUID-VkWriteDescriptorSet-descriptorType-08766
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, the pTexelBufferView buffer view usage **must** include VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT
- VUID-VkWriteDescriptorSet-descriptorType-00336
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo **must** have been created with the identity swizzle
- VUID-VkWriteDescriptorSet-descriptorType-00337
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the imageView member of each element of pImageInfo **must** have been created with the VK_IMAGE_USAGE_SAMPLED_BIT usage flag set
- VUID-VkWriteDescriptorSet-descriptorType-04149
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE the imageLayout member of each element of pImageInfo **must** be a member of the list given in Sampled Image

- VUID-VkWriteDescriptorSet-descriptorType-04150
  If `descriptorType` is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER the `imageLayout` member of each element of `pImageInfo` **must** be a member of the list given in Combined Image Sampler
- VUID-VkWriteDescriptorSet-descriptorType-04151
  If `descriptorType` is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT the `imageLayout` member of each element of `pImageInfo` **must** be a member of the list given in Input Attachment
- VUID-VkWriteDescriptorSet-descriptorType-04152
  If `descriptorType` is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE the `imageLayout` member of each element of `pImageInfo` **must** be a member of the list given in Storage Image
- VUID-VkWriteDescriptorSet-descriptorType-00338
  If `descriptorType` is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the `imageView` member of each element of `pImageInfo` **must** have been created with the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT usage flag set
- VUID-VkWriteDescriptorSet-descriptorType-00339
  If `descriptorType` is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the `imageView` member of each element of `pImageInfo` **must** have been created with the VK_IMAGE_USAGE_STORAGE_BIT usage flag set
- VUID-VkWriteDescriptorSet-descriptorType-02752
  If `descriptorType` is VK_DESCRIPTOR_TYPE_SAMPLER, then `dstSet` **must** not have been allocated with a layout that included immutable samplers for `dstBinding`
- VUID-VkWriteDescriptorSet-dstSet-04611
  If the `VkDescriptorSetLayoutBinding` for `dstSet` at `dstBinding` is VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the new active descriptor type `descriptorType` **must** exist in the corresponding `pMutableDescriptorTypeLists` list for `dstBinding`
- VUID-VkWriteDescriptorSet-descriptorType-06450
  If `descriptorType` is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the `imageView` member of each element of `pImageInfo` **must** have either been created without a VkImageViewMinLodCreateInfoEXT included in the `pNext` chain or with a VkImageViewMinLodCreateInfoEXT::`minLod` of `0.0`
- VUID-VkWriteDescriptorSet-descriptorType-06942
  If `descriptorType` is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, the `imageView` member of each element of `pImageInfo` **must** have been created with a view created with an `image` created with the VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM usage flag set
- VUID-VkWriteDescriptorSet-descriptorType-06943
  If `descriptorType` is VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, the `imageView` member of each element of `pImageInfo` **must** have been created with a view created with an `image` created with the VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM usage flag set

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSet-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET
- VUID-VkWriteDescriptorSet-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of VkWriteDescriptorSetAccelerationStructureKHR, VkWriteDescriptorSetAccelerationStructureNV, VkWriteDescriptorSetInlineUniformBlock, VkWriteDescriptorSetPartitionedAccelerationStructureNV, or VkWriteDescriptorSetTensorARM
- VUID-VkWriteDescriptorSet-sType-unique
  The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkWriteDescriptorSet-descriptorType-parameter
  `descriptorType` **must** be a valid VkDescriptorType value
- VUID-VkWriteDescriptorSet-descriptorCount-arraylength
  `descriptorCount` **must** be greater than `0`
- VUID-VkWriteDescriptorSet-commonparent
  Both of `dstSet`, and the elements of `pTexelBufferView` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

The `VkDescriptorBufferInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorBufferInfo {
    VkBuffer        buffer;
    VkDeviceSize    offset;
    VkDeviceSize    range;
} VkDescriptorBufferInfo;
```

- `buffer` is VK_NULL_HANDLE or the buffer resource.
- `offset` is the offset in bytes from the start of `buffer`. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.
- `range` is the size in bytes that is used for this descriptor update, or VK_WHOLE_SIZE to use the range from `offset` to the end of the buffer.

NOTE

When setting `range` to VK_WHOLE_SIZE, the effective range **must** not be larger than the maximum range for the descriptor type (`maxUniformBufferRange` or `maxStorageBufferRange`). This means that VK_WHOLE_SIZE is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC and

VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC descriptor types, `offset` is the base offset from which the dynamic offset is applied and `range` is the static size used for all dynamic offsets.

When `range` is VK_WHOLE_SIZE the effective range is calculated at vkUpdateDescriptorSets by taking the size of `buffer` minus the `offset`.

Valid Usage

- VUID-VkDescriptorBufferInfo-offset-00340
  `offset` **must** be less than the size of `buffer`
- VUID-VkDescriptorBufferInfo-range-00341
  If `range` is not equal to VK_WHOLE_SIZE, `range` **must** be greater than `0`
- VUID-VkDescriptorBufferInfo-range-00342
  If `range` is not equal to VK_WHOLE_SIZE, `range` **must** be less than or equal to the size of `buffer` minus `offset`
- VUID-VkDescriptorBufferInfo-buffer-02998
  If the `nullDescriptor` feature is not enabled, `buffer` **must** not be VK_NULL_HANDLE
- VUID-VkDescriptorBufferInfo-buffer-02999
  If `buffer` is VK_NULL_HANDLE, `offset` **must** be zero and `range` **must** be VK_WHOLE_SIZE

Valid Usage (Implicit)

- VUID-VkDescriptorBufferInfo-buffer-parameter
  If `buffer` is not VK_NULL_HANDLE, `buffer` **must** be a valid VkBuffer handle

The `VkDescriptorImageInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
    VkSampler        sampler;
    VkImageView      imageView;
    VkImageLayout    imageLayout;
} VkDescriptorImageInfo;
```

- `sampler` is a sampler handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the binding being updated does not use immutable samplers.
- `imageView` is VK_NULL_HANDLE or an image view handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.
- `imageLayout` is the layout that the image subresources accessible from `imageView` will be in at the time this descriptor is accessed. `imageLayout` is used in descriptor updates for types

VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

Members of VkDescriptorImageInfo that are not used in an update (as described above) are ignored.

Valid Usage

- VUID-VkDescriptorImageInfo-imageView-06712
  imageView **must** not be a 2D array image view created from a 3D image
- VUID-VkDescriptorImageInfo-imageView-07795
  If imageView is a 2D view created from a 3D image, then descriptorType **must** be VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER
- VUID-VkDescriptorImageInfo-imageView-07796
  If imageView is a 2D view created from a 3D image, then the image **must** have been created with VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set
- VUID-VkDescriptorImageInfo-descriptorType-06713
  If the image2DViewOf3D feature is not enabled or descriptorType is not VK_DESCRIPTOR_TYPE_STORAGE_IMAGE then imageView **must** not be a 2D view created from a 3D image
- VUID-VkDescriptorImageInfo-descriptorType-06714
  If the sampler2DViewOf3D feature is not enabled or descriptorType is not VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER then imageView **must** not be a 2D view created from a 3D image
- VUID-VkDescriptorImageInfo-imageView-01976
  If imageView is created from a depth/stencil image, the aspectMask used to create the imageView **must** include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT but not both
- VUID-VkDescriptorImageInfo-imageLayout-09425
  If imageLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, then the aspectMask used to create imageView **must** not include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT
- VUID-VkDescriptorImageInfo-imageLayout-09426
  If imageLayout is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, then the aspectMask used to create imageView **must** not include VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkDescriptorImageInfo-sampler-01564
  If `sampler` is used and the VkFormat of the image is a multi-planar format, the image **must** have been created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, and the `aspectMask` of the `imageView` **must** be a valid multi-planar aspect mask bit
- VUID-VkDescriptorImageInfo-mutableComparisonSamplers-04450
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::`mutableComparisonSamplers` is VK_FALSE, then `sampler` **must** have been created with VkSamplerCreateInfo::`compareEnable` set to VK_FALSE

Valid Usage (Implicit)

- VUID-VkDescriptorImageInfo-commonparent
  Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice

If the `descriptorType` member of VkWriteDescriptorSet is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then the data to write to the descriptor set is specified through a `VkWriteDescriptorSetInlineUniformBlock` structure included in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkWriteDescriptorSetInlineUniformBlock` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkWriteDescriptorSetInlineUniformBlock {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           dataSize;
    const void*        pData;
} VkWriteDescriptorSetInlineUniformBlock;
```

```
// Provided by VK_EXT_inline_uniform_block
// Equivalent to VkWriteDescriptorSetInlineUniformBlock
typedef VkWriteDescriptorSetInlineUniformBlock
VkWriteDescriptorSetInlineUniformBlockEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dataSize` is the number of bytes of inline uniform block data pointed to by `pData`.
- `pData` is a pointer to `dataSize` number of bytes of data to write to the inline uniform block.

Valid Usage

- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-02222
  `dataSize` **must** be an integer multiple of `4`

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetInlineUniformBlock-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK
- VUID-VkWriteDescriptorSetInlineUniformBlock-pData-parameter
  `pData` **must** be a valid pointer to an array of `dataSize` bytes
- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-arraylength
  `dataSize` **must** be greater than `0`

Structure Chaining

Extends the structure

- VkWriteDescriptorSet

The `VkWriteDescriptorSetAccelerationStructureKHR` structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType                      sType;
    const void*                          pNext;
    uint32_t                             accelerationStructureCount;
    const VkAccelerationStructureKHR*    pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructureCount` is the number of elements in `pAccelerationStructures`.
- `pAccelerationStructures` is a pointer to an array of VkAccelerationStructureKHR structures specifying the acceleration structures to update.

Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579
  Each acceleration structure in `pAccelerationStructures` **must** have been created with a `type` of VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or

VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580
  If the `nullDescriptor` feature is not enabled, each element of `pAccelerationStructures` **must** not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-parameter
  `pAccelerationStructures` **must** be a valid pointer to an array of `accelerationStructureCount` valid or VK_NULL_HANDLE VkAccelerationStructureKHR handles
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-arraylength
  `accelerationStructureCount` **must** be greater than `0`

Structure Chaining

Extends the structure

- VkWriteDescriptorSet

If the `descriptorType` member of VkWriteDescriptorSet is VK_DESCRIPTOR_TYPE_PARTITIONED_ACCELERATION_STRUCTURE_NV, then the data to write to the descriptor set is specified through a `VkWriteDescriptorSetPartitionedAccelerationStructureNV` structure included in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkWriteDescriptorSetPartitionedAccelerationStructureNV` structure is defined as:

```
// Provided by VK_NV_partitioned_acceleration_structure
typedef struct VkWriteDescriptorSetPartitionedAccelerationStructureNV {
    VkStructureType           sType;
    void*                     pNext;
    uint32_t                  accelerationStructureCount;
    const VkDeviceAddress*    pAccelerationStructures;
} VkWriteDescriptorSetPartitionedAccelerationStructureNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructureCount` is the number of elements in `pAccelerationStructures`.
- `pAccelerationStructures` is a pointer to an array of `accelerationStructureCount` device addresses

pointing to previously built PTLAS.

Valid Usage

- VUID-VkWriteDescriptorSetPartitionedAccelerationStructureNV-accelerationStructureCount-10511
  `accelerationStructureCount` **must** be equal to `descriptorCount` in the extended structure
- VUID-VkWriteDescriptorSetPartitionedAccelerationStructureNV-pAccelerationStructures-10512
  Each entry in `pAccelerationStructures` **must** be a valid address of a PTLAS

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetPartitionedAccelerationStructureNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_PARTITIONED_ACCELERATION_STRUCTURE_NV
- VUID-VkWriteDescriptorSetPartitionedAccelerationStructureNV-pAccelerationStructures-parameter
  `pAccelerationStructures` **must** be a valid pointer to an array of `accelerationStructureCount` or VK_NULL_HANDLE VkDeviceAddress values
- VUID-VkWriteDescriptorSetPartitionedAccelerationStructureNV-accelerationStructureCount-arraylength
  `accelerationStructureCount` **must** be greater than `0`

Structure Chaining

Extends the structure

- VkWriteDescriptorSet

The `VkWriteDescriptorSetAccelerationStructureNV` structure is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkWriteDescriptorSetAccelerationStructureNV {
    VkStructureType                    sType;
    const void*                        pNext;
    uint32_t                           accelerationStructureCount;
    const VkAccelerationStructureNV*   pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `accelerationStructureCount` is the number of elements in `pAccelerationStructures`.
- `pAccelerationStructures` is a pointer to an array of VkAccelerationStructureNV structures specifying the acceleration structures to update.

Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03748
  Each acceleration structure in `pAccelerationStructures` **must** have been created with VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR
- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03749
  If the `nullDescriptor` feature is not enabled, each member of `pAccelerationStructures` **must** not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetAccelerationStructureNV-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_NV
- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-parameter
  `pAccelerationStructures` **must** be a valid pointer to an array of `accelerationStructureCount` valid or VK_NULL_HANDLE VkAccelerationStructureNV handles
- VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-arraylength
  `accelerationStructureCount` **must** be greater than `0`

Structure Chaining

Extends the structure

- VkWriteDescriptorSet

The `VkWriteDescriptorSetTensorARM` structure is defined as:

```
// Provided by VK_ARM_tensors
typedef struct VkWriteDescriptorSetTensorARM {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  tensorViewCount;
    const VkTensorViewARM*    pTensorViews;
} VkWriteDescriptorSetTensorARM;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `tensorViewCount` is the number of elements in `pTensorViews`.
- `pTensorViews` are the tensor views that will be used to update the descriptor set.

Valid Usage

- VUID-VkWriteDescriptorSetTensorARM-nullDescriptor-09898
  If the `nullDescriptor` feature is not enabled, each element of `pTensorViews` **must** not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetTensorARM-sType-sType
  `sType` **must** be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_TENSOR_ARM
- VUID-VkWriteDescriptorSetTensorARM-pTensorViews-parameter
  `pTensorViews` **must** be a valid pointer to an array of `tensorViewCount` valid or VK_NULL_HANDLE VkTensorViewARM handles
- VUID-VkWriteDescriptorSetTensorARM-tensorViewCount-arraylength
  `tensorViewCount` **must** be greater than `0`

Structure Chaining

Extends the structure

- VkWriteDescriptorSet

The `VkCopyDescriptorSet` structure is defined as:

```
// Provided by VK_VERSION_1_0
