Conditional Rendering

vkCmdDrawIndirect2KHR is affected by conditional rendering

To record a non-indexed indirect drawing command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    buffer,
    VkDeviceSize                                offset,
    uint32_t                                    drawCount,
    uint32_t                                    stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.

- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirect` behaves similarly to vkCmdDraw except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of VkDrawIndirectCommand structures. If `drawCount` is less than or equal to one, `stride` is ignored.

To record a non-indexed indirect drawing command, call:

```
// Provided by VK_KHR_device_address_commands with VK_KHR_draw_indirect_count or
VK_VERSION_1_2
void vkCmdDrawIndirectCount2KHR(
    VkCommandBuffer                             commandBuffer,
    const VkDrawIndirectCount2InfoKHR*          pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a VkDrawIndirectCount2InfoKHR structure defining parameters of this command.

`vkCmdDrawIndirectCount2KHR` behaves similarly to vkCmdDrawIndirect2KHR except that the draw count is read by the device from an address range during execution. The command will read an unsigned 32-bit integer from `pInfo->countAddressRange` and use this as the draw count.

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCount` behaves similarly to vkCmdDrawIndirect except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

Conditional Rendering

vkCmdDrawIndirectCount is affected by conditional rendering

To record an indexed indirect drawing command, call:

```
// Provided by VK_KHR_device_address_commands
void vkCmdDrawIndexedIndirect2KHR(
    VkCommandBuffer                             commandBuffer,
    const VkDrawIndirect2InfoKHR*               pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a VkDrawIndirect2InfoKHR structure defining parameters of this command.

`vkCmdDrawIndexedIndirect2KHR` behaves similarly to vkCmdDrawIndexed except that the parameters are read by the device from an address range during execution. `pInfo->drawCount` draws are executed by the command, with parameters taken from `pInfo->addressRange` starting at `addressRange.address` and increasing by `addressRange.stride` bytes for each successive draw. The parameters of each draw are encoded in an array of VkDrawIndexedIndirectCommand structures.

Conditional Rendering

vkCmdDrawIndexedIndirect2KHR is affected by conditional rendering

To record an indexed indirect drawing command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexedIndirect(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    buffer,
    VkDeviceSize                                offset,
    uint32_t                                    drawCount,
    uint32_t                                    stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to vkCmdDrawIndexed except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of VkDrawIndexedIndirectCommand structures. If `drawCount` is less than or equal to one, `stride` is ignored.

Conditional Rendering

vkCmdDrawIndexedIndirect is affected by conditional rendering

The VkDrawIndexedIndirectCommand structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t    indexCount;
    uint32_t    instanceCount;
    uint32_t    firstIndex;
    int32_t     vertexOffset;
    uint32_t    firstInstance;
} VkDrawIndexedIndirectCommand;
```

- indexCount is the number of vertices to draw.
- instanceCount is the number of instances to draw.
- firstIndex is the base index within the index buffer.
- vertexOffset is the value added to the vertex index before indexing into the vertex buffer.
- firstInstance is the instance ID of the first instance to draw.

The members of VkDrawIndexedIndirectCommand have the same meaning as the similarly named parameters of vkCmdDrawIndexed.

Valid Usage

- VUID-VkDrawIndexedIndirectCommand-pNext-09461
  If the bound graphics pipeline state was created with VkPipelineVertexInputDivisorStateCreateInfo in the pNext chain of VkGraphicsPipelineCreateInfo::pVertexInputState, any member of VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors has a value other than 1 in divisor, and VkPhysicalDeviceVertexAttributeDivisorProperties ::supportsNonZeroFirstInstance is VK_FALSE, then firstInstance **must** be 0

with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, any member of the pVertexBindingDescriptions parameter to the vkCmdSetVertexInputEXT call that sets this dynamic state has a value other than 1 in divisor, and VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance is VK_FALSE, then firstInstance **must** be 0

- VUID-VkDrawIndexedIndirectCommand-robustBufferAccess2-08798
  If the robustBufferAccess2 feature is not enabled, (indexSize × (firstIndex + indexCount)) **must** be less than or equal to the size of the bound index buffer range, with indexSize being based on the type specified by indexType, and the other parameters sourced from this command
- VUID-VkDrawIndexedIndirectCommand-firstInstance-00554
  If the drawIndirectFirstInstance feature is not enabled, firstInstance **must** be 0

To record a indexed indirect drawing command, call:

```
// Provided by VK_KHR_device_address_commands with VK_KHR_draw_indirect_count or
VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount2KHR(
    VkCommandBuffer                             commandBuffer,
    const VkDrawIndirectCount2InfoKHR*          pInfo);
```

- commandBuffer is the command buffer into which the command is recorded.
- pInfo is a pointer to a VkDrawIndirectCount2InfoKHR structure defining parameters of this command.

vkCmdDrawIndexedIndirectCount2KHR behaves similarly to vkCmdDrawIndexedIndirect2KHR except that the draw count is read by the device from an address range during execution. The command will read an unsigned 32-bit integer from pInfo->countAddressRange and use this as the draw count.

// Provided by VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount(
    VkCommandBuffer                             commandBuffer,

    uint32_t                                    stride);
```

```
// Provided by VK_KHR_draw_indirect_count
// Equivalent to vkCmdDrawIndexedIndirectCount
void vkCmdDrawIndexedIndirectCountKHR(

    VkDeviceSize                                countBufferOffset,
    uint32_t                                    maxDrawCount,
    uint32_t                                    stride);
```

```
// Provided by VK_AMD_draw_indirect_count
// Equivalent to vkCmdDrawIndexedIndirectCount
void vkCmdDrawIndexedIndirectCountAMD(
    VkCommandBuffer                             commandBuffer,

    VkBuffer                                    countBuffer,
    VkDeviceSize                                countBufferOffset,
    uint32_t                                    maxDrawCount,
    uint32_t                                    stride);

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirectCount` behaves similarly to vkCmdDrawIndexedIndirect except that the

draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

27.4.1. Drawing Transform Feedback

It is possible to draw vertex data that was previously captured during active transform feedback by binding one or more of the transform feedback buffers as vertex buffers. A pipeline barrier is required between using the buffers as transform feedback buffers and vertex buffers to ensure all writes to the transform feedback buffers are visible when the data is read as vertex attributes. The source access is VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT and the destination access is VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT for the pipeline stages VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT and VK_PIPELINE_STAGE_VERTEX_INPUT_BIT respectively. The value written to the counter buffer by vkCmdEndTransformFeedbackEXT **can** be used to determine the vertex count for the draw. A pipeline barrier is required between using the counter buffer for `vkCmdEndTransformFeedbackEXT` and `vkCmdDrawIndirectByteCountEXT` where the source access is VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT and the destination access is VK_ACCESS_INDIRECT_COMMAND_READ_BIT for the pipeline stages VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT and VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT respectively.

To record a non-indexed draw call, where the vertex count is based on a byte count read from a memory range and the passed in vertex stride parameter, call:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_transform_feedback
void vkCmdDrawIndirectByteCount2EXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    instanceCount,
    uint32_t                                    firstInstance,
    const VkBindTransformFeedbackBuffer2InfoEXT* pCounterInfo,
    uint32_t                                    counterOffset,
    uint32_t                                    vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `pCounterInfo` is a pointer to a VkBindTransformFeedbackBuffer2InfoEXT defining the range of memory that the byte count is read from.
- `counterOffset` is subtracted from the byte count.
- `vertexStride` is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the `XfbStride`.

When the command is executed, primitives are assembled in the same way as done with vkCmdDraw except the `vertexCount` is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective `vertexCount` is calculated as follows:

```
const uint32_t * counterBufferPtr = (const uint8_t *)counterRange.address;
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective `firstVertex` is zero.

Conditional Rendering

vkCmdDrawIndirectByteCount2EXT is affected by conditional rendering

To record a non-indexed draw call, where the vertex count is based on a byte count read from a buffer and the passed in vertex stride parameter, call:

WARNING This functionality is superseded by vkCmdDrawIndirectByteCount2EXT. See

> Legacy Functionality for more information.

```
// Provided by VK_EXT_transform_feedback
void vkCmdDrawIndirectByteCountEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    instanceCount,
    uint32_t                                    firstInstance,
    VkBuffer                                    counterBuffer,
    VkDeviceSize                                counterBufferOffset,
    uint32_t                                    counterOffset,
    uint32_t                                    vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `counterBuffer` is the buffer handle from where the byte count is read.
- `counterBufferOffset` is the offset into the buffer used to read the byte count, which is used to calculate the vertex count for this draw call.
- `counterOffset` is subtracted from the byte count read from the `counterBuffer` at the `counterBufferOffset`.
- `vertexStride` is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the `XfbStride`.

When the command is executed, primitives are assembled in the same way as done with vkCmdDraw except the `vertexCount` is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective `vertexCount` is calculated as follows:

```
const uint32_t * counterBufferPtr = (const uint8_t *)counterBuffer.address +
counterBufferOffset;
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective `firstVertex` is zero.

Conditional Rendering

vkCmdDrawIndirectByteCountEXT is affected by conditional rendering

27.5. Conditional Rendering

Certain rendering commands **can** be executed conditionally based on a value in buffer memory. These rendering commands are limited to drawing commands, dispatching commands, and clearing attachments with vkCmdClearAttachments within a conditional rendering block which is defined by commands vkCmdBeginConditionalRenderingEXT and vkCmdEndConditionalRenderingEXT. Other rendering commands remain unaffected by conditional rendering.

The complete list of commands affected by conditional rendering is:

After beginning conditional rendering, it is considered *active* within the command buffer it was called until it is ended with vkCmdEndConditionalRenderingEXT.

Conditional rendering **must** begin and end in the same command buffer. When conditional rendering is active, a primary command buffer **can** execute secondary command buffers if the `inheritedConditionalRendering` feature is enabled. For a secondary command buffer to be executed while conditional rendering is active in the primary command buffer, it **must** set the `conditionalRenderingEnable` flag of VkCommandBufferInheritanceConditionalRenderingInfoEXT, as described in the Command Buffer Recording section.

Conditional rendering **must** also either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

To begin conditional rendering, call:

} VkConditionalRenderingFlagBitsEXT;
```

- VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT specifies the condition used to determine whether to discard rendering commands or not. That is, if the 32-bit predicate read from buffer memory at offset is zero, the rendering commands are not discarded, and if non zero, then they are discarded.

```
// Provided by VK_EXT_conditional_rendering

27.6. Programmable Mesh Shading

In this drawing approach, primitives are assembled by the mesh shader stage. Mesh shading operates similarly to dispatching compute as the shaders make use of workgroups.

To record a mesh tasks drawing command, call:

```
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksNV(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    taskCount,
    uint32_t                                    firstTask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `taskCount` is the number of local workgroups to dispatch in the X dimension. Y and Z dimensions are implicitly set to one.
- `firstTask` is the X component of the first workgroup ID.

When the command is executed, a global workgroup consisting of `taskCount` local workgroups is assembled.

Conditional Rendering

vkCmdDrawMeshTasksNV is affected by conditional rendering

To record an indirect mesh tasks drawing command, call:

```
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksIndirectNV(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    buffer,
    VkDeviceSize                                offset,
    uint32_t                                    drawCount,
    uint32_t                                    stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawMeshTasksIndirectNV` behaves similarly to vkCmdDrawMeshTasksNV except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of VkDrawMeshTasksIndirectCommandNV structures. If `drawCount` is less than or equal to one, `stride` is ignored.

Conditional Rendering

vkCmdDrawMeshTasksIndirectNV is affected by conditional rendering

The VkDrawMeshTasksIndirectCommandNV structure is defined as:

```
// Provided by VK_NV_mesh_shader
typedef struct VkDrawMeshTasksIndirectCommandNV {
    uint32_t    taskCount;
    uint32_t    firstTask;
} VkDrawMeshTasksIndirectCommandNV;
```

- taskCount is the number of local workgroups to dispatch in the X dimension. Y and Z dimensions are implicitly set to one.
- firstTask is the X component of the first workgroup ID.

The members of VkDrawMeshTasksIndirectCommandNV have the same meaning as the similarly named parameters of vkCmdDrawMeshTasksNV.

Valid Usage

- VUID-VkDrawMeshTasksIndirectCommandNV-taskCount-02175
  taskCount **must** be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV ::maxDrawMeshTasksCount

To record an indirect mesh tasks drawing command with the draw count sourced from a buffer, call:

```
// Provided by VK_NV_mesh_shader with VK_VERSION_1_2 or VK_KHR_draw_indirect_count or
VK_AMD_draw_indirect_count
void vkCmdDrawMeshTasksIndirectCountNV(
    VkCommandBuffer                             commandBuffer,
    VkBuffer                                    buffer,
    VkDeviceSize                                offset,
    VkBuffer                                    countBuffer,
    VkDeviceSize                                countBufferOffset,
    uint32_t                                    maxDrawCount,
    uint32_t                                    stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawMeshTasksIndirectCountNV` behaves similarly to vkCmdDrawMeshTasksIndirectNV except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

Conditional Rendering

vkCmdDrawMeshTasksIndirectCountNV is affected by conditional rendering

To record a mesh tasks drawing command, call:

```
// Provided by VK_EXT_mesh_shader
void vkCmdDrawMeshTasksEXT(
    VkCommandBuffer                             commandBuffer,
    uint32_t                                    groupCountX,
    uint32_t                                    groupCountY,
    uint32_t                                    groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
