If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsPerPixel-07483

If the bound graphics pipeline state was created with the

VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current value of sampleLocationsEnable is VK_TRUE, then the sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to vkCmdSetSampleLocationsEXT **must** equal the rasterizationSamples parameter of the last call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-07484

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT then the current active depth attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-07485

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.maxSampleLocationGridSize.width in the last call to vkCmdSetSampleLocationsEXT **must** evenly divide VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-07486

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.maxSampleLocationGridSize.height in the last call to vkCmdSetSampleLocationsEXT **must** evenly divide VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-07487

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, the fragment shader code **must** not statically use the extended instruction InterpolateAtSample

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-07936

If the bound graphics pipeline state was created with the

VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current value of sampleLocationsEnable is VK_TRUE, then sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-07937

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current value of sampleLocationsEnable is VK_TRUE, then sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-07938

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current value of sampleLocationsEnable is VK_TRUE, then sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdDrawIndirectByteCountEXT-stippledLineEnable-07495

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR, then the stippledRectangularLines feature must be enabled

- VUID-vkCmdDrawIndirectByteCountEXT-stippledLineEnable-07496

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_BRESENHAM, then the stippledBresenhamLines feature must be enabled

- VUID-vkCmdDrawIndirectByteCountEXT-stippledLineEnable-07497

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH, then the stippledSmoothLines feature must be enabled

- VUID-vkCmdDrawIndirectByteCountEXT-stippledLineEnable-07498

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`

- VUID-vkCmdDrawIndirectByteCountEXT-stage-07073

If the bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then `Mesh Shader Queries` **must** not be active

- VUID-vkCmdDrawIndirectByteCountEXT-None-08877

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-nextStage-10745

For each shader object bound to a graphics stage, except for shader object bound to the last graphics stage in the logical pipeline, it **must** have been created with a `nextStage` including the corresponding bit to the shader object bound to the following graphics stage in the logical pipeline

- VUID-vkCmdDrawIndirectByteCountEXT-None-08684

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`

- VUID-vkCmdDrawIndirectByteCountEXT-None-08685

If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- VUID-vkCmdDrawIndirectByteCountEXT-None-08686

If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-vkCmdDrawIndirectByteCountEXT-None-08687

If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-vkCmdDrawIndirectByteCountEXT-None-08688

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-vkCmdDrawIndirectByteCountEXT-None-08689
If there is no bound graphics pipeline, and the `taskShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TASK_BIT_EXT`
- VUID-vkCmdDrawIndirectByteCountEXT-None-08690
If there is no bound graphics pipeline, and the `meshShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_MESH_BIT_EXT`
- VUID-vkCmdDrawIndirectByteCountEXT-None-08693
If there is no bound graphics pipeline, and at least one of the `taskShader` and `meshShader` features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages **must** have a valid `VkShaderEXT` bound, and the other **must** have no `VkShaderEXT` bound
- VUID-vkCmdDrawIndirectByteCountEXT-None-08696
If there is no bound graphics pipeline, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, there **must** be no `VkShaderEXT` bound to either the `VK_SHADER_STAGE_TASK_BIT_EXT` stage or the `VK_SHADER_STAGE_MESH_BIT_EXT` stage
- VUID-vkCmdDrawIndirectByteCountEXT-None-08698
If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call **must** also be bound
- VUID-vkCmdDrawIndirectByteCountEXT-None-08699
If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call **must** not have any `VkShaderEXT` bound
- VUID-vkCmdDrawIndirectByteCountEXT-None-08878
All bound graphics shader objects **must** have been created with identical or `identically defined` push constant ranges
- VUID-vkCmdDrawIndirectByteCountEXT-None-08879
All bound graphics shader objects **must** have either been created with the `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` flag set, or with identical or `identically defined` arrays of descriptor set layouts
- VUID-vkCmdDrawIndirectByteCountEXT-pDynamicStates-08715
If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` **must** be `VK_FALSE`
- VUID-vkCmdDrawIndirectByteCountEXT-pDynamicStates-08716
If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo`

::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask **must** be 0

- VUID-vkCmdDrawIndirectByteCountEXT-None-09116

If a shader object is bound to any graphics stage or the bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT **must** either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, VK_COLOR_COMPONENT_B_BIT, and VK_COLOR_COMPONENT_A_BIT, or none of them

- VUID-vkCmdDrawIndirectByteCountEXT-maxFragmentDualSrcAttachments-09239

If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command **must** be less than maxFragmentDualSrcAttachments

- VUID-vkCmdDrawIndirectByteCountEXT-None-09548

If the current render pass was begun with vkCmdBeginRendering, there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfo::pColorAttachmentLocations in the bound pipeline **must** match the value for the corresponding locations set currently in the current render pass instance

- VUID-vkCmdDrawIndirectByteCountEXT-None-09549

If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingInputAttachmentIndexInfo::pColorAttachmentInputIndices in the bound pipeline **must** match the value for the corresponding index set currently in the current render pass instance

- VUID-vkCmdDrawIndirectByteCountEXT-None-10927

If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex in the bound pipeline **must** match the value set currently in the current render pass instance

- VUID-vkCmdDrawIndirectByteCountEXT-None-10928

If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex in the bound pipeline **must** match the value set currently in the current render pass instance

- VUID-vkCmdDrawIndirectByteCountEXT-None-09642

If the current render pass was begun with vkCmdBeginRendering with the VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT flag, the bound graphics pipeline **must** have been created with VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT

- VUID-vkCmdDrawIndirectByteCountEXT-None-09643

If the bound graphics pipeline was created with VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT, the current render pass

must have begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag

- VUID-vkCmdDrawIndirectByteCountEXT-None-10772
If a shader object is bound to any graphics stage, *multiview* functionality **must** not be enabled in the current render pass
- VUID-vkCmdDrawIndirectByteCountEXT-flags-11521
If current render pass instance was begun with `vkCmdBeginRendering` with `VkRenderingInfo::flags` which includes `VK_RENDERING_FRAGMENT_REGION_BIT_EXT`, and if *sample shading* is enabled (explicitly or implicitly), then the minimum fraction for sample shading **must** equal 0.0
- VUID-vkCmdDrawIndirectByteCountEXT-None-11522
If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and the `dynamicRenderingUnusedAttachments` feature is not enabled, the graphics pipeline bound **must** have been created with a `VkCustomResolveCreateInfoEXT`
- VUID-vkCmdDrawIndirectByteCountEXT-None-11523
If the current render pass instance was begun with `vkCmdBeginRendering` and does not contain a custom resolve, and the `dynamicRenderingUnusedAttachments` feature is not enabled, the graphics pipeline bound **must** not have been created with a `VkCustomResolveCreateInfoEXT`
- VUID-vkCmdDrawIndirectByteCountEXT-customResolve-11524
If the current render pass instance was begun with `vkCmdBeginRendering` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`
- VUID-vkCmdDrawIndirectByteCountEXT-customResolve-11525
If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and `vkCmdBeginCustomResolveEXT` has not been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`
- VUID-vkCmdDrawIndirectByteCountEXT-None-11861
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, the bound graphics pipeline **must** have been created with a `VkCustomResolveCreateInfoEXT::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`
- VUID-vkCmdDrawIndirectByteCountEXT-None-11862
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline
- VUID-vkCmdDrawIndirectByteCountEXT-None-11863
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render

pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-11864
If the `dynamicRenderingUnusedAttachments` feature is enabled, the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawIndirectByteCountEXT-None-11865
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawIndirectByteCountEXT-None-11866
If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`
- VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-11867
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawIndirectByteCountEXT-None-11868
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawIndirectByteCountEXT-None-11869
If current render pass instance was begun with `vkCmdBeginRendering`, it contains a

custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`

- VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-11870
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-11871
If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, then for each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE`, the `resolveImageView` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline
- VUID-vkCmdDrawIndirectByteCountEXT-pDepthAttachment-11872
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`
- VUID-vkCmdDrawIndirectByteCountEXT-pStencilAttachment-11873
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`
- VUID-vkCmdDrawIndirectByteCountEXT-customResolve-11529
If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering`, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`
- VUID-vkCmdDrawIndirectByteCountEXT-customResolve-11530
If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has not yet been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`
- VUID-vkCmdDrawIndirectByteCountEXT-flags-13361
If there are any shader objects bound that were created with `flags` that includes the

`VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, then all bound shader objects **must** have been created with the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit

- VUID-vkCmdDrawIndirectByteCountEXT-flags-13362

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `setLayoutCount` not equal to 0, and with `pSetLayouts` not equal to `NULL`, then the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawIndirectByteCountEXT-flags-12491

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `pushConstantRangeCount` not equal to 0, and with `pPushConstantRanges` not equal to `NULL`, then the pipeline layout of the bound push constants **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawIndirectByteCountEXT-flags-13363

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, and any of the descriptor set layouts used to create the pipeline layout of the bound descriptor sets were created with any binding's `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then there **must** be no binding with `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdDrawIndirectByteCountEXT-flags-13364

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR` set

- VUID-vkCmdDrawIndirectByteCountEXT-flags-13365

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, there **must** be no shader object bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawIndirectByteCountEXT-None-04007

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound

- VUID-vkCmdDrawIndirectByteCountEXT-None-04008

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`

- VUID-vkCmdDrawIndirectByteCountEXT-None-02721

If the `robustBufferAccess` feature is not enabled, and that pipeline was created without enabling `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` for `vertexInputs`, then for a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)

- VUID-vkCmdDrawIndirectByteCountEXT-format-10389

For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is a `packed format`, and the `legacyVertexAttributes` feature is not enabled, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the `size of the format`

- VUID-vkCmdDrawIndirectByteCountEXT-format-10390

For each vertex attribute accessed by this command, if its `VkVertexInputAttributeDescription::format` or `VkVertexInputAttributeDescription2EXT::format` is not a `packed format`, and either the `legacyVertexAttributes` feature is not enabled or `format` has 64-bit components, the value of `attribAddress`, calculated as described in [Vertex Input Calculation](#), **must** be a multiple of the `component size of the format`

- VUID-vkCmdDrawIndirectByteCountEXT-None-07842

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopology` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-dynamicPrimitiveTopologyUnrestricted-07500

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled and the `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopology` **must** be of the same `topology class` as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- VUID-vkCmdDrawIndirectByteCountEXT-primitiveTopology-10286

If a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage is bound, then the `current value` of `primitiveTopology` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-primitiveTopology-10747

If `vkCmdSetPrimitiveTopology` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` prior to this drawing command, then a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage **must** be bound

- VUID-vkCmdDrawIndirectByteCountEXT-primitiveTopology-10748

If `vkCmdSetPrimitiveTopology` set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_POINT_LIST` prior to this drawing command, the `maintenance5` feature is not enabled, both a `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` and `VK_SHADER_STAGE_GEOMETRY_BIT` stage are not bound, then the `Vertex Execution Model` **must** have a `PointSize` decorated variable that is statically written to

- VUID-vkCmdDrawIndirectByteCountEXT-pStrides-04913

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2` with a non-NULL `pStrides` parameter or `vkCmdBindVertexBuffers3KHR` with `setStride` set to `VK_TRUE` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndirectByteCountEXT-None-13118

If the bound graphics pipeline was created without the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, and `vkCmdBindVertexBuffers3KHR` was called and not subsequently `invalidated` in the current command buffer prior to this draw command, the value of `setStride` in each of its `pBindInfos` elements must have been `VK_FALSE`

- VUID-vkCmdDrawIndirectByteCountEXT-None-04914

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndirectByteCountEXT-Input-07939

If the `maintenance9` feature is not enabled, and there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription2EXT::location`

- VUID-vkCmdDrawIndirectByteCountEXT-Input-08734

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and either the `legacyVertexAttributes` feature is not enabled or the SPIR-V Type associated with a given `Input` variable of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be the same as `VkVertexInputAttributeDescription2EXT::format`

- VUID-vkCmdDrawIndirectByteCountEXT-format-08936

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** be 64-bit

- VUID-vkCmdDrawIndirectByteCountEXT-format-08937

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the

`VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` **must** have a 64-bit component

- VUID-vkCmdDrawIndirectByteCountEXT-None-09203

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` **must** not use components that are not present in the format

- VUID-vkCmdDrawIndirectByteCountEXT-None-04875

If there is a shader object bound to the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage or the bound graphics pipeline state was created with both a `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage and the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled, and the current value of `primitiveTopology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, then `vkCmdSetPatchControlPointsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-None-04879

If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-None-09637

If the `primitiveTopologyListRestart` feature is not enabled, the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled, then `vkCmdSetPrimitiveRestartEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndirectByteCountEXT-None-10909

If the `primitiveTopologyPatchListRestart` feature is not enabled, the `input assembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, there is a shader object bound to the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawIndirectByteCountEXT-stage-06481

The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of any element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdDrawIndirectByteCountEXT-None-08885
There **must** be no shader object bound to either of the [VK_SHADER_STAGE_TASK_BIT_EXT](#) or [VK_SHADER_STAGE_MESH_BIT_EXT](#) stages
- VUID-vkCmdDrawIndirectByteCountEXT-None-07619
If a shader object is bound to the [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) stage or a graphics pipeline is bound which was created with both a [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) stage and the [VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT](#) dynamic state enabled, then [vkCmdSetTessellationDomainOriginEXT](#) **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawIndirectByteCountEXT-OpExecutionMode-12239
If a shader is bound to both the [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#) and [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) stages, and if both stages contain an [OpExecutionMode](#) instruction specifying the type of subdivision, they **must** be the same
- VUID-vkCmdDrawIndirectByteCountEXT-OpExecutionMode-12240
If a shader is bound to both the [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#) and [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) stages, and if both stages contain an [OpExecutionMode](#) instruction specifying the orientation of triangles, they **must** be the same
- VUID-vkCmdDrawIndirectByteCountEXT-OpExecutionMode-12241
If a shader is bound to both the [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#) and [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) stages, and if both stages contain an [OpExecutionMode](#) instruction specifying the segment spacing, they **must** be the same
- VUID-vkCmdDrawIndirectByteCountEXT-OpExecutionMode-12242
If a shader is bound to both the [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#) and [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) stages, and if both stages contain an [OpExecutionMode](#) instruction specifying the output patch size, they **must** be the same
- VUID-vkCmdDrawIndirectByteCountEXT-pNext-09461
If the bound graphics pipeline state was created with [VkPipelineVertexInputDivisorStateCreateInfo](#) in the [pNext](#) chain of [VkGraphicsPipelineCreateInfo::pVertexInputState](#), any member of [VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors](#) has a value other than **1** in [divisor](#), and [VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance](#) is [VK_FALSE](#), then [firstInstance](#) **must** be **0**
- VUID-vkCmdDrawIndirectByteCountEXT-None-09462
If [shader objects](#) are used for drawing or the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_VERTEX_INPUT_EXT](#) dynamic state enabled, any member of the [pVertexBindingDescriptions](#) parameter to the [vkCmdSetVertexInputEXT](#) call that sets this dynamic state has a value other than **1** in [divisor](#), and [VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance](#) is [VK_FALSE](#), then [firstInstance](#) **must** be **0**
- VUID-vkCmdDrawIndirectByteCountEXT-counterOffset-09474
[counterOffset](#) **must** be a multiple of **4**

- VUID-vkCmdDrawIndirectByteCountEXT-transformFeedback-02287
`VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` **must** be enabled
- VUID-vkCmdDrawIndirectByteCountEXT-transformFeedbackDraw-02288
The implementation **must** support `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackDraw`
- VUID-vkCmdDrawIndirectByteCountEXT-vertexStride-02289
`vertexStride` **must** be greater than 0 and less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataStride`
- VUID-vkCmdDrawIndirectByteCountEXT-vertexStride-09475
`vertexStride` **must** be a multiple of 4
- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02646
`commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-04567
If `counterBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-02290
`counterBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` usage flag set
- VUID-vkCmdDrawIndirectByteCountEXT-counterBufferOffset-04568
`counterBufferOffset` **must** be a multiple of 4

Valid Usage (Implicit)

- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-parameter
`counterBuffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdDrawIndirectByteCountEXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawIndirectByteCountEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDrawIndirectByteCountEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdDrawIndirectByteCountEXT-commonparent
Both of `commandBuffer`, and `counterBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS HICS_BIT	Action

Conditional Rendering

`vkCmdDrawIndirectByteCountEXT` is affected by [conditional rendering](#)

25.5. Conditional Rendering

Certain rendering commands **can** be executed conditionally based on a value in buffer memory. These rendering commands are limited to [drawing commands](#), [dispatching commands](#), and clearing attachments with `vkCmdClearAttachments` within a conditional rendering block which is defined by commands `vkCmdBeginConditionalRenderingEXT` and `vkCmdEndConditionalRenderingEXT`. Other rendering commands remain unaffected by conditional rendering.

The complete list of commands affected by conditional rendering is:

Commands Affected by Conditional Rendering

- [vkCmdBeginCustomResolveEXT](#)
- [vkCmdClearAttachments](#)
- [vkCmdDispatch](#)
- [vkCmdDispatchBase](#)
- [vkCmdDispatchBaseKHR](#)
- [vkCmdDispatchIndirect](#)
- [vkCmdDispatchIndirect2KHR](#)
- [vkCmdDraw](#)
- [vkCmdDrawIndexed](#)

- [vkCmdDrawIndexedIndirect](#)
- [vkCmdDrawIndexedIndirect2KHR](#)
- [vkCmdDrawIndexedIndirectCount](#)
- [vkCmdDrawIndexedIndirectCount2KHR](#)
- [vkCmdDrawIndexedIndirectCountKHR](#)
- [vkCmdDrawIndirect](#)
- [vkCmdDrawIndirect2KHR](#)
- [vkCmdDrawIndirectByteCount2EXT](#)
- [vkCmdDrawIndirectByteCountEXT](#)
- [vkCmdDrawIndirectCount](#)
- [vkCmdDrawIndirectCount2KHR](#)
- [vkCmdDrawIndirectCountKHR](#)
- [vkCmdDrawMeshTasksEXT](#)
- [vkCmdDrawMeshTasksIndirect2EXT](#)
- [vkCmdDrawMeshTasksIndirectCount2EXT](#)
- [vkCmdDrawMeshTasksIndirectCountEXT](#)
- [vkCmdDrawMeshTasksIndirectEXT](#)
- [vkCmdDrawMultiEXT](#)
- [vkCmdDrawMultiIndexedEXT](#)
- [vkCmdExecuteGeneratedCommandsEXT](#)

After beginning conditional rendering, it is considered *active* within the command buffer it was called until it is ended with [vkCmdEndConditionalRenderingEXT](#).

Conditional rendering **must** begin and end in the same command buffer. When conditional rendering is active, a primary command buffer **can** execute secondary command buffers if the [inheritedConditionalRendering](#) feature is enabled. For a secondary command buffer to be executed while conditional rendering is active in the primary command buffer, it **must** set the [conditionalRenderingEnable](#) flag of [VkCommandBufferInheritanceConditionalRenderingInfoEXT](#), as described in the [Command Buffer Recording](#) section.

Conditional rendering **must** also either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

To begin conditional rendering, call:

WARNING

This functionality is superseded by [vkCmdBeginConditionalRendering2EXT](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_conditional_rendering
void vkCmdBeginConditionalRenderingEXT(
    VkCommandBuffer                commandBuffer,
    const VkConditionalRenderingBeginInfoEXT* pConditionalRenderingBegin);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `pConditionalRenderingBegin` is a pointer to a `VkConditionalRenderingBeginInfoEXT` structure specifying parameters of conditional rendering.

Valid Usage

- VUID-vkCmdBeginConditionalRenderingEXT-None-01980
Conditional rendering **must** not already be [active](#)

Valid Usage (Implicit)

- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdBeginConditionalRenderingEXT-pConditionalRenderingBegin-parameter
`pConditionalRenderingBegin` **must** be a valid pointer to a valid [VkConditionalRenderingBeginInfoEXT](#) structure
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), or [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdBeginConditionalRenderingEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdBeginConditionalRenderingEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT HICS_BIT	Action State

Conditional Rendering

`vkCmdBeginConditionalRenderingEXT` is not affected by [conditional rendering](#)

The `VkConditionalRenderingBeginInfoEXT` structure is defined as:

WARNING

This functionality is superseded by `VkConditionalRenderingBeginInfo2EXT`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_conditional_rendering
typedef struct VkConditionalRenderingBeginInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer            buffer;
    VkDeviceSize        offset;
    VkConditionalRenderingFlagsEXT flags;
} VkConditionalRenderingBeginInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is a buffer containing the predicate for conditional rendering.
- `offset` is the byte offset into `buffer` where the predicate is located.
- `flags` is a bitmask of `VkConditionalRenderingFlagsEXT` specifying the behavior of conditional rendering.

If the 32-bit value at `offset` in `buffer` memory is zero, then the rendering commands are discarded, otherwise they are executed as normal. If the value of the predicate in buffer memory changes while conditional rendering is active, the rendering commands **may** be discarded in an implementation-dependent way. Some implementations may latch the value of the predicate upon beginning conditional rendering while others may read it before every rendering command.

Valid Usage

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01981
If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01982
buffer **must** have been created with the **VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT** usage flag set
- VUID-VkConditionalRenderingBeginInfoEXT-offset-01983
offset **must** be less than the size of **buffer** by at least 32 bits
- VUID-VkConditionalRenderingBeginInfoEXT-offset-01984
offset **must** be a multiple of 4

Valid Usage (Implicit)

- VUID-VkConditionalRenderingBeginInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_EXT**
- VUID-VkConditionalRenderingBeginInfoEXT-pNext-pNext
pNext **must** be **NULL**
- VUID-VkConditionalRenderingBeginInfoEXT-buffer-parameter
buffer **must** be a valid **VkBuffer** handle
- VUID-VkConditionalRenderingBeginInfoEXT-flags-parameter
flags **must** be a valid combination of **VkConditionalRenderingFlagBitsEXT** values

To begin conditional rendering, call:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_conditional_rendering
void vkCmdBeginConditionalRendering2EXT(
    VkCommandBuffer                commandBuffer,
    const VkConditionalRenderingBeginInfo2EXT* pConditionalRenderingBegin);
```

- **commandBuffer** is the command buffer into which this command will be recorded.
- **pConditionalRenderingBegin** is a pointer to a **VkConditionalRenderingBeginInfo2EXT** structure specifying parameters of conditional rendering.

Valid Usage

- VUID-vkCmdBeginConditionalRendering2EXT-None-13063
Conditional rendering **must** not already be **active**

Valid Usage (Implicit)

- VUID-vkCmdBeginConditionalRendering2EXT-commandBuffer-parameter **commandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdBeginConditionalRendering2EXT-pConditionalRenderingBegin-parameter **pConditionalRenderingBegin** **must** be a valid pointer to a valid [VkConditionalRenderingBeginInfo2EXT](#) structure
- VUID-vkCmdBeginConditionalRendering2EXT-commandBuffer-recording **commandBuffer** **must** be in the [recording state](#)
- VUID-vkCmdBeginConditionalRendering2EXT-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), or [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdBeginConditionalRendering2EXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdBeginConditionalRendering2EXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT VK_QUEUE_HCS_BIT	Action State

Conditional Rendering

vkCmdBeginConditionalRendering2EXT is not affected by [conditional rendering](#)

The [VkConditionalRenderingBeginInfo2EXT](#) structure is defined as:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_conditional_rendering
typedef struct VkConditionalRenderingBeginInfo2EXT {
    VkStructureType          sType;
    const void*              pNext;
    VkDeviceAddressRangeKHR  addressRange;
    VkAddressCommandFlagsKHR addressFlags;
    VkConditionalRenderingFlagsEXT flags;
} VkConditionalRenderingBeginInfo2EXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **addressRange** is the [VkDeviceAddressRangeKHR](#) containing the predicate for conditional rendering.
- **addressFlags** is a [VkAddressCommandFlagsKHR](#) value defining the flags for the address range.
- **flags** is a bitmask of [VkConditionalRenderingFlagsEXT](#) specifying the behavior of conditional rendering.

If the 32-bit value at **addressRange.address** is zero, then the rendering commands are discarded, otherwise they are executed as normal. If the value of the predicate in memory changes while conditional rendering is active, the rendering commands **may** be discarded in an implementation-dependent way. Some implementations **may** latch the value of the predicate upon beginning conditional rendering while others **may** read it before every rendering command.

Valid Usage

- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13097
If the range specified by **addressRange** is not bound completely to memory when accessed, **addressFlags** **must** not include [VK_ADDRESS_COMMAND_FULLY_BOUND_BIT_KHR](#)
- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13098
If the buffer from which the range specified by **addressRange** was created with [VK_BUFFER_CREATE_PROTECTED_BIT](#), and **protectedNoFault** is not supported, **addressFlags** **must** include [VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR](#)
- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13099
If the buffer from which the range specified by **addressRange** was created without [VK_BUFFER_CREATE_PROTECTED_BIT](#), and **protectedNoFault** is not supported, **addressFlags** **must** not include [VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR](#)
- VUID-VkConditionalRenderingBeginInfo2EXT-addressFlags-13100

addressFlags	must	not	include	both
VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR				and
VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR				
- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13122
If any buffer, which is bound to a range of [VkDeviceMemory](#) that overlaps the range backing **addressRange**, was created with [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#), **addressFlags** **must** include [VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR](#)

or [VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR](#)

- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13123

If any buffer, which is bound to a range of [VkDeviceMemory](#) that overlaps the range backing [addressRange](#), was created without [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#), [addressFlags](#) **must** not include [VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR](#)

- VUID-VkConditionalRenderingBeginInfo2EXT-addressFlags-13101

[addressFlags](#) **must** not include both [VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR](#) and [VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR](#)

- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13124

If any buffer, which is bound to a range of [VkDeviceMemory](#) that overlaps the range backing [addressRange](#), was created with [VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT](#), [addressFlags](#) **must** include [VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR](#) or [VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR](#)

- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13125

If any buffer, which is bound to a range of [VkDeviceMemory](#) that overlaps the range backing [addressRange](#), was created without [VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT](#), [addressFlags](#) **must** not include [VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR](#)

- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13064

The [VkBuffer](#) that [addressRange](#) was queried from **must** have been created with [VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT](#)

- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13065

[addressRange.address](#) **must** be a multiple of 4

- VUID-VkConditionalRenderingBeginInfo2EXT-addressRange-13066

[addressRange.size](#) **must** be greater than or equal to 4

Valid Usage (Implicit)

- VUID-VkConditionalRenderingBeginInfo2EXT-sType-sType

[sType](#) **must** be [VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_2_EXT](#)

- VUID-VkConditionalRenderingBeginInfo2EXT-pNext-pNext

[pNext](#) **must** be [NULL](#)

- VUID-VkConditionalRenderingBeginInfo2EXT-addressFlags-parameter

[addressFlags](#) **must** be a valid combination of [VkAddressCommandFlagBitsKHR](#) values

- VUID-VkConditionalRenderingBeginInfo2EXT-flags-parameter

[flags](#) **must** be a valid combination of [VkConditionalRenderingFlagBitsEXT](#) values

Bits which **can** be set in `vkCmdBeginConditionalRenderingEXT::flags`, specifying the behavior of conditional rendering, are:

```
// Provided by VK_EXT_conditional_rendering
typedef enum VkConditionalRenderingFlagBitsEXT {
    VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT = 0x00000001,
} VkConditionalRenderingFlagBitsEXT;
```

- `VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT` specifies the condition used to determine whether to discard rendering commands or not. That is, if the 32-bit predicate read from `buffer` memory at `offset` is zero, the rendering commands are not discarded, and if non zero, then they are discarded.

```
// Provided by VK_EXT_conditional_rendering
typedef VkFlags VkConditionalRenderingFlagsEXT;
```

`VkConditionalRenderingFlagsEXT` is a bitmask type for setting a mask of zero or more `VkConditionalRenderingFlagBitsEXT`.

To end conditional rendering, call:

```
// Provided by VK_EXT_conditional_rendering
void vkCmdEndConditionalRenderingEXT(
    VkCommandBuffer                                commandBuffer);
```

- `commandBuffer` is the command buffer into which this command will be recorded.

Once ended, conditional rendering becomes inactive.

Valid Usage

- VUID-vkCmdEndConditionalRenderingEXT-None-01985
Conditional rendering **must** be `active`
- VUID-vkCmdEndConditionalRenderingEXT-None-01986
If conditional rendering was made `active` outside of a render pass instance, it **must** not be ended inside a render pass instance
- VUID-vkCmdEndConditionalRenderingEXT-None-01987
If conditional rendering was made `active` within a subpass it **must** be ended in the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), or [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdEndConditionalRenderingEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdEndConditionalRenderingEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type

Conditional Rendering

`vkCmdEndConditionalRenderingEXT` is not affected by [conditional rendering](#)

25.6. Programmable Mesh Shading

In this drawing approach, primitives are assembled by the mesh shader stage. [Mesh shading](#) operates similarly to [dispatching compute](#) as the shaders make use of workgroups.

To record a mesh tasks drawing command, call:

```
// Provided by VK_EXT_mesh_shader
void vkCmdDrawMeshTasksEXT(
    VkCommandBuffer                                commandBuffer,
    uint32_t                                         groupCountX,
    uint32_t                                         groupCountY,
    uint32_t                                         groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX` × `groupCountY` × `groupCountZ` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDrawMeshTasksEXT-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDrawMeshTasksEXT-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawMeshTasksEXT-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDrawMeshTasksEXT-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawMeshTasksEXT-unnormalizedCoordinates-09635
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and

layerCount must be 1

- VUID-vkCmdDrawMeshTasksEXT-None-08609

If a **VkSampler** created with **unnormalizedCoordinates** equal to **VK_TRUE** is used to sample a **VkImageView** as a result of this command, then the image view's **viewType** must be **VK_IMAGE_VIEW_TYPE_1D** or **VK_IMAGE_VIEW_TYPE_2D**

- VUID-vkCmdDrawMeshTasksEXT-None-08610

If a **VkSampler** created with **unnormalizedCoordinates** equal to **VK_TRUE** is used to sample a **VkImageView** as a result of this command, then the sampler must not be used with any of the SPIR-V **OpImageSample*** or **OpImageSparseSample*** instructions with **ImplicitLod**, **Dref** or **Proj** in their name

- VUID-vkCmdDrawMeshTasksEXT-None-08611

If a **VkSampler** created with **unnormalizedCoordinates** equal to **VK_TRUE** is used to sample a **VkImageView** as a result of this command, then the sampler must not be used with any of the SPIR-V **OpImageSample*** or **OpImageSparseSample*** instructions that includes a LOD bias or any offset values

- VUID-vkCmdDrawMeshTasksEXT-None-06479

If a **VkImageView** is sampled with **depth comparison**, the image view's **format features** must contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- VUID-vkCmdDrawMeshTasksEXT-None-02691

If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- VUID-vkCmdDrawMeshTasksEXT-None-07888

If a **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's **format features** must contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

- VUID-vkCmdDrawMeshTasksEXT-None-02692

If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**

- VUID-vkCmdDrawMeshTasksEXT-None-02693

If the **VK_EXT_filter_cubic** extension is not enabled and any **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, it must not have a **VkImageViewType** of **VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**

- VUID-vkCmdDrawMeshTasksEXT-filterCubic-02694

Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering, as specified by **VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic** returned by **vkGetPhysicalDeviceImageFormatProperties2**

- VUID-vkCmdDrawMeshTasksEXT-filterCubicMinmax-02695

Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** with a reduction mode of either **VK_SAMPLER_REDUCTION_MODE_MIN** or **VK_SAMPLER_REDUCTION_MODE_MAX** as a result of this command must have a **VkImageViewType** and format that supports

cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)

- VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07027
For any [VkImageView](#) being written as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07028
For any [VkImageView](#) being read as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07029
For any [VkBufferView](#) being written as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07030
Any [VkBufferView](#) being read as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#) then the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksEXT-None-08600
If a [a bound shader](#) was created with a pipeline layout and statically uses a set *n*, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with layouts compatible for set *n* with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDrawMeshTasksEXT-None-08601
If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader
- VUID-vkCmdDrawMeshTasksEXT-None-10068
For each array of resources that is used by a [a bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDrawMeshTasksEXT-None-08114
Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksEXT-imageLayout-00344
If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)
- VUID-vkCmdDrawMeshTasksEXT-None-08115
If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified

via `vkCmdBindDescriptorSets`, the bound `VkPipeline` **must** have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- VUID-vkCmdDrawMeshTasksEXT-None-08116
Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must** be valid if they are dynamically accessed
- VUID-vkCmdDrawMeshTasksEXT-None-08117
If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` **must** have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`
- VUID-vkCmdDrawMeshTasksEXT-None-08119
If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident
- VUID-vkCmdDrawMeshTasksEXT-None-08605
If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident
- VUID-vkCmdDrawMeshTasksEXT-None-08606
If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDrawMeshTasksEXT-None-08608
If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdDrawMeshTasksEXT-uniformBuffers-06935
If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksEXT-None-08612
If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksEXT-storageBuffers-06936
If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2` for

`storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksEXT-None-08613

If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksEXT-commandBuffer-02707

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource

- VUID-vkCmdDrawMeshTasksEXT-viewType-07752

If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDrawMeshTasksEXT-format-07753

If a `VkImageView` or `VkBufferView` is accessed as a result of this command, then the `numeric type` of the view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match

- VUID-vkCmdDrawMeshTasksEXT-OpImageWrite-08795

If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDrawMeshTasksEXT-OpImageWrite-08796

If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components

- VUID-vkCmdDrawMeshTasksEXT-OpImageWrite-04469

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDrawMeshTasksEXT-SampledType-04470

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDrawMeshTasksEXT-SampledType-04471

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDrawMeshTasksEXT-SampledType-04472

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDrawMeshTasksEXT-SampledType-04473
If a [VkBufferView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32
- VUID-vkCmdDrawMeshTasksEXT-sparseImageInt64Atomics-04474
If the [sparseImageInt64Atomics](#) feature is not enabled, [VkImage](#) objects created with the [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command
- VUID-vkCmdDrawMeshTasksEXT-sparseImageInt64Atomics-04475
If the [sparseImageInt64Atomics](#) feature is not enabled, [VkBuffer](#) objects created with the [VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command
- VUID-vkCmdDrawMeshTasksEXT-None-07288
Any shader invocation executed by this command **must** [terminate](#)
- VUID-vkCmdDrawMeshTasksEXT-None-09600
If a descriptor with type equal to any of [VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE](#), [VK_DESCRIPTOR_TYPE_STORAGE_IMAGE](#), or [VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT](#) is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDrawMeshTasksEXT-micromap-11636
If an acceleration structure is accessed as a result of this command through an [OpRayQueryProceedKHR](#) operation, the [VK_EXT_opacity_micromap](#) extension is not enabled, and the acceleration structure is built using geometry with a [VkAccelerationStructureTrianglesOpacityMicromapKHR](#) structure included in its [pNext](#) chain, the shader **must** have specified a [OpacityMicromapIdKHR](#) execution mode with its specialization constant operand equal to [VK_TRUE](#)
- VUID-vkCmdDrawMeshTasksEXT-micromap-11637
If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device
- VUID-vkCmdDrawMeshTasksEXT-micromap-11638
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkPipeline](#) bound to the pipeline bind point used by this command **must** not have been created with [flags](#) that includes [VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR](#)
- VUID-vkCmdDrawMeshTasksEXT-micromap-11639

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkShaderEXT` that accessed the descriptor **must** not have been created with `flags` that includes `VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT`

- VUID-vkCmdDrawMeshTasksEXT-None-12472

Descriptors dynamically accessed in bound descriptor heaps **must** be valid

- VUID-vkCmdDrawMeshTasksEXT-None-11297

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a `OpTypeStruct` decorated with `Block` or `BufferBlock` using that mapping, the calculated offset for the resource heap **must** be a multiple of `bufferDescriptorAlignment`

- VUID-vkCmdDrawMeshTasksEXT-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeImage` or `OpTypeSampledImage` using that mapping, the calculated offset for the resource heap **must** be a multiple of `imageDescriptorAlignment`

- VUID-vkCmdDrawMeshTasksEXT-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeSampler` or `OpTypeSampledImage` using that mapping, the calculated offset for the sampler heap **must** be a multiple of `samplerDescriptorAlignment`

- VUID-vkCmdDrawMeshTasksEXT-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdDrawMeshTasksEXT-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping`

using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksEXT-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksEXT-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdDrawMeshTasksEXT-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksEXT-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksEXT-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdDrawMeshTasksEXT-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands

- VUID-vkCmdDrawMeshTasksEXT-None-11372

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#)

`uniformBuffers`, the `robustBufferAccess2` feature is not enabled, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via `VkDeviceAddressRangeKHR` when the descriptor was written

- VUID-vkCmdDrawMeshTasksEXT-None-11373

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2` for `storageBuffers`, the `robustBufferAccess2` feature is not enabled, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by `VkDeviceAddressRangeKHR` when the descriptor was written

- VUID-vkCmdDrawMeshTasksEXT-None-11374

If the `robustBufferAccess2` feature is not enabled, the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by `VkDeviceAddressRangeKHR` when the descriptor was written

- VUID-vkCmdDrawMeshTasksEXT-pBindInfo-11375

If any `bound shader` uses an embedded sampler via a `descriptor mapping`, the value of `pBindInfo->reservedRangeSize` set for `vkCmdBindSamplerHeapEXT` **must** be greater than or equal to `minSamplerHeapReservedRangeWithEmbedded`

- VUID-vkCmdDrawMeshTasksEXT-None-11376

If a `bound shader` was created as a `VkShaderEXT` with the `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` flag or as part of a pipeline with the `VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT` flag, and that shader statically uses a push constant value, that value **must** have been set by `vkCmdPushDataEXT`

- VUID-vkCmdDrawMeshTasksEXT-None-11398

If a `bound shader` was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the access **must** not be `out of bounds`

- VUID-vkCmdDrawMeshTasksEXT-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksEXT-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the [VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDrawMeshTasksEXT-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT](#) and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to [minUniformBufferOffsetAlignment](#)

- VUID-vkCmdDrawMeshTasksEXT-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** have been queried from a buffer created with the [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDrawMeshTasksEXT-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to [minStorageBufferOffsetAlignment](#)

- VUID-vkCmdDrawMeshTasksEXT-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a [VkAccelerationStructureKHR](#) object via [vkGetAccelerationStructureDeviceAddressKHR](#)

- VUID-vkCmdDrawMeshTasksEXT-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and

that sampler descriptor uses a custom border color with an index defined by `VkSamplerCustomBorderColorIndexCreateInfoEXT`, the value of `VkSamplerCustomBorderColorIndexCreateInfoEXT::index` **must** have been registered before this command was recorded, and still be registered during the sampling operation, with an identically defined color

- VUID-vkCmdDrawMeshTasksEXT-protectedNoFault-11455

If `protectedNoFault` is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, the address that the resource is mapped to **must** have been queried from a buffer created without the `VK_BUFFER_CREATE_PROTECTED_BIT` create flag set

- VUID-vkCmdDrawMeshTasksEXT-protectedNoFault-11456

If `protectedNoFault` is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, the address of the indirect memory **must** have been queried from a buffer created without the `VK_BUFFER_CREATE_PROTECTED_BIT` create flag set

- VUID-vkCmdDrawMeshTasksEXT-renderPass-02684

The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawMeshTasksEXT-subpass-02685

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07468

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawMeshTasksEXT-None-07469

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the bound `VkFramebuffer` as specified by [Fragment Input Attachment Compatibility](#)

- VUID-vkCmdDrawMeshTasksEXT-pDepthInputAttachmentIndex-09595

Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfo`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` are `NULL`, **must** be

created with a [VkImageView](#) that is compatible with the corresponding color, depth, or stencil attachment in [VkRenderingInfo](#)

- VUID-vkCmdDrawMeshTasksEXT-pDepthInputAttachmentIndex-09596

Input attachment views accessed in a dynamic render pass via a shader object **must** have an [InputAttachmentIndex](#) if both [VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex](#) and [VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex](#) are non-NULL

- VUID-vkCmdDrawMeshTasksEXT-InputAttachmentIndex-09597

If an input attachment view accessed in a dynamic render pass via a shader object has an [InputAttachmentIndex](#), the [InputAttachmentIndex](#) **must** match an index in [VkRenderingInputAttachmentIndexInfo](#)

- VUID-vkCmdDrawMeshTasksEXT-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawMeshTasksEXT-None-10795

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawMeshTasksEXT-None-10796

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawMeshTasksEXT-None-10797

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawMeshTasksEXT-None-12338

If a color attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, the color attachment **must** not be written to by this command

- VUID-vkCmdDrawMeshTasksEXT-None-12339

If a depth attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, the depth attachment **must** not be written to by this command

- VUID-vkCmdDrawMeshTasksEXT-None-12340

If a stencil attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, the stencil attachment **must** not be written to by this command

- VUID-vkCmdDrawMeshTasksEXT-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command
- VUID-vkCmdDrawMeshTasksEXT-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled
- VUID-vkCmdDrawMeshTasksEXT-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back **writeMask** are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**
- VUID-vkCmdDrawMeshTasksEXT-None-07831
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksEXT-None-07832
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksEXT-None-08617
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **effective rasterization input topology** is in the line topology class, then **vkCmdSetLineWidth must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksEXT-None-07834
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBiasEnable** is **VK_TRUE**, then **vkCmdSetDepthBias** or **vkCmdSetDepthBias2EXT must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksEXT-None-07835
If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_BLEND_CONSTANTS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and an active color attachment **current value** of **blendEnable** is **VK_TRUE** with a blend equations where any **VkBlendFactor** member is **VK_BLEND_FACTOR_CONSTANT_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR**, **VK_BLEND_FACTOR_CONSTANT_ALPHA**, **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA**, or **VK_BLEND_FACTOR_CONSTANT_ALPHA**, then **vkCmdSetBlendConstants must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07836

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_DEPTH_BOUNDS](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [current value](#) of [depthBoundsTestEnable](#) is [VK_TRUE](#), then [vkCmdSetDepthBounds](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07837

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [current value](#) of [stencilTestEnable](#) is [VK_TRUE](#), then [vkCmdSetStencilCompareMask](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07838

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_STENCIL_WRITE_MASK](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [current value](#) of [stencilTestEnable](#) is [VK_TRUE](#), then [vkCmdSetStencilWriteMask](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07839

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_STENCIL_REFERENCE](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), the [current value](#) of [stencilTestEnable](#) is [VK_TRUE](#), then [vkCmdSetStencilReference](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to [VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex](#)

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-02689

If the bound graphics pipeline was created with [VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable](#) set to [VK_TRUE](#), then the active depth attachment **must** have been created with the [VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT](#) bit set

- VUID-vkCmdDrawMeshTasksEXT-None-07634

If the [VK_EXT_sample_locations](#) extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), then [vkCmdSetSampleLocationsEnableEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07840

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullMode` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07841

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFace` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07843

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07844

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07845

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthCompareOp` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07846

If the `depthBounds` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07847

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07848

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOp` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-viewportCount-03417

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-scissorCount-03418

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing

- VUID-vkCmdDrawMeshTasksEXT-viewportCount-03419

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- VUID-vkCmdDrawMeshTasksEXT-None-04876

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-04877

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-logicOp-04878

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this

drawing command

- VUID-vkCmdDrawMeshTasksEXT-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdDrawMeshTasksEXT-primitiveFragmentShadingRateWithMultipleViewports-08642

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdDrawMeshTasksEXT-blendEnable-04727

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's **format features** do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding **current value** of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksEXT-None-08644

If a shader object is bound to any graphics stage or a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and none of the following is enabled:

- the `multisampledRenderToSingleSampled` feature

then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDrawMeshTasksEXT-None-08876

If a shader object is bound to any graphics stage, the current render pass instance **must** have been begun with `vkCmdBeginRendering`

- VUID-vkCmdDrawMeshTasksEXT-imageView-06172

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksEXT-imageView-06173

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of

`pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksEXT-imageView-06174

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is

`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksEXT-imageView-06175

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is

`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksEXT-imageView-06176

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksEXT-imageView-06177

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksEXT-viewMask-06178

If the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`

- VUID-vkCmdDrawMeshTasksEXT-colorAttachmentCount-06179

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08910

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08912

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`

::pColorAttachments array with an imageView equal to VK_NULL_HANDLE **must** have the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the bound pipeline equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08911

If the dynamicRenderingUnusedAttachments feature is enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE **must** have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the bound graphics pipeline, or the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats, if it exists, **must** be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawMeshTasksEXT-None-07749

If the colorWriteEnable feature is enabled, a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetColorWriteEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-attachmentCount-07750

If the colorWriteEnable feature is enabled, a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then the attachmentCount parameter of most recent call to vkCmdSetColorWriteEnableEXT in the current command buffer **must** be greater than or equal to the number of active color attachments

- VUID-vkCmdDrawMeshTasksEXT-None-07751

If the VK_EXT_discard_rectangles extension is enabled, a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled and the pNext chain of VkGraphicsPipelineCreateInfo included a VkPipelineDiscardRectangleStateCreateInfoEXT structure, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of discardRectangleEnable is VK_TRUE, then vkCmdSetDiscardRectangleEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount

- VUID-vkCmdDrawMeshTasksEXT-rasterizerDiscardEnable-09236

If the VK_EXT_discard_rectangles extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled and the pNext chain of VkGraphicsPipelineCreateInfo did not include a VkPipelineDiscardRectangleStateCreateInfoEXT structure, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of discardRectangleEnable is VK_TRUE, then vkCmdSetDiscardRectangleEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

for each discard rectangle in `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

- VUID-vkCmdDrawMeshTasksEXT-None-07880

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07881

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08913

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08914

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08915

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08916

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08917

If current render pass instance was begun with `vkCmdBeginRendering`, the

`dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-08918

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-imageView-06183

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingLocalRead-11797

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingLocalRead` feature is enabled, the `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` flag is specified, and an attachment is being used as a feedback loop as specified by `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`, `VkRenderingAttachmentFlagsInfoKHR::flags` for that attachment **must** include `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`

- VUID-vkCmdDrawMeshTasksEXT-imageView-06184

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-vkCmdDrawMeshTasksEXT-multisampledRenderToSingleSampled-07285

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksEXT-multisampledRenderToSingleSampled-07286

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample

count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksEXT-multisampledRenderToSingleSampled-07287
If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`
- VUID-vkCmdDrawMeshTasksEXT-pNext-07935
If this command is called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`
- VUID-vkCmdDrawMeshTasksEXT-renderPass-06198
If the current render pass instance was begun with `vkCmdBeginRendering`, the bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`
- VUID-vkCmdDrawMeshTasksEXT-pColorAttachments-08963
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksEXT-pColorAttachments-11539
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->resolveImageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksEXT-pDepthAttachment-08964
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksEXT-pDepthAttachment-11540
If the current render pass instance was begun with `vkCmdBeginRendering`,

`vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-pStencilAttachment-08965

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-pStencilAttachment-11860

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-flags-10582

If the current render pass instance was begun with a `vkCmdBeginRendering` call in `commandBuffer`, its `VkRenderingInfo::flags` parameter **must** not have `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` set unless `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` is also set

- VUID-vkCmdDrawMeshTasksEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708
If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, `rasterization discard` **must** not be enabled

- VUID-vkCmdDrawMeshTasksEXT-primitivesGeneratedQueryWithNonZeroStreams-06709
If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`

- VUID-vkCmdDrawMeshTasksEXT-None-07620

If the `depthClamp` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07621

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetPolygonModeEXT` **must** have been called and not subsequently `invalidated` in

the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07622

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07623

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-alphaToCoverageEnable-08919

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location 0` at `Index 0`

- VUID-vkCmdDrawMeshTasksEXT-alphaToCoverageEnable-08920

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location 0` at `Index 0`

- VUID-vkCmdDrawMeshTasksEXT-None-07624

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07625

If the `alphaToOne` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07626

If the `logicOp` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07627

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07629

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07630

If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage or a graphics pipeline is bound which was created with both a `VK_SHADER_STAGE_GEOMETRY_BIT` stage and the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled, then `vkCmdSetRasterizationStreamEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07631

If the `VK_EXT_conservative_rasterization` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07632

If the `VK_EXT_conservative_rasterization` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `conservativeRasterizationMode` is `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-conservativePointAndLineRasterization-07499

If the `VK_EXT_conservative_rasterization` extension is enabled, `conservativePointAndLineRasterization` is not supported, a shader object is bound to any graphics stage or a graphics pipeline is bound, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line or point topology class, then the current value of `conservativeRasterizationMode` **must** be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`

- VUID-vkCmdDrawMeshTasksEXT-None-07633

If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics

stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state, then `vkCmdSetDepthClipEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07636

If the `VK_EXT_provoking_vertex` extension is enabled, a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-08666

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineRasterizationModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-08669

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineStippleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-07849

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled and a shader object is bound to any graphics stage, or a bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `stippledLineEnable` is `VK_TRUE`, then `vkCmdSetLineStipple` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-None-10608

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, the effective rasterization input topology is in the line topology class, and the current `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the current `alphaToCoverageEnable`, `alphaToOneEnable` and `sampleShadingEnable` states **must** all be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksEXT-None-07639
If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled, then `vkCmdSetDepthClipNegativeOneToOneEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksEXT-None-09650
If the `depthClampControl` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT` dynamic state enabled, and the `current value` of `depthClampEnable` is `VK_TRUE`, then `vkCmdSetDepthClampRangeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksEXT-rasterizationSamples-07471
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** follow the rules for a `zero-attachment subpass`
- VUID-vkCmdDrawMeshTasksEXT-samples-07472
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline
- VUID-vkCmdDrawMeshTasksEXT-samples-07473
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdDrawMeshTasksEXT-None-09211
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** be the same as the `rasterizationSamples` member of that structure
- VUID-vkCmdDrawMeshTasksEXT-firstAttachment-07476
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to

`vkCmdSetColorBlendEnableEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksEXT-firstAttachment-07478

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorWriteMaskEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksEXT-advancedBlendMaxColorAttachments-07480

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment current value of `blendEnable` is `VK_TRUE`, then the number of active color attachments **must** not exceed `advancedBlendMaxColorAttachments`

- VUID-vkCmdDrawMeshTasksEXT-None-10862

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksEXT-rasterizerDiscardEnable-10863

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendAdvancedEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksEXT-None-10864

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then either `vkCmdSetColorBlendAdvancedEXT` or `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksEXT-primitivesGeneratedQueryWithNonZeroStreams-07481

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state

enabled, the last call to `vkCmdSetRasterizationStreamEXT` **must** have set the `rasterizationStream` to zero

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsPerPixel-07482

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, and the **current** value of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsPerPixel-07483

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the **current** value of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-07484

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT` then the current active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-07485

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-07486

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT`

`::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-07487

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-07936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.width` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-07937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.height` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-07938

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationsPerPixel` **must** equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksEXT-stippledLineEnable-07495

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `stippledRectangularLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksEXT-stippledLineEnable-07496

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or

`VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `stippledBresenhamLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksEXT-stippledLineEnable-07497

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `stippledSmoothLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksEXT-stippledLineEnable-07498

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`

- VUID-vkCmdDrawMeshTasksEXT-stage-07073

If the bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then `Mesh Shader Queries` **must** not be active

- VUID-vkCmdDrawMeshTasksEXT-None-08877

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksEXT-nextStage-10745

For each shader object bound to a graphics stage, except for shader object bound to the last graphics stage in the logical pipeline, it **must** have been created with a `nextStage` including the corresponding bit to the shader object bound to the following graphics stage in the logical pipeline

- VUID-vkCmdDrawMeshTasksEXT-None-08684

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`

- VUID-vkCmdDrawMeshTasksEXT-None-08685

If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- VUID-vkCmdDrawMeshTasksEXT-None-08686

If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-vkCmdDrawMeshTasksEXT-None-08687

If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-vkCmdDrawMeshTasksEXT-None-08688

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-vkCmdDrawMeshTasksEXT-None-08689

If there is no bound graphics pipeline, and the `taskShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TASK_BIT_EXT`

- VUID-vkCmdDrawMeshTasksEXT-None-08690

If there is no bound graphics pipeline, and the `meshShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdDrawMeshTasksEXT-None-08693

If there is no bound graphics pipeline, and at least one of the `taskShader` and `meshShader` features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages **must** have a valid `VkShaderEXT` bound, and the other **must** have no `VkShaderEXT` bound

- VUID-vkCmdDrawMeshTasksEXT-None-08696

If there is no bound graphics pipeline, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, there **must** be no `VkShaderEXT` bound to either the `VK_SHADER_STAGE_TASK_BIT_EXT` stage or the `VK_SHADER_STAGE_MESH_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksEXT-None-08698

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call **must** also be bound

- VUID-vkCmdDrawMeshTasksEXT-None-08699

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call **must** not have any `VkShaderEXT` bound

- VUID-vkCmdDrawMeshTasksEXT-None-08878

All bound graphics shader objects **must** have been created with identical or **identically defined** push constant ranges

- VUID-vkCmdDrawMeshTasksEXT-None-08879

All bound graphics shader objects **must** have either been created with the

VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT flag set, or with identical or **identically defined** arrays of descriptor set layouts

- VUID-vkCmdDrawMeshTasksEXT-pDynamicStates-08715

If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksEXT-pDynamicStates-08716

If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` **must** be `0`

- VUID-vkCmdDrawMeshTasksEXT-None-09116

If a shader object is bound to any graphics stage or the bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` **must** either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, `VK_COLOR_COMPONENT_B_BIT`, and `VK_COLOR_COMPONENT_A_BIT`, or none of them

- VUID-vkCmdDrawMeshTasksEXT-maxFragmentDualSrcAttachments-09239

If **blending** is enabled for any attachment where either the source or destination blend factors for that attachment **use the secondary color input**, the maximum value of `Location` for any output attachment **statically used** in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdDrawMeshTasksEXT-None-09548

If the current render pass was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfo::pColorAttachmentLocations` in the bound pipeline **must** match the value for the corresponding locations set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksEXT-None-09549

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingInputAttachmentIndexInfo::pColorAttachmentInputIndices` in the bound pipeline **must** match the value for the corresponding index set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksEXT-None-10927

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` in the bound pipeline **must** match the value set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksEXT-None-10928

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader

object bound to any graphics stage, the value of `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` in the bound pipeline **must** match the value set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksEXT-None-09642

If the current render pass was begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`

- VUID-vkCmdDrawMeshTasksEXT-None-09643

If the bound graphics pipeline was created with `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`, the current render pass **must** have begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag

- VUID-vkCmdDrawMeshTasksEXT-None-10772

If a shader object is bound to any graphics stage, *multiview* functionality **must** not be enabled in the current render pass

- VUID-vkCmdDrawMeshTasksEXT-flags-11521

If current render pass instance was begun with `vkCmdBeginRendering` with `VkRenderingInfo::flags` which includes `VK_RENDERING_FRAGMENT_REGION_BIT_EXT`, and if *sample shading* is enabled (explicitly or implicitly), then the minimum fraction for sample shading **must** equal 0.0

- VUID-vkCmdDrawMeshTasksEXT-None-11522

If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and the `dynamicRenderingUnusedAttachments` feature is not enabled, the graphics pipeline bound **must** have been created with a `VkCustomResolveCreateInfoEXT`

- VUID-vkCmdDrawMeshTasksEXT-None-11523

If the current render pass instance was begun with `vkCmdBeginRendering` and does not contain a custom resolve, and the `dynamicRenderingUnusedAttachments` feature is not enabled, the graphics pipeline bound **must** not have been created with a `VkCustomResolveCreateInfoEXT`

- VUID-vkCmdDrawMeshTasksEXT-customResolve-11524

If the current render pass instance was begun with `vkCmdBeginRendering` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`

- VUID-vkCmdDrawMeshTasksEXT-customResolve-11525

If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and `vkCmdBeginCustomResolveEXT` has not been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`

- VUID-vkCmdDrawMeshTasksEXT-None-11861

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, the bound graphics pipeline **must** have been created with a `VkCustomResolveCreateInfoEXT`

`::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksEXT-None-11862

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksEXT-None-11863

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-11864

If the `dynamicRenderingUnusedAttachments` feature is enabled, the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-None-11865

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-None-11866

If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-11867

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the

bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-None-11868

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-None-11869

If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksEXT-dynamicRenderingUnusedAttachments-11870

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksEXT-colorAttachmentCount-11871

If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, then for each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE`, the `resolveImageView` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksEXT-pDepthAttachment-11872

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksEXT-pStencilAttachment-11873

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksEXT-customResolve-11529

If a shader object is bound to the fragment stage, the current render pass instance was

begun with `vkCmdBeginRendering`, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`

- VUID-vkCmdDrawMeshTasksEXT-customResolve-11530

If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has not yet been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`

- VUID-vkCmdDrawMeshTasksEXT-flags-13361

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, then all bound shader objects **must** have been created with the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit

- VUID-vkCmdDrawMeshTasksEXT-flags-13362

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `setLayoutCount` not equal to 0, and with `pSetLayouts` not equal to `NULL`, then the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawMeshTasksEXT-flags-12491

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `pushConstantRangeCount` not equal to 0, and with `pPushConstantRanges` not equal to `NULL`, then the pipeline layout of the bound push constants **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawMeshTasksEXT-flags-13363

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, and any of the descriptor set layouts used to create the pipeline layout of the bound descriptor sets were created with any binding's `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then there **must** be no binding with `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdDrawMeshTasksEXT-flags-13364

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR` set

- VUID-vkCmdDrawMeshTasksEXT-flags-13365

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, there **must** be no shader object

bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksEXT-stage-06480

The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of any element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-vkCmdDrawMeshTasksEXT-pStages-10680

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** not have last bound the `pStages` element of `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` with a valid shader object other than `VK_NULL_HANDLE`

- VUID-vkCmdDrawMeshTasksEXT-None-07074

`Transform Feedback Queries` **must** not be active

- VUID-vkCmdDrawMeshTasksEXT-None-07075

`Primitives Generated Queries` **must** not be active

- VUID-vkCmdDrawMeshTasksEXT-pipelineStatistics-07076

The `pipelineStatistics` member used to create any active `Pipeline Statistics Query` **must** not contain `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT`, or `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT`

- VUID-vkCmdDrawMeshTasksEXT-None-08694

If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created without the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, a valid `VkShaderEXT` **must** be bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksEXT-None-08695

If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created with the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, there **must** be no `VkShaderEXT` bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksEXT-TaskEXT-07322

If the current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` contains a shader using the `TaskEXT Execution Model`, `groupCountX` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[0]`

- VUID-vkCmdDrawMeshTasksEXT-TaskEXT-07323

If the current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` contains a shader using the `TaskEXT Execution Model`, `groupCountY` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[1]`

- VUID-vkCmdDrawMeshTasksEXT-TaskEXT-07324

If the current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` contains a shader using the `TaskEXT Execution Model`, `groupCountZ` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[2]`

- VUID-vkCmdDrawMeshTasksEXT-TaskEXT-07325

If the current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` contains a shader using the `TaskEXT Execution Model`, The product of `groupCountX`, `groupCountY` and `groupCountZ` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupTotalCount`

- VUID-vkCmdDrawMeshTasksEXT-TaskEXT-07326

If the current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` does not contain a shader using the `TaskEXT Execution Model`, `groupCountX` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[0]`

- VUID-vkCmdDrawMeshTasksEXT-TaskEXT-07327

If the current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` does not contain a shader using the `TaskEXT Execution Model`, `groupCountY` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[1]`

- VUID-vkCmdDrawMeshTasksEXT-TaskEXT-07328

If the current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` does not contain a shader using the `TaskEXT Execution Model`, `groupCountZ` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[2]`

- VUID-vkCmdDrawMeshTasksEXT-TaskEXT-07329

If the current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` does not contain a shader using the `TaskEXT Execution Model`, The product of `groupCountX`, `groupCountY` and `groupCountZ` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount`

- VUID-vkCmdDrawMeshTasksEXT-MeshEXT-07087

The current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` **must** contain a shader stage using the `MeshEXT Execution Model`

Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksEXT-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawMeshTasksEXT-commandBuffer-recording `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdDrawMeshTasksEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdDrawMeshTasksEXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawMeshTasksEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDrawMeshTasksEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	Action

Conditional Rendering

`vkCmdDrawMeshTasksEXT` is affected by [conditional rendering](#)

To record an indirect mesh tasks drawing command, call:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_mesh_shader
void vkCmdDrawMeshTasksIndirect2EXT(
    VkCommandBuffer                commandBuffer,
    const VkDrawIndirect2InfoKHR*  pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkDrawIndirect2InfoKHR` structure defining parameters of this command.

`vkCmdDrawMeshTasksIndirect2EXT` behaves similarly to `vkCmdDrawMeshTasksEXT` except that the parameters are read by the device from an address range during execution. `pInfo->drawCount` draws are executed by the command, with parameters taken from `pInfo->addressRange` starting at

`addressRange.address` and increasing by `addressRange.stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawMeshTasksIndirectCommandEXT` structures.

Valid Usage

- VUID-vkCmdDrawMeshTasksIndirect2EXT-magFilter-04553

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-magFilter-09598

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample

a [VkImageView](#) as a result of this command, then the sampler **must** not be used with any of the SPIR-V [OpImageSample*](#) or [OpImageSparseSample*](#) instructions that includes a LOD bias or any offset values

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-06479
If a [VkImageView](#) is sampled with [depth comparison](#), the image view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-02691
If a [VkImageView](#) is accessed using atomic operations as a result of this command, then the image view's [format features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07888
If a [VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER](#) descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's [format features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-02692
If a [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, then the image view's [format features](#) **must** contain [VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-02693
If the [VK_EXT_filter_cubic](#) extension is not enabled and any [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, it **must** not have a [VkImageViewType](#) of [VK_IMAGE_VIEW_TYPE_3D](#), [VK_IMAGE_VIEW_TYPE_CUBE](#), or [VK_IMAGE_VIEW_TYPE_CUBE_ARRAY](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-filterCubic-02694
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-filterCubicMinmax-02695
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-OpTypeImage-07027
For any [VkImageView](#) being written as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-OpTypeImage-07028
For any [VkImageView](#) being read as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-OpTypeImage-07029

For any [VkBufferView](#) being written as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-OpTypeImage-07030

Any [VkBufferView](#) being read as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#) then the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08600

If a [a bound shader](#) was created with a pipeline layout and statically uses a set *n*, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with layouts compatible for set *n* with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08601

If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08115

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08116

Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08117

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08119

If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be

resident

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08605

If a descriptor is dynamically used with a [VkShaderEXT](#) created with a [VkDescriptorSetLayout](#) that was created with [VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08606

If the [shaderObject](#) feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08608

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawMeshTasksIndirect2EXT-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08612

If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirect2EXT-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08613

If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirect2EXT-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDrawMeshTasksIndirect2EXT-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's **viewType** **must** match the **Dim** operand of the **OpTypeImage** as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the **numeric type** of the view's **format** and the **Sampled Type** operand of the **OpTypeImage** **must** match

- VUID-vkCmdDrawMeshTasksIndirect2EXT-OpImageWrite-08795

If a [VkImageView](#) created with a format other than [VK_FORMAT_A8_UNORM](#) is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDrawMeshTasksIndirect2EXT-OpImageWrite-08796

If a [VkImageView](#) created with the format [VK_FORMAT_A8_UNORM](#) is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have four components

- VUID-vkCmdDrawMeshTasksIndirect2EXT-OpImageWrite-04469

If a [VkBufferView](#) is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDrawMeshTasksIndirect2EXT-SampledType-04470

If a [VkImageView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- VUID-vkCmdDrawMeshTasksIndirect2EXT-SampledType-04471

If a [VkImageView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- VUID-vkCmdDrawMeshTasksIndirect2EXT-SampledType-04472

If a [VkBufferView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- VUID-vkCmdDrawMeshTasksIndirect2EXT-SampledType-04473

If a [VkBufferView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- VUID-vkCmdDrawMeshTasksIndirect2EXT-sparseImageInt64Atomics-04474

If the **sparseImageInt64Atomics** feature is not enabled, [VkImage](#) objects created with the [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-sparseImageInt64Atomics-04475

If the **sparseImageInt64Atomics** feature is not enabled, [VkBuffer](#) objects created with the [VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this

command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07288
Any shader invocation executed by this command **must** [terminate](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09600
If a descriptor with type equal to any of [VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE](#), [VK_DESCRIPTOR_TYPE_STORAGE_IMAGE](#), or [VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT](#) is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDrawMeshTasksIndirect2EXT-micromap-11636
If an acceleration structure is accessed as a result of this command through an [OpRayQueryProceedKHR](#) operation, the [VK_EXT_opacity_micromap](#) extension is not enabled, and the acceleration structure is built using geometry with a [VkAccelerationStructureTrianglesOpacityMicromapKHR](#) structure included in its [pNext](#) chain, the shader **must** have specified a [OpacityMicromapIdKHR](#) execution mode with its specialization constant operand equal to [VK_TRUE](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-micromap-11637
If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device
- VUID-vkCmdDrawMeshTasksIndirect2EXT-micromap-11638
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkPipeline](#) bound to the pipeline bind point used by this command **must** not have been created with [flags](#) that includes [VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-micromap-11639
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkShaderEXT](#) that accessed the descriptor **must** not have been created with [flags](#) that includes [VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-12472
Descriptors dynamically accessed in bound descriptor heaps **must** be valid
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11297
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#),

[VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a [OpTypeStruct](#) decorated with [Block](#) or [BufferBlock](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [bufferDescriptorAlignment](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeImage](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [imageDescriptorAlignment](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeSampler](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the sampler heap **must** be a multiple of [samplerDescriptorAlignment](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound

to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11372

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11373

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11374

If the `robustBufferAccess2` feature is not enabled, the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by `VkDeviceAddressRangeKHR` when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pBindInfo-11375

If any `bound shader` uses an embedded sampler via a `descriptor mapping`, the value of `pBindInfo->reservedRangeSize` set for `vkCmdBindSamplerHeapEXT` **must** be greater than or equal to `minSamplerHeapReservedRangeWithEmbedded`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11376

If a `bound shader` was created as a `VkShaderEXT` with the `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` flag or as part of a pipeline with the `VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT` flag, and that shader statically uses a push constant value, that value **must** have been set by `vkCmdPushDataEXT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11398

If a `bound shader` was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the access **must** not be `out of bounds`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`,

VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT,
VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, or
VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT and a shader accesses
a uniform buffer using that mapping, the address that the uniform buffer is mapped to
must be aligned to `minUniformBufferOffsetAlignment`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound
to a shader stage used by this command, and it was created with a `descriptor mapping`
using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or
`VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a
storage buffer using that mapping, the address that the storage buffer is mapped to **must**
have been queried from a buffer created with the
`VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound
to a shader stage used by this command, and it was created with a `descriptor mapping`
using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or
`VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a
storage buffer using that mapping, the address that the storage buffer is mapped to **must**
be aligned to `minStorageBufferOffsetAlignment`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound
to a shader stage used by this command, and it was created with a `descriptor mapping`
using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or
`VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses an
acceleration structure using that mapping, the address that the acceleration structure is
mapped to **must** be an acceleration structure address retrieved from a
`VkAccelerationStructureKHR` object via `vkGetAccelerationStructureDeviceAddressKHR`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and
that sampler descriptor uses a custom border color with an index defined by
`VkSamplerCustomBorderColorIndexCreateInfoEXT`, the value of
`VkSamplerCustomBorderColorIndexCreateInfoEXT::index` **must** have been registered
before this command was recorded, and still be registered during the sampling operation,
with an identically defined color

- VUID-vkCmdDrawMeshTasksIndirect2EXT-protectedNoFault-11455

If `protectedNoFault` is not supported, a pipeline is bound to the pipeline bind point used by
this command, or a shader is bound to a shader stage used by this command, and it was
created with a `descriptor mapping` using
`VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or
`VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, the address that the
resource is mapped to **must** have been queried from a buffer created without the

[VK_BUFFER_CREATE_PROTECTED_BIT](#) create flag set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-protectedNoFault-11456

If [protectedNoFault](#) is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), the address of the indirect memory **must** have been queried from a buffer created without the [VK_BUFFER_CREATE_PROTECTED_BIT](#) create flag set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-renderPass-02684

The current render pass **must** be [compatible](#) with the [renderPass](#) member of the [VkGraphicsPipelineCreateInfo](#) structure specified when creating the [VkPipeline](#) bound to [VK_PIPELINE_BIND_POINT_GRAPHICS](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-subpass-02685

The subpass index of the current render pass **must** be equal to the [subpass](#) member of the [VkGraphicsPipelineCreateInfo](#) structure specified when creating the [VkPipeline](#) bound to [VK_PIPELINE_BIND_POINT_GRAPHICS](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-OpTypeImage-07468

If any shader executed by this pipeline accesses an [OpTypeImage](#) variable with a [Dim](#) operand of [SubpassData](#), it **must** be decorated with an [InputAttachmentIndex](#) that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07469

Input attachment views accessed in a subpass **must** be created with the same [VkFormat](#) as the corresponding subpass definition, and be created with a [VkImageView](#) that is compatible with the attachment referenced by the subpass' [pInputAttachments](#) [[InputAttachmentIndex](#)] in the bound [VkFramebuffer](#) as specified by [Fragment Input Attachment Compatibility](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pDepthInputAttachmentIndex-09595

Input attachment views accessed in a dynamic render pass with a [InputAttachmentIndex](#) referenced by [VkRenderingInputAttachmentIndexInfo](#), or no [InputAttachmentIndex](#) if [VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex](#) or [VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex](#) are [NULL](#), **must** be created with a [VkImageView](#) that is compatible with the corresponding color, depth, or stencil attachment in [VkRenderingInfo](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pDepthInputAttachmentIndex-09596

Input attachment views accessed in a dynamic render pass via a shader object **must** have an [InputAttachmentIndex](#) if both [VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex](#) and [VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex](#) are non-[NULL](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-InputAttachmentIndex-09597

If an input attachment view accessed in a dynamic render pass via a shader object has an [InputAttachmentIndex](#), the [InputAttachmentIndex](#) **must** match an index in [VkRenderingInputAttachmentIndexInfo](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10795
If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10796
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10797
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-12338
If a color attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, the color attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-12339
If a depth attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, the depth attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-12340
If a stencil attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, the stencil attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, [depth writes](#) **must** be disabled
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back [writeMask](#) are not zero, and stencil test is enabled, [all stencil ops](#) **must** be [VK_STENCIL_OP_KEEP](#)
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07831

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07832

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08617

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `effective rasterization input topology` is in the line topology class, then `vkCmdSetLineWidth` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07834

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBiasEnable` is `VK_TRUE`, then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07835

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment `current value` of `blendEnable` is `VK_TRUE` with a blend equations where any `VkBlendFactor` member is `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, then `vkCmdSetBlendConstants` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07836

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthBoundsTestEnable` is `VK_TRUE`, then `vkCmdSetDepthBounds` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07837

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilCompareMask` **must** have been

called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07838

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_STENCIL_WRITE_MASK](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [current value](#) of [stencilTestEnable](#) is [VK_TRUE](#), then [vkCmdSetStencilWriteMask](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07839

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_STENCIL_REFERENCE](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), the [current value](#) of [stencilTestEnable](#) is [VK_TRUE](#), then [vkCmdSetStencilReference](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to [VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex](#)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsEnable-02689

If the bound graphics pipeline was created with [VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable](#) set to [VK_TRUE](#), then the active depth attachment **must** have been created with the [VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT](#) bit set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07634

If the [VK_EXT_sample_locations](#) extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), then [vkCmdSetSampleLocationsEnableEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-06666

If the [VK_EXT_sample_locations](#) extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [current value](#) of [sampleLocationsEnable](#) is [VK_TRUE](#), then [vkCmdSetSampleLocationsEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07840

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_CULL_MODE](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), then [vkCmdSetCullMode](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07841
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_FRONT_FACE](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), then [vkCmdSetFrontFace](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07843
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), [vkCmdSetDepthTestEnable](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07844
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [current value](#) of [depthTestEnable](#) is [VK_TRUE](#), then [vkCmdSetDepthWriteEnable](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07845
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_DEPTH_COMPARE_OP](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [current value](#) of [depthTestEnable](#) is [VK_TRUE](#), then [vkCmdSetDepthCompareOp](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07846
If the [depthBounds](#) feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), then [vkCmdSetDepthBoundsTestEnable](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07847
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), then [vkCmdSetStencilTestEnable](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07848
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_STENCIL_OP](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), the [current value](#) of [stencilTestEnable](#) is [VK_TRUE](#), then [vkCmdSetStencilOp](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-viewportCount-03417
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-scissorCount-03418
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing
- VUID-vkCmdDrawMeshTasksIndirect2EXT-viewportCount-03419
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-04876
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-04877
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-logicOp-04878
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-primitiveFragmentShadingRateWithMultipleViewports-04552
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1
- VUID-vkCmdDrawMeshTasksIndirect2EXT-primitiveFragmentShadingRateWithMultipleViewports-08642

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdDrawMeshTasksIndirect2EXT-blendEnable-04727

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's **format features** do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the **current value** of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08644

If a shader object is bound to any graphics stage or a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and none of the following is enabled:

- the `multisampledRenderToSingleSampled` feature

then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08876

If a shader object is bound to any graphics stage, the current render pass instance **must** have been begun with `vkCmdBeginRendering`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageView-06172

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageView-06173

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageView-06174

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageView-06175

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is

`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageView-06176
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment
- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageView-06177
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment
- VUID-vkCmdDrawMeshTasksIndirect2EXT-viewMask-06178
If the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-colorAttachmentCount-06179
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08910
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08912
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08911
If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07749
If the `colorWriteEnable` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-attachmentCount-07750
If the `colorWriteEnable` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer **must** be greater than or equal to the number of active color attachments
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07751
If the `VK_EXT_discard_rectangles` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled and the `pNext` chain of `VkGraphicsPipelineCreateInfo` included a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-rasterizerDiscardEnable-09236
If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled and the `pNext` chain of `VkGraphicsPipelineCreateInfo` did not include a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for each discard rectangle in `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07880
If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07881
If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the

`VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08913
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08914
If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08915
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08916
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08917
If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-08918
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format **must** be

VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageView-06183

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingLocalRead-11797

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingLocalRead` feature is enabled, the `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` flag is specified, and an attachment is being used as a feedback loop as specified by `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`, `VkRenderingAttachmentFlagsInfoKHR::flags` for that attachment **must** include `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-imageView-06184

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-multisampledRenderToSingleSampled-07285

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirect2EXT-multisampledRenderToSingleSampled-07286

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-multisampledRenderToSingleSampled-07287

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pNext-07935

If this command is called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of

`rasterizationSamples` for the bound graphics pipeline **must** be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-renderPass-06198

If the current render pass instance was begun with `vkCmdBeginRendering`, the bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pColorAttachments-08963

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pColorAttachments-11539

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->resolveImageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pDepthAttachment-08964

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pDepthAttachment-11540

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pStencilAttachment-08965

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pStencilAttachment-11860
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-flags-10582
If the current render pass instance was begun with a `vkCmdBeginRendering` call in `commandBuffer`, its `VkRenderingInfo::flags` parameter **must** not have `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` set unless `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` is also set
- VUID-vkCmdDrawMeshTasksIndirect2EXT-primitivesGeneratedQueryWithRasterizerDiscard-06708
If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, `rasterization discard` **must** not be enabled
- VUID-vkCmdDrawMeshTasksIndirect2EXT-primitivesGeneratedQueryWithNonZeroStreams-06709
If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07620
If the `depthClamp` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07621
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetPolygonModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07622
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07623
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled,

and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-alphaToCoverageEnable-08919

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location` 0 at `Index` 0

- VUID-vkCmdDrawMeshTasksIndirect2EXT-alphaToCoverageEnable-08920

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location` 0 at `Index` 0

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07624

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07625

If the `alphaToOne` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07626

If the `logicOp` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07627

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07629

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled, the current

value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07630

If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage or a graphics pipeline is bound which was created with both a `VK_SHADER_STAGE_GEOMETRY_BIT` stage and the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled, then `vkCmdSetRasterizationStreamEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07631

If the `VK_EXT_conservative_rasterization` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07632

If the `VK_EXT_conservative_rasterization` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `conservativeRasterizationMode` is `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-conservativePointAndLineRasterization-07499

If the `VK_EXT_conservative_rasterization` extension is enabled, `conservativePointAndLineRasterization` is not supported, a shader object is bound to any graphics stage or a graphics pipeline is bound, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line or point topology class, then the current value of `conservativeRasterizationMode` **must** be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07633

If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state, then `vkCmdSetDepthClipEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07636

If the `VK_EXT_provoking_vertex` extension is enabled, a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` **must** have been called and not subsequently

invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08666

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineRasterizationModeEXT` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08669

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineStippleEnableEXT` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07849

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled and a shader object is bound to any graphics stage, or a bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `stippledLineEnable` is `VK_TRUE`, then `vkCmdSetLineStipple` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10608

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, the effective rasterization input topology is in the line topology class, and the current `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the current `alphaToCoverageEnable`, `alphaToOneEnable` and `sampleShadingEnable` states **must** all be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07639

If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled, then `vkCmdSetDepthClipNegativeOneToOneEXT` **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09650

If the `depthClampControl` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT` dynamic state enabled, and the current

value of `depthClampEnable` is `VK_TRUE`, then `vkCmdSetDepthClampRangeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirect2EXT-rasterizationSamples-07471

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** follow the rules for a `zero-attachment` subpass

- VUID-vkCmdDrawMeshTasksIndirect2EXT-samples-07472

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirect2EXT-samples-07473

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09211

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** be the same as the `rasterizationSamples` member of that structure

- VUID-vkCmdDrawMeshTasksIndirect2EXT-firstAttachment-07476

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorBlendEnableEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksIndirect2EXT-firstAttachment-07478

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorWriteMaskEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksIndirect2EXT-advancedBlendMaxColorAttachments-07480

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics

pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment current value of `blendEnable` is `VK_TRUE`, then the number of active color attachments **must** not exceed `advancedBlendMaxColorAttachments`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10862

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-rasterizerDiscardEnable-10863

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendAdvancedEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10864

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then either `vkCmdSetColorBlendAdvancedEXT` or `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-primitivesGeneratedQueryWithNonZeroStreams-07481

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` **must** have set the `rasterizationStream` to zero

- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsPerPixel-07482

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, and the current value of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with

- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsPerPixel-07483
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsEnable-07484
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT` then the current active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set
- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsEnable-07485
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsEnable-07486
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsEnable-07487
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsEnable-07936
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.width` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsEnable-07937
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.height` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-sampleLocationsEnable-07938
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationsPerPixel` **must** equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-stippledLineEnable-07495
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `stippledRectangularLines` feature **must** be enabled
- VUID-vkCmdDrawMeshTasksIndirect2EXT-stippledLineEnable-07496
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `stippledBresenhamLines` feature **must** be enabled
- VUID-vkCmdDrawMeshTasksIndirect2EXT-stippledLineEnable-07497
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `stippledSmoothLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksIndirect2EXT-stippledLineEnable-07498
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-stage-07073
If the bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then `Mesh Shader Queries` **must** not be active
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08877
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirect2EXT-nextStage-10745
For each shader object bound to a graphics stage, except for shader object bound to the last graphics stage in the logical pipeline, it **must** have been created with a `nextStage` including the corresponding bit to the shader object bound to the following graphics stage in the logical pipeline
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08684
If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08685
If there is no bound graphics pipeline, and the `tesellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08686
If there is no bound graphics pipeline, and the `tesellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08687
If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08688
If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08689
If there is no bound graphics pipeline, and the **taskShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TASK_BIT_EXT**
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08690
If there is no bound graphics pipeline, and the **meshShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_MESH_BIT_EXT**
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08693
If there is no bound graphics pipeline, and at least one of the **taskShader** and **meshShader** features is enabled, one of the **VK_SHADER_STAGE_VERTEX_BIT** or **VK_SHADER_STAGE_MESH_BIT_EXT** stages **must** have a valid **VkShaderEXT** bound, and the other **must** have no **VkShaderEXT** bound
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08696
If there is no bound graphics pipeline, and a valid **VkShaderEXT** is bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage, there **must** be no **VkShaderEXT** bound to either the **VK_SHADER_STAGE_TASK_BIT_EXT** stage or the **VK_SHADER_STAGE_MESH_BIT_EXT** stage
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08698
If any graphics shader is bound which was created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag, then all shaders created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag in the same **vkCreateShadersEXT** call **must** also be bound
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08699
If any graphics shader is bound which was created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag, any stages in between stages whose shaders which did not create a shader with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag as part of the same **vkCreateShadersEXT** call **must** not have any **VkShaderEXT** bound
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08878
All bound graphics shader objects **must** have been created with identical or **identically defined** push constant ranges
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08879
All bound graphics shader objects **must** have either been created with the **VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT** flag set, or with identical or **identically defined** arrays of descriptor set layouts
- VUID-vkCmdDrawMeshTasksIndirect2EXT-pDynamicStates-08715
If the bound graphics pipeline state includes a fragment shader stage, was created with **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**, and the fragment shader declares the **EarlyFragmentTests** execution mode and uses **OpDepthAttachmentReadEXT**, the **depthWriteEnable** parameter in the last call to **vkCmdSetDepthWriteEnable** **must** be **VK_FALSE**
- VUID-vkCmdDrawMeshTasksIndirect2EXT-pDynamicStates-08716
If the bound graphics pipeline state includes a fragment shader stage, was created with **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** set in **VkPipelineDynamicStateCreateInfo**

::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask **must** be 0

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09116
If a shader object is bound to any graphics stage or the bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT **must** either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, VK_COLOR_COMPONENT_B_BIT, and VK_COLOR_COMPONENT_A_BIT, or none of them
- VUID-vkCmdDrawMeshTasksIndirect2EXT-maxFragmentDualSrcAttachments-09239
If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command **must** be less than maxFragmentDualSrcAttachments
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09548
If the current render pass was begun with vkCmdBeginRendering, there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfo::pColorAttachmentLocations in the bound pipeline **must** match the value for the corresponding locations set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09549
If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingInputAttachmentIndexInfo::pColorAttachmentInputIndices in the bound pipeline **must** match the value for the corresponding index set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10927
If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex in the bound pipeline **must** match the value set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10928
If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex in the bound pipeline **must** match the value set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09642
If the current render pass was begun with vkCmdBeginRendering with the VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT flag, the bound graphics pipeline **must** have been created with VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-09643
If the bound graphics pipeline was created with VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT, the current render pass

must have begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-10772
If a shader object is bound to any graphics stage, *multiview* functionality **must** not be enabled in the current render pass
- VUID-vkCmdDrawMeshTasksIndirect2EXT-flags-11521
If current render pass instance was begun with `vkCmdBeginRendering` with `VkRenderingInfo::flags` which includes `VK_RENDERING_FRAGMENT_REGION_BIT_EXT`, and if *sample shading* is enabled (explicitly or implicitly), then the minimum fraction for sample shading **must** equal 0.0
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11522
If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and the `dynamicRenderingUnusedAttachments` feature is not enabled, the graphics pipeline bound **must** have been created with a `VkCustomResolveCreateInfoEXT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11523
If the current render pass instance was begun with `vkCmdBeginRendering` and does not contain a custom resolve, and the `dynamicRenderingUnusedAttachments` feature is not enabled, the graphics pipeline bound **must** not have been created with a `VkCustomResolveCreateInfoEXT`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-customResolve-11524
If the current render pass instance was begun with `vkCmdBeginRendering` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-customResolve-11525
If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and `vkCmdBeginCustomResolveEXT` has not been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11861
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, the bound graphics pipeline **must** have been created with a `VkCustomResolveCreateInfoEXT::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11862
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11863
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render

pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-11864
If the `dynamicRenderingUnusedAttachments` feature is enabled, the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11865
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11866
If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-11867
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11868
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-11869
If current render pass instance was begun with `vkCmdBeginRendering`, it contains a

custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-dynamicRenderingUnusedAttachments-11870
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-colorAttachmentCount-11871
If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, then for each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE`, the `resolveImageView` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline
- VUID-vkCmdDrawMeshTasksIndirect2EXT-pDepthAttachment-11872
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-pStencilAttachment-11873
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-customResolve-11529
If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering`, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-customResolve-11530
If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has not yet been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`
- VUID-vkCmdDrawMeshTasksIndirect2EXT-flags-13361
If there are any shader objects bound that were created with `flags` that includes the

`VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, then all bound shader objects **must** have been created with the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit

- VUID-vkCmdDrawMeshTasksIndirect2EXT-flags-13362

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `setLayoutCount` not equal to 0, and with `pSetLayouts` not equal to `NULL`, then the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-flags-12491

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `pushConstantRangeCount` not equal to 0, and with `pPushConstantRanges` not equal to `NULL`, then the pipeline layout of the bound push constants **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-flags-13363

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, and any of the descriptor set layouts used to create the pipeline layout of the bound descriptor sets were created with any binding's `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then there **must** be no binding with `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-flags-13364

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR` set

- VUID-vkCmdDrawMeshTasksIndirect2EXT-flags-13365

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, there **must** be no shader object bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksIndirect2EXT-stage-06480

The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of any element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-vkCmdDrawMeshTasksIndirect2EXT-pStages-10680

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** not have last bound the `pStages` element of `VK_SHADER_STAGE_VERTEX_BIT`,

VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT,
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or
VK_SHADER_STAGE_GEOMETRY_BIT with a valid shader object other than
VK_NULL_HANDLE

- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07074
Transform Feedback Queries **must** not be active
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-07075
Primitives Generated Queries **must** not be active
- VUID-vkCmdDrawMeshTasksIndirect2EXT-pipelineStatistics-07076
The **pipelineStatistics** member used to create any active Pipeline Statistics Query **must** not contain VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT, VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT, or VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08694
If there is no bound graphics pipeline, and both the **taskShader** and **meshShader** features are enabled, and a valid **VkShaderEXT** is bound to the VK_SHADER_STAGE_MESH_BIT_EXT stage, and that **VkShaderEXT** was created without the VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, a valid **VkShaderEXT** **must** be bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage
- VUID-vkCmdDrawMeshTasksIndirect2EXT-None-08695
If there is no bound graphics pipeline, and both the **taskShader** and **meshShader** features are enabled, and a valid **VkShaderEXT** is bound to the VK_SHADER_STAGE_MESH_BIT_EXT stage, and that **VkShaderEXT** was created with the VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, there **must** be no **VkShaderEXT** bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage
- VUID-vkCmdDrawMeshTasksIndirect2EXT-commandBuffer-13067
commandBuffer **must** not be a protected command buffer

Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirect2EXT-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdDrawMeshTasksIndirect2EXT-pInfo-parameter
pInfo **must** be a valid pointer to a valid **VkDrawIndirect2InfoKHR** structure
- VUID-vkCmdDrawMeshTasksIndirect2EXT-commandBuffer-recording
commandBuffer **must** be in the **recording state**

- VUID-vkCmdDrawMeshTasksIndirect2EXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdDrawMeshTasksIndirect2EXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawMeshTasksIndirect2EXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDrawMeshTasksIndirect2EXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	Action

Conditional Rendering

`vkCmdDrawMeshTasksIndirect2EXT` is affected by [conditional rendering](#)

To record an indirect mesh tasks drawing command, call:

WARNING

This functionality is superseded by [vkCmdDrawMeshTasksIndirect2EXT](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_mesh_shader
void vkCmdDrawMeshTasksIndirectEXT(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    uint32_t                 drawCount,
    uint32_t                 stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.

- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawMeshTasksIndirectEXT` behaves similarly to `vkCmdDrawMeshTasksEXT` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawMeshTasksIndirectCommandEXT` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

Valid Usage

- VUID-vkCmdDrawMeshTasksIndirectEXT-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDrawMeshTasksIndirectEXT-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawMeshTasksIndirectEXT-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDrawMeshTasksIndirectEXT-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawMeshTasksIndirectEXT-unnormalizedCoordinates-09635
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08609
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample

a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-06479

If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-02691

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07888

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-02692

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-02693

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- VUID-vkCmdDrawMeshTasksIndirectEXT-filterCubic-02694

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDrawMeshTasksIndirectEXT-filterCubicMinmax-02695

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07027
For any [VkImageView](#) being written as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07028
For any [VkImageView](#) being read as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07029
For any [VkBufferView](#) being written as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07030
Any [VkBufferView](#) being read as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#) then the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08600
If a [bound shader](#) was created with a pipeline layout and statically uses a set *n*, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with layouts compatible for set *n* with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08601
If a [bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10068
For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08114
Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-imageLayout-00344
If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08115
If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08116

Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08117
If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08119
If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08605
If a descriptor is dynamically used with a [VkShaderEXT](#) created with a [VkDescriptorSetLayout](#) that was created with [VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08606
If the [shaderObject](#) feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08608
If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdDrawMeshTasksIndirectEXT-uniformBuffers-06935
If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08612
If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksIndirectEXT-storageBuffers-06936
If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08613
If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-02707
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by **bound shaders** **must** not be a protected resource
- VUID-vkCmdDrawMeshTasksIndirectEXT-viewType-07752
If a **VkImageView** is accessed as a result of this command, then the image view's **viewType** **must** match the **Dim** operand of the **OpTypeImage** as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)
- VUID-vkCmdDrawMeshTasksIndirectEXT-format-07753
If a **VkImageView** or **VkBufferView** is accessed as a result of this command, then the **numeric type** of the view's **format** and the **Sampled Type** operand of the **OpTypeImage** **must** match
- VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWrite-08795
If a **VkImageView** created with a format other than **VK_FORMAT_A8_UNORM** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWrite-08796
If a **VkImageView** created with the format **VK_FORMAT_A8_UNORM** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have four components
- VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWrite-04469
If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdDrawMeshTasksIndirectEXT-SampledType-04470
If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdDrawMeshTasksIndirectEXT-SampledType-04471
If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
- VUID-vkCmdDrawMeshTasksIndirectEXT-SampledType-04472
If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdDrawMeshTasksIndirectEXT-SampledType-04473
If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- VUID-vkCmdDrawMeshTasksIndirectEXT-sparseImageInt64Atomics-04474
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07288
Any shader invocation executed by this command **must** `terminate`
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDrawMeshTasksIndirectEXT-micromap-11636
If an acceleration structure is accessed as a result of this command through an `OpRayQueryProceedKHR` operation, the `VK_EXT_opacity_micromap` extension is not enabled, and the acceleration structure is built using geometry with a `VkAccelerationStructureTrianglesOpacityMicromapKHR` structure included in its `pNext` chain, the shader **must** have specified a `OpacityMicromapIdKHR` execution mode with its specialization constant operand equal to `VK_TRUE`
- VUID-vkCmdDrawMeshTasksIndirectEXT-micromap-11637
If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device
- VUID-vkCmdDrawMeshTasksIndirectEXT-micromap-11638
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkPipeline` bound to the pipeline bind point used by this command **must** not have been created with `flags` that includes `VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR`
- VUID-vkCmdDrawMeshTasksIndirectEXT-micromap-11639
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkShaderEXT` that accessed the descriptor **must** not have been created with

`flags` that includes
`VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-12472
Descriptors dynamically accessed in bound descriptor heaps **must** be valid
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11297
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a `OpTypeStruct` decorated with `Block` or `BufferBlock` using that mapping, the calculated offset for the resource heap **must** be a multiple of `bufferDescriptorAlignment`
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11298
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeImage` or `OpTypeSampledImage` using that mapping, the calculated offset for the resource heap **must** be a multiple of `imageDescriptorAlignment`
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11299
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeSampler` or `OpTypeSampledImage` using that mapping, the calculated offset for the sampler heap **must** be a multiple of `samplerDescriptorAlignment`
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11300
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11301
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset

specified by each mapping

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11372

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11373

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11374

If the [robustBufferAccess2](#) feature is not enabled, the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectEXT-pBindInfo-11375

If any [bound shader](#) uses an embedded sampler via a [descriptor mapping](#), the value of [pBindInfo->reservedRangeSize](#) set for [vkCmdBindSamplerHeapEXT](#) **must** be greater than or equal to [minSamplerHeapReservedRangeWithEmbedded](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11376

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, and that shader statically uses a push constant value, that value **must** have been set by [vkCmdPushDataEXT](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11398

If a [bound shader](#) was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the access **must** not be [out of bounds](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the [VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#),

VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or
VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT usage flag set

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to `minUniformBufferOffsetAlignment`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** have been queried from a buffer created with the VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag set

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to `minStorageBufferOffsetAlignment`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a [VkAccelerationStructureKHR](#) object via [vkGetAccelerationStructureDeviceAddressKHR](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and that sampler descriptor uses a custom border color with an index defined by [VkSamplerCustomBorderColorIndexCreateInfoEXT](#), the value of [VkSamplerCustomBorderColorIndexCreateInfoEXT::index](#) **must** have been registered before this command was recorded, and still be registered during the sampling operation,

with an identically defined color

- VUID-vkCmdDrawMeshTasksIndirectEXT-protectedNoFault-11455

If **protectedNoFault** is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a **descriptor mapping** using **VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT**, **VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT**, or **VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT**, the address that the resource is mapped to **must** have been queried from a buffer created without the **VK_BUFFER_CREATE_PROTECTED_BIT** create flag set

- VUID-vkCmdDrawMeshTasksIndirectEXT-protectedNoFault-11456

If **protectedNoFault** is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a **descriptor mapping** using **VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT** or **VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT**, the address of the indirect memory **must** have been queried from a buffer created without the **VK_BUFFER_CREATE_PROTECTED_BIT** create flag set

- VUID-vkCmdDrawMeshTasksIndirectEXT-renderPass-02684

The current render pass **must** be **compatible** with the **renderPass** member of the **VkGraphicsPipelineCreateInfo** structure specified when creating the **VkPipeline** bound to **VK_PIPELINE_BIND_POINT_GRAPHICS**

- VUID-vkCmdDrawMeshTasksIndirectEXT-subpass-02685

The subpass index of the current render pass **must** be equal to the **subpass** member of the **VkGraphicsPipelineCreateInfo** structure specified when creating the **VkPipeline** bound to **VK_PIPELINE_BIND_POINT_GRAPHICS**

- VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07468

If any shader executed by this pipeline accesses an **OpTypeImage** variable with a **Dim** operand of **SubpassData**, it **must** be decorated with an **InputAttachmentIndex** that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07469

Input attachment views accessed in a subpass **must** be created with the same **VkFormat** as the corresponding subpass definition, and be created with a **VkImageView** that is compatible with the attachment referenced by the subpass' **pInputAttachments** [**InputAttachmentIndex**] in the bound **VkFramebuffer** as specified by **Fragment Input Attachment Compatibility**

- VUID-vkCmdDrawMeshTasksIndirectEXT-pDepthInputAttachmentIndex-09595

Input attachment views accessed in a dynamic render pass with a **InputAttachmentIndex** referenced by **VkRenderingInputAttachmentIndexInfo**, or no **InputAttachmentIndex** if **VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex** or **VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex** are **NULL**, **must** be created with a **VkImageView** that is compatible with the corresponding color, depth, or stencil attachment in **VkRenderingInfo**

- VUID-vkCmdDrawMeshTasksIndirectEXT-pDepthInputAttachmentIndex-09596

Input attachment views accessed in a dynamic render pass via a shader object **must** have

an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` are non-NULL

- VUID-vkCmdDrawMeshTasksIndirectEXT-InputAttachmentIndex-09597
If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` **must** match an index in `VkRenderingInputAttachmentIndexInfo`
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-06537
Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10795
If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and `feedback loop` is not enabled for `VK_IMAGE_ASPECT_COLOR_BIT` on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10796
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and `feedback loop` is not enabled for `VK_IMAGE_ASPECT_DEPTH_BIT` on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10797
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and `feedback loop` is not enabled for `VK_IMAGE_ASPECT_STENCIL_BIT` on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-12338
If a color attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and `feedback loop` is not enabled for `VK_IMAGE_ASPECT_COLOR_BIT` on that attachment, the color attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-12339
If a depth attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and `feedback loop` is not enabled for `VK_IMAGE_ASPECT_DEPTH_BIT` on that attachment, the depth attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-12340
If a stencil attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and `feedback loop` is not enabled for `VK_IMAGE_ASPECT_STENCIL_BIT` on that attachment, the stencil attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back **writeMask** are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07831
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07832
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08617
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **effective rasterization input topology** is in the line topology class, then **vkCmdSetLineWidth must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07834
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBiasEnable** is **VK_TRUE**, then **vkCmdSetDepthBias** or **vkCmdSetDepthBias2EXT must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07835
If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_BLEND_CONSTANTS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and an active color attachment **current value** of **blendEnable** is **VK_TRUE** with a blend equations where any **VkBlendFactor** member is **VK_BLEND_FACTOR_CONSTANT_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR**, **VK_BLEND_FACTOR_CONSTANT_ALPHA**, **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA**, or **VK_BLEND_FACTOR_CONSTANT_ALPHA**, then **vkCmdSetBlendConstants must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07836
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BOUNDS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of

`depthBoundsTestEnable` is `VK_TRUE`, then `vkCmdSetDepthBounds` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07837

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilCompareMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07838

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07839

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07634

If the `VK_EXT_sample_locations` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `sampleLocationsEnable` is

VK_TRUE, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07840

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullMode` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07841

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFace` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07843

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07844

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07845

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthCompareOp` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07846

If the `depthBounds` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07847

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then

`vkCmdSetStencilTestEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07848

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOp` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewportCount-03417

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-scissorCount-03418

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewportCount-03419

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-04876

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-04877

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-logicOp-04878

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the

bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdDrawMeshTasksIndirectEXT-

`primitiveFragmentShadingRateWithMultipleViewports-08642`

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdDrawMeshTasksIndirectEXT-blendEnable-04727

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's **format features** do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the **current value** of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08644

If a shader object is bound to any graphics stage or a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and none of the following is enabled:

- the `multisampledRenderToSingleSampled` feature

then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08876

If a shader object is bound to any graphics stage, the current render pass instance **must** have been begun with `vkCmdBeginRendering`

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06172

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06173

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06174

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView`

member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06175

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06176

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06177

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewMask-06178

If the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`

- VUID-vkCmdDrawMeshTasksIndirectEXT-colorAttachmentCount-06179

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08910

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08912

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08911

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07749

If the `colorWriteEnable` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-attachmentCount-07750

If the `colorWriteEnable` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer **must** be greater than or equal to the number of active color attachments

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07751

If the `VK_EXT_discard_rectangles` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled and the `pNext` chain of `VkGraphicsPipelineCreateInfo` included a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`

- VUID-vkCmdDrawMeshTasksIndirectEXT-rasterizerDiscardEnable-09236

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled and the `pNext` chain of `VkGraphicsPipelineCreateInfo` did not include a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for each discard rectangle in `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07880

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any

graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07881

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08913

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08914

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08915

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08916

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08917

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo`

`::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-08918
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06183
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`
- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingLocalRead-11797
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingLocalRead` feature is enabled, the `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` flag is specified, and an attachment is being used as a feedback loop as specified by `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`, `VkRenderingAttachmentFlagsInfoKHR::flags` for that attachment **must** include `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`
- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06184
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`
- VUID-vkCmdDrawMeshTasksIndirectEXT-multisampledRenderToSingleSampled-07285
If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline
- VUID-vkCmdDrawMeshTasksIndirectEXT-multisampledRenderToSingleSampled-07286
If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`
- VUID-vkCmdDrawMeshTasksIndirectEXT-multisampledRenderToSingleSampled-07287
If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance,

and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectEXT-pNext-07935

If this command is called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-vkCmdDrawMeshTasksIndirectEXT-renderPass-06198

If the current render pass instance was begun with `vkCmdBeginRendering`, the bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-pColorAttachments-08963

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-pColorAttachments-11539

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->resolveImageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-pDepthAttachment-08964

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-pDepthAttachment-11540

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the pipeline **must**

not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-pStencilAttachment-08965

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-pStencilAttachment-11860

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-flags-10582

If the current render pass instance was begun with a `vkCmdBeginRendering` call in `commandBuffer`, its `VkRenderingInfo::flags` parameter **must** not have `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` set unless `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` is also set

- VUID-vkCmdDrawMeshTasksIndirectEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, `rasterization discard` **must** not be enabled

- VUID-vkCmdDrawMeshTasksIndirectEXT-primitivesGeneratedQueryWithNonZeroStreams-06709

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07620

If the `depthClamp` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07621

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetPolygonModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07622

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07623

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-alphaToCoverageEnable-08919

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location` 0 at `Index` 0

- VUID-vkCmdDrawMeshTasksIndirectEXT-alphaToCoverageEnable-08920

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location` 0 at `Index` 0

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07624

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07625

If the `alphaToOne` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07626

If the `logicOp` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07627

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with

VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is VK_FALSE, and there are color attachments bound, then **vkCmdSetColorBlendEnableEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07629

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage or a graphics pipeline is bound which was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is VK_FALSE, and there are color attachments bound, then **vkCmdSetColorWriteMaskEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07630

If the **geometryStreams** feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_GEOMETRY_BIT stage or a graphics pipeline is bound which was created with both a VK_SHADER_STAGE_GEOMETRY_BIT stage and the VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT dynamic state enabled, then **vkCmdSetRasterizationStreamEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07631

If the VK_EXT_conservative_rasterization extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is VK_FALSE, then **vkCmdSetConservativeRasterizationModeEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07632

If the VK_EXT_conservative_rasterization extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is VK_FALSE, and the **current value** of **conservativeRasterizationMode** is VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT, then **vkCmdSetExtraPrimitiveOverestimationSizeEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-conservativePointAndLineRasterization-07499

If the VK_EXT_conservative_rasterization extension is enabled, **conservativePointAndLineRasterization** is not supported, a shader object is bound to any graphics stage or a graphics pipeline is bound, the **current value** of **rasterizerDiscardEnable** is VK_FALSE, and the **effective rasterization input topology** is in the line or point topology class, then the **current value** of **conservativeRasterizationMode** **must** be VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07633

If the **depthClipEnable** feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT dynamic state, then

`vkCmdSetDepthClipEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07636

If the `VK_EXT_provoking_vertex` extension is enabled, a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08666

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineRasterizationModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08669

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineStippleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07849

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled and a shader object is bound to any graphics stage, or a bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `stippledLineEnable` is `VK_TRUE`, then `vkCmdSetLineStipple` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10608

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, the effective rasterization input topology is in the line topology class, and the current `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the current `alphaToCoverageEnable`, `alphaToOneEnable` and `sampleShadingEnable` states **must** all be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07639

If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics

stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled, then `vkCmdSetDepthClipNegativeOneToOneEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09650

If the `depthClampControl` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT` dynamic state enabled, and the `current value` of `depthClampEnable` is `VK_TRUE`, then `vkCmdSetDepthClampRangeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-rasterizationSamples-07471

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** follow the rules for a `zero-attachment subpass`

- VUID-vkCmdDrawMeshTasksIndirectEXT-samples-07472

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectEXT-samples-07473

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09211

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** be the same as the `rasterizationSamples` member of that structure

- VUID-vkCmdDrawMeshTasksIndirectEXT-firstAttachment-07476

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorBlendEnableEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksIndirectEXT-firstAttachment-07478

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states enabled, and the `current` value of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorWriteMaskEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksIndirectEXT-advancedBlendMaxColorAttachments-07480

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, the `current` value of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment `current` value of `blendEnable` is `VK_TRUE`, then the number of active color attachments **must** not exceed `advancedBlendMaxColorAttachments`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10862

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled, and the `current` value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` `current` value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-rasterizerDiscardEnable-10863

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the `current` value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendAdvancedEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` `current` value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10864

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the `current` value of `rasterizerDiscardEnable` is `VK_FALSE`, then either `vkCmdSetColorBlendAdvancedEXT` or `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` `current` value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-primitivesGeneratedQueryWithNonZeroStreams-07481

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` **must** have set the `rasterizationStream` to zero

- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsPerPixel-07482
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with
- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsPerPixel-07483
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-07484
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT` then the current active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set
- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-07485
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`
- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-07486
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling

rasterizationSamples

- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-07487

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`

- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-07936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.width` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-07937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.height` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-07938

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationsPerPixel` **must** equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-stippledLineEnable-07495

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `stippledRectangularLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksIndirectEXT-stippledLineEnable-07496

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode`

state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `stippledBresenhamLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksIndirectEXT-stippledLineEnable-07497

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `stippledSmoothLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksIndirectEXT-stippledLineEnable-07498

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-stage-07073

If the bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then `Mesh Shader Queries` **must** not be active

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08877

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectEXT-nextStage-10745

For each shader object bound to a graphics stage, except for shader object bound to the last graphics stage in the logical pipeline, it **must** have been created with a `nextStage` including the corresponding bit to the shader object bound to the following graphics stage in the logical pipeline

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08684

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08685

If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08686

If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages`

with an element of [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08687

If there is no bound graphics pipeline, and the [geometryShader](#) feature is enabled, [vkCmdBindShadersEXT](#) **must** have been called in the current command buffer with [pStages](#) with an element of [VK_SHADER_STAGE_GEOMETRY_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08688

If there is no bound graphics pipeline, [vkCmdBindShadersEXT](#) **must** have been called in the current command buffer with [pStages](#) with an element of [VK_SHADER_STAGE_FRAGMENT_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08689

If there is no bound graphics pipeline, and the [taskShader](#) feature is enabled, [vkCmdBindShadersEXT](#) **must** have been called in the current command buffer with [pStages](#) with an element of [VK_SHADER_STAGE_TASK_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08690

If there is no bound graphics pipeline, and the [meshShader](#) feature is enabled, [vkCmdBindShadersEXT](#) **must** have been called in the current command buffer with [pStages](#) with an element of [VK_SHADER_STAGE_MESH_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08693

If there is no bound graphics pipeline, and at least one of the [taskShader](#) and [meshShader](#) features is enabled, one of the [VK_SHADER_STAGE_VERTEX_BIT](#) or [VK_SHADER_STAGE_MESH_BIT_EXT](#) stages **must** have a valid [VkShaderEXT](#) bound, and the other **must** have no [VkShaderEXT](#) bound

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08696

If there is no bound graphics pipeline, and a valid [VkShaderEXT](#) is bound to the [VK_SHADER_STAGE_VERTEX_BIT](#) stage, there **must** be no [VkShaderEXT](#) bound to either the [VK_SHADER_STAGE_TASK_BIT_EXT](#) stage or the [VK_SHADER_STAGE_MESH_BIT_EXT](#) stage

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08698

If any graphics shader is bound which was created with the [VK_SHADER_CREATE_LINK_STAGE_BIT_EXT](#) flag, then all shaders created with the [VK_SHADER_CREATE_LINK_STAGE_BIT_EXT](#) flag in the same [vkCreateShadersEXT](#) call **must** also be bound

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08699

If any graphics shader is bound which was created with the [VK_SHADER_CREATE_LINK_STAGE_BIT_EXT](#) flag, any stages in between stages whose shaders which did not create a shader with the [VK_SHADER_CREATE_LINK_STAGE_BIT_EXT](#) flag as part of the same [vkCreateShadersEXT](#) call **must** not have any [VkShaderEXT](#) bound

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08878

All bound graphics shader objects **must** have been created with identical or [identically defined](#) push constant ranges

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08879

All bound graphics shader objects **must** have either been created with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag set, or with identical or [identically defined](#) arrays of descriptor set layouts

- VUID-vkCmdDrawMeshTasksIndirectEXT-pDynamicStates-08715
If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` **must** be `VK_FALSE`
- VUID-vkCmdDrawMeshTasksIndirectEXT-pDynamicStates-08716
If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` **must** be `0`
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09116
If a shader object is bound to any graphics stage or the bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` **must** either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, `VK_COLOR_COMPONENT_B_BIT`, and `VK_COLOR_COMPONENT_A_BIT`, or none of them
- VUID-vkCmdDrawMeshTasksIndirectEXT-maxFragmentDualSrcAttachments-09239
If `blending` is enabled for any attachment where either the source or destination blend factors for that attachment `use the secondary color input`, the maximum value of `Location` for any output attachment `statically used` in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09548
If the current render pass was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfo::pColorAttachmentLocations` in the bound pipeline **must** match the value for the corresponding locations set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09549
If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingInputAttachmentIndexInfo::pColorAttachmentInputIndices` in the bound pipeline **must** match the value for the corresponding index set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10927
If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` in the bound pipeline **must** match the value set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10928
If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` in the bound pipeline **must** match the value set currently

in the current render pass instance

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09642

If the current render pass was begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-09643

If the bound graphics pipeline was created with `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`, the current render pass **must** have begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-10772

If a shader object is bound to any graphics stage, *multiview* functionality **must** not be enabled in the current render pass

- VUID-vkCmdDrawMeshTasksIndirectEXT-flags-11521

If current render pass instance was begun with `vkCmdBeginRendering` with `VkRenderingInfo::flags` which includes `VK_RENDERING_FRAGMENT_REGION_BIT_EXT`, and if *sample shading* is enabled (explicitly or implicitly), then the minimum fraction for sample shading **must** equal 0.0

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11522

If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and the `dynamicRenderingUnusedAttachments` feature is not enabled, the graphics pipeline bound **must** have been created with a `VkCustomResolveCreateInfoEXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11523

If the current render pass instance was begun with `vkCmdBeginRendering` and does not contain a custom resolve, and the `dynamicRenderingUnusedAttachments` feature is not enabled, the graphics pipeline bound **must** not have been created with a `VkCustomResolveCreateInfoEXT`

- VUID-vkCmdDrawMeshTasksIndirectEXT-customResolve-11524

If the current render pass instance was begun with `vkCmdBeginRendering` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-customResolve-11525

If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and `vkCmdBeginCustomResolveEXT` has not been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11861

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, the bound graphics pipeline **must** have been created with a `VkCustomResolveCreateInfoEXT::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11862

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11863

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-11864

If the `dynamicRenderingUnusedAttachments` feature is enabled, the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11865

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11866

If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-11867

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11868
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirectEXT-None-11869
If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`
- VUID-vkCmdDrawMeshTasksIndirectEXT-dynamicRenderingUnusedAttachments-11870
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirectEXT-colorAttachmentCount-11871
If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, then for each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE`, the `resolveImageView` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline
- VUID-vkCmdDrawMeshTasksIndirectEXT-pDepthAttachment-11872
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`
- VUID-vkCmdDrawMeshTasksIndirectEXT-pStencilAttachment-11873
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`
- VUID-vkCmdDrawMeshTasksIndirectEXT-customResolve-11529
If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering`, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectEXT-customResolve-11530

If a shader object is bound to the fragment stage, the current render pass instance was begun with [vkCmdBeginRendering](#) and contains a custom resolve, a fragment density map attachment is active, and [vkCmdBeginCustomResolveEXT](#) has not yet been called, then the fragment shader object bound **must** have been created with [VkCustomResolveCreateInfoEXT::customResolve](#) as [VK_FALSE](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-flags-13361

If there are any shader objects bound that were created with [flags](#) that includes the [VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR](#) bit, then all bound shader objects **must** have been created with the [VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR](#) bit

- VUID-vkCmdDrawMeshTasksIndirectEXT-flags-13362

If there are any shader objects bound that were created with [flags](#) that includes the [VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR](#) bit, with a [setLayoutCount](#) not equal to 0, and with [pSetLayouts](#) not equal to [NULL](#), then the pipeline layout of the bound descriptor sets **must** have been created with [VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT](#) set

- VUID-vkCmdDrawMeshTasksIndirectEXT-flags-12491

If there are any shader objects bound that were created with [flags](#) that includes the [VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR](#) bit, with a [pushConstantRangeCount](#) not equal to 0, and with [pPushConstantRanges](#) not equal to [NULL](#), then the pipeline layout of the bound push constants **must** have been created with [VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT](#) set

- VUID-vkCmdDrawMeshTasksIndirectEXT-flags-13363

If there are any shader objects bound that were created with [flags](#) that includes the [VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR](#) bit, and any of the descriptor set layouts used to create the pipeline layout of the bound descriptor sets were created with any binding's [VkDescriptorSetLayoutBinding::stageFlags](#) set with [VK_SHADER_STAGE_VERTEX_BIT](#), [VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT](#), [VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT](#) or [VK_SHADER_STAGE_GEOMETRY_BIT](#), then there **must** be no binding with [VkDescriptorSetLayoutBinding::stageFlags](#) set with [VK_SHADER_STAGE_TASK_BIT_EXT](#) or [VK_SHADER_STAGE_MESH_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirectEXT-flags-13364

If there are any shader objects bound that were created with [flags](#) that includes both the [VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR](#) and [VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT](#) bits, the pipeline layout of the bound descriptor sets **must** have been created with [VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR](#) set

- VUID-vkCmdDrawMeshTasksIndirectEXT-flags-13365

If there are any shader objects bound that were created with [flags](#) that includes both the [VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR](#) and [VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT](#) bits, there **must** be no shader object bound to the [VK_SHADER_STAGE_TASK_BIT_EXT](#) stage

- VUID-vkCmdDrawMeshTasksIndirectEXT-stage-06480

The bound graphics pipeline **must** not have been created with the

VkPipelineShaderStageCreateInfo::stage member of any element of
VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT,
VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT,
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or
VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-vkCmdDrawMeshTasksIndirectEXT-pStages-10680

If there is no bound graphics pipeline, vkCmdBindShadersEXT **must** not have last bound the
pStages element of VK_SHADER_STAGE_VERTEX_BIT,
VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT,
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or
VK_SHADER_STAGE_GEOMETRY_BIT with a valid shader object other than
VK_NULL_HANDLE

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07074

Transform Feedback Queries **must** not be active

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-07075

Primitives Generated Queries **must** not be active

- VUID-vkCmdDrawMeshTasksIndirectEXT-pipelineStatistics-07076

The pipelineStatistics member used to create any active Pipeline Statistics Query **must**
not contain VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT,
VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT,
VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT,
VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT,
VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT,
VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT,
VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT,
VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT, or
VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_
BIT

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08694

If there is no bound graphics pipeline, and both the taskShader and meshShader features
are enabled, and a valid VkShaderEXT is bound to the
VK_SHADER_STAGE_MESH_BIT_EXT stage, and that VkShaderEXT was created without the
VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, a valid VkShaderEXT **must** be
bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-08695

If there is no bound graphics pipeline, and both the taskShader and meshShader features
are enabled, and a valid VkShaderEXT is bound to the
VK_SHADER_STAGE_MESH_BIT_EXT stage, and that VkShaderEXT was created with the
VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, there **must** be no VkShaderEXT
bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage

- VUID-vkCmdDrawMeshTasksIndirectEXT-buffer-02708

If buffer is non-sparse then it **must** be bound completely and contiguously to a single
VkDeviceMemory object

- VUID-vkCmdDrawMeshTasksIndirectEXT-buffer-02709

buffer must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirectEXT-offset-02710
offset must be a multiple of 4
- VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-02711
commandBuffer must not be a protected command buffer
- VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-02718
If the `multiDrawIndirect` feature is not enabled, **drawCount must** be 0 or 1
- VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-02719
drawCount must be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`
- VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-07088
If **drawCount** is greater than 1, **stride must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawMeshTasksIndirectCommandEXT)`
- VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-07089
If **drawCount** is equal to 1, $(\text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandEXT}))$ **must** be less than or equal to the size of **buffer**
- VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-07090
If **drawCount** is greater than 1, $(\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandEXT}))$ **must** be less than or equal to the size of **buffer**
- VUID-vkCmdDrawMeshTasksIndirectEXT-MeshEXT-07091
The current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` **must** contain a shader stage using the `MeshEXT Execution Model`

Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-parameter
commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawMeshTasksIndirectEXT-buffer-parameter
buffer must be a valid `VkBuffer` handle
- VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-recording
commandBuffer must be in the `recording state`
- VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-cmdpool
The `VkCommandPool` that **commandBuffer** was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdDrawMeshTasksIndirectEXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawMeshTasksIndirectEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDrawMeshTasksIndirectEXT-videocoding
This command **must** only be called outside of a video coding scope

- VUID-vkCmdDrawMeshTasksIndirectEXT-commonparent
Both of **buffer**, and **commandBuffer** **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS HICS_BIT	Action

Conditional Rendering

vkCmdDrawMeshTasksIndirectEXT is affected by [conditional rendering](#)

The **VkDrawMeshTasksIndirectCommandEXT** structure is defined as:

```
// Provided by VK_EXT_mesh_shader
typedef struct VkDrawMeshTasksIndirectCommandEXT {
    uint32_t    groupCountX;
    uint32_t    groupCountY;
    uint32_t    groupCountZ;
} VkDrawMeshTasksIndirectCommandEXT;
```

- **groupCountX** is the number of local workgroups to dispatch in the X dimension.
- **groupCountY** is the number of local workgroups to dispatch in the Y dimension.
- **groupCountZ** is the number of local workgroups to dispatch in the Z dimension.

The members of **VkDrawMeshTasksIndirectCommandEXT** have the same meaning as the similarly named parameters of **vkCmdDrawMeshTasksEXT**.

Valid Usage

- VUID-VkDrawMeshTasksIndirectCommandEXT-TaskEXT-07322
If the current pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** contains a shader

using the **TaskEXT Execution Model**, **groupCountX** **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[0]**

- VUID-VkDrawMeshTasksIndirectCommandEXT-TaskEXT-07323

If the current pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** contains a shader using the **TaskEXT Execution Model**, **groupCountY** **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[1]**

- VUID-VkDrawMeshTasksIndirectCommandEXT-TaskEXT-07324

If the current pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** contains a shader using the **TaskEXT Execution Model**, **groupCountZ** **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[2]**

- VUID-VkDrawMeshTasksIndirectCommandEXT-TaskEXT-07325

If the current pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** contains a shader using the **TaskEXT Execution Model**, The product of **groupCountX**, **groupCountY** and **groupCountZ** **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupTotalCount**

- VUID-VkDrawMeshTasksIndirectCommandEXT-TaskEXT-07326

If the current pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** does not contain a shader using the **TaskEXT Execution Model**, **groupCountX** **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[0]**

- VUID-VkDrawMeshTasksIndirectCommandEXT-TaskEXT-07327

If the current pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** does not contain a shader using the **TaskEXT Execution Model**, **groupCountY** **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[1]**

- VUID-VkDrawMeshTasksIndirectCommandEXT-TaskEXT-07328

If the current pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** does not contain a shader using the **TaskEXT Execution Model**, **groupCountZ** **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount[2]**

- VUID-VkDrawMeshTasksIndirectCommandEXT-TaskEXT-07329

If the current pipeline bound to **VK_PIPELINE_BIND_POINT_GRAPHICS** does not contain a shader using the **TaskEXT Execution Model**, The product of **groupCountX**, **groupCountY** and **groupCountZ** **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount**

To record an indirect mesh tasks drawing command with the draw count sourced from an address range, call:

```
// Provided by VK_KHR_device_address_commands with (VK_KHR_draw_indirect_count or
VK_VERSION_1_2) and VK_EXT_mesh_shader
void vkCmdDrawMeshTasksIndirectCount2EXT(
    VkCommandBuffer                                commandBuffer,
    const VkDrawIndirectCount2InfoKHR*              pInfo);
```

- **commandBuffer** is the command buffer into which the command is recorded.

- `pInfo` is a pointer to a `VkDrawIndirectCount2InfoKHR` structure defining parameters of this command.

`vkCmdDrawMeshTasksIndirectCount2EXT` behaves similarly to `vkCmdDrawMeshTasksIndirect2EXT` except that the draw count is read by the device from an address range during execution. The command will read an unsigned 32-bit integer from `pInfo->countAddressRange` and use this as the draw count.

Valid Usage

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-unnormalizedCoordinates-09635
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08609
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08610
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any

of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08611
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-06479
If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07888
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-02693
If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-filterCubicMinmax-02695
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-OpTypeImage-07027
For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's `format features` **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-OpTypeImage-07028

For any [VkImageView](#) being read as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-OpTypeImage-07029

For any [VkBufferView](#) being written as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-OpTypeImage-07030

Any [VkBufferView](#) being read as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#) then the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08600

If a [a bound shader](#) was created with a pipeline layout and statically uses a set *n*, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with layouts compatible for set *n* with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08601

If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08115

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08116

Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08117

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created

with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08119

If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08605

If a descriptor is dynamically used with a [VkShaderEXT](#) created with a [VkDescriptorSetLayout](#) that was created with [VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08606

If the [shaderObject](#) feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08608

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08612

If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08613

If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-commandBuffer-02707
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by **bound shaders** **must** not be a protected resource
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-viewType-07752
If a **VkImageView** is accessed as a result of this command, then the image view's **viewType** **must** match the **Dim** operand of the **OpTypeImage** as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-format-07753
If a **VkImageView** or **VkBufferView** is accessed as a result of this command, then the **numeric type** of the view's **format** and the **Sampled Type** operand of the **OpTypeImage** **must** match
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-OpImageWrite-08795
If a **VkImageView** created with a format other than **VK_FORMAT_A8_UNORM** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-OpImageWrite-08796
If a **VkImageView** created with the format **VK_FORMAT_A8_UNORM** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have four components
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-OpImageWrite-04469
If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-SampledType-04470
If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-SampledType-04471
If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-SampledType-04472
If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-SampledType-04473
If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sparseImageInt64Atomics-04474
If the **sparseImageInt64Atomics** feature is not enabled, **VkImage** objects created with the **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07288
Any shader invocation executed by this command **must** `terminate`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-micromap-11636
If an acceleration structure is accessed as a result of this command through an `OpRayQueryProceedKHR` operation, the `VK_EXT_opacity_micromap` extension is not enabled, and the acceleration structure is built using geometry with a `VkAccelerationStructureTrianglesOpacityMicromapKHR` structure included in its `pNext` chain, the shader **must** have specified a `OpacityMicromapIdKHR` execution mode with its specialization constant operand equal to `VK_TRUE`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-micromap-11637
If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-micromap-11638
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkPipeline` bound to the pipeline bind point used by this command **must** not have been created with `flags` that includes `VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-micromap-11639
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkShaderEXT` that accessed the descriptor **must** not have been created with `flags` that includes `VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-12472
Descriptors dynamically accessed in bound descriptor heaps **must** be valid
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11297

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a [OpTypeStruct](#) decorated with [Block](#) or [BufferBlock](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [bufferDescriptorAlignment](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeImage](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [imageDescriptorAlignment](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeSampler](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the sampler heap **must** be a multiple of [samplerDescriptorAlignment](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push

data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11372

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11373

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#)

feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11374

If the [robustBufferAccess2](#) feature is not enabled, the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pBindInfo-11375

If any [bound shader](#) uses an embedded sampler via a [descriptor mapping](#), the value of [pBindInfo->reservedRangeSize](#) set for [vkCmdBindSamplerHeapEXT](#) **must** be greater than or equal to [minSamplerHeapReservedRangeWithEmbedded](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11376

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, and that shader statically uses a push constant value, that value **must** have been set by [vkCmdPushDataEXT](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11398

If a [bound shader](#) was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the access **must** not be [out of bounds](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the [VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the [VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT](#) and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to [minUniformBufferOffsetAlignment](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** have been queried from a buffer created with the [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to [minStorageBufferOffsetAlignment](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a [VkAccelerationStructureKHR](#) object via [vkGetAccelerationStructureDeviceAddressKHR](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and that sampler descriptor uses a custom border color with an index defined by [VkSamplerCustomBorderColorIndexCreateInfoEXT](#), the value of [VkSamplerCustomBorderColorIndexCreateInfoEXT::index](#) **must** have been registered before this command was recorded, and still be registered during the sampling operation, with an identically defined color

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-protectedNoFault-11455

If [protectedNoFault](#) is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#),

VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or
VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, the address that the
resource is mapped to **must** have been queried from a buffer created without the
VK_BUFFER_CREATE_PROTECTED_BIT create flag set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-protectedNoFault-11456

If **protectedNoFault** is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a **descriptor mapping** using
VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT or
VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, the
address of the indirect memory **must** have been queried from a buffer created without the
VK_BUFFER_CREATE_PROTECTED_BIT create flag set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-renderPass-02684

The current render pass **must** be **compatible** with the **renderPass** member of the
VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to
VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-subpass-02685

The subpass index of the current render pass **must** be equal to the **subpass** member of the
VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to
VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-OpTypeImage-07468

If any shader executed by this pipeline accesses an **OpTypeImage** variable with a **Dim**
operand of **SubpassData**, it **must** be decorated with an **InputAttachmentIndex** that
corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07469

Input attachment views accessed in a subpass **must** be created with the same **VkFormat**
as the corresponding subpass definition, and be created with a **VkImageView** that is
compatible with the attachment referenced by the subpass' **pInputAttachments**
[**InputAttachmentIndex**] in the bound **VkFramebuffer** as specified by **Fragment Input Attachment Compatibility**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pDepthInputAttachmentIndex-09595

Input attachment views accessed in a dynamic render pass with a **InputAttachmentIndex**
referenced by **VkRenderingInputAttachmentIndexInfo**, or no **InputAttachmentIndex** if
VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex or
VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex are **NULL**, **must** be
created with a **VkImageView** that is compatible with the corresponding color, depth, or
stencil attachment in **VkRenderingInfo**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pDepthInputAttachmentIndex-09596

Input attachment views accessed in a dynamic render pass via a shader object **must** have
an **InputAttachmentIndex** if both **VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex**
and **VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex** are non-**NULL**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-InputAttachmentIndex-09597

If an input attachment view accessed in a dynamic render pass via a shader object has an
InputAttachmentIndex, the **InputAttachmentIndex** **must** match an index in

VkRenderingInputAttachmentIndexInfo

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-06537
Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10795
If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10796
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10797
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-12338
If a color attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, the color attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-12339
If a depth attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, the depth attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-12340
If a stencil attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, the stencil attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, [depth writes](#) **must** be disabled
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back [writeMask](#) are not zero, and stencil test is

enabled, **all stencil ops must** be `VK_STENCIL_OP_KEEP`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07831

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07832

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08617

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **effective rasterization input topology** is in the line topology class, then `vkCmdSetLineWidth` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07834

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `depthBiasEnable` is `VK_TRUE`, then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07835

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment **current value** of `blendEnable` is `VK_TRUE` with a blend equations where any `VkBlendFactor` member is `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, then `vkCmdSetBlendConstants` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07836

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `depthBoundsTestEnable` is `VK_TRUE`, then `vkCmdSetDepthBounds` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07837

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state

enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilCompareMask` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07838

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07839

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, the **current value** of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07634

If the `VK_EXT_sample_locations` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07840

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullMode` **must**

have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07841

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_FRONT_FACE** dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, then **vkCmdSetFrontFace** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07843

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, **vkCmdSetDepthTestEnable** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07844

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthTestEnable** is **VK_TRUE**, then **vkCmdSetDepthWriteEnable** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07845

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthTestEnable** is **VK_TRUE**, then **vkCmdSetDepthCompareOp** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07846

If the **depthBounds** feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE** dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, then **vkCmdSetDepthBoundsTestEnable** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07847

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE** dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, then **vkCmdSetStencilTestEnable** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07848

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_STENCIL_OP** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, the **current value** of

`stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOp` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-viewportCount-03417

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-scissorCount-03418

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-viewportCount-03419

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-04876

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-04877

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-logicOp-04878

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-primitiveFragmentShadingRateWithMultipleViewports-08642
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-blendEnable-04727
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the **current value** of `blendEnable` **must** be `VK_FALSE`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08644
If a shader object is bound to any graphics stage or a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and none of the following is enabled:
 - the `multisampledRenderToSingleSampled` feature
 then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08876
If a shader object is bound to any graphics stage, the current render pass instance **must** have been begun with `vkCmdBeginRendering`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageView-06172
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageView-06173
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageView-06174
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageView-06175
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView`

member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageView-06176

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageView-06177

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-viewMask-06178

If the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-colorAttachmentCount-06179

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08910

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08912

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08911

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`

::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE **must** have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the bound graphics pipeline, or the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats, if it exists, **must** be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07749

If the colorWriteEnable feature is enabled, a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then vkCmdSetColorWriteEnableEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-attachmentCount-07750

If the colorWriteEnable feature is enabled, a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled, and the current value of rasterizerDiscardEnable is VK_FALSE, then the attachmentCount parameter of most recent call to vkCmdSetColorWriteEnableEXT in the current command buffer **must** be greater than or equal to the number of active color attachments

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07751

If the VK_EXT_discard_rectangles extension is enabled, a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled and the pNext chain of VkGraphicsPipelineCreateInfo included a VkPipelineDiscardRectangleStateCreateInfoEXT structure, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of discardRectangleEnable is VK_TRUE, then vkCmdSetDiscardRectangleEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-rasterizerDiscardEnable-09236

If the VK_EXT_discard_rectangles extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled and the pNext chain of VkGraphicsPipelineCreateInfo did not include a VkPipelineDiscardRectangleStateCreateInfoEXT structure, the current value of rasterizerDiscardEnable is VK_FALSE, and the current value of discardRectangleEnable is VK_TRUE, then vkCmdSetDiscardRectangleEXT **must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07880

If the VK_EXT_discard_rectangles extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT dynamic state enabled, the current value of rasterizerDiscardEnable is VK_FALSE, then

`vkCmdSetDiscardRectangleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07881

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08913

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08914

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08915

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08916

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08917

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of

`VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-08918

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageView-06183

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingLocalRead-11797

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingLocalRead` feature is enabled, the `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` flag is specified, and an attachment is being used as a feedback loop as specified by `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`, `VkRenderingAttachmentFlagsInfoKHR::flags` for that attachment **must** include `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-imageView-06184

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-multisampledRenderToSingleSampled-07285

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-multisampledRenderToSingleSampled-07286

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value

of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-multisampledRenderToSingleSampled-07287

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pNext-07935

If this command is called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-renderPass-06198

If the current render pass instance was begun with `vkCmdBeginRendering`, the bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pColorAttachments-08963

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pColorAttachments-11539

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->resolveImageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pDepthAttachment-08964

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pDepthAttachment-11540
 If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pStencilAttachment-08965
 If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pStencilAttachment-11860
 If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-flags-10582
 If the current render pass instance was begun with a `vkCmdBeginRendering` call in `commandBuffer`, its `VkRenderingInfo::flags` parameter **must** not have `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` set unless `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` is also set
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-primitivesGeneratedQueryWithRasterizerDiscard-06708
 If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, `rasterization discard` **must** not be enabled
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-primitivesGeneratedQueryWithNonZeroStreams-06709
 If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07620
 If the `depthClamp` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07621

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetPolygonModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07622

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07623

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-alphaToCoverageEnable-08919

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location 0` at `Index 0`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-alphaToCoverageEnable-08920

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location 0` at `Index 0`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07624

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07625

If the `alphaToOne` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07626

If the `logicOp` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled,

and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07627

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07629

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07630

If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage or a graphics pipeline is bound which was created with both a `VK_SHADER_STAGE_GEOMETRY_BIT` stage and the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled, then `vkCmdSetRasterizationStreamEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07631

If the `VK_EXT_conservative_rasterization` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07632

If the `VK_EXT_conservative_rasterization` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `conservativeRasterizationMode` is `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-conservativePointAndLineRasterization-07499

If the `VK_EXT_conservative_rasterization` extension is enabled, `conservativePointAndLineRasterization` is not supported, a shader object is bound to any graphics stage or a graphics pipeline is bound, the current value of

`rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line or point topology class, then the current value of `conservativeRasterizationMode` must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07633

If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state, then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07636

If the `VK_EXT_provoking_vertex` extension is enabled, a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08666

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08669

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07849

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled and a shader object is bound to any graphics stage, or a bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `stippledLineEnable` is `VK_TRUE`, then `vkCmdSetLineStipple` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10608

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic

state enabled, the [effective rasterization input topology](#) is in the line topology class, and the current [lineRasterizationMode](#) is [VK_LINE_RASTERIZATION_MODE_BRESENHAM](#) or [VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH](#), then the current [alphaToCoverageEnable](#), [alphaToOneEnable](#) and [sampleShadingEnable](#) states **must** all be [VK_FALSE](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07639

If the [depthClipControl](#) feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT](#) dynamic state enabled, then [vkCmdSetDepthClipNegativeOneToOneEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09650

If the [depthClampControl](#) feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT](#) dynamic state enabled, and the [current value](#) of [depthClampEnable](#) is [VK_TRUE](#), then [vkCmdSetDepthClampRangeEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-rasterizationSamples-07471

If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT](#) state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the [rasterizationSamples](#) in the last call to [vkCmdSetRasterizationSamplesEXT](#) **must** follow the rules for a [zero-attachment subpass](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-samples-07472

If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_SAMPLE_MASK_EXT](#) state enabled and the [VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT](#) state disabled, then the [samples](#) parameter in the last call to [vkCmdSetSampleMaskEXT](#) **must** be greater or equal to the [VkPipelineMultisampleStateCreateInfo::rasterizationSamples](#) parameter used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-samples-07473

If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_SAMPLE_MASK_EXT](#) state and [VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT](#) states enabled, then the [samples](#) parameter in the last call to [vkCmdSetSampleMaskEXT](#) **must** be greater or equal to the [rasterizationSamples](#) parameter in the last call to [vkCmdSetRasterizationSamplesEXT](#)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09211

If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT](#) state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a [VkMultisampledRenderToSingleSampledInfoEXT](#) structure with [multisampledRenderToSingleSampledEnable](#) equal to [VK_TRUE](#), then the [rasterizationSamples](#) in the last call to [vkCmdSetRasterizationSamplesEXT](#) **must** be the same as the [rasterizationSamples](#) member of that structure

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-firstAttachment-07476

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorBlendEnableEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-firstAttachment-07478

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorWriteMaskEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-advancedBlendMaxColorAttachments-07480

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment current value of `blendEnable` is `VK_TRUE`, then the number of active color attachments **must** not exceed `advancedBlendMaxColorAttachments`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10862

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-rasterizerDiscardEnable-10863

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendAdvancedEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10864

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then either `vkCmdSetColorBlendAdvancedEXT` or `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of

VK_TRUE

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-

primitivesGeneratedQueryWithNonZeroStreams-07481

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` **must** have set the `rasterizationStream` to zero

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsPerPixel-07482

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsPerPixel-07483

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsEnable-07484

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT` then the current active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsEnable-07485

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsEnable-07486

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound

graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsEnable-07487

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsEnable-07936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.width` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsEnable-07937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.height` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-sampleLocationsEnable-07938

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationsPerPixel` **must** equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-stippledLineEnable-07495

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if

the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `stippledRectangularLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-stippledLineEnable-07496

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `stippledBresenhamLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-stippledLineEnable-07497

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `stippledSmoothLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-stippledLineEnable-07498

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-stage-07073

If the bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then `Mesh Shader Queries` **must** not be active

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08877

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-nextStage-10745

For each shader object bound to a graphics stage, except for shader object bound to the last graphics stage in the logical pipeline, it **must** have been created with a `nextStage` including the corresponding bit to the shader object bound to the following graphics stage in the logical pipeline

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08684

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of

VK_SHADER_STAGE_VERTEX_BIT

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08685

If there is no bound graphics pipeline, and the **tessellationShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08686

If there is no bound graphics pipeline, and the **tessellationShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08687

If there is no bound graphics pipeline, and the **geometryShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_GEOMETRY_BIT**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08688

If there is no bound graphics pipeline, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_FRAGMENT_BIT**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08689

If there is no bound graphics pipeline, and the **taskShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TASK_BIT_EXT**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08690

If there is no bound graphics pipeline, and the **meshShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_MESH_BIT_EXT**

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08693

If there is no bound graphics pipeline, and at least one of the **taskShader** and **meshShader** features is enabled, one of the **VK_SHADER_STAGE_VERTEX_BIT** or **VK_SHADER_STAGE_MESH_BIT_EXT** stages **must** have a valid **VkShaderEXT** bound, and the other **must** have no **VkShaderEXT** bound

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08696

If there is no bound graphics pipeline, and a valid **VkShaderEXT** is bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage, there **must** be no **VkShaderEXT** bound to either the **VK_SHADER_STAGE_TASK_BIT_EXT** stage or the **VK_SHADER_STAGE_MESH_BIT_EXT** stage

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08698

If any graphics shader is bound which was created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag, then all shaders created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag in the same **vkCreateShadersEXT** call **must** also be bound

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08699

If any graphics shader is bound which was created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag, any stages in between stages whose shaders which did not create a shader with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag as part of the same **vkCreateShadersEXT**

call **must** not have any `VkShaderEXT` bound

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08878

All bound graphics shader objects **must** have been created with identical or `identically defined` push constant ranges

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08879

All bound graphics shader objects **must** have either been created with the `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` flag set, or with identical or `identically defined` arrays of descriptor set layouts

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pDynamicStates-08715

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pDynamicStates-08716

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` **must** be 0

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09116

If a shader object is bound to any graphics stage or the bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` **must** either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, `VK_COLOR_COMPONENT_B_BIT`, and `VK_COLOR_COMPONENT_A_BIT`, or none of them

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-maxFragmentDualSrcAttachments-09239

If `blending` is enabled for any attachment where either the source or destination blend factors for that attachment `use the secondary color input`, the maximum value of `Location` for any output attachment `statically used` in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09548

If the current render pass was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfo::pColorAttachmentLocations` in the bound pipeline **must** match the value for the corresponding locations set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09549

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingInputAttachmentIndexInfo::pColorAttachmentInputIndices` in the bound pipeline **must** match the value for the corresponding index set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10927
If the current render pass was begun with [vkCmdBeginRendering](#), and there is no shader object bound to any graphics stage, the value of [VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex](#) in the bound pipeline **must** match the value set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10928
If the current render pass was begun with [vkCmdBeginRendering](#), and there is no shader object bound to any graphics stage, the value of [VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex](#) in the bound pipeline **must** match the value set currently in the current render pass instance
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09642
If the current render pass was begun with [vkCmdBeginRendering](#) with the [VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT](#) flag, the bound graphics pipeline **must** have been created with [VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-09643
If the bound graphics pipeline was created with [VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT](#), the current render pass **must** have begun with [vkCmdBeginRendering](#) with the [VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT](#) flag
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-10772
If a shader object is bound to any graphics stage, *multiview* functionality **must** not be enabled in the current render pass
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-flags-11521
If current render pass instance was begun with [vkCmdBeginRendering](#) with [VkRenderingInfo::flags](#) which includes [VK_RENDERING_FRAGMENT_REGION_BIT_EXT](#), and if [sample shading](#) is enabled (explicitly or implicitly), then the minimum fraction for sample shading **must** equal 0.0
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11522
If the current render pass instance was begun with [vkCmdBeginRendering](#) and contains a custom resolve, and the [dynamicRenderingUnusedAttachments](#) feature is not enabled, the graphics pipeline bound **must** have been created with a [VkCustomResolveCreateInfoEXT](#)
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11523
If the current render pass instance was begun with [vkCmdBeginRendering](#) and does not contain a custom resolve, and the [dynamicRenderingUnusedAttachments](#) feature is not enabled, the graphics pipeline bound **must** not have been created with a [VkCustomResolveCreateInfoEXT](#)
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-customResolve-11524
If the current render pass instance was begun with [vkCmdBeginRendering](#) and [vkCmdBeginCustomResolveEXT](#) has been recorded in the render pass instance, the graphics pipeline bound **must** have been created with [VkCustomResolveCreateInfoEXT::customResolve](#) as [VK_TRUE](#)
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-customResolve-11525
If the current render pass instance was begun with [vkCmdBeginRendering](#) and contains a

custom resolve, and `vkCmdBeginCustomResolveEXT` has not been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11861

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, the bound graphics pipeline **must** have been created with a `VkCustomResolveCreateInfoEXT::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11862

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11863

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-11864

If the `dynamicRenderingUnusedAttachments` feature is enabled, the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11865

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11866

If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the

value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-11867

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11868

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-11869

If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-dynamicRenderingUnusedAttachments-11870

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-colorAttachmentCount-11871

If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, then for each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE`, the `resolveImageView` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pDepthAttachment-11872

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the

value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pStencilAttachment-11873

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-customResolve-11529

If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering`, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-customResolve-11530

If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has not yet been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-flags-13361

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, then all bound shader objects **must** have been created with the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-flags-13362

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `setLayoutCount` not equal to 0, and with `pSetLayouts` not equal to `NULL`, then the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-flags-12491

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `pushConstantRangeCount` not equal to 0, and with `pPushConstantRanges` not equal to `NULL`, then the pipeline layout of the bound push constants **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-flags-13363

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, and any of the descriptor set layouts used to create the pipeline layout of the bound descriptor sets were created with any binding's `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then there **must** be no binding with `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-flags-13364
If there are any shader objects bound that were created with **flags** that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR` set
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-flags-13365
If there are any shader objects bound that were created with **flags** that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, there **must** be no shader object bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-stage-06480
The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of any element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pStages-10680
If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** not have last bound the `pStages` element of `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` with a valid shader object other than `VK_NULL_HANDLE`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07074
`Transform Feedback Queries` **must** not be active
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-07075
`Primitives Generated Queries` **must** not be active
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pipelineStatistics-07076
The `pipelineStatistics` member used to create any active `Pipeline Statistics Query` **must** not contain `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT`, or `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08694
If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created without the

`VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, a valid `VkShaderEXT` **must** be bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-None-08695
If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created with the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, there **must** be no `VkShaderEXT` bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-commandBuffer-13068
`commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-drawIndirectCount-13069
If the `drawIndirectCount` feature is not enabled this function **must** not be used

Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-pInfo-parameter
`pInfo` **must** be a valid pointer to a valid `VkDrawIndirectCount2InfoKHR` structure
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDrawMeshTasksIndirectCount2EXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAP HICS_BIT	Action

Conditional Rendering

vkCmdDrawMeshTasksIndirectCount2EXT is affected by [conditional rendering](#)

To record an indirect mesh tasks drawing command with the draw count sourced from a buffer, call:

WARNING

This functionality is superseded by [vkCmdDrawMeshTasksIndirectCount2EXT](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_mesh_shader with VK_VERSION_1_2 or VK_KHR_draw_indirect_count or
VK_AMD_draw_indirect_count
void vkCmdDrawMeshTasksIndirectCountEXT(
    VkCommandBuffer          commandBuffer,
    VkBuffer                  buffer,
    VkDeviceSize              offset,
    VkBuffer                  countBuffer,
    VkDeviceSize              countBufferOffset,
    uint32_t                  maxDrawCount,
    uint32_t                  stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawMeshTasksIndirectCountEXT` behaves similarly to `vkCmdDrawMeshTasksIndirectEXT` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

Valid Usage

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-magFilter-04553

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-magFilter-09598

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06479
If a [VkImageView](#) is sampled with [depth comparison](#), the image view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-02691
If a [VkImageView](#) is accessed using atomic operations as a result of this command, then the image view's [format features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07888
If a [VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER](#) descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's [format features](#) **must** contain [VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-02692
If a [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, then the image view's [format features](#) **must** contain [VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-02693
If the [VK_EXT_filter_cubic](#) extension is not enabled and any [VkImageView](#) is sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command, it **must** not have a [VkImageViewType](#) of [VK_IMAGE_VIEW_TYPE_3D](#), [VK_IMAGE_VIEW_TYPE_CUBE](#), or [VK_IMAGE_VIEW_TYPE_CUBE_ARRAY](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-filterCubic-02694
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-filterCubicMinmax-02695
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07027
For any [VkImageView](#) being written as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07028
For any [VkImageView](#) being read as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07029
For any [VkBufferView](#) being written as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07030
Any [VkBufferView](#) being read as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#) then the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08600
If a [a bound shader](#) was created with a pipeline layout and statically uses a set *n*, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with layouts compatible for set *n* with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08601
If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10068
For each array of resources that is used by [a bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08114
Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageLayout-00344
If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08115
If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08116
Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08117
If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08119
If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08605
If a descriptor is dynamically used with a [VkShaderEXT](#) created with a

`VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08606
If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08608
If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-uniformBuffers-06935
If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08612
If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-storageBuffers-06936
If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08613
If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-02707
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewType-07752
If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-format-07753
If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpImageWrite-08795
If a [VkImageView](#) created with a format other than [VK_FORMAT_A8_UNORM](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpImageWrite-08796
If a [VkImageView](#) created with the format [VK_FORMAT_A8_UNORM](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have four components
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpImageWrite-04469
If a [VkBufferView](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-SampledType-04470
If a [VkImageView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-SampledType-04471
If a [VkImageView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-SampledType-04472
If a [VkBufferView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-SampledType-04473
If a [VkBufferView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sparseImageInt64Atomics-04474
If the [sparseImageInt64Atomics](#) feature is not enabled, [VkImage](#) objects created with the [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sparseImageInt64Atomics-04475
If the [sparseImageInt64Atomics](#) feature is not enabled, [VkBuffer](#) objects created with the [VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07288
Any shader invocation executed by this command **must** [terminate](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09600
If a descriptor with type equal to any of [VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE](#), [VK_DESCRIPTOR_TYPE_STORAGE_IMAGE](#), or [VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT](#) is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-micromap-11636
If an acceleration structure is accessed as a result of this command through an [OpRayQueryProceedKHR](#) operation, the [VK_EXT_opacity_micromap](#) extension is not enabled, and the acceleration structure is built using geometry with a [VkAccelerationStructureTrianglesOpacityMicromapKHR](#) structure included in its [pNext](#) chain, the shader **must** have specified a [OpacityMicromapIdKHR](#) execution mode with its specialization constant operand equal to [VK_TRUE](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-micromap-11637
If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-micromap-11638
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkPipeline](#) bound to the pipeline bind point used by this command **must** not have been created with [flags](#) that includes [VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-micromap-11639
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkShaderEXT](#) that accessed the descriptor **must** not have been created with [flags](#) that includes [VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-12472
Descriptors dynamically accessed in bound descriptor heaps **must** be valid
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11297
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a [OpTypeStruct](#) decorated with [Block](#) or [BufferBlock](#) using that mapping, the

calculated offset for the resource heap **must** be a multiple of `bufferDescriptorAlignment`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeImage` or `OpTypeSampledImage` using that mapping, the calculated offset for the resource heap **must** be a multiple of `imageDescriptorAlignment`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeSampler` or `OpTypeSampledImage` using that mapping, the calculated offset for the sampler heap **must** be a multiple of `samplerDescriptorAlignment`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid `VkDeviceAddress` backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid `VkDeviceAddress`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location

in push data **must** be a multiple of 8

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11372

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11373

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11374

If the [robustBufferAccess2](#) feature is not enabled, the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or

storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pBindInfo-11375

If any [bound shader](#) uses an embedded sampler via a [descriptor mapping](#), the value of `pBindInfo->reservedRangeSize` set for `vkCmdBindSamplerHeapEXT` **must** be greater than or equal to `minSamplerHeapReservedRangeWithEmbedded`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11376

If a [bound shader](#) was created as a `VkShaderEXT` with the `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` flag or as part of a pipeline with the `VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT` flag, and that shader statically uses a push constant value, that value **must** have been set by `vkCmdPushDataEXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11398

If a [bound shader](#) was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the access **must** not be [out of bounds](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT` and a shader accesses

a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to `minUniformBufferOffsetAlignment`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** have been queried from a buffer created with the `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to `minStorageBufferOffsetAlignment`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a `VkAccelerationStructureKHR` object via `vkGetAccelerationStructureDeviceAddressKHR`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and that sampler descriptor uses a custom border color with an index defined by `VkSamplerCustomBorderColorIndexCreateInfoEXT`, the value of `VkSamplerCustomBorderColorIndexCreateInfoEXT::index` **must** have been registered before this command was recorded, and still be registered during the sampling operation, with an identically defined color

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-protectedNoFault-11455

If `protectedNoFault` is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, the address that the resource is mapped to **must** have been queried from a buffer created without the `VK_BUFFER_CREATE_PROTECTED_BIT` create flag set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-protectedNoFault-11456

If `protectedNoFault` is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, the address of the indirect memory **must** have been queried from a buffer created without the `VK_BUFFER_CREATE_PROTECTED_BIT` create flag set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-renderPass-02684

The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-subpass-02685

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07468

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07469

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments` [`InputAttachmentIndex`] in the bound `VkFramebuffer` as specified by `Fragment Input Attachment Compatibility`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthInputAttachmentIndex-09595

Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfo`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` are `NULL`, **must** be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthInputAttachmentIndex-09596

Input attachment views accessed in a dynamic render pass via a shader object **must** have an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` are non-`NULL`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-InputAttachmentIndex-09597

If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` **must** match an index in `VkRenderingInputAttachmentIndexInfo`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10795
If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10796
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10797
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-12338
If a color attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, the color attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-12339
If a depth attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, the depth attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-12340
If a stencil attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, the stencil attachment **must** not be written to by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, [depth writes](#) **must** be disabled
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back [writeMask](#) are not zero, and stencil test is enabled, [all stencil ops](#) **must** be [VK_STENCIL_OP_KEEP](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07831
If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_VIEWPORT](#) dynamic state enabled then [vkCmdSetViewport](#) **must**

have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07832

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08617

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **effective rasterization input topology** is in the line topology class, then **vkCmdSetLineWidth** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07834

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBiasEnable** is **VK_TRUE**, then **vkCmdSetDepthBias** or **vkCmdSetDepthBias2EXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07835

If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_BLEND_CONSTANTS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and an active color attachment **current value** of **blendEnable** is **VK_TRUE** with a blend equations where any **VkBlendFactor** member is **VK_BLEND_FACTOR_CONSTANT_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR**, **VK_BLEND_FACTOR_CONSTANT_ALPHA**, or **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA**, then **vkCmdSetBlendConstants** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07836

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BOUNDS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBoundsTestEnable** is **VK_TRUE**, then **vkCmdSetDepthBounds** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07837

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **stencilTestEnable** is **VK_TRUE**, then **vkCmdSetStencilCompareMask** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07838

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilWriteMask` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07839

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, the **current value** of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-02689

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE`, then the active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07634

If the `VK_EXT_sample_locations` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06666

If the `VK_EXT_sample_locations` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07840

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetCullMode` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07841

If a shader object is bound to any graphics stage or a graphics pipeline is bound which

was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetFrontFace` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07843

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07844

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07845

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthCompareOp` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07846

If the `depthBounds` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07847

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07848

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, the `current value` of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOp` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-03417

If a shader object is bound to any graphics stage or a graphics pipeline is bound which

was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-scissorCount-03418

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-03419

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-04876

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-04877

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-logicOp-04878

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitiveFragmentShadingRateWithMultipleViewports-08642

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in,

then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-blendEnable-04727

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's **format features** do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding **current value** of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08644

If a shader object is bound to any graphics stage or a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and none of the following is enabled:

- the `multisampledRenderToSingleSampled` feature

then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08876

If a shader object is bound to any graphics stage, the current render pass instance **must** have been begun with `vkCmdBeginRendering`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06172

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06173

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06174

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06175

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06176
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06177
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewMask-06178
If the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-colorAttachmentCount-06179
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08910
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08912
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08911
If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo`

::pColorAttachmentFormats, if it exists, **must** be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07749

If the `colorWriteEnable` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-attachmentCount-07750

If the `colorWriteEnable` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer **must** be greater than or equal to the number of active color attachments

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07751

If the `VK_EXT_discard_rectangles` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled and the `pNext` chain of `VkGraphicsPipelineCreateInfo` included a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizerDiscardEnable-09236

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled and the `pNext` chain of `VkGraphicsPipelineCreateInfo` did not include a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for each discard rectangle in `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07880

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07881

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08913

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08914

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08915

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08916

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08917

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-08918

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06183

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingLocalRead-11797

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingLocalRead` feature is enabled, the `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` flag is specified, and an attachment is being used as a feedback loop as specified by `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`, `VkRenderingAttachmentFlagsInfoKHR::flags` for that attachment **must** include `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06184

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07285

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07286

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-

07287

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pNext-07935

If this command is called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-renderPass-06198

If the current render pass instance was begun with `vkCmdBeginRendering`, the bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pColorAttachments-08963

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pColorAttachments-11539

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->resolveImageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthAttachment-08964

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthAttachment-11540

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a

graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pStencilAttachment-08965

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pStencilAttachment-11860

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-10582

If the current render pass instance was begun with a `vkCmdBeginRendering` call in `commandBuffer`, its `VkRenderingInfo::flags` parameter **must** not have `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` set unless `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` is also set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, `rasterization discard` **must** not be enabled

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitivesGeneratedQueryWithNonZeroStreams-06709

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07620

If the `depthClamp` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07621

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then

`vkCmdSetPolygonModeEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07622

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07623

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleMaskEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-alphaToCoverageEnable-08919

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the **Fragment Output Interface** **must** contain a variable for the alpha **Component** word in **Location** 0 at **Index** 0

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-alphaToCoverageEnable-08920

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the **Fragment Output Interface** **must** contain a variable for the alpha **Component** word in **Location** 0 at **Index** 0

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07624

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07625

If the `alphaToOne` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07626

If the `logicOp` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07627

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07629

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07630

If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage or a graphics pipeline is bound which was created with both a `VK_SHADER_STAGE_GEOMETRY_BIT` stage and the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled, then `vkCmdSetRasterizationStreamEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07631

If the `VK_EXT_conservative_rasterization` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07632

If the `VK_EXT_conservative_rasterization` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `conservativeRasterizationMode` is `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-conservativePointAndLineRasterization-07499

If the `VK_EXT_conservative_rasterization` extension is enabled, `conservativePointAndLineRasterization` is not supported, a shader object is bound to any graphics stage or a graphics pipeline is bound, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line or point topology class, then the current value of `conservativeRasterizationMode` **must** be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07633
If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state, then `vkCmdSetDepthClipEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07636
If the `VK_EXT_provoking_vertex` extension is enabled, a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08666
If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineRasterizationModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08669
If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineStippleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07849
If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled and a shader object is bound to any graphics stage, or a bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `stippledLineEnable` is `VK_TRUE`, then `vkCmdSetLineStipple` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10608
If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, the effective rasterization input topology is in the line topology class, and the current `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the current `alphaToCoverageEnable`, `alphaToOneEnable` and `sampleShadingEnable` states **must** all be

VK_FALSE

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07639

If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled, then `vkCmdSetDepthClipNegativeOneToOneEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09650

If the `depthClampControl` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT` dynamic state enabled, and the `current value` of `depthClampEnable` is `VK_TRUE`, then `vkCmdSetDepthClampRangeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizationSamples-07471

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** follow the rules for a `zero-attachment subpass`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-samples-07472

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-samples-07473

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` **must** be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09211

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` **must** be the same as the `rasterizationSamples` member of that structure

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07476

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, and the

current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorBlendEnableEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-firstAttachment-07478

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorWriteMaskEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-advancedBlendMaxColorAttachments-07480

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment current value of `blendEnable` is `VK_TRUE`, then the number of active color attachments **must** not exceed `advancedBlendMaxColorAttachments`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10862

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-rasterizerDiscardEnable-10863

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendAdvancedEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10864

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then either `vkCmdSetColorBlendAdvancedEXT` or `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable` current value of `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-

`primitivesGeneratedQueryWithNonZeroStreams-07481`

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` **must** have set the `rasterizationStream` to zero

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsPerPixel-07482

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsPerPixel-07483

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the **current value** of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07484

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT` then the current active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07485

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07486

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to

`vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07487

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07936

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.width` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07937

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.height` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-07938

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `current` value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationsPerPixel` **must** equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stippledLineEnable-07495

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `stippledRectangularLines` feature **must** be enabled

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stippledLineEnable-07496
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `stippledBresenhamLines` feature **must** be enabled
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stippledLineEnable-07497
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `stippledSmoothLines` feature **must** be enabled
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stippledLineEnable-07498
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stage-07073
If the bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then `Mesh Shader Queries` **must** not be active
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08877
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-nextStage-10745
For each shader object bound to a graphics stage, except for shader object bound to the last graphics stage in the logical pipeline, it **must** have been created with a `nextStage` including the corresponding bit to the shader object bound to the following graphics stage in the logical pipeline
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08684
If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08685
If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled,

vkCmdBindShadersEXT **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT**

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08686

If there is no bound graphics pipeline, and the **tessellationShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT**

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08687

If there is no bound graphics pipeline, and the **geometryShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_GEOMETRY_BIT**

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08688

If there is no bound graphics pipeline, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_FRAGMENT_BIT**

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08689

If there is no bound graphics pipeline, and the **taskShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_TASK_BIT_EXT**

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08690

If there is no bound graphics pipeline, and the **meshShader** feature is enabled, **vkCmdBindShadersEXT** **must** have been called in the current command buffer with **pStages** with an element of **VK_SHADER_STAGE_MESH_BIT_EXT**

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08693

If there is no bound graphics pipeline, and at least one of the **taskShader** and **meshShader** features is enabled, one of the **VK_SHADER_STAGE_VERTEX_BIT** or **VK_SHADER_STAGE_MESH_BIT_EXT** stages **must** have a valid **VkShaderEXT** bound, and the other **must** have no **VkShaderEXT** bound

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08696

If there is no bound graphics pipeline, and a valid **VkShaderEXT** is bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage, there **must** be no **VkShaderEXT** bound to either the **VK_SHADER_STAGE_TASK_BIT_EXT** stage or the **VK_SHADER_STAGE_MESH_BIT_EXT** stage

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08698

If any graphics shader is bound which was created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag, then all shaders created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag in the same **vkCreateShadersEXT** call **must** also be bound

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08699

If any graphics shader is bound which was created with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag, any stages in between stages whose shaders which did not create a shader with the **VK_SHADER_CREATE_LINK_STAGE_BIT_EXT** flag as part of the same **vkCreateShadersEXT** call **must** not have any **VkShaderEXT** bound

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08878

All bound graphics shader objects **must** have been created with identical or **identically**

defined push constant ranges

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08879

All bound graphics shader objects **must** have either been created with the `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` flag set, or with identical or **identically defined** arrays of descriptor set layouts

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDynamicStates-08715

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` **must** be `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDynamicStates-08716

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` **must** be 0

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09116

If a shader object is bound to any graphics stage or the bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` **must** either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, `VK_COLOR_COMPONENT_B_BIT`, and `VK_COLOR_COMPONENT_A_BIT`, or none of them

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-maxFragmentDualSrcAttachments-09239

If **blending** is enabled for any attachment where either the source or destination blend factors for that attachment **use the secondary color input**, the maximum value of `Location` for any output attachment **statically used** in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09548

If the current render pass was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfo::pColorAttachmentLocations` in the bound pipeline **must** match the value for the corresponding locations set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09549

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingInputAttachmentIndexInfo::pColorAttachmentInputIndices` in the bound pipeline **must** match the value for the corresponding index set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10927

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` in the bound pipeline **must** match the value set currently in

the current render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10928

If the current render pass was begun with [vkCmdBeginRendering](#), and there is no shader object bound to any graphics stage, the value of [VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex](#) in the bound pipeline **must** match the value set currently in the current render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09642

If the current render pass was begun with [vkCmdBeginRendering](#) with the [VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT](#) flag, the bound graphics pipeline **must** have been created with [VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-09643

If the bound graphics pipeline was created with [VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT](#), the current render pass **must** have begun with [vkCmdBeginRendering](#) with the [VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT](#) flag

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-10772

If a shader object is bound to any graphics stage, *multiview* functionality **must** not be enabled in the current render pass

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-11521

If current render pass instance was begun with [vkCmdBeginRendering](#) with [VkRenderingInfo::flags](#) which includes [VK_RENDERING_FRAGMENT_REGION_BIT_EXT](#), and if [sample shading](#) is enabled (explicitly or implicitly), then the minimum fraction for sample shading **must** equal 0.0

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11522

If the current render pass instance was begun with [vkCmdBeginRendering](#) and contains a custom resolve, and the [dynamicRenderingUnusedAttachments](#) feature is not enabled, the graphics pipeline bound **must** have been created with a [VkCustomResolveCreateInfoEXT](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11523

If the current render pass instance was begun with [vkCmdBeginRendering](#) and does not contain a custom resolve, and the [dynamicRenderingUnusedAttachments](#) feature is not enabled, the graphics pipeline bound **must** not have been created with a [VkCustomResolveCreateInfoEXT](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-customResolve-11524

If the current render pass instance was begun with [vkCmdBeginRendering](#) and [vkCmdBeginCustomResolveEXT](#) has been recorded in the render pass instance, the graphics pipeline bound **must** have been created with [VkCustomResolveCreateInfoEXT::customResolve](#) as [VK_TRUE](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-customResolve-11525

If the current render pass instance was begun with [vkCmdBeginRendering](#) and contains a custom resolve, and [vkCmdBeginCustomResolveEXT](#) has not been recorded in the render pass instance, the graphics pipeline bound **must** have been created with [VkCustomResolveCreateInfoEXT::customResolve](#) as [VK_FALSE](#)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11861

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, the bound graphics pipeline **must** have been created with a `VkCustomResolveCreateInfoEXT::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11862

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11863

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-11864

If the `dynamicRenderingUnusedAttachments` feature is enabled, the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11865

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11866

If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-

11867

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11868

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-11869

If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-dynamicRenderingUnusedAttachments-11870

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-colorAttachmentCount-11871

If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, then for each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE`, the `resolveImageView` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthAttachment-11872

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pStencilAttachment-11873

If the current render pass instance was begun with `vkCmdBeginRendering`,

`vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-customResolve-11529

If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering`, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-customResolve-11530

If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has not yet been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-13361

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, then all bound shader objects **must** have been created with the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-13362

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `setLayoutCount` not equal to 0, and with `pSetLayouts` not equal to `NULL`, then the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-12491

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `pushConstantRangeCount` not equal to 0, and with `pPushConstantRanges` not equal to `NULL`, then the pipeline layout of the bound push constants **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-13363

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, and any of the descriptor set layouts used to create the pipeline layout of the bound descriptor sets were created with any binding's `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then there **must** be no binding with `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-13364

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, the pipeline layout of the bound

descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR` set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-13365

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, there **must** be no shader object bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stage-06480

The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of any element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pStages-10680

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** not have last bound the `pStages` element of `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` with a valid shader object other than `VK_NULL_HANDLE`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07074

`Transform Feedback Queries` **must** not be active

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-07075

`Primitives Generated Queries` **must** not be active

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pipelineStatistics-07076

The `pipelineStatistics` member used to create any active `Pipeline Statistics Query` **must** not contain `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT`, or `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08694

If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created without the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, a valid `VkShaderEXT` **must** be bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-08695

If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created with the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, there **must** be no `VkShaderEXT` bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-02708

If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-02709

`buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-offset-02710

`offset` **must** be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-02711

`commandBuffer` **must** not be a protected command buffer

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02714

If `countBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02715

`countBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` usage flag set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-02716

`countBufferOffset` **must** be a multiple of 4

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02717

The count stored in `countBuffer` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-04129

$(\text{countBufferOffset} + \text{sizeof}(\text{uint32_t}))$ **must** be less than or equal to the size of `countBuffer`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-04445

If the `drawIndirectCount` feature is not enabled this function **must** not be used

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stride-07096

`stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawMeshTasksIndirectCommandEXT)`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-maxDrawCount-07097

If `maxDrawCount` is greater than or equal to 1, $(\text{stride} \times (\text{maxDrawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandEXT}))$ **must** be less than or equal to the size of `buffer`

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-MeshEXT-07100

The current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` **must** contain a shader stage using the `MeshEXT Execution Model`

Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-parameter **commandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-parameter **buffer** **must** be a valid [VkBuffer](#) handle
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-parameter **countBuffer** **must** be a valid [VkBuffer](#) handle
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-recording **commandBuffer** **must** be in the [recording state](#)
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commonparent
Each of **buffer**, **commandBuffer**, and **countBuffer** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	Action

Conditional Rendering

vkCmdDrawMeshTasksIndirectCountEXT is affected by [conditional rendering](#)

Chapter 26. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

26.1. Vertex Attributes

Vertex shaders **can** define input variables, which receive *vertex attribute* data transferred from one or more `VkBuffer`(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a *vertex input attribute* number with each variable, vertex input attributes are associated to *vertex input bindings* on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the `vkCmdBindVertexBuffers` command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are `VkPhysicalDeviceLimits::maxVertexInputAttributes` number of vertex input attributes and `VkPhysicalDeviceLimits::maxVertexInputBindings` number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications **can** store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the `location` layout qualifier. The `Component` layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

GLSL Example

```
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the `Location` decoration. The `Component` decoration associates components of a vertex shader input variable with components of a vertex input attribute. The `Location` and `Component` decorations are specified via the `OpDecorate` instruction.

SPIR-V Example

```
...
%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```

```

OpDecorate %19 BuiltIn InstanceIndex
OpDecorate %9 Location M
OpDecorate %9 Component 2
OpDecorate %15 Location N
...
%2 = OpTypeVoid
%3 = OpTypeFunction %2
%6 = OpTypeFloat 32
%7 = OpTypeVector %6 2
%8 = OpTypePointer Input %7
%9 = OpVariable %8 Input
%10 = OpTypeVector %6 4
%11 = OpTypeInt 32 0
%12 = OpConstant %11 L
%13 = OpTypeArray %10 %12
%14 = OpTypePointer Input %13
%15 = OpVariable %14 Input
...

```

26.1.1. Attribute Location and Component Assignment

The **Location** decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a **Location**, its value(s) are taken from the components of the input attribute specified with the corresponding `VkVertexInputAttributeDescription::location`. The components used depend on the type of variable and the **Component** decoration specified in the variable declaration, as identified in [Input Attribute Components Accessed By 16-Bit and 32-Bit Input Variables](#). Any 16-bit or 32-bit scalar or vector input will consume a single **Location**. For 16-bit and 32-bit data types, missing components are filled in with default values as described [below](#).

If an implementation supports `storageInputOutput16`, vertex shader input variables **can** have a width of 16 bits.

In all the following component assignment specifications, if or the `maintenance9` feature is enabled, and there is no `VkVertexInputAttributeDescription::location` specified for the shader vertex attribute **Location** being read, the value (0,0,0,0) or (0,0,0,1) is used for each of the equivalent (x,y,z,w) components consumed entries as specified below.

Table 31. Input Attribute Components Accessed By 16-Bit and 32-Bit Input Variables

16-bit or 32-bit data type	Component decoration	Components consumed
scalar	0 or unspecified	(x, o, o, o)
scalar	1	(o, y, o, o)
scalar	2	(o, o, z, o)

16-bit or 32-bit data type	Component decoration	Components consumed
scalar	3	(o, o, o, w)
two-component vector	0 or unspecified	(x, y, o, o)
two-component vector	1	(o, y, z, o)
two-component vector	2	(o, o, z, w)
three-component vector	0 or unspecified	(x, y, z, o)
three-component vector	1	(o, y, z, w)
four-component vector	0 or unspecified	(x, y, z, w)

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating-point matrix type is assigned a **Location** *i*, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in [Input Attributes Accessed by 32-Bit Input Matrix Variables](#). The `VkVertexInputAttributeDescription::format` **must** be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The **Component** decoration **must** not be used with matrix types.

Table 32. Input Attributes Accessed by 32-Bit Input Matrix Variables

Data type	Column vector type	Locations consumed	Components consumed
mat2	two-component vector	i, i+1	(x, y, o, o), (x, y, o, o)
mat2x3	three-component vector	i, i+1	(x, y, z, o), (x, y, z, o)
mat2x4	four-component vector	i, i+1	(x, y, z, w), (x, y, z, w)
mat3x2	two-component vector	i, i+1, i+2	(x, y, o, o), (x, y, o, o), (x, y, o, o)
mat3	three-component vector	i, i+1, i+2	(x, y, z, o), (x, y, z, o), (x, y, z, o)
mat3x4	four-component vector	i, i+1, i+2	(x, y, z, w), (x, y, z, w), (x, y, z, w)
mat4x2	two-component vector	i, i+1, i+2, i+3	(x, y, o, o), (x, y, o, o), (x, y, o, o), (x, y, o, o)
mat4x3	three-component vector	i, i+1, i+2, i+3	(x, y, z, o), (x, y, z, o), (x, y, z, o), (x, y, z, o)
mat4	four-component vector	i, i+1, i+2, i+3	(x, y, z, w), (x, y, z, w), (x, y, z, w), (x, y, z, w)

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input (if present), or the default value.

When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a **Location** *i*, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The **Location** slots and **Component** words used depend on the type of variable and the **Component** decoration specified in the variable declaration, as identified in [Input Attribute Locations and Components Accessed by 64-Bit Input Variables](#). For 64-bit data types, no default attribute values are provided. Input variables **must** not use more components than provided by the attribute.

Table 33. Input Attribute Locations and Components Accessed by 64-Bit Input Variables

Input format	Locations consumed	64-bit data type	Location decoration	Component decoration	32-bit component s consumed
R64	i	scalar	i	0 or unspecified	(x, y, -, -)
R64G64	i	scalar	i	0 or unspecified	(x, y, o, o)
		scalar	i	2	(o, o, z, w)
		two-component vector	i	0 or unspecified	(x, y, z, w)
R64G64B64	i, i+1	scalar	i	0 or unspecified	(x, y, o, o), (o, o, -, -)
		scalar	i	2	(o, o, z, w), (o, o, -, -)
		scalar	i+1	0 or unspecified	(o, o, o, o), (x, y, -, -)
		two-component vector	i	0 or unspecified	(x, y, z, w), (o, o, -, -)
		three-component vector	i	unspecified	(x, y, z, w), (x, y, -, -)

Input format	Locations consumed	64-bit data type	Location decoration	Component decoration	32-bit components consumed
R64G64B64A64	i, i+1	scalar	i	0 or unspecified	(x, y, o, o), (o, o, o, o)
		scalar	i	2	(o, o, z, w), (o, o, o, o)
		scalar	i+1	0 or unspecified	(o, o, o, o), (x, y, o, o)
		scalar	i+1	2	(o, o, o, o), (o, o, z, w)
		two-component vector	i	0 or unspecified	(x, y, z, w), (o, o, o, o)
		two-component vector	i+1	0 or unspecified	(o, o, o, o), (x, y, z, w)
		three-component vector	i	unspecified	(x, y, z, w), (x, y, o, o)
		four-component vector	i	unspecified	(x, y, z, w), (x, y, z, w)

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a **Location** *i*, its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in [Input Attribute Locations and Components Accessed by 64-Bit Input Variables](#). Each column vector starts at the **Location** immediately following the last **Location** of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding **VkVertexInputAttributeDescription::location**. The number of attributes and components assigned to each element are determined according to the data type of the array elements and **Component** decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Two variables are allowed to share the same **Location** slot only if their **Component** words do not overlap. If multiple variables share the same **Location** slot, they **must** all have the same SPIR-V floating-point component type or all have the same width scalar type components.

26.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the `VkGraphicsPipelineCreateInfo::pVertexInputState` pointer to a `VkPipelineVertexInputStateCreateInfo` structure. Alternatively, if the graphics pipeline is created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with `vkCmdSetVertexInputEXT`, and the `VkGraphicsPipelineCreateInfo::pVertexInputState` pointer is ignored.

The `VkPipelineVertexInputStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType             sType;
    const void*                 pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t                    vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t                    vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription` structures.

Valid Usage

- VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613
`vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614
`vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`
- VUID-VkPipelineVertexInputStateCreateInfo-binding-00615

For every **binding** specified by each element of **pVertexAttributeDescriptions**, a **VkVertexInputBindingDescription** **must** exist in **pVertexBindingDescriptions** with the same value of **binding**

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616
All elements of **pVertexBindingDescriptions** **must** describe distinct binding numbers
- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617
All elements of **pVertexAttributeDescriptions** **must** describe distinct attribute locations

Valid Usage (Implicit)

- VUID-VkPipelineVertexInputStateCreateInfo-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO**
- VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext
pNext **must** be **NULL** or a pointer to a valid instance of **VkPipelineVertexInputDivisorStateCreateInfo**
- VUID-VkPipelineVertexInputStateCreateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkPipelineVertexInputStateCreateInfo-flags-zero-bitmask
flags **must** be 0
- VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter
If **vertexBindingDescriptionCount** is not 0, **pVertexBindingDescriptions** **must** be a valid pointer to an array of **vertexBindingDescriptionCount** valid **VkVertexInputBindingDescription** structures
- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter
If **vertexAttributeDescriptionCount** is not 0, **pVertexAttributeDescriptions** **must** be a valid pointer to an array of **vertexAttributeDescriptionCount** valid **VkVertexInputAttributeDescription** structures

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineVertexInputStateCreateFlags;
```

VkPipelineVertexInputStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the **VkVertexInputBindingDescription** structure, defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t      binding;
    uint32_t      stride;
    VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;
```

- **binding** is the binding number that this structure describes.
- **stride** is the byte stride between consecutive elements within the buffer.
- **inputRate** is a [VkVertexInputRate](#) value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

Valid Usage

- VUID-VkVertexInputBindingDescription-binding-00618
binding **must** be less than [VkPhysicalDeviceLimits::maxVertexInputBindings](#)
- VUID-VkVertexInputBindingDescription-stride-00619
stride **must** be less than or equal to [VkPhysicalDeviceLimits::maxVertexInputBindingStride](#)
- VUID-VkVertexInputBindingDescription-stride-04456
If the [VK_KHR_portability_subset](#) extension is enabled, **stride** **must** be a multiple of, and at least as large as, [VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment](#)

Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription-inputRate-parameter
inputRate **must** be a valid [VkVertexInputRate](#) value

Possible values of [VkVertexInputBindingDescription::inputRate](#), specifying the rate at which vertex attributes are pulled from buffers, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;
```

- [VK_VERTEX_INPUT_RATE_VERTEX](#) specifies that vertex attribute addressing is a function of the vertex index.
- [VK_VERTEX_INPUT_RATE_INSTANCE](#) specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the [VkVertexInputAttributeDescription](#) structure, defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
    uint32_t    location;
    uint32_t    binding;
    VkFormat     format;
    uint32_t    offset;
} VkVertexInputAttributeDescription;
```

- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

Valid Usage

- VUID-VkVertexInputAttributeDescription-location-00620
location must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`
- VUID-VkVertexInputAttributeDescription-binding-00621
binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkVertexInputAttributeDescription-offset-00622
offset must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`
- VUID-VkVertexInputAttributeDescription-format-00623
The **format features** of **format must** contain `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT`
- VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of **offset** plus the size of the vertex attribute data described by **format must** not be greater than **stride** in the `VkVertexInputBindingDescription` referenced in **binding**

Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription-format-parameter
format must be a valid `VkFormat` value

To [dynamically set](#) the vertex input attribute and vertex input binding descriptions, call:

```
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             vertexBindingDescriptionCount,
    const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,
    uint32_t                             vertexAttributeDescriptionCount,
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription2EXT` structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkGraphicsPipelineCreateInfo::pVertexInputState` values used to create the currently active pipeline.

If drawing using `shader objects`, or if the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, then `vkCmdBindVertexBuffers2` can be used instead of `vkCmdSetVertexInputEXT` to dynamically set the stride.

The vertex attribute description for any location in the range `[0, VkPhysicalDeviceLimits::maxVertexInputAttributes)` not specified in the `pVertexAttributeDescriptions` array becomes undefined.

Valid Usage

- VUID-vkCmdSetVertexInputEXT-None-08546
Either the `vertexInputDynamicState` feature or the `shaderObject` feature or both **must** be enabled
- VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791
`vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
`vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-vkCmdSetVertexInputEXT-binding-04793
For every **binding** specified by each element of **pVertexAttributeDescriptions**, a **VkVertexInputBindingDescription2EXT** **must** exist in **pVertexBindingDescriptions** with the same value of **binding**
- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
All elements of **pVertexBindingDescriptions** **must** describe distinct binding numbers
- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
All elements of **pVertexAttributeDescriptions** **must** describe distinct attribute locations

Valid Usage (Implicit)

- VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
If **vertexBindingDescriptionCount** is not 0, **pVertexBindingDescriptions** **must** be a valid pointer to an array of **vertexBindingDescriptionCount** valid **VkVertexInputBindingDescription2EXT** structures
- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
If **vertexAttributeDescriptionCount** is not 0, **pVertexAttributeDescriptions** **must** be a valid pointer to an array of **vertexAttributeDescriptionCount** valid **VkVertexInputAttributeDescription2EXT** structures
- VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations
- VUID-vkCmdSetVertexInputEXT-vidcoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

vkCmdSetVertexInputEXT is not affected by [conditional rendering](#)

The `VkVertexInputBindingDescription2EXT` structure is defined as:

```
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           binding;
    uint32_t           stride;
    VkVertexInputRate   inputRate;
    uint32_t           divisor;
} VkVertexInputBindingDescription2EXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a [VkVertexInputRate](#) value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member **can** be a value other than `1` if the `vertexAttributeInstanceRateDivisor` feature is enabled. For example, if the divisor is `N`, the same vertex attribute will be applied to `N` successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of `0` **can** be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

Valid Usage

- VUID-VkVertexInputBindingDescription2EXT-binding-04796
`binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDescription2EXT-stride-04797
stride **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`
- VUID-VkVertexInputBindingDescription2EXT-divisor-04798
If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, **divisor** **must** not be `0`
- VUID-VkVertexInputBindingDescription2EXT-divisor-04799
If the `vertexAttributeInstanceRateDivisor` feature is not enabled, **divisor** **must** be `1`
- VUID-VkVertexInputBindingDescription2EXT-divisor-06226
divisor **must** be a value between `0` and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive
- VUID-VkVertexInputBindingDescription2EXT-divisor-06227
If **divisor** is not `1` then **inputRate** **must** be of type `VK_VERTEX_INPUT_RATE_INSTANCE`

Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription2EXT-sType-sType
sType **must** be `VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT`
- VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter
inputRate **must** be a valid `VkVertexInputRate` value

The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           location;
    uint32_t           binding;
    VkFormat            format;
    uint32_t           offset;
} VkVertexInputAttributeDescription2EXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

Valid Usage

- VUID-VkVertexInputAttributeDescription2EXT-location-06228
`location` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`
- VUID-VkVertexInputAttributeDescription2EXT-binding-06229
`binding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkVertexInputAttributeDescription2EXT-offset-06230
`offset` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`
- VUID-VkVertexInputAttributeDescription2EXT-format-04805
The `format` features of `format` **must** contain `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT`
- VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of `offset` plus the size of the vertex attribute data described by `format` **must** not be greater than `stride` in the `VkVertexInputBindingDescription2EXT` referenced in `binding`

Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription2EXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT`
- VUID-VkVertexInputAttributeDescription2EXT-format-parameter
`format` **must** be a valid `VkFormat` value

To bind strided address ranges as vertex buffers to a command buffer for use in subsequent drawing commands, call:

```
// Provided by VK_KHR_device_address_commands
void vkCmdBindVertexBuffers3KHR(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstBinding,
    uint32_t                 bindingCount,
    const VkBindVertexBuffer3InfoKHR* pBindingInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pInfos` is a pointer to an array of `VkBindVertexBuffer3InfoKHR` structures defining address ranges to bind as vertex buffers.

The values taken from the address ranges defined by elements `i` of `pInfos` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to the range of memory indicated by `pInfos[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the `nullDescriptor` feature is enabled, elements of `pInfos` **can** have a `addressRange.size` and `addressRange.address` of 0. If a vertex input attribute is bound to a vertex input binding with a `size` and `address` of 0, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

This command also dynamically sets the byte strides between consecutive elements within the strided range defined by `pInfos[i]` to the value of `pInfos[i].addressRange.stride` when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, strides are specified by the `VkVertexInputBindingDescription::stride` values used to create the currently active pipeline.

If drawing using shader objects or if the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` **can** be used instead of `vkCmdBindVertexBuffers2` to set the stride.

NOTE

Unlike the static state to set the same, `stride` for each address range must be between 0 and the maximum extent of the attributes in the binding. `vkCmdSetVertexInputEXT` does not have this restriction so can be used if other stride values are desired.

Valid Usage

- VUID-vkCmdBindVertexBuffers3KHR-firstBinding-13070
`firstBinding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-vkCmdBindVertexBuffers3KHR-firstBinding-13071
The sum of `firstBinding` and `bindingCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-vkCmdBindVertexBuffers3KHR-addressRange-13073
The `addressRange.stride` of all elements of `pInfos` **must** be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size

Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers3KHR-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindVertexBuffers3KHR-pBindingInfos-parameter
`pBindingInfos` **must** be a valid pointer to an array of `bindingCount` valid

VkBindVertexBuffer3InfoKHR structures

- VUID-vkCmdBindVertexBuffers3KHR-commandBuffer-recording
commandBuffer **must** be in the recording state
- VUID-vkCmdBindVertexBuffers3KHR-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from **must** support VK_QUEUE_GRAPHICS_BIT operations
- VUID-vkCmdBindVertexBuffers3KHR-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindVertexBuffers3KHR-bindingCount-arraylength
bindingCount **must** be greater than 0

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdBindVertexBuffers3KHR is not affected by conditional rendering

VkBindVertexBuffer3InfoKHR is defined as:

```
// Provided by VK_KHR_device_address_commands
typedef struct VkBindVertexBuffer3InfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkBool32             setStride;
    VkStridedDeviceAddressRangeKHR addressRange;
    VkAddressCommandFlagsKHR addressFlags;
} VkBindVertexBuffer3InfoKHR;
```

- sType is a VkStructureType value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `setStride` is a `VkBool32` value indicating whether `addressRange.stride` sets the stride for the buffer. If `setStride` is `VK_TRUE`, the dynamic stride is set for all attributes from this buffer. If `setStride` is `VK_FALSE`, the stride value is not set.
- `addressRange` is the `VkStridedDeviceAddressRangeKHR` of the address range to bind.
- `addressFlags` is a `VkAddressCommandFlagsKHR` value defining the flags for the address range.

Valid Usage

- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13097
If the range specified by `addressRange` is not bound completely to memory when accessed, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_FULLY_BOUND_BIT_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13098
If the buffer from which the range specified by `addressRange` was created with `VK_BUFFER_CREATE_PROTECTED_BIT`, and `protectedNoFault` is not supported, `addressFlags` **must** include `VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13099
If the buffer from which the range specified by `addressRange` was created without `VK_BUFFER_CREATE_PROTECTED_BIT`, and `protectedNoFault` is not supported, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-addressFlags-13100
`addressFlags` **must** not include both `VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR` and `VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13122
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `addressFlags` **must** include `VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR` or `VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13123
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created without `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-addressFlags-13101
`addressFlags` **must** not include both `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR` and `VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13124
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created with `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`, `addressFlags` **must**

include `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR` or `VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`

- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13125
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created without `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13074
If `addressRange.address` is not 0, the buffer from which `addressRange` was queried **must** have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` usage flag set
- VUID-VkBindVertexBuffer3InfoKHR-addressRange-13075
If `addressRange.size` is 0, `addressRange.address` **must** be 0
- VUID-VkBindVertexBuffer3InfoKHR-size-13072
If the `nullDescriptor` feature is not enabled, `addressRange.size` **must** not be 0
- VUID-VkBindVertexBuffer3InfoKHR-setStride-13126
If `setStride` is `VK_TRUE`, `addressRange.stride` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`
- VUID-VkBindVertexBuffer3InfoKHR-setStride-13127
If `setStride` is `VK_FALSE`, `addressRange.stride` **must** be 0

Valid Usage (Implicit)

- VUID-VkBindVertexBuffer3InfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_BIND_VERTEX_BUFFER_3_INFO_KHR`
- VUID-VkBindVertexBuffer3InfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkBindVertexBuffer3InfoKHR-addressFlags-parameter
`addressFlags` **must** be a valid combination of `VkAddressCommandFlagBitsKHR` values

To bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```
// Provided by VK_VERSION_1_3
void vkCmdBindVertexBuffers2(
    VkCommandBuffer                commandBuffer,
    uint32_t                       firstBinding,
    uint32_t                       bindingCount,
    const VkBuffer*                pBuffers,
    const VkDeviceSize*            pOffsets,
    const VkDeviceSize*            pSizes,
    const VkDeviceSize*            pStrides);
```

```

// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdBindVertexBuffers2
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer                                commandBuffer,
    uint32_t                                         firstBinding,
    uint32_t                                         bindingCount,
    const VkBuffer*                                  pBuffers,
    const VkDeviceSize*                             pOffsets,
    const VkDeviceSize*                             pSizes,
    const VkDeviceSize*                             pStrides);

```

- **commandBuffer** is the command buffer into which the command is recorded.
- **firstBinding** is the index of the first vertex input binding whose state is updated by the command.
- **bindingCount** is the number of vertex input bindings whose state is updated by the command.
- **pBuffers** is a pointer to an array of buffer handles.
- **pOffsets** is a pointer to an array of buffer offsets.
- **pSizes** is **NULL** or a pointer to an array of the size in bytes of vertex data bound from **pBuffers**.
- **pStrides** is **NULL** or a pointer to an array of buffer strides.

The values taken from elements *i* of **pBuffers** and **pOffsets** replace the current state for the vertex input binding **firstBinding** + *i*, for *i* in [0, **bindingCount**). The vertex input binding is updated to start at the offset indicated by **pOffsets**[*i*] from the start of the buffer **pBuffers**[*i*]. If **pSizes** is not **NULL** then **pSizes**[*i*] specifies the bound size of the vertex buffer starting from the corresponding elements of **pBuffers**[*i*] plus **pOffsets**[*i*]. If **pSizes**[*i*] is **VK_WHOLE_SIZE** then the bound size is from **pBuffers**[*i*] plus **pOffsets**[*i*] to the end of the buffer **pBuffers**[*i*]. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the **nullDescriptor** feature is enabled, elements of **pBuffers** **can** be **VK_NULL_HANDLE**, and **can** be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is **VK_NULL_HANDLE**, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

This command also **dynamically sets** the byte strides between consecutive elements within buffer **pBuffers**[*i*] to the corresponding **pStrides**[*i*] value when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, strides are specified by the **VkVertexInputBindingDescription::stride** values used to create the currently active pipeline.

If drawing using **shader objects** or if the bound pipeline state object was also created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_EXT** dynamic state enabled then **vkCmdSetVertexInputEXT** **can** be used instead of **vkCmdBindVertexBuffers2** to set the stride.

NOTE Unlike the static state to set the same, **pStrides** must be between 0 and the maximum extent of the attributes in the binding. **vkCmdSetVertexInputEXT** does not have this restriction so can be used if other stride values are desired.

Valid Usage

- VUID-vkCmdBindVertexBuffers2-None-08971

At least one of the following **must** be true:

- the `extendedDynamicState` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

- VUID-vkCmdBindVertexBuffers2-firstBinding-03355

`firstBinding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers2-firstBinding-03356

The sum of `firstBinding` and `bindingCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers2-pOffsets-03357

If `pSizes` is not `NULL`, all elements of `pOffsets` **must** be less than the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindVertexBuffers2-pSizes-03358

If `pSizes` is not `NULL`, all elements of `pOffsets` plus `pSizes`, where `pSizes` is not `VK_WHOLE_SIZE`, **must** be less than or equal to the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindVertexBuffers2-pBuffers-03359

All elements of `pBuffers` **must** have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` usage flag set

- VUID-vkCmdBindVertexBuffers2-pBuffers-03360

Each element of `pBuffers` that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBindVertexBuffers2-pBuffers-04111

If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` **must** not be `VK_NULL_HANDLE`

- VUID-vkCmdBindVertexBuffers2-pBuffers-04112

If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` **must** be zero

- VUID-vkCmdBindVertexBuffers2-pStrides-03362

If `pStrides` is not `NULL` each element of `pStrides` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-vkCmdBindVertexBuffers2-pStrides-06209

If `pStrides` is not `NULL` each element of `pStrides` **must** be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size

Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers2-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindVertexBuffers2-pBuffers-parameter
`pBuffers` **must** be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles
- VUID-vkCmdBindVertexBuffers2-pOffsets-parameter
`pOffsets` **must** be a valid pointer to an array of `bindingCount` `VkDeviceSize` values
- VUID-vkCmdBindVertexBuffers2-pSizes-parameter
If `pSizes` is not `NULL`, `pSizes` **must** be a valid pointer to an array of `bindingCount` `VkDeviceSize` values
- VUID-vkCmdBindVertexBuffers2-pStrides-parameter
If `pStrides` is not `NULL`, `pStrides` **must** be a valid pointer to an array of `bindingCount` `VkDeviceSize` values
- VUID-vkCmdBindVertexBuffers2-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdBindVertexBuffers2-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBindVertexBuffers2-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindVertexBuffers2-bindingCount-arraylength
If any of `pSizes`, or `pStrides` are not `NULL`, `bindingCount` **must** be greater than `0`
- VUID-vkCmdBindVertexBuffers2-commonparent
Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdBindVertexBuffers2 is not affected by [conditional rendering](#)

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstBinding,
    uint32_t                 bindingCount,
    const VkBuffer*          pBuffer,
    const VkDeviceSize*      pOffsets);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **firstBinding** is the index of the first vertex input binding whose state is updated by the command.
- **bindingCount** is the number of vertex input bindings whose state is updated by the command.
- **pBuffers** is a pointer to an array of buffer handles.
- **pOffsets** is a pointer to an array of buffer offsets.

The values taken from elements *i* of **pBuffers** and **pOffsets** replace the current state for the vertex input binding **firstBinding** + *i*, for *i* in [0, **bindingCount**). The vertex input binding is updated to start at the offset indicated by **pOffsets**[*i*] from the start of the buffer **pBuffers**[*i*]. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the **nullDescriptor** feature is enabled, elements of **pBuffers** **can** be **VK_NULL_HANDLE**, and **can** be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is **VK_NULL_HANDLE**, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

Valid Usage

- VUID-vkCmdBindVertexBuffers-firstBinding-00624
firstBinding **must** be less than **VkPhysicalDeviceLimits::maxVertexInputBindings**
- VUID-vkCmdBindVertexBuffers-firstBinding-00625
The sum of **firstBinding** and **bindingCount** **must** be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputBindings**
- VUID-vkCmdBindVertexBuffers-pOffsets-00626
All elements of **pOffsets** **must** be less than the size of the corresponding element in **pBuffers**
- VUID-vkCmdBindVertexBuffers-pBuffers-00627
All elements of **pBuffers** **must** have been created with the **VK_BUFFER_USAGE_VERTEX_BUFFER_BIT** flag

- VUID-vkCmdBindVertexBuffers-pBuffers-00628
Each element of **pBuffers** that is non-sparse **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdBindVertexBuffers-pBuffers-04001
If the **nullDescriptor** feature is not enabled, all elements of **pBuffers** **must** not be **VK_NULL_HANDLE**
- VUID-vkCmdBindVertexBuffers-pBuffers-04002
If an element of **pBuffers** is **VK_NULL_HANDLE**, then the corresponding element of **pOffsets** **must** be zero

Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdBindVertexBuffers-pBuffers-parameter
pBuffers **must** be a valid pointer to an array of **bindingCount** valid or **VK_NULL_HANDLE** **VkBuffer** handles
- VUID-vkCmdBindVertexBuffers-pOffsets-parameter
pOffsets **must** be a valid pointer to an array of **bindingCount** **VkDeviceSize** values
- VUID-vkCmdBindVertexBuffers-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdBindVertexBuffers-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations
- VUID-vkCmdBindVertexBuffers-vidcoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindVertexBuffers-bindingCount-arraylength
bindingCount **must** be greater than 0
- VUID-vkCmdBindVertexBuffers-commonparent
Both of **commandBuffer**, and the elements of **pBuffers** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

`vkCmdBindVertexBuffers` is not affected by [conditional rendering](#)

26.3. Vertex Attribute Divisor in Instanced Rendering

If the `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfo` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkPipelineVertexInputDivisorStateCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescription* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfo;
```

```
// Provided by VK_KHR_vertex_attribute_divisor
// Equivalent to VkPipelineVertexInputDivisorStateCreateInfo
typedef VkPipelineVertexInputDivisorStateCreateInfo
VkPipelineVertexInputDivisorStateCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescription` structures specifying the divisor value for each binding.

Valid Usage (Implicit)

- VUID-VkPipelineVertexInputDivisorStateCreateInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO`

- VUID-VkPipelineVertexInputDivisorStateCreateInfo-pVertexBindingDivisors-parameter `pVertexBindingDivisors` **must** be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescription` structures
- VUID-VkPipelineVertexInputDivisorStateCreateInfo-vertexBindingDivisorCount-arraylength `vertexBindingDivisorCount` **must** be greater than 0

Structure Chaining

Extends the structure

- `VkPipelineVertexInputStateCreateInfo`

The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescription` structure which is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkVertexInputBindingDivisorDescription {
    uint32_t    binding;
    uint32_t    divisor;
} VkVertexInputBindingDivisorDescription;
```

```
// Provided by VK_KHR_vertex_attribute_divisor
// Equivalent to VkVertexInputBindingDivisorDescription
typedef VkVertexInputBindingDivisorDescription
VkVertexInputBindingDivisorDescriptionKHR;
```

- `binding` is the binding number for which the divisor is specified.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorProperties::maxVertexAttribDivisor`. A value of 0 **can** be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

Valid Usage

- VUID-VkVertexInputBindingDivisorDescription-binding-01869

`binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDivisorDescription-vertexAttributeInstanceRateZeroDivisor-02228

If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, `divisor` must not be 0

- VUID-VkVertexInputBindingDivisorDescription-vertexAttributeInstanceRateDivisor-02229

If the `vertexAttributeInstanceRateDivisor` feature is not enabled, `divisor` must be 1

- VUID-VkVertexInputBindingDivisorDescription-divisor-01870

`divisor` must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorProperties::maxVertexAttribDivisor`, inclusive

- VUID-VkVertexInputBindingDivisorDescription-inputRate-01871

`VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this `binding`

26.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexAttributeDescriptions` with `VkVertexInputAttributeDescription::location` equal to the vertex input attribute number.
- Let `bindingDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions` with `VkVertexInputAttributeDescription::binding` equal to `attribDesc.binding`.
- Let `vertexIndex` be the index of the vertex within the draw (a value between `firstVertex` and `firstVertex+vertexCount` for `vkCmdDraw`, or a value taken from the index buffer plus `vertexOffset` for `vkCmdDrawIndexed`), and let `instanceIndex` be the instance number of the draw (a value between `firstInstance` and `firstInstance+instanceCount`).
- Let `offset` be an array of offsets into the bound vertex buffers specified during `vkCmdBindVertexBuffers` or `vkCmdBindVertexBuffers2` with `pOffsets`.
- Let `divisor` be the member of `VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors` with `VkVertexInputBindingDivisorDescription::binding` equal to `attribDesc.binding`. If the vertex binding state is dynamically set, instead let `divisor` be the member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call with `VkVertexInputBindingDescription2EXT::binding` equal to `attribDesc.binding`.
- Let `stride` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions->stride` unless there is dynamic state causing the value to be ignored. In this case the value is set from the last value from one of the following
 - `vkCmdSetVertexInputEXT::pVertexBindingDescriptions->stride`
 - `vkCmdBindVertexBuffers2::pStrides`, if not NULL

```
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];
```

```

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) /
divisor)) * stride;

attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;

```

26.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at `attribAddress` and is converted from the `VkVertexInputAttributeDescription`'s `format` in the same manner as described for [image reads](#) as if a texel were read from that address. The numeric type of the attribute's `format` **must** match the numeric type of the input variable in the shader. The input variable in the shader **must** be declared as a 64-bit data type if and only if `format` is a 64-bit data type. If the sum of `attribAddress` and the data extracted is outside of the bound vertex buffer, behavior is as described by [Shader Out-of-Bounds Memory Access](#).

If either `format` is a 64-bit format or the `legacyVertexAttributes` feature is not enabled, and `format` is a packed format, `attribAddress` **must** be a multiple of the size in bytes of the size of the format as described in [Packed Formats](#). Otherwise, if either `format` is a 64-bit format or the `legacyVertexAttributes` feature is not enabled, `attribAddress` **must** be a multiple of the size in bytes of the component type indicated by `format` (see [Formats](#)).

The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded. If the `numeric format` of `format` uses sRGB encoding, and the `maintenance10` feature is enabled, the implementation **must** convert values from nonlinear to linear as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). If the `maintenance10` feature is not enabled, the implementation **should** convert values from nonlinear to linear. Implementations which do not support `maintenance10`, and which do not convert nonlinear to linear for sRGB formats **should** not expose `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` for such formats.

Chapter 27. Tessellation

Tessellation involves three pipeline stages. First, a [tessellation control shader](#) transforms control points of a patch and **can** produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in (u,v) or (u,v,w) parameter space. Third, a [tessellation evaluation shader](#) transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

27.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the [built-in variables](#) [TessLevelOuter](#) and [TessLevelInner](#), respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an [OpExecutionMode](#) instruction using one of the [Triangles](#), [Quads](#), or [IsoLines](#) execution modes. When using [shader objects](#), this instruction **must** be specified in the tessellation evaluation shader, and **may** also be specified in the tessellation control shader. When using pipelines, this instruction **may** be specified in either the tessellation evaluation or tessellation control shader. When using shader objects, [OutputVertices](#) **must** be specified in the tessellation control shader, and **may** also be specified in the tessellation evaluation shader. Other tessellation-related execution modes **can** also be specified in either the tessellation control or tessellation evaluation shaders.

Any tessellation-related modes specified in both the tessellation control and tessellation evaluation shaders **must** be the same.

Tessellation execution modes include:

- [Triangles](#), [Quads](#), and [IsoLines](#). These control the type of subdivision and topology of the output primitives. When using [shader objects](#), one mode **must** be set in at least the tessellation evaluation stage. When using pipelines, one mode **must** be set in at least one of the tessellation shader stages. If the [VK_KHR_portability_subset](#) extension is enabled, and [VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsoLines](#) is [VK_FALSE](#), then isoline tessellation is not supported by the implementation, and [IsoLines](#) **must** not be used in either tessellation shader stage.
- [VertexOrderCw](#) and [VertexOrderCcw](#). These control the orientation of triangles generated by the tessellator. When using [shader objects](#), one mode **must** be set in at least the tessellation evaluation stage. When using pipelines, one mode **must** be set in at least one of the tessellation shader stages.
- [PointMode](#). Controls generation of points rather than triangles or lines. This functionality

defaults to disabled, and is enabled if either shader stage includes the execution mode. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointSize` is `VK_FALSE`, then point mode tessellation is not supported by the implementation, and `PointSize` **must** not be used in either tessellation shader stage.

- `SpacingEqual`, `SpacingFractionalEven`, and `SpacingFractionalOdd`. Controls the spacing of segments on the edges of tessellated primitives. One mode **must** be set in at least one of the tessellation shader stages.
- `OutputVertices`. Controls the size of the output patch of the tessellation control shader. When using `shader objects`, one value **must** be set in at least the tessellation control stage. When using pipelines, one value **must** be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in `TessCoord` are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures [Domain parameterization for tessellation primitive modes \(upper-left origin\)](#) and [Domain parameterization for tessellation primitive modes \(lower-left origin\)](#). The domain space **can** have either an upper-left or lower-left origin, selected by the `domainOrigin` member of `VkPipelineTessellationDomainOriginStateCreateInfo`.

Figure 11. Domain parameterization for tessellation primitive modes (upper-left origin)

Figure 12. Domain parameterization for tessellation primitive modes (lower-left origin)

Caption

In the domain parameterization diagrams, the coordinates illustrate the value of **TessCoord** at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex's position is a barycentric coordinate (u,v,w) , where $u + v + w = 1.0$, and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a (u,v) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

27.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point

NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For **Quads**, all four outer levels are relevant. For **Triangles** and **Isolines**, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

27.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an **OpExecutionMode** in the tessellation control or tessellation evaluation shader using one of the identifiers **SpacingEqual**, **SpacingFractionalEven**, or **SpacingFractionalOdd**.

If **SpacingEqual** is used, the floating-point tessellation level is first clamped to $[1, \text{maxLevel}]$, where **maxLevel** is the implementation-dependent maximum tessellation level (**VkPhysicalDeviceLimits::maxTessellationGenerationLevel**). The result is rounded up to the nearest integer n , and the corresponding edge is divided into n segments of equal length in (u,v) space.

If **SpacingFractionalEven** is used, the tessellation level is first clamped to $[2, \text{maxLevel}]$ and then rounded up to the nearest even integer n . If **SpacingFractionalOdd** is used, the tessellation level is clamped to $[1, \text{maxLevel} - 1]$ and then rounded up to the nearest odd integer n . If n is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into $n - 2$ segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with $n - f$, where f is the clamped floating-point tessellation level. When $n - f$ is zero, the additional segments will have equal length to the other segments. As $n - f$ approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments **must** be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but **must** be identical for any pair of subdivided edges with identical values of f .

When tessellating triangles or quads using **point mode** with fractional odd spacing, the tessellator **may** produce *interior vertices* that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

27.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to **primitive order**.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

27.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the **Triangles** or **Quads** modes), the orientation of all triangles is specified with an **OpExecutionMode** of **VertexOrderCw** or **VertexOrderCcw** in the tessellation control or tessellation evaluation shaders. If the order is **VertexOrderCw**, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is **VertexOrderCcw**, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

$$a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2$$

is negative, and clockwise ordering if a is positive. u_i and v_i are the u and v coordinates in normalized parameter space of the i th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if a is positive, and clockwise ordering if a is negative.

NOTE

The value a is proportional (with a positive factor) to the signed area of the triangle.

In **Triangles** mode, even though the vertex coordinates have a w value, it does not participate directly in the computation of a , being an affine combination of u and v .

27.6. Triangle Tessellation

If the tessellation primitive mode is **Triangles**, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the $u = 0$ (left), $v = 0$ (bottom), and $w = 0$ (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with (u,v,w) coordinates of (0,0,1), (1,0,0), and (0,1,0) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as $1 + \epsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision **may** produce *inner vertices* positioned on the edge of the triangle.

If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing,

generating n segments. For the outermost inner triangle, the inner triangle is degenerate — a single point at the center of the triangle — if n is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner's two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If n is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into $n - 2$ segments, with the $n - 1$ vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the $n - 1$ innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in [Inner Triangle Tessellation](#).

Figure 13. Inner Triangle Tessellation

Caption

In the [Inner Triangle Tessellation](#) diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge passing through each inner vertex of the subdivided outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.

After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the

temporary subdivision of the outer triangle edge above is discarded. Instead, the $u = 0$, $v = 0$, and $w = 0$ edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric (u,v,w) coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in (u,v,w) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to [triangle lists](#), except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in [Tessellator Vertex Winding Order](#).

27.7. Quad Tessellation

If the tessellation primitive mode is **Quads**, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the $u = 0$ and $u = 1$ (vertical) and $v = 0$ and $v = 1$ (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the $u = 0$ (left), $v = 0$ (bottom), $u = 1$ (right), and $v = 1$ (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as $1 + \epsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision **may** produce *inner vertices* positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the $u = 0$ and $u = 1$ edges of the outer rectangle into m segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The $v = 0$ and $v = 1$ edges are subdivided into n segments using the second inner tessellation level. Each vertex on the $u = 0$ and $v = 0$ edges are joined with the corresponding vertex on the $u = 1$ and $v = 1$ edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the

edges of which are subdivided by the grid vertices that lie on the edge. If either m or n is two, the inner rectangle is degenerate, and one or both of the rectangle's *edges* consist of a single point. This subdivision is illustrated in Figure [Inner Quad Tessellation](#).

Figure 14. Inner Quad Tessellation

Caption

In the [Inner Quad Tessellation](#) diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator **must** produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the $u = 0$, $v = 0$, $u = 1$, and $v = 1$ edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the *inner edge*.

The algorithm used to subdivide the rectangular domain in (u,v) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to [triangle lists](#), except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in [Tessellator Vertex Winding Order](#).

27.8. Isoline Tessellation

If the tessellation primitive mode is `Isolines`, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called *isolines*, where the vertices of each isoline have a constant *v* coordinate and *u* coordinates covering the full range [0,1]. The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The *u* = 0 and *u* = 1 edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as `equal_spacing`. An isoline is drawn connecting each vertex on the *u* = 0 rectangle edge to the corresponding vertex on the *u* = 1 rectangle edge, except that no line is drawn between (0,1) and (1,1). If the number of isolines on the subdivided *u* = 0 and *u* = 1 edges is *n*, this process will result in *n* equally spaced lines with constant *v* coordinates of $0, \frac{1}{n}, \frac{2}{n}, \dots, \frac{n-1}{n}$.

Each of the *n* isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in *m* line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to [line lists](#), except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

NOTE	If the <code>VK_KHR_portability_subset</code> extension is enabled, and <code>VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines</code> is <code>VK_FALSE</code> , then isoline tessellation is not supported by the implementation.
-------------	--

27.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the `OpExecutionMode PointMode`, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to [point lists](#), except the order in which the points are generated for each input primitive is undefined.

NOTE	If the <code>VK_KHR_portability_subset</code> extension is enabled, and <code>VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode</code> is <code>VK_FALSE</code> , then tessellation point mode is not supported by the implementation.
-------------	--

27.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t                  patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `patchControlPoints` is the number of control points per patch.

Valid Usage

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
`patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

Valid Usage (Implicit)

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`
- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`
- VUID-VkPipelineTessellationStateCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineTessellationStateCreateInfo-flags-zero-bitmask
`flags` **must** be 0

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineTessellationDomainOriginStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

```
// Provided by VK_KHR_maintenance2
// Equivalent to VkPipelineTessellationDomainOriginStateCreateInfo
typedef VkPipelineTessellationDomainOriginStateCreateInfo
VkPipelineTessellationDomainOriginStateCreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **domainOrigin** is a [VkTessellationDomainOrigin](#) value controlling the origin of the tessellation domain space.

If the [VkPipelineTessellationDomainOriginStateCreateInfo](#) structure is included in the **pNext** chain of [VkPipelineTessellationStateCreateInfo](#), it controls the origin of the tessellation domain. If this structure is not present, it is as if **domainOrigin** was [VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT](#).

Valid Usage (Implicit)

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType **must** be [VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO](#)
- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter **domainOrigin** **must** be a valid [VkTessellationDomainOrigin](#) value

Structure Chaining

Extends the structure

- [VkPipelineTessellationStateCreateInfo](#)

The possible tessellation domain origins are specified by the [VkTessellationDomainOrigin](#) enumeration:

```
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR =
VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR =
VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT,
} VkTessellationDomainOrigin;
```

```
// Provided by VK_KHR_maintenance2
// Equivalent to VkTessellationDomainOrigin
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;
```

- [VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT](#) specifies that the origin of the domain space is in the upper left corner, as shown in figure [Domain parameterization for tessellation primitive modes \(upper-left origin\)](#).
- [VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT](#) specifies that the origin of the domain space is in the lower left corner, as shown in figure [Domain parameterization for tessellation primitive modes \(lower-left origin\)](#).

This enum affects how the [VertexOrderCw](#) and [VertexOrderCcw](#) tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.

To [dynamically set](#) the origin of the tessellation domain space, call:

```
// Provided by VK_EXT_extended_dynamic_state3 with VK_KHR_maintenance2 or
VK_VERSION_1_1, VK_EXT_shader_object
void vkCmdSetTessellationDomainOriginEXT(
    VkCommandBuffer          commandBuffer,
    VkTessellationDomainOrigin domainOrigin);
```

- [commandBuffer](#) is the command buffer into which the command will be recorded.
- [domainOrigin](#) specifies the origin of the tessellation domain space.

This command sets the origin of the tessellation domain space for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineTessellationDomainOriginStateCreateInfo::domainOrigin](#) value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetTessellationDomainOriginEXT-None-09423

At least one of the following **must** be true:

- The `extendedDynamicState3TessellationDomainOrigin` feature is enabled
- The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetTessellationDomainOriginEXT-domainOrigin-parameter
`domainOrigin` **must** be a valid `VkTessellationDomainOrigin` value
- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetTessellationDomainOriginEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetTessellationDomainOriginEXT` is not affected by [conditional rendering](#)

Chapter 28. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

28.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and **must** match the incoming primitive type specified by either the pipeline's `primitive topology` if tessellation is inactive, or the `tessellation mode` if tessellation is active, as follows:

- An input primitive type of `InputPoints` **must** only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader specifying `PointMode`. The input arrays always contain one element, as described by the `point list topology` or `tessellation in point mode`.
- An input primitive type of `InputLines` **must** only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `IsoLines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the `line list topology` or `line strip topology`, or by `isoline tessellation`.
- An input primitive type of `InputLinesAdjacency` **must** only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the `line list with adjacency topology` or `line strip with adjacency topology`.
- An input primitive type of `Triangles` **must** only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the `triangle list topology`, `triangle strip topology`, or `triangle fan topology`, or by `triangle` or `quad tessellation`. Vertices **may** be in a different absolute order than specified by the topology, but **must** adhere to the specified winding order.
- An input primitive type of `InputTrianglesAdjacency` **must** only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the `triangle list with adjacency topology` or `triangle strip with adjacency topology`. Vertices **may** be in a different absolute order than specified by the topology, but **must** adhere to the specified winding order, and the vertices making up the main primitive **must** still occur at the first, third, and fifth index.

28.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader **must** include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in [Rasterization](#). If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader **must** specify a maximum output vertex count.

28.3. Multiple Invocations of Geometry Shaders

Geometry shaders **can** be invoked more than one time for each input primitive. This is known as *geometry shader instancing* and is requested by including an `OpExecutionMode` instruction with `mode` specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least *n* times for each input primitive, where *n* is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

28.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to [primitive order](#).

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

Chapter 29. Mesh Shading

Task and **mesh shaders** operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline.

Work on the mesh pipeline is initiated by the application **drawing** a set of mesh tasks organized in global workgroups. If the optional task shader is active, each workgroup triggers the execution of task shader invocations that will create a new set of mesh workgroups upon completion. Each of these created workgroups, or each of the original workgroups if no task shader is present, triggers the execution of mesh shader invocations.

Each mesh shader workgroup emits zero or more output primitives along with the group of vertices and their associated data required for each output primitive.

29.1. Task Shader Input

For every workgroup issued via the drawing commands a group of task shader invocations is executed. There are no inputs other than the builtin workgroup identifiers.

29.2. Task Shader Output

The task shader can emit zero or more mesh workgroups to be generated. Shaders using the **TaskEXT Execution Model** can do so using the **OpEmitMeshTasksEXT** instruction. The **groupCountX**, **groupCountY** and **groupCountZ** arguments passed to this instruction **must** be less than or equal to the respective dimension within **VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount**. The product of these arguments **must** be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount**.

The task shader can also pass user-defined data to all mesh shader invocations that it creates. Shaders using the **TaskEXT Execution Model** can do so by writing to a payload variable with **TaskPayloadWorkgroupEXT** storage class that is passed to the **OpEmitMeshTasksEXT** instruction.

29.3. Mesh Generation

If a task shader exists, the mesh assembler creates a variable amount of mesh workgroups depending on each task's output. If there is no task shader, the drawing commands emit the mesh shader invocations directly.

29.4. Mesh Shader Input

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, the payload variable passed to the **OpEmitMeshTasksEXT** instruction by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

29.5. Mesh Shader Output

A mesh shader generates primitives in one of three output modes: points, lines, or triangles. For shaders using the [MeshEXT Execution Model](#) the primitive mode is specified in the shader using an [OpExecutionMode](#) instruction with the [OutputPoints](#), [OutputLinesEXT](#), or [OutputTrianglesEXT](#) modes, respectively. Each mesh shader **must** include exactly one output primitive mode.

For shaders using the [MeshEXT Execution Model](#) the maximum output vertex count is specified as a literal in the shader using an [OpExecutionMode](#) instruction with the mode set to [OutputVertices](#) and **must** be less than or equal to [VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputVertices](#).

For shaders using the [MeshEXT Execution Model](#) the maximum output primitive count is specified as a literal in the shader using an [OpExecutionMode](#) instruction with the mode set to [OutputPrimitivesEXT](#), and **must** be less than or equal to [VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputPrimitives](#).

For shaders using the [MeshEXT Execution Model](#) the number of vertices and primitives output by the mesh shader is provided via calling the [OpSetMeshOutputsEXT](#) instruction. The [vertexCount](#) argument **must** be less than or equal to the maximum output vertex count specified in the shader. The [primitiveCount](#) argument **must** be less than or equal to the maximum output primitive count specified in the shader.

Depending on the output primitive mode an appropriately-decorated variable is the output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type:

- [OutputPoints](#) uses the [PrimitivePointIndicesEXT](#) decoration.
- [OutputLinesEXT](#) uses the [PrimitiveLineIndicesEXT](#) decoration.
- [OutputTrianglesEXT](#) uses the [PrimitiveTriangleIndicesEXT](#) decoration.

These resulting primitives are then further processed as described in [Rasterization](#).

With the exception of primitive indices, all output built-ins and custom attributes count towards the total storage size occupied by output variables in mesh shaders. This size can be calculated as follows, taking into account the fact that the number of effective scalar attributes is 4 times the number of effective locations used according to the [location assignment rules](#). Let v be the number of views, n_v be the number of effective scalar per-vertex attributes not dependent on [ViewIndex](#), n_{vpv} be the number of effective scalar per-vertex attributes dependent on [ViewIndex](#), m_v be the maximum number of vertices specified by the [OutputVertices Execution Mode](#), g_v be [meshOutputPerVertexGranularity](#), n_p be the number of effective scalar per-primitive attributes not dependent on [ViewIndex](#), n_{ppv} be the number of effective scalar per-primitive attributes dependent on [ViewIndex](#), m_p be the maximum number of primitives specified by the [OutputPrimitivesEXT Execution Mode](#) and g_p be [meshOutputPerPrimitiveGranularity](#):

$$(n_v + (n_{vpv} \times v)) \times 4 \times \text{align}(m_v, g_v) + (n_p + (n_{ppv} \times v)) \times 4 \times \text{align}(m_p, g_p)$$

29.6. Mesh Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a mesh shader, as they pertain to [primitive order](#).

- When a task shader is used, mesh workgroups spawned from lower tasks will be ordered prior those workgroups from subsequent tasks.
- All output primitives generated from a given mesh workgroup are passed to subsequent pipeline stages before any output primitives generated from subsequent input workgroups.
- All output primitives within a mesh workgroup, will be generated in the ordering provided by the builtin primitive indexbuffer (from low address to high address).

Chapter 30. Fixed-Function Vertex Post-Processing

After [pre-rasterization shader stages](#), the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see [Transform Feedback](#))
- Flat shading (see [Flat Shading](#)).
- Primitive clipping, including application-defined half-spaces (see [Primitive Clipping](#)).
- Shader output attribute clipping (see [Clipping Shader Outputs](#)).
- Perspective division on clip coordinates (see [Coordinate Transformations](#)).
- Viewport mapping, including depth range scaling (see [Controlling the Viewport](#)).
- Front face determination for polygon primitives (see [Basic Polygon Rasterization](#)).

Next, rasterization is performed on primitives as described in chapter [Rasterization](#).

30.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the [pre-rasterization shader stage](#) **can** be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last [pre-rasterization shader stage](#) shader **must** be declared with the `Xfb` execution mode. Outputs decorated with `XfbBuffer` will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using `vkCmdBindTransformFeedbackBuffersEXT`. Transform feedback is made active by calling `vkCmdBeginTransformFeedbackEXT` and made inactive by calling `vkCmdEndTransformFeedbackEXT`. After vertex data is written it is possible to use `vkCmdDrawIndirectByteCountEXT` to start a new draw where the `vertexCount` is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. Any primitive for which any pair of vertices have the same position **should** be assembled for transform feedback normally but it **may** be discarded prior to primitive assembly instead. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional `pCounterBuffers` and `pCounterBufferOffsets` parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When the `transformFeedbackPreservesProvokingVertex` feature is not enabled, implementations **may** write out any vertex within the primitive first, but all subsequent vertices for

that primitive **must** be written out in a consistent winding order defined as follows:

- If neither [geometry](#) or [tessellation shading](#) is active, vertices within a primitive are appended according to the winding order described by the [primitive topology](#) defined by the [VkPipelineInputAssemblyStateCreateInfo::topology](#) used to execute the [drawing command](#).
- If [geometry shading](#) is active, vertices within a primitive are appended according to the winding order described by the [primitive topology](#) defined by the [OutputPoints](#), [OutputLineStrip](#), or [OutputTriangleStrip](#) execution mode.
- If [tessellation shading](#) is active but [geometry shading](#) is not, vertices within a primitive are appended according to the winding order defined by [triangle tessellation](#), [quad tessellation](#), and [isoline tessellation](#).

When the [transformFeedbackPreservesProvokingVertex](#) feature is enabled, then in addition to writing vertices with a consistent winding order, the vertex order **must** preserve the [provoking vertex](#) of each primitive:

- When the [pipeline's provoking vertex mode](#) is [VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT](#), the primitive's provoking vertex **must** be the first vertex written.
- When the [pipeline's provoking vertex mode](#) is [VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT](#), the primitive's provoking vertex **must** be the last vertex written.

If [transformFeedbackPreservesTriangleFanProvokingVertex](#) is [VK_FALSE](#), neither [geometry](#) nor [tessellation shading](#) is active, and the [primitive topology](#) is [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN](#), then the first vertex written from each primitive is implementation-defined even when the [transformFeedbackPreservesProvokingVertex](#) feature is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by the [XfbStride](#) decoration, indicates the number of bytes of storage reserved for each vertex in the transform feedback buffer. For every vertex captured, each output attribute with a [Offset](#) decoration will be written to the storage reserved for the vertex at the associated transform feedback buffer. When writing output variables that are arrays or structures, individual array elements or structure members are written tightly packed in order. For vector types, individual components are written in order. For matrix types, outputs are written as an array of column vectors.

If any component of an output with an assigned transform feedback offset was not written to by its shader, the value recorded for that component is undefined, and the primitives needed and primitives written counts in the corresponding [VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT](#) query will increment as normal. All components of an output variable **must** be written at an offset aligned to the size of the component. The size of each component of an output variable **must** be at least 32-bits. When capturing a vertex, any portion of the reserved storage not associated with an output variable with an assigned transform feedback offset will be unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer

handle and counter buffer offset in the `pCounterBuffers` and `pCounterBufferOffsets` arrays, writes to the corresponding transform feedback buffer will start at the byte offset represented by the value stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately. Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be assembled and output for each stream when there are enough vertices emitted for the output primitive type. All outputs assigned to a given transform feedback buffer are required to come from a single vertex stream.

The sizes of the transform feedback buffers are defined by the `vkCmdBindTransformFeedbackBuffersEXT` `pSizes` parameter for each of the bound buffers, or the size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the transform feedback buffers than the size of all of the vertex data for that primitive based on the `XfbStride` for that `XfbBuffer` then no vertex data of that primitive is recorded in any transform feedback buffer, and the value for the number of primitives written in the corresponding `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` query for all transform feedback buffers is no longer incremented.

Any outputs made to a `XfbBuffer` that is not bound to a transform feedback buffer is ignored.

To bind transform feedback memory ranges to a command buffer for use in subsequent drawing commands, call:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffers2EXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstBinding,
    uint32_t                 bindingCount,
    const VkBindTransformFeedbackBuffer2InfoEXT* pBindingInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBindingInfos` is a pointer to an array of `VkBindTransformFeedbackBuffer2InfoEXT` structures specifying the ranges of memory to be used to capture transform feedback data.

Element `i` of `pBindingInfos` replaces the current state for the transform feedback binding `firstBinding + i`, for `i` in `[0, bindingCount)`.

Valid Usage

- VUID-vkCmdBindTransformFeedbackBuffers2EXT-transformFeedback-02355

`VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` **must** be enabled

- VUID-vkCmdBindTransformFeedbackBuffers2EXT-firstBinding-02356
`firstBinding` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-firstBinding-02357
The sum of `firstBinding` and `bindingCount` **must** be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-None-02365
Transform feedback **must** not be active when the `vkCmdBindTransformFeedbackBuffers2EXT` command is recorded
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-addressRange-13090
The `addressRange.address` member of all elements of `pBindingInfos` **must** be a multiple of 4
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-addressRange-13091
The buffer that the `addressRange` of each element of `pBindingInfos` was queried from **must** have been created with `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-addressRange-13092
The `addressRange.size` member of all elements of `pBindingInfos` **must** be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize`

Valid Usage (Implicit)

- VUID-vkCmdBindTransformFeedbackBuffers2EXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-pBindingInfos-parameter
If `pBindingInfos` is not `NULL`, `pBindingInfos` **must** be a valid pointer to an array of `bindingCount` valid `VkBindTransformFeedbackBuffer2InfoEXT` structures
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-vidcoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindTransformFeedbackBuffers2EXT-bindingCount-arraylength
If `pBindingInfos` is not `NULL`, `bindingCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

vkCmdBindTransformFeedbackBuffers2EXT is not affected by [conditional rendering](#)

VkBindTransformFeedbackBuffer2InfoEXT is defined as:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_transform_feedback
typedef struct VkBindTransformFeedbackBuffer2InfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceAddressRangeKHR addressRange;
    VkAddressCommandFlagsKHR addressFlags;
} VkBindTransformFeedbackBuffer2InfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `addressRange` is the [VkDeviceAddressRangeKHR](#) of the address range to use.
- `addressFlags` is a [VkAddressCommandFlagsKHR](#) value defining the flags for the address range.

Valid Usage

- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressRange-13097
If the range specified by `addressRange` is not bound completely to memory when accessed, `addressFlags` **must** not include [VK_ADDRESS_COMMAND_FULLY_BOUND_BIT_KHR](#)
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressRange-13098
If the buffer from which the range specified by `addressRange` was created with [VK_BUFFER_CREATE_PROTECTED_BIT](#), and `protectedNoFault` is not supported, `addressFlags` **must** include [VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR](#)
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressRange-13099
If the buffer from which the range specified by `addressRange` was created without [VK_BUFFER_CREATE_PROTECTED_BIT](#), and `protectedNoFault` is not supported, `addressFlags` **must** not include [VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR](#)

- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressFlags-13100
`addressFlags` **must** not include both
`VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR` and
`VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressRange-13122
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `addressFlags` **must** include `VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR` or `VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressRange-13123
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created without `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressFlags-13101
`addressFlags` **must** not include both
`VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR` and
`VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressRange-13124
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created with `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`, `addressFlags` **must** include `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR` or `VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressRange-13125
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created without `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`

Valid Usage (Implicit)

- VUID-VkBindTransformFeedbackBuffer2InfoEXT-sType-sType
`sType` **must** be
`VK_STRUCTURE_TYPE_BIND_TRANSFORM_FEEDBACK_BUFFER_2_INFO_EXT`
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkBindTransformFeedbackBuffer2InfoEXT-addressFlags-parameter
`addressFlags` **must** be a valid combination of `VkAddressCommandFlagBitsKHR` values

To bind transform feedback buffers to a command buffer for use in subsequent drawing

commands, call:

WARNING This functionality is superseded by `vkCmdBindTransformFeedbackBuffers2EXT`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffersEXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       firstBinding,
    uint32_t                       bindingCount,
    const VkBuffer*                pBuffers,
    const VkDeviceSize*            pOffsets,
    const VkDeviceSize*            pSizes);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of `VkDeviceSize` buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is `NULL`, it is equivalent to setting a `pSizes` array where every element is `VK_WHOLE_SIZE`.

The values taken from elements `i` of `pBuffers`, `pOffsets` and `pSizes` replace the current state for the transform feedback binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The transform feedback binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`.

When an element of `pSizes[i]` is `VK_WHOLE_SIZE`, or `pSizes` is `NULL`, the effective range is calculated by taking the size of `pBuffers[i]` minus `pOffsets[i]`. Otherwise, the effective range is equal to the element in `pSizes[i]`.

Valid Usage

- VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355
`VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` **must** be enabled
- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356
`firstBinding` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357
The sum of `firstBinding` and `bindingCount` **must** be less than or equal to

VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365
Transform feedback **must** not be active when the `vkCmdBindTransformFeedbackBuffersEXT` command is recorded
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358
All elements of `pOffsets` **must** be less than the size of the corresponding element in `pBuffers`
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359
All elements of `pOffsets` **must** be a multiple of 4
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360
All elements of `pBuffers` **must** have been created with the `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT` usage flag set
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363
All elements of `pOffsets` plus the `effective size` of the element, **must** be less than or equal to the size of the corresponding buffer in `pBuffers`
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364
Each element of `pBuffers` that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter
`pBuffers` **must** be a valid pointer to an array of `bindingCount` valid `VkBuffer` handles
- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter
`pOffsets` **must** be a valid pointer to an array of `bindingCount` `VkDeviceSize` values
- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBindTransformFeedbackBuffersEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arraylength
`bindingCount` **must** be greater than 0
- VUID-vkCmdBindTransformFeedbackBuffersEXT-commonparent
Both of `commandBuffer`, and the elements of `pBuffers` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

`vkCmdBindTransformFeedbackBuffersEXT` is not affected by [conditional rendering](#)

Transform feedback for specific transform feedback buffers is made active by calling:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_transform_feedback
void vkCmdBeginTransformFeedback2EXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       firstCounterRange,
    uint32_t                       counterRangeCount,
    const VkBindTransformFeedbackBuffer2InfoEXT* pCounterInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterRange` is the index of the first transform feedback buffer corresponding to `pCounterInfos[0]`.
- `counterRangeCount` is the size of the `pCounterInfos` array.
- `pCounterInfos` is `NULL` or a pointer to an array of `VkBindTransformFeedbackBuffer2InfoEXT` structures defining memory ranges containing counters used to resume transform feedback from a previous location.

If `pCounterInfos` is `NULL`, it is equivalent to an array of `VkBindTransformFeedbackBuffer2InfoEXT` structures with each element having a `addressRange.size` of 0.

If the `addressRange.size` of an element of `pCounterInfos` at index `i` is 0, transform feedback data written to `XfbBuffer` with a `XFB Buffer Number` equal to the sum of `i` and `firstCounterRange` will be written starting at an offset of 0 in the bound transform feedback buffer. If the `addressRange.size` of an element of `pCounterInfos` at index `i` is not 0, it will instead be written starting at an offset equal to the 32-bit value found at `pCounterInfos[i].addressRange.address`.

The active transform feedback buffers will capture primitives emitted from the corresponding `XfbBuffer` in the bound graphics pipeline. Any `XfbBuffer` emitted that does not output to an active transform feedback buffer will not be captured.

Valid Usage

- VUID-vkCmdBeginTransformFeedback2EXT-transformFeedback-02366
`VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` **must** be enabled
- VUID-vkCmdBeginTransformFeedback2EXT-None-02367
Transform feedback **must** not be active
- VUID-vkCmdBeginTransformFeedback2EXT-firstCounter-02368
`firstCounterRange` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdBeginTransformFeedback2EXT-firstCounter-02369
The sum of `firstCounterRange` and `counterRangeCount` **must** be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdBeginTransformFeedback2EXT-firstCounter-09630
The sum of `firstCounterRange` and `counterRangeCount` **must** be less than or equal to the number of transform feedback buffers bound by `vkCmdBindTransformFeedbackBuffers2EXT`
- VUID-vkCmdBeginTransformFeedback2EXT-None-06233
If the `shaderObject` feature is not enabled, a valid graphics pipeline **must** be bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-vkCmdBeginTransformFeedback2EXT-None-04128
The last `pre-rasterization shader stage` of the bound graphics pipeline **must** have been declared with the `Xfb` execution mode
- VUID-vkCmdBeginTransformFeedback2EXT-None-02373
Transform feedback **must** not be made active in a render pass instance with multiview enabled
- VUID-vkCmdBeginTransformFeedback2EXT-pCounterInfos-13093
Each element of `pCounterInfos` **must** have a `addressRange.size` that is either 0 or greater than or equal to 4
- VUID-vkCmdBeginTransformFeedback2EXT-pCounterInfos-13094
For each element of `pCounterInfos` with a non-zero address, the buffer the address was queried from **must** have been created with the `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT` usage flag set

Valid Usage (Implicit)

- VUID-vkCmdBeginTransformFeedback2EXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginTransformFeedback2EXT-pCounterInfos-parameter

If `counterRangeCount` is not 0, and `pCounterInfos` is not NULL, `pCounterInfos` **must** be a valid pointer to an array of `counterRangeCount` valid `VkBindTransformFeedbackBuffer2InfoEXT` structures

- VUID-vkCmdBeginTransformFeedback2EXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdBeginTransformFeedback2EXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBeginTransformFeedback2EXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdBeginTransformFeedback2EXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT VK_QUEUE_VIDEO_CODING_BIT	State

Conditional Rendering

`vkCmdBeginTransformFeedback2EXT` is not affected by `conditional rendering`

Transform feedback for specific transform feedback buffers is made inactive by calling:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_transform_feedback
void vkCmdEndTransformFeedback2EXT(
    VkCommandBuffer                    commandBuffer,
    uint32_t                           firstCounterRange,
    uint32_t                           counterRangeCount,
    const VkBindTransformFeedbackBuffer2InfoEXT* pCounterInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.

- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterInfos[0]`.
- `counterRangeCount` is the size of the `pCounterInfos` array.
- `pCounterInfos` is `NULL` or a pointer to an array of `VkBindTransformFeedbackBuffer2InfoEXT` structures defining memory ranges used to write counters used to later resume transform feedback.

If `pCounterInfos` is `NULL`, it is equivalent to an array of `VkBindTransformFeedbackBuffer2InfoEXT` structures with each element having a `addressRange.size` of 0.

If the `addressRange.size` of an element of `pCounterInfos` at index `i` is 0, no data is written to the address range. If the `addressRange.size` of an element of `pCounterInfos` at index `i` is not 0, the byte offset, where the next vertex data would be written to in the transform feedback buffer at a binding equal to the sum of `i` and `firstCounterBuffer`, is written to that range's `address`.

Valid Usage

- VUID-vkCmdEndTransformFeedback2EXT-transformFeedback-02374
`VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` **must** be enabled
- VUID-vkCmdEndTransformFeedback2EXT-None-02375
Transform feedback **must** be active
- VUID-vkCmdEndTransformFeedback2EXT-firstCounterBuffer-02376
`firstCounterBuffer` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdEndTransformFeedback2EXT-firstCounterBuffer-02377
The sum of `firstCounterBuffer` and `counterRangeCount` **must** be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdEndTransformFeedback2EXT-pCounterInfos-13095
Each element of `pCounterInfos` **must** have a `addressRange.size` that is either 0 or greater than or equal to 4
- VUID-vkCmdEndTransformFeedback2EXT-pCounterInfos-13096
For each element of `pCounterInfos` with a non-zero address, the buffer the address was queried from **must** have been created with the `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT` usage flag set

Valid Usage (Implicit)

- VUID-vkCmdEndTransformFeedback2EXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndTransformFeedback2EXT-pCounterInfos-parameter
If `counterRangeCount` is not 0, and `pCounterInfos` is not `NULL`, `pCounterInfos` **must** be a valid pointer to an array of `counterRangeCount` valid `VkBindTransformFeedbackBuffer2InfoEXT` structures

- VUID-vkCmdEndTransformFeedback2EXT-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdEndTransformFeedback2EXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdEndTransformFeedback2EXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndTransformFeedback2EXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdEndTransformFeedback2EXT` is not affected by [conditional rendering](#)

Transform feedback for specific transform feedback buffers is made active by calling:

WARNING

This functionality is superseded by [vkCmdBeginTransformFeedback2EXT](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_transform_feedback
void vkCmdBeginTransformFeedbackEXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       firstCounterBuffer,
    uint32_t                       counterBufferCount,
    const VkBuffer*                pCounterBuffers,
    const VkDeviceSize*            pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.

- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`.
- `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.
- `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using `vkCmdEndTransformFeedbackEXT` it can be used to resume transform feedback from the previous location. In that case, a pipeline barrier is required between the calls to `vkCmdEndTransformFeedbackEXT` and `vkCmdBeginTransformFeedbackEXT`, with `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` as the source and destination stages, `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` as the source access and `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT` as the destination access. If `pCounterBuffers` is `NULL`, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of `pCounterBuffers` that is `VK_NULL_HANDLE`, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.
- `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values were previously written. The location in each counter buffer at these offsets **must** be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding `XfbBuffer` in the bound graphics pipeline. Any `XfbBuffer` emitted that does not output to an active transform feedback buffer will not be captured.

Valid Usage

- VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366
`VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` **must** be enabled
- VUID-vkCmdBeginTransformFeedbackEXT-None-02367
Transform feedback **must** not be active
- VUID-vkCmdBeginTransformFeedbackEXT-firstCounter-02368
`firstCounterBuffer` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdBeginTransformFeedbackEXT-firstCounter-02369
The sum of `firstCounterBuffer` and `counterBufferCount` **must** be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdBeginTransformFeedbackEXT-firstCounter-09630
The sum of `firstCounterBuffer` and `counterBufferCount` **must** be less than or equal to the number of transform feedback buffers bound by `vkCmdBindTransformFeedbackBuffersEXT`
- VUID-vkCmdBeginTransformFeedbackEXT-None-06233

If the `shaderObject` feature is not enabled, a valid graphics pipeline **must** be bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdBeginTransformFeedbackEXT-None-04128
The last `pre-rasterization shader stage` of the bound graphics pipeline **must** have been declared with the `Xfb` execution mode
- VUID-vkCmdBeginTransformFeedbackEXT-None-02373
Transform feedback **must** not be made active in a render pass instance with multiview enabled
- VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607
If `counterBufferCount` is not 0, and `pCounterBuffers` is not `NULL`, `pCounterBuffers` **must** be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`
- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370
For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it **must** reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array
- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371
If `pCounterBuffer` is `NULL`, then `pCounterBufferOffsets` **must** also be `NULL`
- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372
For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it **must** have been with the `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT` usage flag set

Valid Usage (Implicit)

- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-parameter
If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not `NULL`, `pCounterBufferOffsets` **must** be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values
- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdBeginTransformFeedbackEXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdBeginTransformFeedbackEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdBeginTransformFeedbackEXT-commonparent
Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

`vkCmdBeginTransformFeedbackEXT` is not affected by [conditional rendering](#)

Transform feedback for specific transform feedback buffers is made inactive by calling:

WARNING

This functionality is superseded by [vkCmdEndTransformFeedback2EXT](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_transform_feedback
void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       firstCounterBuffer,
    uint32_t                       counterBufferCount,
    const VkBuffer*                pCounterBuffers,
    const VkDeviceSize*            pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`.
- `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.
- `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This **can** be used by a subsequent [vkCmdBeginTransformFeedbackEXT](#) call to resume transform feedback capture from this position. It can also be used by [vkCmdDrawIndirectByteCountEXT](#) to determine the vertex count

of the draw call.

- `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets **must** be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

Valid Usage

- VUID-vkCmdEndTransformFeedbackEXT-transformFeedback-02374
`VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` **must** be enabled
- VUID-vkCmdEndTransformFeedbackEXT-None-02375
Transform feedback **must** be active
- VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02376
`firstCounterBuffer` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02377
The sum of `firstCounterBuffer` and `counterBufferCount` **must** be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
- VUID-vkCmdEndTransformFeedbackEXT-counterBufferCount-02608
If `counterBufferCount` is not 0, and `pCounterBuffers` is not `NULL`, `pCounterBuffers` **must** be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`
- VUID-vkCmdEndTransformFeedbackEXT-pCounterBufferOffsets-02378
For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it **must** reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array
- VUID-vkCmdEndTransformFeedbackEXT-pCounterBuffer-02379
If `pCounterBuffer` is `NULL`, then `pCounterBufferOffsets` **must** also be `NULL`
- VUID-vkCmdEndTransformFeedbackEXT-pCounterBuffers-02380
For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it **must** have been created with the `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT` usage flag set

Valid Usage (Implicit)

- VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdEndTransformFeedbackEXT-pCounterBufferOffsets-parameter
If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not `NULL`, `pCounterBufferOffsets` **must** be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values

- VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdEndTransformFeedbackEXT-renderpass
This command **must** only be called inside of a render pass instance
- VUID-vkCmdEndTransformFeedbackEXT-vidcoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdEndTransformFeedbackEXT-commonparent
Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Inside	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdEndTransformFeedbackEXT` is not affected by `conditional rendering`

30.2. Flat Shading

Flat shading a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the *provoking vertex* of the primitive. Flat shading is applied to those vertex attributes that `match` fragment input attributes which are decorated as `Flat`.

If neither `mesh`, `geometry` nor `tessellation shading` is active, the provoking vertex is determined by the `primitive topology` defined by `VkPipelineInputAssemblyStateCreateInfo::topology` used to execute the `drawing command`.

If a shader using **MeshEXT Execution Model** is active, the provoking vertex is determined by the **primitive topology** defined by the **OutputPoints**, **OutputLinesEXT**, or **OutputTrianglesEXT** execution mode.

If **geometry shading** is active, the provoking vertex is determined by the **primitive topology** defined by the **OutputPoints**, **OutputLineStrip**, or **OutputTriangleStrip** execution mode.

If **tessellation shading** is active but **geometry shading** is not, the provoking vertex **may** be any of the vertices in each primitive.

For a given primitive topology, the pipeline's provoking vertex mode determines which vertex is the provoking vertex. To specify the provoking vertex mode, include a **VkPipelineRasterizationProvokingVertexStateCreateInfoEXT** structure in the **VkPipelineRasterizationStateCreateInfo::pNext** chain when creating the pipeline.

The **VkPipelineRasterizationProvokingVertexStateCreateInfoEXT** structure is defined as:

```
// Provided by VK_EXT_provoking_vertex
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkProvokingVertexModeEXT provokingVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **provokingVertexMode** is a **VkProvokingVertexModeEXT** value selecting the provoking vertex mode.

If this structure is not provided when creating the pipeline, the pipeline will use the **VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT** mode.

If the **provokingVertexModePerPipeline** limit is **VK_FALSE**, then all pipelines bound within a render pass instance **must** have the same **provokingVertexMode**.

Valid Usage

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883
If **provokingVertexMode** is **VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT**, then the **provokingVertexLast** feature **must** be enabled

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType
sType **must** be

[VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT](#)

- `VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter`
`provokingVertexMode` must be a valid [VkProvokingVertexModeEXT](#) value

Structure Chaining

Extends the structure

- [VkPipelineRasterizationStateCreateInfo](#)

Possible values of [VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode](#) are:

```
// Provided by VK_EXT_provoking_vertex
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} VkProvokingVertexModeEXT;
```

- [VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT](#) specifies that the provoking vertex is the first non-adjacency vertex in the list of vertices used by a primitive.
- [VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT](#) specifies that the provoking vertex is the last non-adjacency vertex in the list of vertices used by a primitive.

These modes are described more precisely in [Primitive Topologies](#).

To [dynamically set](#) the `provokingVertexMode` state, call:

```
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_provoking_vertex,
VK_EXT_provoking_vertex with VK_EXT_shader_object
void vkCmdSetProvokingVertexModeEXT(
    VkCommandBuffer          commandBuffer,
    VkProvokingVertexModeEXT provokingVertexMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `provokingVertexMode` specifies the `provokingVertexMode` state.

This command sets the `provokingVertexMode` state for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode](#) value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetProvokingVertexModeEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3ProvokingVertexMode` feature is enabled
 - The `shaderObject` feature is enabled
- VUID-vkCmdSetProvokingVertexModeEXT-provokingVertexMode-07447
If `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the `provokingVertexLast` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetProvokingVertexModeEXT-provokingVertexMode-parameter
`provokingVertexMode` **must** be a valid `VkProvokingVertexModeEXT` value
- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetProvokingVertexModeEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

vkCmdSetProvokingVertexModeEXT is not affected by [conditional rendering](#)

30.3. Primitive Clipping

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

$$\begin{aligned} -w_c &\leq x_c \leq w_c \\ -w_c &\leq y_c \leq w_c \\ z_m &\leq z_c \leq w_c \end{aligned}$$

where if [VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne](#) is [VK_TRUE](#) z_m is equal to $-w_c$ otherwise z_m is equal to zero.

This view volume **can** be further restricted by as many as [VkPhysicalDeviceLimits::maxClipDistances](#) application-defined half-spaces.

The cull volume is the intersection of up to [VkPhysicalDeviceLimits::maxCullDistances](#) application-defined half-spaces (if no application-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader **must** write a single cull distance for each enabled cull half-space to elements of the [CullDistance](#) array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to [VkPhysicalDeviceLimits::maxClipDistances](#) application-defined half-spaces with the view volume (if no application-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader **must** write a single clip distance for each enabled clip half-space to elements of the [ClipDistance](#) array. Clip half-space i is then given by the set of points satisfying the inequality

$$c_i(\mathbf{P}) \geq 0$$

where $c_i(\mathbf{P})$ is the clip distance i at point $\mathbf{P}$. For point primitives, $c_i(\mathbf{P})$ is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections [Basic Line Segment Rasterization](#) and [Basic Polygon Rasterization](#), using the perspective interpolation equations.

The number of application-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays [ClipDistance](#) and [CullDistance](#), respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#) is present in the graphics pipeline state

then depth clipping is disabled if `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` is `VK_FALSE`. Otherwise, if `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is not present, depth clipping is disabled when `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is `VK_TRUE`.

To dynamically set enable or disable depth clamping, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetDepthClampEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthClampEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthClampEnable` specifies whether depth clamping is enabled.

This command sets whether depth clamping is enabled or disabled for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthClampEnable` value used to create the currently active pipeline.

If the depth clamping state is changed dynamically, and the pipeline was not created with `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` enabled, then depth clipping is enabled when depth clamping is disabled and vice versa.

If the `maintenance11` feature is enabled, the above statement is further clarified to state that the depth clipping state is only affected by the `current value` of `depthClampEnable` if the pipeline was not created with the `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure. If `VkPipelineRasterizationDepthClipStateCreateInfoEXT` was included in the pipeline creation then the depth clipping state is set explicitly by `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` and not changed when the depth clamping state is modified.

Valid Usage

- VUID-vkCmdSetDepthClampEnableEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3DepthClampEnable` feature is enabled
 - The `shaderObject` feature is enabled
- VUID-vkCmdSetDepthClampEnableEXT-depthClamp-07449
If the `depthClamp` feature is not enabled, `depthClampEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetDepthClampEnableEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetDepthClampEnableEXT` is not affected by [conditional rendering](#)

To [dynamically set](#) enable or disable depth clipping, call:

```
// Provided by VK_EXT_depth_clip_enable with VK_EXT_extended_dynamic_state3,
VK_EXT_depth_clip_enable with VK_EXT_shader_object
void vkCmdSetDepthClipEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthClipEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthClipEnable` specifies whether depth clipping is enabled.

This command sets whether depth clipping is enabled or disabled for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable](#) value used to create the

currently active pipeline. If `VkPipelineRasterizationDepthClipStateCreateInfoEXT` was not specified, depth clipping is set to the inverse of the `current value` of `depthClampEnable`.

Valid Usage

- VUID-vkCmdSetDepthClipEnableEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3DepthClipEnable` feature is enabled
 - The `shaderObject` feature is enabled
- VUID-vkCmdSetDepthClipEnableEXT-depthClipEnable-07451
The `depthClipEnable` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetDepthClipEnableEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

vkCmdSetDepthClipEnableEXT is not affected by [conditional rendering](#)

When depth clipping is disabled, the plane equation

$$Z_m \leq Z_c \leq W_c$$

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of [VkPhysicalDevicePointClippingProperties::pointClippingBehavior](#), specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```
// Provided by VK_VERSION_1_1
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR =
VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR =
VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY,
} VkPointClippingBehavior;
```

```
// Provided by VK_KHR_maintenance2
// Equivalent to VkPointClippingBehavior
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```

- [VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES](#) specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- [VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY](#) specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment's vertices lie outside of the clip volume, the line segment **may** be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, $0 \leq t \leq 1$, for each clipped vertex. If the coordinates of a clipped vertex are $\mathbf{P}$ and the unclipped line segment's vertex coordinates are $\mathbf{P}_1$ and $\mathbf{P}_2$, then t satisfies the following equation

$$\mathbf{P} = t \mathbf{P}_1 + (1-t) \mathbf{P}_2.$$

t is used to clip vertex output attributes as described in [Clipping Shader Outputs](#).

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume's boundary, the clipped polygon **must** include a point on this boundary edge.

Primitives rendered with application-defined half-spaces **must** satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex i has a single specified clip distance d_i (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by $-d_i$ (and the graphics pipeline is otherwise the same). In this case, primitives **must** not be missing any pixels, and pixels **must** not be drawn twice in regions where those primitives are cut by the clip planes.

The `VkPipelineViewportDepthClipControlCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_depth_clip_control
typedef struct VkPipelineViewportDepthClipControlCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           negativeOneToOne;
} VkPipelineViewportDepthClipControlCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `negativeOneToOne` sets the z_m in the *view volume* to $-w_c$

Valid Usage

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-negativeOneToOne-06470
If the `depthClipControl` feature is not enabled, `negativeOneToOne` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLIP_CONTROL_CREATE_INFO_EXT`

Structure Chaining

Extends the structure

- `VkPipelineViewportStateCreateInfo`

To dynamically set `negativeOneToOne`, call:

```
// Provided by VK_EXT_depth_clip_control with VK_EXT_extended_dynamic_state3,  
VK_EXT_depth_clip_control with VK_EXT_shader_object  
void vkCmdSetDepthClipNegativeOneToOneEXT(  
    VkCommandBuffer                commandBuffer,  
    VkBool32                       negativeOneToOne);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `negativeOneToOne` specifies the `negativeOneToOne` state.

This command sets the `negativeOneToOne` state for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3DepthClipNegativeOneToOne` feature is enabled
 - The `shaderObject` feature is enabled
- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-depthClipControl-07453
The `depthClipControl` feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

`vkCmdSetDepthClipNegativeOneToOneEXT` is not affected by [conditional rendering](#)

30.4. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices $\mathbf{P}_1$ and $\mathbf{P}_2$ of an unclipped edge be $\mathbf{c}_1$ and $\mathbf{c}_2$. The value of t (see [Primitive Clipping](#)) for a clipped point $\mathbf{P}$ is used to obtain the output value associated with $\mathbf{P}$ as

$$\mathbf{c} = t \mathbf{c}_1 + (1-t) \mathbf{c}_2.$$

(Multiplying an output value by a scalar means multiplying each of x , y , z , and w by the scalar.)

Since this computation is performed in clip space before division by w_c , clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume's boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume's boundary.

For vertex output attributes whose matching fragment input attributes are decorated with

NoPerspective, the value of t used to obtain the output value associated with $\mathbf{P}$ will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type **must** always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see [Basic Line Segment Rasterization](#) and [Basic Polygon Rasterization](#)), and no interpolation is performed. The output value $\mathbf{c}$ is taken from either $\mathbf{c}_1$ or $\mathbf{c}_2$, since flat shading has already occurred and the two values are identical.

30.5. Coordinate Transformations

Clip coordinates for a vertex result from shader execution, which yields a vertex coordinate **Position**.

Perspective division on clip coordinates yields *normalized device coordinates*, followed by a *viewport* transformation (see [Controlling the Viewport](#)) to convert these coordinates into *framebuffer coordinates*.

If a vertex in clip coordinates has a position given by

$$\begin{pmatrix} x_c \\ y_c \\ z_c \\ w_c \end{pmatrix}$$

then the vertex's normalized device coordinates are

$$\begin{pmatrix} x_d \\ y_d \\ z_d \end{pmatrix} = \begin{pmatrix} \frac{x_c}{w_c} \\ \frac{y_c}{w_c} \\ \frac{z_c}{w_c} \end{pmatrix}$$

30.6. Controlling the Viewport

The viewport transformation is determined by the selected viewport's width and height in pixels, p_x and p_y , respectively, and its center (o_x , o_y) (also in pixels), as well as its depth range min and max determining a depth range scale value p_z and a depth range bias value o_z (defined below). The vertex's framebuffer coordinates (x_f , y_f) and depth z_f are given by

$$x_f = (p_x / 2) x_d + o_x$$

$$y_f = (p_y / 2) y_d + o_y$$

$$z_f = p_z \times z_d + o_z$$

Multiple viewports are available, numbered zero up to `VkPhysicalDeviceLimits::maxViewports` minus one. The number of viewports used by a pipeline is controlled by the `viewportCount` member of the `VkPipelineViewportStateCreateInfo` structure used in pipeline creation.

x_f and y_f have limited precision, where the number of fractional bits retained is specified by `VkPhysicalDeviceLimits::subPixelPrecisionBits`. When rasterizing `line segments`, the number of fractional bits is specified by `VkPhysicalDeviceLineRasterizationProperties::lineSubPixelPrecisionBits`.

The `VkPipelineViewportStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t                 viewportCount;
    const VkViewport*        pViewports;
    uint32_t                 scissorCount;
    const VkRect2D*          pScissors;
} VkPipelineViewportStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `viewportCount` is the number of viewports used by the pipeline.
- `pViewports` is a pointer to an array of `VkViewport` structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- `scissorCount` is the number of `scissors` and **must** match the number of viewports.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

Valid Usage

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
If the `multiViewport` feature is not enabled, `viewportCount` **must** not be greater than 1
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
If the `multiViewport` feature is not enabled, `scissorCount` **must** not be greater than 1
- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
`viewportCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxViewports`
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
`scissorCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxViewports`
- VUID-VkPipelineViewportStateCreateInfo-x-02821
The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than

or equal to 0

- VUID-VkPipelineViewportStateCreateInfo-offset-02822
Evaluation of (`offset.x + extent.width`) **must** not cause a signed integer addition overflow for any element of `pScissors`
- VUID-VkPipelineViewportStateCreateInfo-offset-02823
Evaluation of (`offset.y + extent.height`) **must** not cause a signed integer addition overflow for any element of `pScissors`
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134
If `scissorCount` and `viewportCount` are both not dynamic, then `scissorCount` and `viewportCount` **must** be identical
- VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135
If the graphics pipeline is being created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set then `viewportCount` **must** be 0, otherwise `viewportCount` **must** be greater than 0
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136
If the graphics pipeline is being created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set then `scissorCount` **must** be 0, otherwise `scissorCount` **must** be greater than 0

Valid Usage (Implicit)

- VUID-VkPipelineViewportStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO`
- VUID-VkPipelineViewportStateCreateInfo-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPipelineViewportDepthClampControlCreateInfoEXT` or `VkPipelineViewportDepthClipControlCreateInfoEXT`
- VUID-VkPipelineViewportStateCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask
`flags` **must** be 0

To [dynamically set](#) the viewport count and viewports, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetViewportWithCount(
    VkCommandBuffer          commandBuffer,
    uint32_t                 viewportCount,
    const VkViewport*         pViewports);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetViewportWithCount
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 viewportCount,
    const VkViewport*        pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportCount` specifies the viewport count.
- `pViewports` specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::viewportCount` and `pViewports` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetViewportWithCount-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled
 - the `shaderObject` feature is enabled
 - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3
- VUID-vkCmdSetViewportWithCount-viewportCount-03394
`viewportCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetViewportWithCount-viewportCount-03395
If the `multiViewport` feature is not enabled, `viewportCount` **must** be 1

Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetViewportWithCount-pViewports-parameter
`pViewports` **must** be a valid pointer to an array of `viewportCount` valid `VkViewport` structures
- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support

[VK_QUEUE_GRAPHICS_BIT](#) operations

- VUID-vkCmdSetViewportWithCount-[videocoding](#)
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetViewportWithCount-[viewportCount-arraylength](#)
[viewportCount](#) **must** be greater than 0

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

[vkCmdSetViewportWithCount](#) is not affected by [conditional rendering](#)

To [dynamically set](#) the scissor count and scissor rectangular bounds, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer          commandBuffer,
    uint32_t                 scissorCount,
    const VkRect2D*          pScissors);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetScissorWithCount
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 scissorCount,
    const VkRect2D*          pScissors);
```

- [commandBuffer](#) is the command buffer into which the command will be recorded.
- [scissorCount](#) specifies the scissor count.

- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetScissorWithCount-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled
 - the `shaderObject` feature is enabled
 - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3
- VUID-vkCmdSetScissorWithCount-scissorCount-03397
`scissorCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetScissorWithCount-scissorCount-03398
If the `multiViewport` feature is not enabled, `scissorCount` **must** be 1
- VUID-vkCmdSetScissorWithCount-x-03399
The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than or equal to 0
- VUID-vkCmdSetScissorWithCount-offset-03400
Evaluation of $(\text{offset.x} + \text{extent.width})$ **must** not cause a signed integer addition overflow for any element of `pScissors`
- VUID-vkCmdSetScissorWithCount-offset-03401
Evaluation of $(\text{offset.y} + \text{extent.height})$ **must** not cause a signed integer addition overflow for any element of `pScissors`

Valid Usage (Implicit)

- VUID-vkCmdSetScissorWithCount-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetScissorWithCount-pScissors-parameter
`pScissors` **must** be a valid pointer to an array of `scissorCount` `VkRect2D` structures
- VUID-vkCmdSetScissorWithCount-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetScissorWithCount-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdSetScissorWithCount-vidcoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetScissorWithCount-scissorCount-arraylength
`scissorCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

`vkCmdSetScissorWithCount` is not affected by [conditional rendering](#)

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineViewportStateCreateFlags;
```

`VkPipelineViewportStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

A [pre-rasterization shader stage](#) **can** direct each primitive to one of several viewports. The destination viewport for a primitive is selected by the last active [pre-rasterization shader stage](#) that has an output variable decorated with `ViewportIndex`. The viewport transform uses the viewport corresponding to the value assigned to `ViewportIndex`, and taken from an implementation-dependent vertex of each primitive. If `ViewportIndex` is outside the range zero to `viewportCount` minus one for a primitive, or if the last active [pre-rasterization shader stage](#) did not assign a value to `ViewportIndex` for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last [pre-rasterization shader stage](#) does not have an output decorated with `ViewportIndex`, the viewport numbered zero is used by the viewport transformation.

A single vertex **can** be used in more than one individual primitive, in primitives such as `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`. In this case, the viewport transformation is applied separately for each primitive.

To [dynamically set](#) the viewport transformation parameters, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetViewport(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstViewport,
    uint32_t                 viewportCount,
    const VkViewport*        pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewports` is a pointer to an array of [VkViewport](#) structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pViewports` values used to create the currently active pipeline.

The viewport parameters taken from element `i` of `pViewports` replace the current state for the viewport index `firstViewport + i`, for `i` in `[0, viewportCount)`.

Valid Usage

- VUID-vkCmdSetViewport-firstViewport-01223
The sum of `firstViewport` and `viewportCount` **must** be between `1` and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetViewport-firstViewport-01224
If the `multiViewport` feature is not enabled, `firstViewport` **must** be `0`
- VUID-vkCmdSetViewport-viewportCount-01225
If the `multiViewport` feature is not enabled, `viewportCount` **must** be `1`

Valid Usage (Implicit)

- VUID-vkCmdSetViewport-commandBuffer-parameter
`commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetViewport-pViewports-parameter
`pViewports` **must** be a valid pointer to an array of `viewportCount` valid [VkViewport](#) structures
- VUID-vkCmdSetViewport-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetViewport-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdSetViewport-`videocoding`
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetViewport-`viewportCount-arraylength`
`viewportCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT VK_QUEUE_COMPUTE_BIT	State

Conditional Rendering

`vkCmdSetViewport` is not affected by [conditional rendering](#)

Both `VkPipelineViewportStateCreateInfo` and `vkCmdSetViewport` use `VkViewport` to set the viewport transformation parameters.

The `VkViewport` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float    x;
    float    y;
    float    width;
    float    height;
    float    minDepth;
    float    maxDepth;
} VkViewport;
```

- `x` and `y` are the viewport's upper left corner (x,y).
- `width` and `height` are the viewport's width and height, respectively.

- `minDepth` and `maxDepth` are the depth range for the viewport.

NOTE Despite their names, `minDepth` **can** be less than, equal to, or greater than `maxDepth`.

The framebuffer depth coordinate z_f **may** be represented using either a fixed-point or floating-point representation. However, a floating-point representation **must** be used if the depth/stencil attachment has a floating-point depth component. If an m-bit fixed-point representation is used, we assume that it represents each value $\frac{k}{2^m-1}$, where $k \in \{0, 1, \dots, 2^m-1\}$, as k (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

$$o_x = x + \text{width} / 2$$

$$o_y = y + \text{height} / 2$$

$$o_z = \text{minDepth} \text{ (or } (\text{maxDepth} + \text{minDepth}) / 2 \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT}::\text{negativeOneToOne} \text{ is } \text{VK_TRUE})$$

$$p_x = \text{width}$$

$$p_y = \text{height}$$

$$p_z = \text{maxDepth} - \text{minDepth} \text{ (or } (\text{maxDepth} - \text{minDepth}) / 2 \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT}::\text{negativeOneToOne} \text{ is } \text{VK_TRUE})$$

The application **can** specify a negative term for `height`, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative `height`, the application **should** also adjust the `y` value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative `height` allows the application to avoid having to negate the y component of the `Position` output from the last `pre-rasterization shader stage`.

The width and height of the `implementation-dependent maximum viewport dimensions` **must** be greater than or equal to the width and height of the largest image which **can** be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an `implementation-dependent precision`.

Valid Usage

- VUID-VkViewport-width-01770
`width` **must** be greater than 0.0

- VUID-VkViewport-width-01771
width **must** be less than or equal to `VkPhysicalDeviceLimits::maxViewportDimensions[0]`
- VUID-VkViewport-apiVersion-07917
If the `VK_KHR_maintenance1` extension is not enabled, the `VK_AMD_negative_viewport_height` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, height **must** be greater than `0.0`
- VUID-VkViewport-height-01773
The absolute value of height **must** be less than or equal to `VkPhysicalDeviceLimits::maxViewportDimensions[1]`
- VUID-VkViewport-x-01774
x **must** be greater than or equal to `viewportBoundsRange[0]`
- VUID-VkViewport-x-01232
(x + width) **must** be less than or equal to `viewportBoundsRange[1]`
- VUID-VkViewport-y-01775
y **must** be greater than or equal to `viewportBoundsRange[0]`
- VUID-VkViewport-y-01776
y **must** be less than or equal to `viewportBoundsRange[1]`
- VUID-VkViewport-y-01777
(y + height) **must** be greater than or equal to `viewportBoundsRange[0]`
- VUID-VkViewport-y-01233
(y + height) **must** be less than or equal to `viewportBoundsRange[1]`
- VUID-VkViewport-minDepth-01234
If the `VK_EXT_depth_range_unrestricted` extension is not enabled, minDepth **must** be between `0.0` and `1.0`, inclusive
- VUID-VkViewport-maxDepth-01235
If the `VK_EXT_depth_range_unrestricted` extension is not enabled, maxDepth **must** be between `0.0` and `1.0`, inclusive

Chapter 31. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment's sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by [fragment operations](#).

Several factors affect rasterization, including the members of [VkPipelineRasterizationStateCreateInfo](#) and [VkPipelineMultisampleStateCreateInfo](#).

The [VkPipelineRasterizationStateCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32                  depthClampEnable;
    VkBool32                  rasterizerDiscardEnable;
    VkPolygonMode              polygonMode;
    VkCullModeFlags            cullMode;
    VkFrontFace                frontFace;
    VkBool32                  depthBiasEnable;
    float                     depthBiasConstantFactor;
    float                     depthBiasClamp;
    float                     depthBiasSlopeFactor;
    float                     lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

- **depthClampEnable** controls whether to clamp the fragment's depth values as described in [Depth Test](#). If the pipeline is not created with [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#) present then enabling depth clamp will also disable clipping primitives to the z planes of the frustum as described in [Primitive Clipping](#). Otherwise depth clipping is controlled by the state set in [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#).
- **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.
- **polygonMode** is the triangle rendering mode. See [VkPolygonMode](#).
- **cullMode** is the triangle facing direction used for primitive culling. See [VkCullModeFlagBits](#).
- **frontFace** is a [VkFrontFace](#) value specifying the front-facing triangle orientation to be used for culling.
- **depthBiasEnable** controls whether to bias fragment depth values.
- **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.
- **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.
- **depthBiasSlopeFactor** is a scalar factor applied to a fragment's slope in depth bias calculations.
- **lineWidth** is the width of rasterized line segments.

Valid Usage

- VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782
If the **depthClamp** feature is not enabled, **depthClampEnable** **must** be [VK_FALSE](#)
- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507
If the **fillModeNonSolid** feature is not enabled, **polygonMode** **must** be [VK_POLYGON_MODE_FILL](#)
- VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458
If the [VK_KHR_portability_subset](#) extension is enabled, and [VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons](#) is [VK_FALSE](#), and **rasterizerDiscardEnable** is [VK_FALSE](#), **polygonMode** **must** not be [VK_POLYGON_MODE_POINT](#)

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationStateCreateInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO](#)
- VUID-VkPipelineRasterizationStateCreateInfo-pNext-pNext
Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either [NULL](#) or a pointer to a valid instance of [VkDepthBiasRepresentationInfoEXT](#), [VkPipelineRasterizationConservativeStateCreateInfoEXT](#), [VkPipelineRasterizationDepthClipStateCreateInfoEXT](#), [VkPipelineRasterizationLineStateCreateInfo](#), [VkPipelineRasterizationProvokingVertexStateCreateInfoEXT](#),
or

VkPipelineRasterizationStateStreamCreateInfoEXT

- VUID-VkPipelineRasterizationStateCreateInfo-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkPipelineRasterizationStateCreateInfo-flags-zero-bitmask
flags **must** be 0
- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-parameter
polygonMode **must** be a valid **VkPolygonMode** value
- VUID-VkPipelineRasterizationStateCreateInfo-cullMode-parameter
cullMode **must** be a valid combination of **VkCullModeFlagBits** values
- VUID-VkPipelineRasterizationStateCreateInfo-frontFace-parameter
frontFace **must** be a valid **VkFrontFace** value

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineRasterizationStateCreateFlags;
```

VkPipelineRasterizationStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

If the **pNext** chain of **VkPipelineRasterizationStateCreateInfo** includes a **VkPipelineRasterizationDepthClipStateCreateInfoEXT** structure, then that structure controls whether depth clipping is enabled or disabled.

The **VkPipelineRasterizationDepthClipStateCreateInfoEXT** structure is defined as:

```
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineRasterizationDepthClipStateCreateFlagsEXT flags;
    VkBool32                 depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **depthClipEnable** controls whether depth clipping is enabled as described in **Primitive Clipping**.

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType
sType **must** be
VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zero bitmask
flags must be 0

Structure Chaining

Extends the structure

- [VkPipelineRasterizationStateCreateInfo](#)

```
// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;
```

[VkPipelineRasterizationDepthClipStateCreateFlagsEXT](#) is a bitmask type for setting a mask, but is currently reserved for future use.

The [VkPipelineMultisampleStateCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits     rasterizationSamples;
    VkBool32                  sampleShadingEnable;
    float                     minSampleShading;
    const VkSampleMask*       pSampleMask;
    VkBool32                  alphaToCoverageEnable;
    VkBool32                  alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationSamples** is a [VkSampleCountFlagBits](#) value specifying the number of samples used in rasterization. This value is ignored for the purposes of setting the number of samples used in rasterization if the pipeline is created with the [VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT](#) dynamic state set, but if [VK_DYNAMIC_STATE_SAMPLE_MASK_EXT](#) dynamic state is not set, it is still used to define the size of the **pSampleMask** array as described below.
- **sampleShadingEnable** **can** be used to enable [Sample Shading](#).
- **minSampleShading** specifies a minimum fraction of sample shading if **sampleShadingEnable** is [VK_TRUE](#).
- **pSampleMask** is a pointer to an array of [VkSampleMask](#) values used in the [sample mask test](#).

- `alphaToCoverageEnable` controls whether a temporary coverage value is generated based on the alpha component of the fragment's first color output as specified in the [Multisample Coverage](#) section.
- `alphaToOneEnable` controls whether the alpha component of the fragment's first color output is replaced with one as described in [Multisample Coverage](#).

Each bit in the sample mask is associated with a unique [sample index](#) as defined for the [coverage mask](#). Each bit `b` for mask word `w` in the sample mask corresponds to sample index `i`, where $i = 32 \times w + b$. `pSampleMask` has a length equal to $\lceil \text{rasterizationSamples} / 32 \rceil$ words.

If `pSampleMask` is `NULL`, it is treated as if the mask has all bits set to 1.

Valid Usage

- VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784
If the `sampleRateShading` feature is not enabled, `sampleShadingEnable` **must** be `VK_FALSE`
- VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785
If the `alphaToOne` feature is not enabled, `alphaToOneEnable` **must** be `VK_FALSE`
- VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786
`minSampleShading` **must** be in the range [0,1]

Valid Usage (Implicit)

- VUID-VkPipelineMultisampleStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO`
- VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineSampleLocationsStateCreateInfoEXT`
- VUID-VkPipelineMultisampleStateCreateInfo-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask
`flags` **must** be 0
- VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter
`rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineMultisampleStateCreateFlags;
```

`VkPipelineMultisampleStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type `VkSampleMask`, each representing 32 bits of coverage information:

```
// Provided by VK_VERSION_1_0
typedef uint32_t VkSampleMask;
```

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the [fragment operations](#).

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and **can** also modify or replace their assigned depth values.

31.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the `rasterizerDiscardEnable` member of `VkPipelineRasterizationStateCreateInfo` is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To [dynamically enable](#) whether primitives are discarded before the rasterization stage, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetRasterizerDiscardEnable(
    VkCommandBuffer          commandBuffer,
    VkBool32                  rasterizerDiscardEnable);
```

```
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
// Equivalent to vkCmdSetRasterizerDiscardEnable
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                  rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

This command sets the discard enable for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetRasterizerDiscardEnable-None-08970
At least one of the following **must** be true:

- the `extendedDynamicState2` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetRasterizerDiscardEnable-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetRasterizerDiscardEnable` is not affected by `conditional rendering`

31.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last `pre-rasterization shader stage` are directed to vertex stream zero. Geometry shaders **can** emit primitives to multiple independent vertex streams. Each

vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions `OpEndPrimitive` and `OpEndStreamPrimitive` **can** be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams` streams, which is at least 1. The individual streams are numbered 0 through `maxTransformFeedbackStreams` minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream **can** be completely independent, subject only to the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize` and `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize` limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last [pre-rasterization shader stage](#) shader's `XfbBuffer`, `XfbStride`, and `Offsets` decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the `GeometryStreams` capability **must** be specified.

By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the `OutputPoints` output primitive type. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles` property it is possible to emit `OutputLineStrip` or `OutputTriangleStrip` in addition to `OutputPoints`.

The vertex stream used for rasterization is specified by adding a `VkPipelineRasterizationStateStreamCreateInfoEXT` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateStreamCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_transform_feedback
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineRasterizationStateStreamCreateFlagsEXT flags;
    uint32_t                 rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `rasterizationStream` is the vertex stream selected for rasterization.

If this structure is not present, `rasterizationStream` is assumed to be zero.

Valid Usage

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324 `VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams` **must** be enabled
- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325 `rasterizationStream` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`
- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326 `rasterizationStream` **must** be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT`
- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-flags-zerobitmask `flags` **must** be 0

Structure Chaining

Extends the structure

- `VkPipelineRasterizationStateCreateInfo`

```
// Provided by VK_EXT_transform_feedback
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;
```

`VkPipelineRasterizationStateStreamCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

To [dynamically set](#) the `rasterizationStream` state, call:

```
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_transform_feedback,
VK_EXT_shader_object with VK_EXT_transform_feedback
void vkCmdSetRasterizationStreamEXT(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             rasterizationStream);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizationStream` specifies the `rasterizationStream` state.

This command sets the `rasterizationStream` state for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetRasterizationStreamEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3RasterizationStream` feature is enabled
 - The `shaderObject` feature is enabled
- VUID-vkCmdSetRasterizationStreamEXT-transformFeedback-07411
The `transformFeedback` feature **must** be enabled
- VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07412
`rasterizationStream` **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`
- VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07413
`rasterizationStream` **must** be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is `VK_FALSE`

Valid Usage (Implicit)

- VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetRasterizationStreamEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

vkCmdSetRasterizationStreamEXT is not affected by [conditional rendering](#)

31.3. Rasterization Order

Within a subpass of a [render pass instance](#), for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in *rasterization order*, for each separate primitive that includes that sample location:

1. [Fragment operations](#), in the order defined
2. [Blending](#), [logic operations](#), and color writes

Execution of these operations for each primitive in a subpass occurs in [primitive order](#).

31.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values **can** be later *resolved* to a single color (see [Resolving Multisample Images](#) and the [Render Pass](#) chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a [coverage mask](#) with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.

It is understood that each pixel has `rasterizationSamples` locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel **must** be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points **may** be identical for each pixel in the framebuffer, or they **may** differ.

If the render pass has a fragment density map attachment, each fragment only has `rasterizationSamples` locations associated with it regardless of how many pixels are covered in the

fragment area. Fragment sample locations are defined as if the fragment had an area of (1,1) and its sample points **must** be located within these bounds. Their actual location in the framebuffer is calculated by scaling the sample location by the fragment area. Attachments with storage for multiple samples per pixel are located at the pixel sample locations. Otherwise, the fragment's sample locations are generally used for evaluation of associated data and fragment operations.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with **Sample** and **Input**, the data associated with those variables will be assigned independently for each sample. The values for each sample **must** be evaluated at the location of the sample. The data associated with any other variables not decorated with **Sample** and **Input** need not be evaluated independently for each sample.

A *coverage mask* is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments and multi-pixel fragments defined by a **fragment density map** have one set of samples. Multi-pixel fragments defined by setting the **fragment shading rate** have one set of samples per pixel. Each set of samples has a number of samples determined by `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. Each sample in a set is assigned a unique *sample index* *i* in the range [0, `rasterizationSamples`).

To **dynamically set** the `rasterizationSamples`, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetRasterizationSamplesEXT(
    VkCommandBuffer                commandBuffer,
    VkSampleCountFlagBits          rasterizationSamples);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizationSamples` specifies `rasterizationSamples`.

This command sets the `rasterizationSamples` for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetRasterizationSamplesEXT-None-09423

At least one of the following **must** be true:

- The `extendedDynamicState3RasterizationSamples` feature is enabled
- The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-parameter **commandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetRasterizationSamplesEXT-rasterizationSamples-parameter **rasterizationSamples** **must** be a valid [VkSampleCountFlagBits](#) value
- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-recording **commandBuffer** **must** be in the [recording state](#)
- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetRasterizationSamplesEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdSetRasterizationSamplesEXT is not affected by [conditional rendering](#)

Each sample in a fragment is also assigned a unique *coverage index* j in the range $[0, n \times \text{rasterizationSamples})$, where n is the number of sets in the fragment. If the fragment contains a single set of samples, the *coverage index* is always equal to the *sample index*.

If the [fragment shading rate](#) is set, the coverage index j is determined as a function of the *pixel index* p , the *sample index* i , and the number of rasterization samples r as:

$$j = i + r \times ((f_w \times f_h) - 1 - p)$$

where the pixel index p is determined as a function of the pixel's framebuffer location (x,y) and the fragment size (f_w,f_h) :

$$p_x = x \% f_w$$

$$p_y = y \% f_h$$

$$p = p_x + (p_y \times f_w)$$

The tables below illustrate the pixel index for multi-pixel fragments:

Table 34. Pixel Indices - 1 Wide

1x1	1x2	1x4
		

Table 35. Pixel Indices - 2 Wide

2x1	2x2	2x4
		

Table 36. Pixel Indices - 4 Wide

4x1	4x2	4x4
		

The coverage mask includes B bits packed into W words, defined as:

$$B = n \times \text{rasterizationSamples}$$

$$W = \lceil B/32 \rceil$$

Bit b in coverage mask word w is 1 if the sample with coverage index $j = 32 \times w + b$ is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the *i*th entry in the table corresponding to sample index *i*. `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.

Table 37. Standard Sample Locations

Sample count	Sample Locations	
VK_SAMPLE_COUNT_1_BIT	(0.5,0.5)	
VK_SAMPLE_COUNT_2_BIT	(0.75,0.75) (0.25,0.25)	
VK_SAMPLE_COUNT_4_BIT	(0.375, 0.125) (0.875, 0.375) (0.125, 0.625) (0.625, 0.875)	
VK_SAMPLE_COUNT_8_BIT	(0.5625, 0.3125) (0.4375, 0.6875) (0.8125, 0.5625) (0.3125, 0.1875) (0.1875, 0.8125) (0.0625, 0.4375) (0.6875, 0.9375) (0.9375, 0.0625)	
VK_SAMPLE_COUNT_16_BIT	(0.5625, 0.5625) (0.4375, 0.3125) (0.3125, 0.625) (0.75, 0.4375) (0.1875, 0.375) (0.625, 0.8125) (0.8125, 0.6875) (0.6875, 0.1875) (0.375, 0.875) (0.5, 0.0625) (0.25, 0.125) (0.125, 0.75) (0.0, 0.5) (0.9375, 0.25) (0.875, 0.9375) (0.0625, 0.0)	

31.5. Custom Sample Locations

Applications **can** also control the sample locations used for rasterization.

If the `pNext` chain of the `VkPipelineMultisampleStateCreateInfo` structure specified at pipeline creation time includes a `VkPipelineSampleLocationsStateCreateInfoEXT` structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The `VkPipelineSampleLocationsStateCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkBool32             sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleLocationsEnable` controls whether custom sample locations are used. If `sampleLocationsEnable` is `VK_FALSE`, the default sample locations are used and the values specified in `sampleLocationsInfo` are ignored.
- `sampleLocationsInfo` is the sample locations to use during rasterization if `sampleLocationsEnable` is `VK_TRUE` and the graphics pipeline is not created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`.

Valid Usage (Implicit)

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter `sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

Structure Chaining

Extends the structure

- `VkPipelineMultisampleStateCreateInfo`

The `VkSampleLocationsInfoEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D           sampleLocationGridSize;
    uint32_t             sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleLocationsPerPixel` is a `VkSampleCountFlagBits` value specifying the number of sample locations per pixel.
- `sampleLocationGridSize` is the size of the sample location grid to select custom sample locations for.
- `sampleLocationsCount` is the number of sample locations in `pSampleLocations`.
- `pSampleLocations` is a pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures.

This structure **can** be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`.

The sample locations in `pSampleLocations` specify `sampleLocationsPerPixel` number of sample locations for each pixel in the grid of the size specified in `sampleLocationGridSize`. The sample location for sample `i` at the pixel grid location `(x,y)` is taken from `pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i]`.

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of `pSampleLocations` **may** be ignored.

Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
`sampleLocationsPerPixel` **must** be a valid `VkSampleCountFlagBits` value that is set in `VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts`
- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
`sampleLocationsCount` **must** equal `sampleLocationsPerPixel × sampleLocationGridSize.width × sampleLocationGridSize.height`

Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT`
- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
If `sampleLocationsCount` is not 0, `pSampleLocations` **must** be a valid pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures

Structure Chaining

Extends the structures

- `VkImageMemoryBarrier`
- `VkImageMemoryBarrier2`

The `VkSampleLocationEXT` structure is defined as:

```
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float    x;
    float    y;
} VkSampleLocationEXT;
```

- `x` is the horizontal coordinate of the sample's location.
- `y` is the vertical coordinate of the sample's location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a `VkSampleLocationEXT` structure are always clamped to the implementation-dependent sample location coordinate range `[sampleLocationCoordinateRange[0],sampleLocationCoordinateRange[1]]` that **can** be queried using `VkPhysicalDeviceSampleLocationsPropertiesEXT`.

To **dynamically set** the `sampleLocationsEnable` state, call:

```
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_sample_locations,
VK_EXT_sample_locations with VK_EXT_shader_object
void vkCmdSetSampleLocationsEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                  sampleLocationsEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `sampleLocationsEnable` specifies the `sampleLocationsEnable` state.

This command sets the `sampleLocationsEnable` state for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetSampleLocationsEnableEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3SampleLocationsEnable` feature is enabled
 - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetSampleLocationsEnableEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdSetSampleLocationsEnableEXT is not affected by [conditional rendering](#)

To [dynamically set](#) the sample locations used for rasterization, call:

```
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer                      commandBuffer,
    const VkSampleLocationsInfoEXT*      pSampleLocationsInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pSampleLocationsInfo` is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#), and when the [VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable](#) property of the bound graphics pipeline is [VK_TRUE](#). Otherwise, this state is specified by the [VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo](#) values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530
If [VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations](#) is [VK_FALSE](#) then the current render pass **must** have been begun by specifying a [VkRenderPassSampleLocationsBeginInfoEXT](#) structure whose [pPostSubpassSampleLocations](#) member contains an element with a [subpassIndex](#) matching the current subpass index and the [sampleLocationsInfo](#) member of that element **must** match the sample locations state pointed to by [pSampleLocationsInfo](#)

Valid Usage (Implicit)

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter
`pSampleLocationsInfo` **must** be a valid pointer to a valid [VkSampleLocationsInfoEXT](#) structure
- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that `commandBuffer` was allocated from **must** support

[VK_QUEUE_GRAPHICS_BIT](#) operations

- VUID-vkCmdSetSampleLocationsEXT-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

`vkCmdSetSampleLocationsEXT` is not affected by [conditional rendering](#)

31.6. Fragment Shading Rates

The features advertised by [VkPhysicalDeviceFragmentShadingRateFeaturesKHR](#) allow an application to control the [shading rate](#) of a given fragment shader invocation.

The fragment shading rate strongly interacts with [Multisampling](#), and the set of available rates for an implementation **may** be restricted by sample rate.

To query available shading rates, call:

```
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of

VkPhysicalDeviceFragmentShadingRateKHR structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` **must** point to a variable set by the application to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates **must** be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value **must** be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array **must** not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` **must** be less than or equal to `maxFragmentSize.width`.
- The value of `fragmentSize.width` **must** be greater than or equal to 1.
- The value of `fragmentSize.width` **must** be a power-of-two.
- The value of `fragmentSize.height` **must** be less than or equal to `maxFragmentSize.height`.
- The value of `fragmentSize.height` **must** be greater than or equal to 1.
- The value of `fragmentSize.height` **must** be a power-of-two.
- The highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
- The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations **must** support at least the following shading rates:

<code>sampleCounts</code>	<code>fragmentSize</code>
<code>VK_SAMPLE_COUNT_1_BIT</code> <code>VK_SAMPLE_COUNT_4_BIT</code>	{2,2}
<code>VK_SAMPLE_COUNT_1_BIT</code> <code>VK_SAMPLE_COUNT_4_BIT</code>	{2,1}
~0	{1,1}

If `framebufferColorSampleCounts`, includes `VK_SAMPLE_COUNT_2_BIT`, the required rates **must** also include `VK_SAMPLE_COUNT_2_BIT`.

NOTE

Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts are supported for this rate.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter

`physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter

`pFragmentShadingRateCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter

If the value referenced by `pFragmentShadingRateCount` is not `0`, and `pFragmentShadingRates` is not `NULL`, `pFragmentShadingRates` **must** be a valid pointer to an array of `pFragmentShadingRateCount` `VkPhysicalDeviceFragmentShadingRateKHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPhysicalDeviceFragmentShadingRateKHR` structure is defined as

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType    sType;
    void*              pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D         fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleCounts` is a bitmask of sample counts for which the shading rate described by `fragmentSize` is supported.
- `fragmentSize` is a `VkExtent2D` describing the width and height of a supported shading rate.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType

`sType`

must

be

`VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR`

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-pNext-pNext
pNext **must** be NULL

Fragment shading rates **can** be set at three points, with the three rates combined to determine the final shading rate.

31.6.1. Pipeline Fragment Shading Rate

The *pipeline fragment shading rate* **can** be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via [vkCmdSetFragmentShadingRateKHR](#).

The [VkPipelineFragmentShadingRateStateCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkExtent2D               fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- sType is a [VkStructureType](#) value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fragmentSize specifies a [VkExtent2D](#) structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- combinerOps specifies a [VkFragmentShadingRateCombinerOpKHR](#) value determining how the [pipeline](#), [primitive](#), and [attachment shading rates](#) are [combined](#) for fragments generated by drawing commands using the created pipeline.

If the pNext chain of [VkGraphicsPipelineCreateInfo](#) includes a [VkPipelineFragmentShadingRateStateCreateInfoKHR](#) structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, [fragmentSize](#) is considered to be equal to (1,1), and both elements of [combinerOps](#) are considered to be equal to [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR](#).

Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR](#)

Structure Chaining

Extends the structure

- [VkGraphicsPipelineCreateInfo](#)

To [dynamically set](#) the pipeline fragment shading rate and combiner operation, call:

```
// Provided by VK_KHR_fragment_shading_rate
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer          commandBuffer,
    const VkExtent2D*        pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
- `combinerOps` specifies a [VkFragmentShadingRateCombinerOpKHR](#) determining how the [pipeline](#), [primitive](#), and [attachment shading rates](#) are [combined](#) for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineFragmentShadingRateStateCreateInfoKHR](#) values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507
If the `pipelineFragmentShadingRate` feature is not enabled, `pFragmentSize->width` **must** be 1
- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508
If the `pipelineFragmentShadingRate` feature is not enabled, `pFragmentSize->height` **must** be 1
- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509
One of the `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` features **must** be enabled
- VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510
If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` **must** be [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR](#)
- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511
If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` **must** be [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR](#)
- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps`

must be either [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR](#) or [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR](#)

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513
[pFragmentSize->width](#) **must** be greater than or equal to 1
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
[pFragmentSize->height](#) **must** be greater than or equal to 1
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
[pFragmentSize->width](#) **must** be a power-of-two value
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
[pFragmentSize->height](#) **must** be a power-of-two value
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
[pFragmentSize->width](#) **must** be less than or equal to 4
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
[pFragmentSize->height](#) **must** be less than or equal to 4

Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
[pFragmentSize](#) **must** be a valid pointer to a valid [VkExtent2D](#) structure
- VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
Each element of [combinerOps](#) **must** be a valid [VkFragmentShadingRateCombinerOpKHR](#) value
- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
[commandBuffer](#) **must** be in the [recording state](#)
- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetFragmentShadingRateKHR-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

vkCmdSetFragmentShadingRateKHR is not affected by [conditional rendering](#)

31.6.2. Primitive Fragment Shading Rate

The *primitive fragment shading rate* **can** be set via the `PrimitiveShadingRateKHR` built-in in the last active [pre-rasterization shader stage](#). If the last [pre-rasterization shader stage](#) is using the `MeshEXT Execution Model`, the rate associated with a given primitive is sourced from the value written to the per-primitive `PrimitiveShadingRateKHR`. Otherwise the rate associated with a given primitive is sourced from the value written to `PrimitiveShadingRateKHR` by that primitive's [provoking vertex](#).

31.6.3. Attachment Fragment Shading Rate

The *attachment shading rate* **can** be set by including `VkFragmentShadingRateAttachmentInfoKHR` in a subpass to define a *fragment shading rate attachment*. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

$$x' = \text{floor}(x / \text{region}_x)$$

$$y' = \text{floor}(y / \text{region}_y)$$

where x' and y' are the coordinates of a texel in the fragment shading rate attachment, x and y are the coordinates of the pixel in the framebuffer, and region_x and region_y are the size of the region each texel corresponds to, as defined by the `shadingRateAttachmentTexelSize` member of `VkFragmentShadingRateAttachmentInfoKHR`.

If [multiview is enabled](#) and the shading rate attachment has multiple layers, the shading rate attachment texel is selected using `layer = ViewIndex`. If [multiview is disabled](#), and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected using `layer = Layer`. Otherwise, `layer = 0`.

The texel is [read from the fragment shading rate attachment image](#) using image coordinates equal to $(x', y', 0, \text{layer}, 0, 0)$. The fragment size is encoded into the first component of the result of that operation as follows:

$$\text{size}_w = 2^{((\text{texel}/4)\&3)}$$

$$\text{size}_h = 2^{(\text{texel}\&3)}$$

where `texel` is the value in the first component of the returned value, and `sizew` and `sizeh` are the width and height of the fragment size, decoded from the `texel`.

If no fragment shading rate attachment is specified, this size is calculated as `sizew = sizeh = 1`. Applications **must** not specify a width or height greater than 4 by this method.

The *Fragment Shading Rate* enumeration in SPIR-V adheres to the above encoding.

31.6.4. Combining the Fragment Shading Rates

The final rate (`Cxy`) used for fragment shading **must** be one of the rates returned by `vkGetPhysicalDeviceFragmentShadingRatesKHR` for the sample count used by rasterization.

If any of the following conditions are met, `Cxy` is set to {1,1} by the implementation:

- If [Sample Shading](#) is enabled.
- The `fragmentShadingRateWithSampleMask` limit is not supported, and `VkPipelineMultisampleStateCreateInfo::pSampleMask` contains a zero value in any bit used by fragment operations.
- The `fragmentShadingRateWithShaderSampleMask` is not supported, and the fragment shader has `SampleMask` in the input or output interface.
- The `fragmentShadingRateWithShaderDepthStencilWrites` limit is not supported, and the fragment shader declares the `FragDepth` or `FragStencilRefEXT` built-in.
- The `fragmentShadingRateWithConservativeRasterization` limit is not supported, and `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.
- The `fragmentShadingRateWithFragmentShaderInterlock` limit is not supported, and the fragment shader declares any of the [fragment shader interlock](#) execution modes.
- The `fragmentShadingRateWithCustomSampleLocations` limit is not supported, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE`.
- The fragment shader declares any of the `TileImageColorReadAccessEXT`, `TileImageDepthReadAccessEXT`, or `TileImageStencilReadAccessEXT` capabilities.

Otherwise, each of the specified shading rates are combined and then used to derive the value of `Cxy`. As there are three ways to specify shading rates, two combiner operations are specified - between the [pipeline](#) and [primitive](#) shading rates, and between the result of that and the [attachment shading rate](#).

The equation used for each combiner operation is defined by `VkFragmentShadingRateCombinerOpKHR`:

```
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR](#) specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy}$.
- [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR](#) specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = B_{xy}$.
- [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR](#) specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy})$.
- [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR](#) specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy})$.
- [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR](#) specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy} * B_{xy}$.

where $\text{combine}(A_{xy}, B_{xy})$ is the combine operation, and A_{xy} and B_{xy} are the inputs to the operation.

If `fragmentShadingRateStrictMultiplyCombiner` is [VK_FALSE](#), using [VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR](#) with values of 1 for both A and B in the same dimension results in the value 2 being produced for that dimension. See the definition of `fragmentShadingRateStrictMultiplyCombiner` for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

$$C_{xy} = \text{combine}(A_{xy}, B_{xy})$$

where C_{xy} is the combined fragment area result, and A_{xy} and B_{xy} are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with A_{xy} equal to the [pipeline fragment shading rate](#) and B_{xy} equal to the [primitive fragment shading rate](#), with the combine() operation selected by `combinerOps[0]`. A second combination is then performed, with A_{xy} equal to the result of the first combination and B_{xy} equal to the [attachment fragment shading rate](#), with the combine() operation selected by `combinerOps[1]`. The result of the second combination is used as the final fragment shading rate, reported via the [ShadingRateKHR built-in](#).

Implementations **should** clamp the inputs to the combiner operations A_{xy} and B_{xy} , and **must** do so if `VkPhysicalDeviceMaintenance6Properties::fragmentShadingRateClampCombinerInputs` is [VK_TRUE](#). All implementations **must** clamp the result of the second combiner operation.

A fragment shading rate R_{xy} representing any of A_{xy} , B_{xy} or C_{xy} is clamped as follows. If R_{xy} is one of the rates returned by `vkGetPhysicalDeviceFragmentShadingRatesKHR` for the sample count used by rasterization, the clamped shading rate R_{xy}' is R_{xy} . Otherwise, the clamped shading rate is selected from the rates returned by `vkGetPhysicalDeviceFragmentShadingRatesKHR` for the sample count used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where $R_x' \leq R_x$ and $R_y' \leq R_y$.
 - Implementations **may** also keep rates where $R_x' \leq R_y$ and $R_y' \leq R_x$.
2. Keep only rates with the highest area ($R_x' \times R_y'$).
3. Keep only rates with the lowest aspect ratio ($R_x' + R_y'$).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation **may** choose either rate. However, it **must** choose this rate consistently for the same shading rates, and combiner operations for the lifetime of the `VkDevice`.

31.7. Sample Shading

Sample shading **can** be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation **must** invoke the fragment shader at least $\max(\lceil \frac{\text{VkPipelineMultisampleStateCreateInfo::minSampleShading}}{\text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples}} \rceil, 1)$ times per fragment. If `VkPipelineMultisampleStateCreateInfo::sampleShadingEnable` is `VK_TRUE`, sample shading is enabled.

If a fragment shader entry point **statically uses** an input variable decorated with a `BuiltIn` of `SampleId` or `SamplePosition`, sample shading is enabled and a value of `1.0` is used instead of `minSampleShading`. If a fragment shader entry point **statically uses** an input variable decorated with `Sample`, sample shading **may** be enabled and a value of `1.0` will be used instead of `minSampleShading` if it is.

NOTE

If a shader decorates an input variable with `Sample` and that value meaningfully impacts the output of a shader, sample shading will be enabled to ensure that the input is in fact interpolated per-sample. This is inherent to the specification and not spelled out here - if an application simply declares such a variable it is implementation-defined whether sample shading is enabled or not. It is possible to see the effects of this by using atomics in the shader or using a pipeline statistics query to query the number of fragment invocations, even if the shader itself does not use any per-sample variables.

If there are fewer fragment invocations than `covered samples`, implementations **may** include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once, and each invocation that is not a `helper invocation` covers at least one sample.

31.8. Barycentric Interpolation

When the `fragmentShaderBarycentric` feature is enabled, the `PerVertexKHR` `interpolation decoration`

can be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs **can** only be accessed in a fragment shader using an array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the fragment. Reads of per-vertex values for missing vertices, such as the third vertex of a line primitive, will return values from the valid vertex with the highest index. This means that the per-vertex values of indices 1 and 2 for point primitives will be equal to those of index 0, and the per-vertex values of index 2 for line primitives will be equal to those of index 1.

When [tessellation](#), [geometry shading](#), and [mesh shading](#) are not active, fragment shader inputs decorated with [PerVertexKHR](#) will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the n vertices passed to a draw call are numbered 0 through $n-1$, and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used when the [provoking vertex mode](#) is [VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT](#) for index values of 0, 1, and 2. If an input decorated with [PerVertexKHR](#) is accessed with any other vertex index value, or is accessed while rasterizing a polygon when the [VkPipelineRasterizationStateCreateInfo::polygonMode](#) property of the currently active pipeline is not [VK_POLYGON_MODE_FILL](#), an undefined value is returned.

Primitive Topology	Vertex 0	Vertex 1	Vertex 2
VK_PRIMITIVE_TOPOLOGY_POINT_LIST	i	i	i
VK_PRIMITIVE_TOPOLOGY_LINE_LIST	$2i$	$2i+1$	$2i+1$
VK_PRIMITIVE_TOPOLOGY_LINE_STRIP	i	$i+1$	$i+1$
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST	$3i$	$3i+1$	$3i+2$
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP (even)	i	$i+1$	$i+2$
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP (odd)	i	$i+2$	$i+1$
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN	$i+1$	$i+2$	0
VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY	$4i+1$	$4i+2$	$4i+2$
VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY	$i+1$	$i+2$	$i+2$

Primitive Topology	Vertex 0	Vertex 1	Vertex 2
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY	$6i$	$6i+2$	$6i+4$
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY (even)	$2i$	$2i+2$	$2i+4$
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY (odd)	$2i$	$2i+4$	$2i+2$

When the provoking vertex mode is [VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT](#), the original vertex numbers used are the same as above except as indicated in the table below.

Primitive Topology	Vertex 0	Vertex 1	Vertex 2
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP (odd, and triStripVertexOrderIndependentOfProvokingVertex of VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR is VK_FALSE)	$i+1$	i	$i+2$
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN	0	$i+1$	$i+2$
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY (odd)	$2i+2$	$2i$	$2i+4$

When geometry or mesh shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry or mesh shader. In this case, the vertices used for fragment shader inputs decorated with [PerVertexKHR](#) are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting [the table above](#).

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with [PerVertexKHR](#), the vertex ordering used in this case will be consistent with the ordering used to derive the values of inputs decorated with [BaryCoordKHR](#) or [BaryCoordNoPerspKHR](#).

Fragment shader inputs decorated with [BaryCoordKHR](#) or [BaryCoordNoPerspKHR](#) hold three-component

vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For [line](#) primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For [polygon](#) primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For [BaryCoordKHR](#), the values are obtained using perspective interpolation. For [BaryCoordNoPerspKHR](#), the values are obtained using linear interpolation. The values of [BaryCoordKHR](#) and [BaryCoordNoPerspKHR](#) are undefined while rasterizing a polygon when the [VkPipelineRasterizationStateCreateInfo::polygonMode](#) property of the currently active pipeline is not [VK_POLYGON_MODE_FILL](#).

31.9. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in [PointSize](#) written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range [[pointSizeRange\[0\]](#), [pointSizeRange\[1\]](#)]. The value written to [PointSize](#) **must** be greater than zero. If the [maintenance5](#) feature is enabled, and a value is not written to [PointSize](#), the point size takes a default value of 1.0.

Not all point sizes need be supported, but the size 1.0 **must** be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the [pointSizeRange](#) and [pointSizeGranularity](#) members of [VkPhysicalDeviceLimits](#). If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes **may** also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

Further, if the render pass has a fragment density map attachment, point size **may** be rounded by the implementation to a multiple of the fragment's width or height.

31.9.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point's (x_b, y_f) . This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in [PointCoord](#) contains point sprite texture coordinates. The s and t point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate s and t :

$$s = \frac{1}{2} + \frac{(x_p - x_f)}{\text{size}}$$

$$t = \frac{1}{2} + \frac{(y_p - y_f)}{\text{size}}$$

where `size` is the point's size; (x_p, y_p) is the location at which the point sprite coordinates are evaluated - this **may** be the framebuffer coordinates of the fragment center, or the location of a sample; and (x_f, y_f) is the exact, unrounded framebuffer coordinate of the vertex for the point.

31.10. Line Segments

Line segment rasterization options are controlled by the [VkPipelineRasterizationLineStateCreateInfo](#) structure.

The [VkPipelineRasterizationLineStateCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkPipelineRasterizationLineStateCreateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkLineRasterizationMode lineRasterizationMode;
    VkBool32           stippledLineEnable;
    uint32_t           lineStippleFactor;
    uint16_t           lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfo;
```

```
// Provided by VK_KHR_line_rasterization
// Equivalent to VkPipelineRasterizationLineStateCreateInfo
typedef VkPipelineRasterizationLineStateCreateInfo
VkPipelineRasterizationLineStateCreateInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lineRasterizationMode` is a [VkLineRasterizationMode](#) value selecting the style of line rasterization.
- `stippledLineEnable` enables [stippled line rasterization](#).
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

If `stippledLineEnable` is `VK_FALSE`, the values of `lineStippleFactor` and `lineStipplePattern` are ignored.

Valid Usage

- VUID-VkPipelineRasterizationLineStateCreateInfo-lineRasterizationMode-02768
If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `rectangularLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-lineRasterizationMode-02769
If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `bresenhamLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-lineRasterizationMode-02770
If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `smoothLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-stippledLineEnable-02771
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `stippledRectangularLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-stippledLineEnable-02772
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `stippledBresenhamLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-stippledLineEnable-02773
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `stippledSmoothLines` feature **must** be enabled
- VUID-VkPipelineRasterizationLineStateCreateInfo-stippledLineEnable-02774
If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationLineStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO`
- VUID-VkPipelineRasterizationLineStateCreateInfo-lineRasterizationMode-parameter
`lineRasterizationMode` **must** be a valid `VkLineRasterizationMode` value

Structure Chaining

Extends the structure

- `VkPipelineRasterizationStateCreateInfo`

Possible values of `VkPipelineRasterizationLineStateCreateInfo::lineRasterizationMode`, specifying the line rasterization mode, are:

```
// Provided by VK_VERSION_1_4
typedef enum VkLineRasterizationMode {
    VK_LINE_RASTERIZATION_MODE_DEFAULT = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH = 3,
    // Provided by VK_KHR_line_rasterization
    VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR = VK_LINE_RASTERIZATION_MODE_DEFAULT,
    // Provided by VK_KHR_line_rasterization
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR =
VK_LINE_RASTERIZATION_MODE_RECTANGULAR,
    // Provided by VK_KHR_line_rasterization
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR = VK_LINE_RASTERIZATION_MODE_BRESENHAM,
    // Provided by VK_KHR_line_rasterization
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR =
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH,
} VkLineRasterizationMode;
```

```
// Provided by VK_KHR_line_rasterization
// Equivalent to VkLineRasterizationMode
typedef VkLineRasterizationMode VkLineRasterizationModeKHR;
```

- `VK_LINE_RASTERIZATION_MODE_DEFAULT` is equivalent to `VK_LINE_RASTERIZATION_MODE_RECTANGULAR` if `VkPhysicalDeviceLimits::strictLines` is `VK_TRUE`, otherwise lines are drawn as non-`strictLines` parallelograms. Both of these modes are defined in [Basic Line Segment Rasterization](#).
- `VK_LINE_RASTERIZATION_MODE_RECTANGULAR` specifies lines drawn as if they were rectangles extruded from the line
- `VK_LINE_RASTERIZATION_MODE_BRESENHAM` specifies lines drawn by determining which pixel diamonds the line intersects and exits, as defined in [Bresenham Line Segment Rasterization](#).
- `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH` specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in [Smooth Lines](#).

To [dynamically set](#) the line width, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer          commandBuffer,
    float                    lineWidth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `lineWidth` is the width of rasterized line segments.

This command sets the line width for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_WIDTH` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::lineWidth` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLineWidth-lineWidth-00788
If the `wideLines` feature is not enabled, `lineWidth` **must** be `1.0`

Valid Usage (Implicit)

- VUID-vkCmdSetLineWidth-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineWidth-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetLineWidth-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetLineWidth-vidcoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

vkCmdSetLineWidth is not affected by [conditional rendering](#)

Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments **must** be provided. The range and gradations are obtained from the [lineWidthRange](#) and [lineWidthGranularity](#) members of [VkPhysicalDeviceLimits](#). If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths **may** also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

Further, if the render pass has a fragment density map attachment, line width **may** be rounded by the implementation to a multiple of the fragment's width or height.

31.10.1. Basic Line Segment Rasterization

If the [lineRasterizationMode](#) member of [VkPipelineRasterizationLineStateCreateInfo](#) is [VK_LINE_RASTERIZATION_MODE_RECTANGULAR](#), rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let $\mathbf{p}_r = (x_d, y_d)$ be the framebuffer coordinates at which associated data are evaluated. This **may** be the center of a fragment or the location of a sample within the fragment. When [rasterizationSamples](#) is [VK_SAMPLE_COUNT_1_BIT](#), the fragment center **must** be used. Let $\mathbf{p}_a = (x_a, y_a)$ and $\mathbf{p}_b = (x_b, y_b)$ be initial and final endpoints of the line segment, respectively. Set

$$t = \frac{(\mathbf{p}_r - \mathbf{p}_a) \cdot (\mathbf{p}_b - \mathbf{p}_a)}{\|\mathbf{p}_b - \mathbf{p}_a\|^2}$$

(Note that $t = 0$ at $\mathbf{p}_a$ and $t = 1$ at $\mathbf{p}_b$. Also note that this calculation projects the vector from $\mathbf{p}_a$ to $\mathbf{p}_r$ onto the line, and thus computes the normalized distance of the fragment along the line.)

If [strictLines](#) is [VK_TRUE](#), line segments are rasterized using perspective or linear interpolation.

Perspective interpolation for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment's clip coordinates. An interpolated value f can be determined by

$$f = \frac{(1-t)f_a/w_a + tf_b/w_b}{(1-t)/w_a + t/w_b}$$

where f_a and f_b are the data associated with the starting and ending endpoints of the segment, respectively; w_a and w_b are the clip w coordinates of the starting and ending endpoints of the segment, respectively.

Linear interpolation for a line segment directly interpolates two values, and an interpolated value f can be determined by

$$f = (1 - t) f_a + t f_b$$

where f_a and f_b are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate w for a sample is determined using perspective interpolation. The depth value z for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by [Interpolation decorations](#).

The above description documents the preferred method of line rasterization, and **must** be used when `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`.

By default, when `strictLines` is `VK_FALSE`, and when the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in [Non strict lines](#), and each is `lineWidth` long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.

Figure 15. Non strict lines

Only when `strictLines` is `VK_FALSE` implementations **may** deviate from the non-strict line algorithm described above in the following ways:

- Implementations **may** instead interpolate each fragment according to the formula in [Basic Line Segment Rasterization](#) using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments **may** be performed using the rules defined in [Bresenham Line Segment Rasterization](#).

If `VkPhysicalDeviceMaintenance5Properties::nonStrictSinglePixelWideLinesUseParallelogram` is `VK_TRUE`, and `strictLines` is `VK_FALSE`, non-strict lines of width 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham's algorithm.

If `VkPhysicalDeviceMaintenance5Properties::nonStrictWideLinesUseParallelogram` is `VK_TRUE`, and `strictLines` is `VK_FALSE`, non-strict lines of width greater than 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham's algorithm.

31.10.2. Bresenham Line Segment Rasterization

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the following rules replace the line rasterization rules defined in [Basic Line Segment Rasterization](#).

Non-strict lines **may** also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either *x-major* or *y-major*. *x-major* line segments have slope in the closed interval $[-1,1]$; all other line segments are *y-major* (slope is determined by the segment's endpoints). We specify rasterization only for *x-major* segments except in cases where the modifications for *y-major* segments are not self-evident.

Ideally, Vulkan uses a *diamond-exit* rule to determine those fragments that are produced by rasterizing a line segment. For each fragment f with center at framebuffer coordinates x_f and y_f , define a diamond-shaped region that is the intersection of four half planes:

$$R_f = \{(x, y) \mid |x - x_f| + |y - y_f| < \frac{1}{2}\}$$

Essentially, a line segment starting at p_a and ending at p_b produces those fragments f for which the segment intersects R_f , except if p_b is contained in R_f .

Figure 16. Visualization of Bresenham's algorithm

To avoid difficulties when an endpoint lies on a boundary of R_f we (in principle) perturb the supplied endpoints by a tiny amount. Let p_a and p_b have framebuffer coordinates (x_a, y_a) and (x_b, y_b) , respectively. Obtain the perturbed endpoints p_a' given by $(x_a, y_a) - (\epsilon, \epsilon^2)$ and p_b' given by $(x_b, y_b) - (\epsilon, \epsilon^2)$. Rasterizing the line segment starting at p_a and ending at p_b produces those fragments f for which the segment starting at p_a' and ending on p_b' intersects R_f , except if p_b' is contained in R_f . ϵ is chosen to be so small that rasterizing the line segment produces the same fragments when δ is substituted for ϵ for any $0 < \delta \leq \epsilon$.

When p_a and p_b lie on fragment centers, this characterization of fragments reduces to Bresenham's algorithm with one modification: lines produced in this description are "half-open", meaning that the final fragment (corresponding to p_b) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham's algorithm).

Implementations **may** use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm **must** not deviate by more than one unit in either x or y framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm **must** not differ from that produced by the diamond-exit rule by more than one.
- For an x -major line, two fragments that lie in the same framebuffer-coordinate column **must** not be produced (for a y -major line, two fragments that lie in the same framebuffer-coordinate row **must** not be produced).

- If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments **must** not produce duplicate fragments. Fragments also **must** not be omitted so as to interrupt continuity of the connected segments.

The actual width w of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent `LineWidthRange` (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an x-major line, the minor direction is y , and for a y-major line, the minor direction is x) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by (x_0, y_0) and (x_1, y_1) in framebuffer coordinates, the segment with endpoints $(x_0, y_0 - \frac{w-1}{2})$ and $(x_1, y_1 - \frac{w-1}{2})$ is rasterized, but instead of a single fragment, a column of fragments of height w (a row of fragments of length w for a y-major segment) is produced at each x (y for y-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for `FragCoord` which is interpolated as usual. Implementations **may** instead interpolate each fragment according to the formula in [Basic Line Segment Rasterization](#), using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations **may** all be treated as being at the pixel center (this **may** affect attribute and depth interpolation).

NOTE

The sample locations described above are **not** used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects **pixels**, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

31.10.3. Line Stipple

If the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfo` is `VK_TRUE`, then lines are rasterized with a *line stipple* determined by `lineStippleFactor` and `lineStipplePattern`. `lineStipplePattern` is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. `lineStippleFactor` is a count that is used to modify the effective line stipple by causing each bit in `lineStipplePattern` to be used `lineStippleFactor` times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern p , the line stipple factor r , and an integer stipple counter s . Let

$$b = \lfloor \frac{s}{r} \rfloor \bmod 16$$

Then a fragment is produced if the b 'th bit of p is 1, and discarded otherwise. The bits of p are numbered with 0 being the least significant and 15 being the most significant.

The initial value of s is zero. For [VK_LINE_RASTERIZATION_MODE_BRESENHAM](#) lines, s is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For [VK_LINE_RASTERIZATION_MODE_RECTANGULAR](#) and [VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH](#) lines, the rectangular region is subdivided into adjacent unit-length rectangles, and s is incremented once for each rectangle. Rectangles with a value of s such that the b 'th bit of p is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder **may** carry over to the next line segment in the line strip using the same value of s (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

s is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of s at the beginning of the line segment is implementation-dependent.

To [dynamically set](#) the line stipple state, call:

```
// Provided by VK_VERSION_1_4
void vkCmdSetLineStipple(
    VkCommandBuffer          commandBuffer,
    uint32_t                 lineStippleFactor,
    uint16_t                 lineStipplePattern);
```

```
// Provided by VK_KHR_line_rasterization
// Equivalent to vkCmdSetLineStipple
void vkCmdSetLineStippleKHR(
    VkCommandBuffer          commandBuffer,
    uint32_t                 lineStippleFactor,
    uint16_t                 lineStipplePattern);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_LINE_STIPPLE](#) set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfo::lineStippleFactor` and `VkPipelineRasterizationLineStateCreateInfo::lineStipplePattern` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLineStipple-lineStippleFactor-02776
`lineStippleFactor` **must** be in the range [1,256]

Valid Usage (Implicit)

- VUID-vkCmdSetLineStipple-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStipple-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetLineStipple-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetLineStipple-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetLineStipple` is not affected by `conditional rendering`

31.10.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfo` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then lines are considered to be rectangles using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR` lines. The rules for determining which pixels are covered are implementation-dependent, and **may**

include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0's alpha value after fragment shading, as described in [Multisample Coverage](#).

NOTE

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.

31.11. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the [VkPipelineRasterizationStateCreateInfo](#) structure.

31.11.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is *back-facing* or *front-facing*. This determination is made based on the sign of the (clipped or unclipped) polygon's area computed in framebuffer coordinates. One way to compute this area is:

$$a = -\frac{1}{2} \sum_{i=0}^{n-1} x_f^i y_f^{i+1} - x_f^{i+1} y_f^i$$

where x_f^i and y_f^i are the x and y framebuffer coordinates of the i th vertex of the n -vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and $i + 1$ is $(i + 1) \bmod n$.

The interpretation of the sign of a is determined by the [VkPipelineRasterizationStateCreateInfo::frontFace](#) property of the currently active pipeline. Possible values are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;
```

- [VK_FRONT_FACE_COUNTER_CLOCKWISE](#) specifies that a triangle with positive area is considered front-facing.
- [VK_FRONT_FACE_CLOCKWISE](#) specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To [dynamically set](#) the front face orientation, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetFrontFace(
    VkCommandBuffer          commandBuffer,
    VkFrontFace              frontFace);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetFrontFace
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer          commandBuffer,
    VkFrontFace              frontFace);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **frontFace** is a **VkFrontFace** value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_FRONT_FACE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::frontFace** value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetFrontFace-None-08971
At least one of the following **must** be true:
 - the **extendedDynamicState** feature is enabled
 - the **shaderObject** feature is enabled
 - the value of **VkApplicationInfo::apiVersion** used to create the **VkInstance** parent of **commandBuffer** is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetFrontFace-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetFrontFace-frontFace-parameter
frontFace **must** be a valid **VkFrontFace** value
- VUID-vkCmdSetFrontFace-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdSetFrontFace-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations
- VUID-vkCmdSetFrontFace-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

`vkCmdSetFrontFace` is not affected by [conditional rendering](#)

Once the orientation of triangles is determined, they are culled according to the `VkPipelineRasterizationStateCreateInfo::cullMode` property of the currently active pipeline. Possible values are:

```
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```

- `VK_CULL_MODE_NONE` specifies that no triangles are discarded
- `VK_CULL_MODE_FRONT_BIT` specifies that front-facing triangles are discarded
- `VK_CULL_MODE_BACK_BIT` specifies that back-facing triangles are discarded
- `VK_CULL_MODE_FRONT_AND_BACK` specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;
```

`VkCullModeFlags` is a bitmask type for setting a mask of zero or more `VkCullModeFlagBits`.

To [dynamically set](#) the cull mode, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetCullMode(
    VkCommandBuffer          commandBuffer,
    VkCullModeFlags          cullMode);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetCullMode
void vkCmdSetCullModeEXT(
    VkCommandBuffer          commandBuffer,
    VkCullModeFlags          cullMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `cullMode` specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_CULL_MODE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::cullMode` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCullMode-None-08971

At least one of the following **must** be true:

- the `extendedDynamicState` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetCullMode-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCullMode-cullMode-parameter
`cullMode` **must** be a valid combination of `VkCullModeFlagBits` values
- VUID-vkCmdSetCullMode-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)

- VUID-vkCmdSetCullMode-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support

VK_QUEUE_GRAPHICS_BIT operations

- VUID-vkCmdSetCullMode-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

vkCmdSetCullMode is not affected by [conditional rendering](#)

The rule for determining which fragments are produced by polygon rasterization is called *point sampling*. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon's vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons **must** result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

Barycentric coordinates are a set of three numbers, a, b, and c, each in the range [0,1], with $a + b + c = 1$. These coordinates uniquely specify any point p within the triangle or on the triangle's boundary as

$$p = a p_a + b p_b + c p_c$$

where p_a , p_b , and p_c are the vertices of the triangle. a, b, and c are determined by:

$$a = \frac{A(p p_b p_c)}{A(p_a p_b p_c)}, \quad b = \frac{A(p p_a p_c)}{A(p_a p_b p_c)}, \quad c = \frac{A(p p_a p_b)}{A(p_a p_b p_c)},$$

where $A(lmn)$ denotes the area in framebuffer coordinates of the triangle with vertices l , m , and n .

Denote an associated datum at p_a , p_b , or p_c as f_a , f_b , or f_c respectively.

Perspective interpolation for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle's clip coordinates. An interpolated value f can be determined by

$$f = \frac{af_a / w_a + bf_b / w_b + cf_c / w_c}{a / w_a + b / w_b + c / w_c}$$

where w_a , w_b , and w_c are the clip w coordinates of p_a , p_b , and p_c , respectively. a , b , and c are the barycentric coordinates of the location at which the data are produced.

Linear interpolation for a triangle directly interpolates three values, and an interpolated value f can be determined by

$$f = a f_a + b f_b + c f_c$$

where f_a , f_b , and f_c are the data associated with p_a , p_b , and p_c , respectively.

The clip coordinate w for a sample is determined using perspective interpolation. The depth value z for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by [Interpolation decorations](#).

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon's vertices **must** be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it **must** be the case that at every fragment

$$f = \sum_{i=1}^n a_i f_i$$

where n is the number of vertices in the polygon and f_i is the value of f at vertex i . For each i , $0 \leq a_i \leq 1$ and $\sum_{i=1}^n a_i = 1$. The values of a_i **may** differ from fragment to fragment, but at vertex i , $a_i = 1$ and $a_j = 0$ for $j \neq i$.

NOTE

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of [perspective interpolation](#) are iterated independently, and a division is performed for each fragment).

31.11.2. Polygon Mode

Possible values of the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
} VkPolygonMode;
```

- [VK_POLYGON_MODE_POINT](#) specifies that polygon vertices are drawn as points.
- [VK_POLYGON_MODE_LINE](#) specifies that polygon edges are drawn as line segments.
- [VK_POLYGON_MODE_FILL](#) specifies that polygons are rendered using the polygon rasterization rules in this section.

These modes affect only the final rasterization of polygons: in particular, a polygon's vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

If [VkPhysicalDeviceMaintenance5Properties::polygonModePointSize](#) is [VK_TRUE](#), the point size of the final rasterization of polygons is taken from [PointSize](#) when [polygon mode](#) is [VK_POLYGON_MODE_POINT](#).

Otherwise, if [VkPhysicalDeviceMaintenance5Properties::polygonModePointSize](#) is [VK_FALSE](#), the point size of the final rasterization of polygons is 1.0 when [polygon mode](#) is [VK_POLYGON_MODE_POINT](#).

To [dynamically set](#) the polygon mode, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetPolygonModeEXT(
    VkCommandBuffer          commandBuffer,
    VkPolygonMode            polygonMode);
```

- [commandBuffer](#) is the command buffer into which the command will be recorded.
- [polygonMode](#) specifies polygon mode.

This command sets the polygon mode for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_POLYGON_MODE_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineRasterizationStateCreateInfo::polygonMode](#) value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPolygonModeEXT-None-09423
At least one of the following **must** be true:
 - The [extendedDynamicState3PolygonMode](#) feature is enabled
 - The [shaderObject](#) feature is enabled
- VUID-vkCmdSetPolygonModeEXT-fillModeNonSolid-07424

If the `fillModeNonSolid` feature is not enabled, `polygonMode` **must** be `VK_POLYGON_MODE_FILL`

Valid Usage (Implicit)

- VUID-vkCmdSetPolygonModeEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPolygonModeEXT-polygonMode-parameter
`polygonMode` **must** be a valid `VkPolygonMode` value
- VUID-vkCmdSetPolygonModeEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetPolygonModeEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetPolygonModeEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetPolygonModeEXT` is not affected by `conditional rendering`

31.11.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon **can** be biased (offset) by a single depth bias value o that is computed for that polygon.

Depth Bias Enable

The depth bias computation is enabled by the `depthBiasEnable` set with `vkCmdSetDepthBiasEnable` and `vkCmdSetDepthBiasEnableEXT`, or the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline. If the depth bias enable is `VK_FALSE`, no bias is applied and the fragment's depth values are unchanged.

To [dynamically enable](#) whether to bias fragment depth values, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBiasEnable(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthBiasEnable);
```

```
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
// Equivalent to vkCmdSetDepthBiasEnable
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the depth bias enable for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBiasEnable-None-08970

At least one of the following **must** be true:

- the `extendedDynamicState2` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording `commandBuffer` **must** be in the [recording state](#)

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdSetDepthBiasEnable-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetDepthBiasEnable` is not affected by [conditional rendering](#)

Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope m of the polygon
- `depthBiasConstantFactor` scales the parameter r of the depth attachment
- the scaled terms are summed to produce a value which is then clamped to a minimum or maximum value specified by `depthBiasClamp`

`depthBiasSlopeFactor`, `depthBiasConstantFactor`, and `depthBiasClamp` **can** each be positive, negative, or zero. These parameters are set as described for [vkCmdSetDepthBias](#) and [vkCmdSetDepthBias2EXT](#) below.

The maximum depth slope m of a triangle is

$$m = \sqrt{\left(\frac{\partial z_f}{\partial x_f}\right)^2 + \left(\frac{\partial z_f}{\partial y_f}\right)^2}$$

where (x_f, y_f, z_f) is a point on the triangle. m **may** be approximated as

$$m = \max\left(\left|\frac{\partial z_f}{\partial x_f}\right|, \left|\frac{\partial z_f}{\partial y_f}\right|\right).$$

In a pipeline with a depth bias representation of `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`, `r`, for the given primitive is defined as

$$r = 1$$

Otherwise `r` is the minimum resolvable difference that depends on the depth attachment representation. If `VkDepthBiasRepresentationInfoEXT::depthBiasExact` is `VK_FALSE` it is the smallest difference in a sample's depth z_f values that is guaranteed to remain distinct throughout polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but z_f values that differ by `r`, will have distinct depth values.

For fixed-point depth attachment representations, or in a pipeline with a depth bias representation of `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`, `r` is constant throughout the range of the entire depth attachment. If `VkDepthBiasRepresentationInfoEXT::depthBiasExact` is `VK_TRUE`, then its value **must** be

$$r = 2^{-n}$$

Otherwise its value is implementation-dependent but **must** be at most

$$r = 2 \times 2^{-n}$$

where `n` is the number of bits used for the depth aspect when using a fixed-point attachment, or the number of mantissa bits plus one when using a floating-point attachment.

Otherwise for floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, `e`, in the range of `z` values spanned by the primitive. If `n` is the number of bits in the floating-point mantissa, the minimum resolvable difference, `r`, for the given primitive is defined as

$$r = 2^{e-n}$$

If no depth attachment is present, `r` is undefined.

The bias value `o` for a polygon is

$$o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor})$$

$$\text{where } \text{dbclamp}(x) = \begin{cases} x & \text{depthBiasClamp} = 0 \text{ or NaN} \\ \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\ \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0 \end{cases}$$

m is computed as described above. If the depth attachment uses a fixed-point representation, m is a function of depth values in the range [0,1], and o is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of [polygon mode](#). Depth bias **may** also be applied to line and point topology primitives received by the rasterizer.

To [dynamically set](#) the depth bias parameters, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer          commandBuffer,
    float                    depthBiasConstantFactor,
    float                    depthBiasClamp,
    float                    depthBiasSlopeFactor);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_DEPTH_BIAS](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the corresponding [VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor](#), [depthBiasClamp](#), and [depthBiasSlopeFactor](#) values used to create the currently active pipeline.

Calling this function is equivalent to calling [vkCmdSetDepthBias2EXT](#) without a [VkDepthBiasRepresentationInfoEXT](#) in the pNext chain of [VkDepthBiasInfoEXT](#).

Valid Usage

- VUID-vkCmdSetDepthBias-depthBiasClamp-00790
If the [depthBiasClamp](#) feature is not enabled, [depthBiasClamp](#) **must** be 0.0

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetDepthBias-commandBuffer-recording
[commandBuffer](#) **must** be in the [recording state](#)
- VUID-vkCmdSetDepthBias-commandBuffer-cmdpool
The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support

[VK_QUEUE_GRAPHICS_BIT](#) operations

- VUID-vkCmdSetDepthBias-[videocoding](#)

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

[vkCmdSetDepthBias](#) is not affected by [conditional rendering](#)

The [VkDepthBiasRepresentationInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasRepresentationInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkDepthBiasRepresentationEXT depthBiasRepresentation;
    VkBool32                  depthBiasExact;
} VkDepthBiasRepresentationInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [depthBiasRepresentation](#) is a [VkDepthBiasRepresentationEXT](#) value specifying the depth bias representation.
- [depthBiasExact](#) specifies that the implementation is not allowed to scale the depth bias value to ensure a minimum resolvable distance.

Valid Usage

- VUID-VkDepthBiasRepresentationInfoEXT-leastRepresentableValueForceUnormRepresentation-08947
If the `leastRepresentableValueForceUnormRepresentation` feature is not enabled, `depthBiasRepresentation` **must** not be `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`
- VUID-VkDepthBiasRepresentationInfoEXT-floatRepresentation-08948
If the `floatRepresentation` feature is not enabled, `depthBiasRepresentation` **must** not be `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`
- VUID-VkDepthBiasRepresentationInfoEXT-depthBiasExact-08949
If the `depthBiasExact` feature is not enabled, `depthBiasExact` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-VkDepthBiasRepresentationInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEPTH_BIAS_REPRESENTATION_INFO_EXT`
- VUID-VkDepthBiasRepresentationInfoEXT-depthBiasRepresentation-parameter
`depthBiasRepresentation` **must** be a valid `VkDepthBiasRepresentationEXT` value

Structure Chaining

Extends the structures

- `VkDepthBiasInfoEXT`
- `VkPipelineRasterizationStateCreateInfo`

Possible values of `VkDepthBiasRepresentationInfoEXT::depthBiasRepresentation`, specifying the depth bias representation are:

```
// Provided by VK_EXT_depth_bias_control
typedef enum VkDepthBiasRepresentationEXT {
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT = 0,
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT = 1,
    VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT = 2,
} VkDepthBiasRepresentationEXT;
```

- `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT` specifies that the depth bias representation is a factor of the format's `r` as described in [Depth Bias Computation](#).
- `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT` specifies that the depth bias representation is a factor of a constant `r` defined by the bit-size or

mantissa of the format as described in [Depth Bias Computation](#).

- [VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT](#) specifies that the depth bias representation is a factor of constant r equal to 1.

The [VkDepthBiasInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    float              depthBiasConstantFactor;
    float              depthBiasClamp;
    float              depthBiasSlopeFactor;
} VkDepthBiasInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [depthBiasConstantFactor](#) is a scalar factor controlling the constant depth value added to each fragment.
- [depthBiasClamp](#) is the maximum (or minimum) depth bias of a fragment.
- [depthBiasSlopeFactor](#) is a scalar factor applied to a fragment's slope in depth bias calculations.

If [pNext](#) does not contain a [VkDepthBiasRepresentationInfoEXT](#) structure, then this command is equivalent to including a [VkDepthBiasRepresentationInfoEXT](#) with [depthBiasExact](#) set to [VK_FALSE](#) and [depthBiasRepresentation](#) set to [VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT](#).

Valid Usage

- VUID-VkDepthBiasInfoEXT-depthBiasClamp-08950
If the [depthBiasClamp](#) feature is not enabled, [depthBiasClamp](#) **must** be 0.0

Valid Usage (Implicit)

- VUID-VkDepthBiasInfoEXT-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_DEPTH_BIAS_INFO_EXT](#)
- VUID-VkDepthBiasInfoEXT-pNext-pNext
[pNext](#) **must** be `NULL` or a pointer to a valid instance of [VkDepthBiasRepresentationInfoEXT](#)
- VUID-VkDepthBiasInfoEXT-sType-unique
The [sType](#) value of each structure in the [pNext](#) chain **must** be unique

To [dynamically set](#) the depth bias parameters, call:

```
// Provided by VK_EXT_depth_bias_control
void vkCmdSetDepthBias2EXT(
    VkCommandBuffer                      commandBuffer,
    const VkDepthBiasInfoEXT*           pDepthBiasInfo);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pDepthBiasInfo** is a pointer to a **VkDepthBiasInfoEXT** structure specifying depth bias parameters.

This command is functionally identical to **vkCmdSetDepthBias**, but includes extensible sub-structures that include **sType** and **pNext** parameters, allowing them to be more easily extended.

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias2EXT-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetDepthBias2EXT-pDepthBiasInfo-parameter
pDepthBiasInfo **must** be a valid pointer to a valid **VkDepthBiasInfoEXT** structure
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations
- VUID-vkCmdSetDepthBias2EXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT VK_QUEUE_COMPUTE_BIT	State

Conditional Rendering

vkCmdSetDepthBias2EXT is not affected by [conditional rendering](#)

31.11.4. Conservative Rasterization

If the `pNext` chain of [VkPipelineRasterizationStateCreateInfo](#) includes a [VkPipelineRasterizationConservativeStateCreateInfoEXT](#) structure, then that structure includes parameters controlling conservative rasterization.

[VkPipelineRasterizationConservativeStateCreateInfoEXT](#) is defined as:

```
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType              sType;
    const void*                  pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT
conservativeRasterizationMode;
    float
extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in `X` and `Y` equally in screen space beyond the base overestimation specified in [VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize](#). If `conservativeRasterizationMode` is not [VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT](#), this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be [VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT](#), and conservative rasterization is disabled.

Polygon rasterization **can** be made conservative by setting `conservativeRasterizationMode` to [VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT](#) or [VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT](#) in [VkPipelineRasterizationConservativeStateCreateInfoEXT](#).

NOTE

If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

Valid Usage

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769
`extraPrimitiveOverestimationSize` **must** be in the range of `0.0` to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zeroBitmask
`flags` **must** be `0`
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter
`conservativeRasterizationMode` **must** be a valid `VkConservativeRasterizationModeEXT` value

Structure Chaining

Extends the structure

- `VkPipelineRasterizationStateCreateInfo`

```
// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;
```

`VkPipelineRasterizationConservativeStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode`, specifying the conservative rasterization mode are:

```
// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
    VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
    VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
    VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;
```

- `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT` specifies that conservative rasterization is disabled and rasterization proceeds as normal.
- `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` specifies that conservative rasterization is enabled in overestimation mode.
- `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` specifies that conservative rasterization is enabled in underestimation mode.

To dynamically set the `conservativeRasterizationMode`, call:

```
// Provided by VK_EXT_conservative_rasterization with VK_EXT_extended_dynamic_state3,
VK_EXT_conservative_rasterization with VK_EXT_shader_object
void vkCmdSetConservativeRasterizationModeEXT(
    VkCommandBuffer          commandBuffer,
    VkConservativeRasterizationModeEXT conservativeRasterizationMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `conservativeRasterizationMode` specifies the `conservativeRasterizationMode` state.

This command sets the `conservativeRasterizationMode` state for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetConservativeRasterizationModeEXT-None-09423

At least one of the following **must** be true:

- The `extendedDynamicState3ConservativeRasterizationMode` feature is enabled
- The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetConservativeRasterizationModeEXT-conservativeRasterizationMode-parameter `conservativeRasterizationMode` **must** be a valid `VkConservativeRasterizationModeEXT` value
- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-recording `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- `VUID-vkCmdSetConservativeRasterizationModeEXT-videocoding`
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	<code>VK_QUEUE_GRAPHICS_BIT</code> <code>VK_QUEUE_VIDEO_CODING_BIT</code>	State

Conditional Rendering

`vkCmdSetConservativeRasterizationModeEXT` is not affected by [conditional rendering](#)

To [dynamically set](#) the `extraPrimitiveOverestimationSize`, call:

```
// Provided by VK_EXT_conservative_rasterization with VK_EXT_extended_dynamic_state3,
VK_EXT_conservative_rasterization with VK_EXT_shader_object
void vkCmdSetExtraPrimitiveOverestimationSizeEXT(
    VkCommandBuffer          commandBuffer,
    float                    extraPrimitiveOverestimationSize);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `extraPrimitiveOverestimationSize` specifies the `extraPrimitiveOverestimationSize`.

This command sets the `extraPrimitiveOverestimationSize` for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationConservativeStateCreateInfoEXT::extraPrimitiveOverestimationSize` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-None-09423

At least one of the following **must** be true:

- The `extendedDynamicState3ExtraPrimitiveOverestimationSize` feature is enabled
- The `shaderObject` feature is enabled

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-extraPrimitiveOverestimationSize-07428

`extraPrimitiveOverestimationSize` **must** be in the range of `0.0` to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive

Valid Usage (Implicit)

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetExtraPrimitiveOverestimationSizeEXT` is not affected by [conditional rendering](#)

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the [coverage mask](#) for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the [coverage mask](#) for the fragment is enabled, then all bits of the [coverage mask](#) for the fragment are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations **can** increase the size of the primitive by up to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize` pixels at each of the primitive edges. This **may** increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the `extraPrimitiveOverestimationSize` value above `0.0` in steps of `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity` up to and including `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize`. This **may** further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization **may** vary between implementations and produce results that only approximate the `primitiveOverestimationSize` and `extraPrimitiveOverestimationSizeGranularity` properties. Implementations **may** especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.

For triangles if [VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT](#) is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in [Basic Polygon Rasterization](#) does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized` is `VK_FALSE` or will generate fragments if `degenerateTrianglesRasterized` is `VK_TRUE`. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application **can** enable backface culling if desired. Triangles that are zero area before rasterization **may** be culled regardless.

For lines if [VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT](#) is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized` is `VK_FALSE` or will generate fragments if `degenerateLinesRasterized` is `VK_TRUE`. The fragments input values for

these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization **may** be culled regardless.

For points if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its `coverage mask` corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the fragment is discarded even if some pixels are considered covered.

For triangles, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.

For points, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive **must** set `FullyCoveredEXT` to `VK_TRUE` if the implementation enables the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::fullyCoveredFragmentShaderInputVariable` feature.

When setting the `fragment shading rate` results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.

Chapter 32. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to [rasterization order](#), and are typically performed in this order:

1. [Discard rectangles test](#)
2. [Scissor test](#)
3. [Sample mask test](#)
4. Certain [Fragment shading](#) operations:
 - [Sample Mask Accesses](#)
 - [Tile Image Reads](#)
 - [Depth Replacement](#)
 - [Stencil Reference Replacement](#)
 - [Interlocked Operations](#)
5. [Multisample coverage](#)
6. [Depth bounds test](#)
7. [Stencil test](#)
8. [Depth test](#)
9. [Sample counting](#)
10. [Coverage reduction](#)

The [coverage mask](#) generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

If there is a [fragment shader](#) and it declares the [PostDepthCoverage](#) execution mode, the [sample mask test](#) is instead performed after the [depth test](#).

If `VkPhysicalDeviceMaintenance5Properties::earlyFragmentMultisampleCoverageAfterSampleCounting` is `VK_TRUE` and there is a [fragment shader](#) which declares the [EarlyFragmentTests](#) execution mode, [fragment shading](#) and [multisample coverage](#) operations **must** be performed after [sample counting](#).

Otherwise, if `VkPhysicalDeviceMaintenance5Properties::earlyFragmentMultisampleCoverageAfterSampleCounting` is `VK_FALSE` and there is a [fragment shader](#) which declares the [EarlyFragmentTests](#) execution mode, [fragment shading](#) and [multisample](#)

coverage operations **should** instead be performed after [sample counting](#), but **may** be performed before [sample counting](#).

If `VkPhysicalDeviceMaintenance5Properties::earlyFragmentSampleMaskTestBeforeSampleCounting` is `VK_TRUE` and there is a [fragment shader](#) which declares the `EarlyFragmentTests` execution mode [sample mask test](#) operations **must** follow the order of fragment operations from above.

Otherwise, if `VkPhysicalDeviceMaintenance5Properties::earlyFragmentSampleMaskTestBeforeSampleCounting` is `VK_FALSE` and there is a [fragment shader](#) which declares the `EarlyFragmentTests` execution mode, [sample mask test](#) operations **should** follow the order of fragment operations from above but **may** instead be performed after [sample counting](#).

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader does not write to storage resources;
- the fragment shader specifies the `DepthReplacing` execution mode; and
- either
 - the fragment shader specifies the `DepthUnchanged` execution mode;
 - the fragment shader specifies the `DepthLess` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_GREATER` or `VK_COMPARE_OP_GREATER_OR_EQUAL`; or
 - the fragment shader specifies the `DepthGreater` execution mode and the pipeline uses a `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` of `VK_COMPARE_OP_LESS` or `VK_COMPARE_OP_LESS_OR_EQUAL`

the implementation **may** perform [depth bounds test](#) before [fragment shading](#) and perform an additional [depth test](#) immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through [framebuffer operations](#).

32.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates (x_f, y_f) of each sample covered by a fragment against a set of *discard rectangles*.

Each discard rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure during pipeline creation, or dynamically by the `vkCmdSetDiscardRectangleEXT` command.

A given sample is considered inside a discard rectangle if the x_f is in the range [`VkRect2D::offset.x`, `VkRect2D::offset.x` + `VkRect2D::extent.x`), and y_f is in the range [`VkRect2D::offset.y`, `VkRect2D::offset.y` + `VkRect2D::extent.y`). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t                 discardRectangleCount;
    const VkRect2D*          pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state is not enabled for the pipeline the presence of this structure in the `VkGraphicsPipelineCreateInfo` chain, and a `discardRectangleCount` greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles **must** be enabled or disabled by `vkCmdSetDiscardRectangleEnableEXT`. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state is enabled for the pipeline, the `discardRectangleMode` member is ignored, and the discard rectangle mode **must** be set by `vkCmdSetDiscardRectangleModeEXT`.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the discard rectangle test. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is not enabled, and this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of `0`. If all `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`, `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT`, and `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic states are enabled, the application **can** omit this structure from the `pNext` chain of `VkGraphicsPipelineCreateInfo` and still use discard rectangles by setting all state dynamically. In this case `vkCmdSetDiscardRectangleEXT` **must** be called to set the discard rectangle for all indices `[0, maxDiscardRectangles)` before drawing with discard rectangles enabled. Individual discard rectangles **can** be made ineffective by setting their `VkRect2D::extent.width` and `VkRect2D::extent.height` to zero.

Valid Usage

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582
`discardRectangleCount` **must** be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zeroBitmask
`flags` **must** be 0
- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
`discardRectangleMode` **must** be a valid `VkDiscardRectangleModeEXT` value

Structure Chaining

Extends the structure

- `VkGraphicsPipelineCreateInfo`

```
// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;
```

`VkPipelineDiscardRectangleStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

`VkDiscardRectangleModeEXT` values are:

```
// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
    VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
    VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;
```

- `VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` specifies that the discard rectangle test is inclusive.
- `VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` specifies that the discard rectangle test is exclusive.

To [dynamically set](#) the discard rectangles, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer                    commandBuffer,
    uint32_t                          firstDiscardRectangle,
    uint32_t                          discardRectangleCount,
    const VkRect2D*                   pDiscardRectangles);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstDiscardRectangle` is the index of the first discard rectangle whose state is updated by the command.
- `discardRectangleCount` is the number of discard rectangles whose state are updated by the command.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures specifying discard rectangles.

The discard rectangle taken from element `i` of `pDiscardRectangles` replace the current state for the discard rectangle at index `firstDiscardRectangle + i`, for `i` in `[0, discardRectangleCount)`.

This command sets the discard rectangles for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::pDiscardRectangles` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585
The sum of `firstDiscardRectangle` and `discardRectangleCount` **must** be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`
- VUID-vkCmdSetDiscardRectangleEXT-x-00587
The `x` and `y` member of `offset` in each `VkRect2D` element of `pDiscardRectangles` **must** be greater than or equal to `0`
- VUID-vkCmdSetDiscardRectangleEXT-offset-00588
Evaluation of `(offset.x + extent.width)` in each `VkRect2D` element of `pDiscardRectangles` **must** not cause a signed integer addition overflow
- VUID-vkCmdSetDiscardRectangleEXT-offset-00589
Evaluation of `(offset.y + extent.height)` in each `VkRect2D` element of `pDiscardRectangles` **must** not cause a signed integer addition overflow

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter
`pDiscardRectangles` **must** be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures
- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetDiscardRectangleEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength
`discardRectangleCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetDiscardRectangleEXT` is not affected by `conditional rendering`

To `dynamically set` whether discard rectangles are enabled, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 discardRectangleEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleEnable` specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is implied by the [VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount](#) value used to create the currently active pipeline, where a non-zero [discardRectangleCount](#) implicitly enables discard rectangles, otherwise they are disabled.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851
The [VK_EXT_discard_rectangles](#) extension **must** be enabled, and the implementation **must** support at least [specVersion 2](#) of this extension

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter
[commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording
[commandBuffer](#) **must** be in the [recording state](#)
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetDiscardRectangleEnableEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

vkCmdSetDiscardRectangleEnableEXT is not affected by [conditional rendering](#)

To [dynamically set](#) the discard rectangle mode, call:

```
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleModeEXT(
    VkCommandBuffer          commandBuffer,
    VkDiscardRectangleModeEXT discardRectangleMode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **discardRectangleMode** specifies the discard rectangle mode for all discard rectangles, either inclusive or exclusive.

This command sets the discard rectangle mode for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleMode](#) value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDiscardRectangleModeEXT-specVersion-07852
The [VK_EXT_discard_rectangles](#) extension **must** be enabled, and the implementation **must** support at least [specVersion 2](#) of this extension

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-parameter
commandBuffer **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetDiscardRectangleModeEXT-discardRectangleMode-parameter
discardRectangleMode **must** be a valid [VkDiscardRectangleModeEXT](#) value
- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-recording
commandBuffer **must** be in the [recording state](#)
- VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetDiscardRectangleModeEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

`vkCmdSetDiscardRectangleModeEXT` is not affected by [conditional rendering](#)

32.2. Scissor Test

The scissor test compares the framebuffer coordinates (x_f, y_f) of each sample covered by a fragment against a *scissor rectangle* at the index equal to the fragment's `ViewportIndex`.

Each scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportStateCreateInfo` structure during pipeline creation, or dynamically by the `vkCmdSetScissor` command.

A given sample is considered inside a scissor rectangle if x_f is in the range [`VkRect2D::offset.x`, `VkRect2D::offset.x` + `VkRect2D::extent.x`), and y_f is in the range [`VkRect2D::offset.y`, `VkRect2D::offset.y` + `VkRect2D::extent.y`). Samples with coordinates outside the scissor rectangle at the corresponding `ViewportIndex` will have their coverage set to 0.

To [dynamically set](#) the scissor rectangles, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstScissor,
    uint32_t                 scissorCount,
    const VkRect2D*          pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstScissor` is the index of the first scissor whose state is updated by the command.

- `scissorCount` is the number of scissors whose rectangles are updated by the command.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining scissor rectangles.

The scissor rectangles taken from element `i` of `pScissors` replace the current state for the scissor index `firstScissor + i`, for `i` in `[0, scissorCount)`.

This command sets the scissor rectangles for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pScissors` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetScissor-firstScissor-00592
The sum of `firstScissor` and `scissorCount` **must** be between `1` and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetScissor-firstScissor-00593
If the `multiViewport` feature is not enabled, `firstScissor` **must** be `0`
- VUID-vkCmdSetScissor-scissorCount-00594
If the `multiViewport` feature is not enabled, `scissorCount` **must** be `1`
- VUID-vkCmdSetScissor-x-00595
The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than or equal to `0`
- VUID-vkCmdSetScissor-offset-00596
Evaluation of `(offset.x + extent.width)` **must** not cause a signed integer addition overflow for any element of `pScissors`
- VUID-vkCmdSetScissor-offset-00597
Evaluation of `(offset.y + extent.height)` **must** not cause a signed integer addition overflow for any element of `pScissors`

Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetScissor-pScissors-parameter
`pScissors` **must** be a valid pointer to an array of `scissorCount` `VkRect2D` structures
- VUID-vkCmdSetScissor-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetScissor-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetScissor-videocoding
This command **must** only be called outside of a video coding scope

- VUID-vkCmdSetScissor-scissorCount-arraylength
`scissorCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

`vkCmdSetScissor` is not affected by [conditional rendering](#)

32.3. Sample Mask Test

The sample mask test compares the [coverage mask](#) for a fragment with the *sample mask* defined by `VkPipelineMultisampleStateCreateInfo::pSampleMask`.

To [dynamically set](#) the sample mask, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetSampleMaskEXT(
    VkCommandBuffer          commandBuffer,
    VkSampleCountFlagBits    samples,
    const VkSampleMask*      pSampleMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `samples` specifies the number of sample bits in the `pSampleMask`.
- `pSampleMask` is a pointer to an array of `VkSampleMask` values, where the array size is based on the `samples` parameter. If the `maintenance10` feature is enabled, and this parameter is set to `NULL`, it is treated as if the mask has all bits set to 1.

This command sets the sample mask for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with

`VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::pSampleMask` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetSampleMaskEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3SampleMask` feature is enabled
 - The `shaderObject` feature is enabled
- VUID-vkCmdSetSampleMaskEXT-pSampleMask-10999
`pSampleMask` **must** not be `NULL` if the `maintenance10` feature is not enabled

Valid Usage (Implicit)

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetSampleMaskEXT-samples-parameter
`samples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-vkCmdSetSampleMaskEXT-pSampleMask-parameter
If `pSampleMask` is not `NULL`, `pSampleMask` **must** be a valid pointer to an array of $\lceil \frac{\text{samples}}{32} \rceil$ `VkSampleMask` values
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetSampleMaskEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

vkCmdSetSampleMaskEXT is not affected by [conditional rendering](#)

Each bit of the coverage mask is associated with a sample index as described in the [rasterization chapter](#). If the bit in `VkPipelineMultisampleStateCreateInfo::pSampleMask` which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

32.4. Fragment Shading

[Fragment shaders](#) are invoked for each fragment, or as [helper invocations](#).

Most operations in the fragment shader are not performed in [rasterization order](#), with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader **must** not be executed if a [fragment operation](#) that executes before fragment shading discards the fragment.
- A fragment shader **may** not be executed if:
 - An implementation determines that another fragment shader, invoked by a subsequent primitive in [primitive order](#), overwrites all results computed by the shader (including writes to storage resources).
 - Any other [fragment operation](#) discards the fragment, and the shader does not write to any storage resources.
 - If a fragment shader statically computes the same values for different framebuffer locations, and does not write to any storage resources, multiple fragments **may** be shaded by one fragment shader invocation. This **may** affect `VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT` results, but **must** otherwise not be visible behavior to applications.
- Otherwise, at least one fragment shader **must** be executed.
 - If [sample shading](#) is enabled and multiple invocations per fragment are **required**, additional invocations **must** be executed as specified.
 - Each covered sample **must** be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined

values **may** be written to all color attachment outputs during this fragment operation.

NOTE

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

Similarly, if the render pass has a fragment density map attachment, more than one fragment shader invocation may be invoked for each covered sample. Such additional invocations are only produced if `VkPhysicalDeviceFragmentDensityMapPropertiesEXT::fragmentDensityInvocations` is `VK_TRUE`. Implementations may generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.

32.4.1. Sample Mask

Reading from the `SampleMask` built-in in the `Input` storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If `sample shading` is enabled, fragment shaders will only see values of `1` for samples being shaded - other bits will be `0`.

Each bit of the coverage mask is associated with a sample index as described in the [rasterization chapter](#). If the bit in `SampleMask` which is associated with that same sample index is set to `0`, that coverage mask bit is set to `0`.

Values written to the `SampleMask` built-in in the `Output` storage class will be used by the `multisample coverage` operation, with the same encoding as the input built-in.

32.4.2. Shader Termination and Demotion

If a fragment shader is `terminated early` or `demoted to a helper invocation` by using `OpKill`, `OpTerminateInvocation`, or `OpDemoteToHelperInvocation`, samples covered by that shader invocation have their coverage mask bits set to `0`.

32.4.3. Fragment Shader Tile Image Reads

If the `VK_EXT_shader_tile_image` extension is enabled, implementations divide the framebuffer into a grid of tiles. A `tile image` is a view of a framebuffer attachment tile for fragments with locations within the tile.

Within a render pass instance initiated by `vkCmdBeginRenderingKHR`, fragment shader invocations **can** read the framebuffer color, depth, and stencil values at the fragment location via tile images.

Even though fragment shader invocation can only read from the corresponding fragment location, the abstraction of a tile image is introduced for the following reasons:

NOTE

- Tile dimensions will be exposed in a future extension
- Future functionality such as executing compute dispatches within render passes via tile shaders can leverage tile images.

Enabling `shaderTileImageColorReadAccess`, `shaderTileImageDepthReadAccess`, `shaderTileImageStencilReadAccess` enables fragment shader invocations to read from color, depth, and stencil, respectively.

Color values are read from tile image variables with `OpColorAttachmentReadEXT`. Tile image variables are linked to specific color attachments using `Location` decoration. See [Fragment Tile Image Interface](#) for more details.

Depth values are read with `OpDepthAttachmentReadEXT`.

Stencil values are read with `OpStencilAttachmentReadEXT`.

The sample to read is specified by a `sample index` value specified as the `Sample` operand to `OpColorAttachmentReadEXT`, `OpDepthAttachmentReadEXT`, or `OpStencilAttachmentReadEXT`.

If `sample shading` is disabled, a fragment invocation **can** read from all sample locations associated with the fragment regardless of the fragment's coverage. This functionality is supported for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` > 1 when `VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadSampleFromPixelRateInvocation` is `VK_TRUE`.

If `sample shading` is enabled, and `minSampleShading` is 1.0, a fragment invocation **must** only read from the `coverage index` sample. Tile image access **must** not be used if the value of `minSampleShading` is not 1.0.

If the `fragment shader` declares the `EarlyFragmentTests` execution mode, depth reads are allowed only if depth writes are disabled and stencil reads are allowed only if stencil writes are disabled.

If `VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadFromHelperInvocation` is `VK_FALSE`, values read from helper invocations are poison, otherwise the values read are subject to the coherency guarantees described below.

`OpDepthAttachmentReadEXT` returns a poison value if no depth attachment is present. `OpStencilAttachmentReadEXT` returns a poison value if no stencil attachment is present.

Tile image reads from color, depth, and stencil attachments are said to be coherent when the accesses happen in raster order and without `data race` with respect to accesses to the attachments from framebuffer-space pipeline stages. The samples which qualify for coherent access and the enabling conditions are described below.

- Let `Rc` be the set of components being read from an attachment `A` in a draw call

- Let W_c be the set of components being written to A by the draw call

The samples which qualify for coherent tile image reads from an attachment A are:

- All samples in a pixel when R_c is disjoint with W_c .
- The samples with coverage in a fragment when R_c is not disjoint with W_c . The samples with coverage are determined by the coverage mask for the fragment as calculated by fragment operations that executed prior to fragment shading, including early fragment tests if enabled for the draw call.

A fragment shader **can** declare `NonCoherentColorAttachmentReadEXT`, `NonCoherentDepthAttachmentReadEXT`, or `NonCoherentStencilAttachmentReadEXT` execution modes to enable non-coherent tile image reads which require an explicit `vkCmdPipelineBarrier2` call for the writes to an attachment to be made visible via tile image reads.

When `VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageCoherentReadAccelerated` is `VK_TRUE`, the implementation prefers that coherent tile image reads are used, otherwise the implementation prefers that non-coherent tile image reads are used.

NOTE

In practice, the most common tile image reads usage patterns fall under one of the following:

- Programmable blending - each fragment reads from a single sample (`SampleID`) at its location. Per-sample shading is typically enabled when multisampled rendertargets are used.
- G-buffer generation and shading in one render pass - in the shading phase a fragment reads from a single sample at its location.
- Programmable resolve - a fragment reads from all samples at its location (per-sample shading is disabled). This requires the use of a “full-screen triangle” instead of a rectangle composed of two triangles in order to avoid data races along the shared edge of the triangles.
- 1:1 texturing with LOD - in use cases such a deferred screen space decals a fragment reads a single sample (`SampleID`) from depth buffer, but requires being able to read from helper threads to derive the texture LOD. This use case is supported as long as the attachment components being read are not overwritten by color, depth, or stencil attachment writes.

All of the above use cases are supported by coherent tile image reads, but only the latter three are supported when non-coherent reads are used as there is no mechanism to synchronize non-coherent reads with writes within a draw call.

32.4.4. Depth Replacement

Writing to the `FragDepth` built-in will replace the fragment’s calculated depth values for each sample in the input `SampleMask`. `Depth testing` performed after the fragment shader for this fragment will use this new value as z_f .

32.4.5. Stencil Reference Replacement

Writing to the `FragStencilRefEXT` built-in will replace the fragment's stencil reference value for each sample in the input `SampleMask`. `Stencil testing` performed after the fragment shader for this fragment will use this new value as s_r .

32.4.6. Interlocked Operations

`OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT` define a section of a fragment shader which imposes additional ordering constraints on operations performed within them. These operations are defined as *interlocked operations*. How interlocked operations are ordered against other fragment shader invocations depends on the specified execution modes.

If the `ShadingRateInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in `rasterization order` and cover at least one sample in the same fragment area, and **must** happen after interlocked operations in a fragment shader that executes earlier in `rasterization order` and cover at least one sample in the same fragment area.

If the `ShadingRateInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in `rasterization order` and cover at least one sample in the same fragment area.

If the `PixelInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in `rasterization order` and cover at least one sample in the same pixel, and **must** happen after interlocked operations in a fragment shader that executes earlier in `rasterization order` and cover at least one sample in the same pixel.

If the `PixelInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in `rasterization order` and cover at least one sample in the same pixel.

If the `SampleInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in `rasterization order` and cover at least one of the same samples, and **must** happen after interlocked operations in a fragment shader that executes earlier in `rasterization order` and cover at least one of the same samples.

If the `SampleInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in `rasterization order` and cover at least one of the same samples.

32.5. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable

decorated with `SampleMask`, the coverage mask is `ANDed` with the bits of the `SampleMask` built-in to generate a new coverage mask. If `sample shading` is enabled, bits written to `SampleMask` corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include `SampleMask` in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, and the `alphaToCoverageEnable` and `alphaToOneEnable` members of the `VkPipelineMultisampleStateCreateInfo` structure.

To `dynamically set` the `alphaToCoverageEnable` state, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToCoverageEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 alphaToCoverageEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToCoverageEnable` specifies the `alphaToCoverageEnable` state.

This command sets the `alphaToCoverageEnable` state for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetAlphaToCoverageEnableEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3AlphaToCoverageEnable` feature is enabled
 - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdSetAlphaToCoverageEnableEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

`vkCmdSetAlphaToCoverageEnableEXT` is not affected by [conditional rendering](#)

To [dynamically set](#) the `alphaToOneEnable` state, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToOneEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 alphaToOneEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToOneEnable` specifies the `alphaToOneEnable` state.

This command sets the `alphaToOneEnable` state for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT](#) set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToOneEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetAlphaToOneEnableEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3AlphaToOneEnable` feature is enabled

- The `shaderObject` feature is enabled
- VUID-vkCmdSetAlphaToOneEnableEXT-alphaToOne-07607
If the `alphaToOne` feature is not enabled, `alphaToOneEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetAlphaToOneEnableEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

`vkCmdSetAlphaToOneEnableEXT` is not affected by `conditional rendering`

All alpha values in this section refer only to the alpha component of the fragment shader output that has a `Location` and `Index` decoration of zero (see the `Fragment Output Interface` section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH` and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment

computed during [smooth line rasterization](#).

If [alphaToCoverageEnable](#) is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm **may** be different at different framebuffer coordinates.

NOTE

Using different algorithms at different framebuffer coordinates **may** help to avoid artifacts caused by regular coverage sample locations.

Finally, if [alphaToOneEnable](#) is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

32.6. Depth and Stencil Operations

Pipeline state controlling the [depth bounds tests](#), [stencil test](#), and [depth test](#) is specified through the members of the [VkPipelineDepthStencilStateCreateInfo](#) structure.

The [VkPipelineDepthStencilStateCreateInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32                  depthTestEnable;
    VkBool32                  depthWriteEnable;
    VkCompareOp               depthCompareOp;
    VkBool32                  depthBoundsTestEnable;
    VkBool32                  stencilTestEnable;
    VkStencilOpState          front;
    VkStencilOpState          back;
    float                     minDepthBounds;
    float                     maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [flags](#) is a bitmask of [VkPipelineDepthStencilStateCreateFlagBits](#) specifying additional depth/stencil state information.
- [depthTestEnable](#) controls whether [depth testing](#) is enabled.
- [depthWriteEnable](#) controls whether [depth writes](#) are enabled when [depthTestEnable](#) is `VK_TRUE`. Depth writes are always disabled when [depthTestEnable](#) is `VK_FALSE`.

- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator to use in the `Depth Comparison` step of the `depth test`.
- `depthBoundsTestEnable` controls whether `depth bounds testing` is enabled.
- `stencilTestEnable` controls whether `stencil testing` is enabled.
- `front` and `back` are `VkStencilOpState` values controlling the corresponding parameters of the `stencil test`.
- `minDepthBounds` is the minimum depth bound used in the `depth bounds test`.
- `maxDepthBounds` is the maximum depth bound used in the `depth bounds test`.

Valid Usage

- VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
If the `depthBounds` feature is not enabled, `depthBoundsTestEnable` **must** be `VK_FALSE`
- VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef` is `VK_FALSE`, and the value of `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` is `VK_TRUE`, and the value of `VkPipelineRasterizationStateCreateInfo::cullMode` is `VK_CULL_MODE_NONE`, the value of `reference` in each of the `VkStencilOpState` structs in `front` and `back` **must** be the same
- VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderDepthAttachmentAccess-06463
If the `rasterizationOrderDepthAttachmentAccess` feature is not enabled, `flags` **must** not include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT`
- VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderStencilAttachmentAccess-06464
If the `rasterizationOrderStencilAttachmentAccess` feature is not enabled, `flags` **must** not include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`
- VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkPipelineDepthStencilStateCreateInfo-flags-parameter
`flags` **must** be a valid combination of `VkPipelineDepthStencilStateCreateFlagBits` values
- VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter

`depthCompareOp` **must** be a valid `VkCompareOp` value

- `VOID-VkPipelineDepthStencilStateCreateInfo-front-parameter`
`front` **must** be a valid `VkStencilOpState` structure
- `VOID-VkPipelineDepthStencilStateCreateInfo-back-parameter`
`back` **must** be a valid `VkStencilOpState` structure

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineDepthStencilStateCreateFlagBits`.

Bits which **can** be set in the `VkPipelineDepthStencilStateCreateInfo::flags` parameter are:

```
// Provided by VK_VERSION_1_0, VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineDepthStencilStateCreateFlagBits {
    // Provided by VK_EXT_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT = 0x00000002,
} VkPipelineDepthStencilStateCreateFlagBits;
```

- `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT` specifies that access to the depth aspects of depth/stencil and input attachments will have implicit framebuffer-local memory dependencies.
- `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT` specifies that access to the stencil aspects of depth/stencil and input attachments will have implicit framebuffer-local memory dependencies.

When

`VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT` is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:

- The first `synchronization scope` includes `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages executed by all previous fragments (as defined by `primitive order`) in the corresponding `framebuffer regions` including those generated by the same draw command.
- The second `synchronization scope` includes `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` stage executed by the generated fragment.
- The first `access scope` includes all writes to the depth aspect of depth/stencil attachments.

- The second [access scope](#) includes all reads from the depth aspect of input attachments.

When

[VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT](#) is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:

- The first [synchronization scope](#) includes [VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT](#) and [VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT](#) pipeline stages executed by all previous fragments (as defined by [primitive order](#)) in the corresponding [framebuffer regions](#) including those generated by the same draw command.
- The second [synchronization scope](#) includes [VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT](#) and [VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT](#) pipeline stages executed by the generated fragment.
- The first [access scope](#) includes all writes to the stencil aspect of depth/stencil attachments.
- The second [access scope](#) includes all reads from the stencil aspect of input attachments.

32.7. Depth Bounds Test

The depth bounds test compares the depth value z_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f, y_f) and [sample index](#) i against a set of *depth bounds*.

The depth bounds are determined by two floating-point values defining a minimum ([minDepthBounds](#)) and maximum ([maxDepthBounds](#)) depth value. These values are either set by the [VkPipelineDepthStencilStateCreateInfo](#) structure during pipeline creation, or dynamically by [vkCmdSetDepthBoundsTestEnable](#) and [vkCmdSetDepthBounds](#).

A given sample is considered within the depth bounds if z_a is in the range [[minDepthBounds](#), [maxDepthBounds](#)]. Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To [dynamically enable or disable](#) the depth bounds test, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBoundsTestEnable(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthBoundsTestEnable);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetDepthBoundsTestEnable
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthBoundsTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBoundsTestEnable` specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthBoundsTestEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBoundsTestEnable-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled
 - the `shaderObject` feature is enabled
 - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3
- VUID-vkCmdSetDepthBoundsTestEnable-depthBounds-10010
If the `depthBounds` feature is not enabled, `depthBoundsTestEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetDepthBoundsTestEnable-vidcoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

vkCmdSetDepthBoundsTestEnable is not affected by [conditional rendering](#)

To [dynamically set](#) the depth bounds range, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer          commandBuffer,
    float                    minDepthBounds,
    float                    maxDepthBounds);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_DEPTH_BOUNDS](#) set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::minDepthBounds` and `VkPipelineDepthStencilStateCreateInfo::maxDepthBounds` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthBounds-minDepthBounds-00600
If the [VK_EXT_depth_range_unrestricted](#) extension is not enabled `minDepthBounds` **must** be between `0.0` and `1.0`, inclusive
- VUID-vkCmdSetDepthBounds-maxDepthBounds-00601
If the [VK_EXT_depth_range_unrestricted](#) extension is not enabled `maxDepthBounds` **must** be between `0.0` and `1.0`, inclusive
- VUID-vkCmdSetDepthBounds-minDepthBounds-10912
`minDepthBounds` **must** be less than or equal to `maxDepthBounds`

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBounds-commandBuffer-parameter **commandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetDepthBounds-commandBuffer-recording **commandBuffer** **must** be in the [recording state](#)
- VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetDepthBounds-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetDepthBounds` is not affected by [conditional rendering](#)

32.8. Stencil Test

The stencil test compares the stencil attachment value s_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f, y_f) and [sample index](#) i against a *stencil reference value*.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by [vkCmdSetStencilTestEnable](#) or [VkPipelineDepthStencilStateCreateInfo::stencilTestEnable](#), or if there is no stencil attachment, the

coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by [back-facing polygons](#), and the front stencil state when processing fragments generated by [front-facing polygons](#) or any other primitives.

The comparison operation performed is determined by the [VkCompareOp](#) value set by [vkCmdSetStencilOp::compareOp](#), or by [VkStencilOpState::compareOp](#) during pipeline creation.

The compare mask s_c and stencil reference value s_r of the front or the back stencil state set determine arguments of the comparison operation. s_c is set by the [VkPipelineDepthStencilStateCreateInfo](#) structure during pipeline creation, or by the [vkCmdSetStencilCompareMask](#) command. s_r is set by [VkPipelineDepthStencilStateCreateInfo](#) or by [vkCmdSetStencilReference](#).

s_r and s_a are each independently combined with s_c using a bitwise **AND** operation to create masked reference and attachment values s'_r and s'_a . s'_r and s'_a are used as the *reference* and *test* values, respectively, in the operation specified by the [VkCompareOp](#).

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value s_g is generated according to a stencil operation defined by [VkStencilOp](#) parameters set by [vkCmdSetStencilOp](#) or [VkPipelineDepthStencilStateCreateInfo](#). If the stencil test fails, [failOp](#) defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the [depth test](#) - if it passes, [VkPipelineDepthStencilStateCreateInfo::passOp](#) is used, otherwise [VkPipelineDepthStencilStateCreateInfo::depthFailOp](#) is used.

The stencil attachment value s_a is then updated with the generated stencil value s_g according to the write mask s_w defined by [writeMask](#) in [VkPipelineDepthStencilStateCreateInfo::front](#) and [VkPipelineDepthStencilStateCreateInfo::back](#) as:

$$s_a = (s_a \oplus \neg s_w) \oplus (s_g \oplus s_w)$$

To [dynamically enable or disable](#) the stencil test, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetStencilTestEnable(
    VkCommandBuffer          commandBuffer,
    VkBool32                 stencilTestEnable);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetStencilTestEnable
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 stencilTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stencilTestEnable` specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetStencilTestEnable-None-08971

At least one of the following **must** be true:

- the `extendedDynamicState` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetStencilTestEnable-vidcoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

vkCmdSetStencilTestEnable is not affected by [conditional rendering](#)

To [dynamically set](#) the stencil operation, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetStencilOp(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags       faceMask,
    VkStencilOp              failOp,
    VkStencilOp              passOp,
    VkStencilOp              depthFailOp,
    VkCompareOp              compareOp);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetStencilOp
void vkCmdSetStencilOpEXT(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags       faceMask,
    VkStencilOp              failOp,
    VkStencilOp              passOp,
    VkStencilOp              depthFailOp,
    VkCompareOp              compareOp);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **faceMask** is a bitmask of [VkStencilFaceFlagBits](#) specifying the set of stencil state for which to update the stencil operation.
- **failOp** is a [VkStencilOp](#) value specifying the action performed on samples that fail the stencil test.
- **passOp** is a [VkStencilOp](#) value specifying the action performed on samples that pass both the depth and stencil tests.
- **depthFailOp** is a [VkStencilOp](#) value specifying the action performed on samples that pass the stencil test and fail the depth test.
- **compareOp** is a [VkCompareOp](#) value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineDepthStencilStateCreateInfo::failOp`, `passOp`, `depthFailOp`, and `compareOp` values used to create the currently active pipeline, for both front and back faces.

Valid Usage

- VUID-vkCmdSetStencilOp-None-08971

At least one of the following **must** be true:

- the `extendedDynamicState` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetStencilOp-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilOp-faceMask-parameter
`faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilOp-faceMask-requiredbitmask
`faceMask` **must** not be 0
- VUID-vkCmdSetStencilOp-failOp-parameter
`failOp` **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-passOp-parameter
`passOp` **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-depthFailOp-parameter
`depthFailOp` **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-compareOp-parameter
`compareOp` **must** be a valid `VkCompareOp` value
- VUID-vkCmdSetStencilOp-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetStencilOp-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

`vkCmdSetStencilOp` is not affected by [conditional rendering](#)

The `VkStencilOpState` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp    failOp;
    VkStencilOp    passOp;
    VkStencilOp    depthFailOp;
    VkCompareOp    compareOp;
    uint32_t       compareMask;
    uint32_t       writeMask;
    uint32_t       reference;
} VkStencilOpState;
```

- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.
- `compareMask` selects the bits of the unsigned integer stencil values participating in the stencil test.
- `writeMask` selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- `reference` is an integer stencil reference value that is used in the unsigned stencil comparison.

Valid Usage (Implicit)

- VUID-VkStencilOpState-failOp-parameter
failOp must be a valid [VkStencilOp](#) value
- VUID-VkStencilOpState-passOp-parameter
passOp must be a valid [VkStencilOp](#) value
- VUID-VkStencilOpState-depthFailOp-parameter
depthFailOp must be a valid [VkStencilOp](#) value
- VUID-VkStencilOpState-compareOp-parameter
compareOp must be a valid [VkCompareOp](#) value

To [dynamically set](#) the stencil compare mask, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags       faceMask,
    uint32_t                 compareMask);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **faceMask** is a bitmask of [VkStencilFaceFlagBits](#) specifying the set of stencil state for which to update the compare mask.
- **compareMask** is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkStencilOpState::compareMask](#) value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter
commandBuffer must be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetStencilCompareMask-faceMask-parameter
faceMask must be a valid combination of [VkStencilFaceFlagBits](#) values
- VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmask
faceMask must not be 0
- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording
commandBuffer must be in the [recording state](#)
- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from must support

[VK_QUEUE_GRAPHICS_BIT](#) operations

- VUID-vkCmdSetStencilCompareMask-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

[vkCmdSetStencilCompareMask](#) is not affected by [conditional rendering](#)

[VkStencilFaceFlagBits](#) values are:

```
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    // VK_STENCIL_FACE_FRONT_AND_BACK is a legacy alias
    VK_STENCIL_FACE_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- [VK_STENCIL_FACE_FRONT_BIT](#) specifies that only the front set of stencil state is updated.
- [VK_STENCIL_FACE_BACK_BIT](#) specifies that only the back set of stencil state is updated.
- [VK_STENCIL_FACE_FRONT_AND_BACK](#) is the combination of [VK_STENCIL_FACE_FRONT_BIT](#) and [VK_STENCIL_FACE_BACK_BIT](#), and specifies that both sets of stencil state are updated.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more `VkStencilFaceFlagBits`.

To [dynamically set](#) the stencil write mask, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags        faceMask,
    uint32_t                  writeMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the write mask, as described above for `vkCmdSetStencilCompareMask`.
- `writeMask` is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `writeMask` value used to create the currently active pipeline, for both `VkPipelineDepthStencilStateCreateInfo::front` and `VkPipelineDepthStencilStateCreateInfo::back` faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilWriteMask-faceMask-parameter `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask `faceMask` **must** not be 0
- VUID-vkCmdSetStencilWriteMask-commandBuffer-recording `commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetStencilWriteMask-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

vkCmdSetStencilWriteMask is not affected by [conditional rendering](#)

To [dynamically set](#) the stencil reference value, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer          commandBuffer,
    VkStencilFaceFlags       faceMask,
    uint32_t                 reference);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of [VkStencilFaceFlagBits](#) specifying the set of stencil state for which to update the reference value, as described above for [vkCmdSetStencilCompareMask](#).
- `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_STENCIL_REFERENCE](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineDepthStencilStateCreateInfo::reference](#) value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter `commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetStencilReference-faceMask-parameter `faceMask` **must** be a valid combination of [VkStencilFaceFlagBits](#) values
- VUID-vkCmdSetStencilReference-faceMask-requiredbitmask `faceMask` **must** not be 0
- VUID-vkCmdSetStencilReference-commandBuffer-recording `commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
The [VkCommandPool](#) that `commandBuffer` was allocated from **must** support

[VK_QUEUE_GRAPHICS_BIT](#) operations

- VUID-vkCmdSetStencilReference-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

[vkCmdSetStencilReference](#) is not affected by [conditional rendering](#)

Possible values of the [failOp](#), [passOp](#), and [depthFailOp](#) members of [VkStencilOpState](#), specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;
```

- [VK_STENCIL_OP_KEEP](#) keeps the current value.
- [VK_STENCIL_OP_ZERO](#) sets the value to 0.
- [VK_STENCIL_OP_REPLACE](#) sets the value to [reference](#).
- [VK_STENCIL_OP_INCREMENT_AND_CLAMP](#) increments the current value and clamps to the maximum representable unsigned value.

- `VK_STENCIL_OP_DECREMENT_AND_CLAMP` decrements the current value and clamps to 0.
- `VK_STENCIL_OP_INVERT` bitwise-inverts the current value.
- `VK_STENCIL_OP_INCREMENT_AND_WRAP` increments the current value and wraps to 0 when the maximum value would have been exceeded.
- `VK_STENCIL_OP_DECREMENT_AND_WRAP` decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

32.9. Depth Test

The depth test compares the depth value z_a in the depth/stencil attachment at each sample's framebuffer coordinates (x_f, y_f) and [sample index](#) i against the sample's depth value z_f . If there is no depth attachment then the depth test is skipped.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

The depth test occurs in three stages, as detailed in the following sections.

32.9.1. Depth Clamping and Range Adjustment

If `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is enabled, z_f is clamped to $[z_{\min}, z_{\max}]$, where $z_{\min} = \min(n, f)$, $z_{\max} = \max(n, f)$, and n and f are the `minDepth` and `maxDepth` depth range values of the viewport used by this fragment, respectively. If the `depthClampControl` feature is enabled and `VkPipelineViewportDepthClampControlCreateInfoEXT::depthClampMode` is `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT`, then $z_{\min}$ and $z_{\max}$ are equal to the `minDepthClamp` and `maxDepthClamp` values of the `VkDepthClampRangeEXT` structure pointed to by `pDepthClampRange`.

If `VkPhysicalDeviceDepthClampZeroOneFeaturesKHR::depthClampZeroOne` is enabled:

- If the depth attachment has a floating-point format and `VK_EXT_depth_range_unrestricted` is enabled then z_f is unchanged.
- Otherwise, z_f is clamped to the range $[0, 1]$.

Otherwise:

- If z_f is not in the range $[z_{\min}, z_{\max}]$, then z_f is undefined following this step.
- If the depth attachment has a fixed-point format and z_f is not in the range $[0, 1]$, then z_f is undefined following this step.

The `VkPipelineViewportDepthClampControlCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_depth_clamp_control
typedef struct VkPipelineViewportDepthClampControlCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkDepthClampModeEXT  depthClampMode;
    const VkDepthClampRangeEXT* pDepthClampRange;
} VkPipelineViewportDepthClampControlCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthClampMode` determines how the clamp range is determined for each viewport.
- `pDepthClampRange` sets the depth clamp range for all viewports if `depthClampMode` is `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT`.

This structure extends `VkPipelineViewportStateCreateInfo` and specifies the depth clamp range used in the pipeline. If this structure is not provided in the next chain then `depthClampMode` defaults to `VK_DEPTH_CLAMP_MODE_VIEWPORT_RANGE_EXT`.

Valid Usage

- VUID-VkPipelineViewportDepthClampControlCreateInfoEXT-pDepthClampRange-09646
If `depthClampMode` is `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT`, and the pipeline is not created with `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT`, then `pDepthClampRange` **must** be a valid pointer to a valid `VkDepthClampRangeEXT` structure

Valid Usage (Implicit)

- VUID-VkPipelineViewportDepthClampControlCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLAMP_CONTROL_CREATE_INFO_EXT`
- VUID-VkPipelineViewportDepthClampControlCreateInfoEXT-depthClampMode-parameter
`depthClampMode` **must** be a valid `VkDepthClampModeEXT` value
- VUID-VkPipelineViewportDepthClampControlCreateInfoEXT-pDepthClampRange-parameter
If `pDepthClampRange` is not `NULL`, `pDepthClampRange` **must** be a valid pointer to a valid `VkDepthClampRangeEXT` structure

Structure Chaining

Extends the structure

- `VkPipelineViewportStateCreateInfo`

Possible values of `VkPipelineViewportDepthClampControlCreateInfoEXT::depthClampMode`, specifying which range should be used for depth clamping, are:

```
// Provided by VK_EXT_depth_clamp_control
typedef enum VkDepthClampModeEXT {
    VK_DEPTH_CLAMP_MODE_VIEWPORT_RANGE_EXT = 0,
    VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT = 1,
} VkDepthClampModeEXT;
```

- `VK_DEPTH_CLAMP_MODE_VIEWPORT_RANGE_EXT` specifies that the depth clamp range follows the viewport depth range. The depth clamp range of each viewport will implicitly be set to $z_{\min} = \min(n, f)$ and $z_{\max} = \max(n, f)$, where n and f are the `minDepth` and `maxDepth` depth range values of the viewport.
- `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT` specifies that a single user-defined depth clamp range will be used for all viewports. The user-defined depth clamp range is defined by the `minDepthClamp` and `maxDepthClamp` members of `VkDepthClampRangeEXT`.

To dynamically set the viewport depth clamp range parameters, call:

```
// Provided by VK_EXT_depth_clamp_control, VK_EXT_depth_clamp_control with
VK_EXT_shader_object
void vkCmdSetDepthClampRangeEXT(
    VkCommandBuffer                commandBuffer,
    VkDepthClampModeEXT            depthClampMode,
    const VkDepthClampRangeEXT*    pDepthClampRange);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthClampMode` determines how the clamp range is determined for each viewport.
- `pDepthClampRange` sets the depth clamp range for all viewports if `depthClampMode` is `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT`.

This command sets the viewport depth clamp range for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportDepthClampControlCreateInfoEXT::depthClampMode` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthClampRangeEXT-pDepthClampRange-09647
If `depthClampMode` is `VK_DEPTH_CLAMP_MODE_USER_DEFINED_RANGE_EXT`, then `pDepthClampRange` must be a valid pointer to a valid `VkDepthClampRangeEXT` structure

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClampRangeEXT-commandBuffer-parameter **commandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetDepthClampRangeEXT-depthClampMode-parameter **depthClampMode** **must** be a valid [VkDepthClampModeEXT](#) value
- VUID-vkCmdSetDepthClampRangeEXT-pDepthClampRange-parameter
If **pDepthClampRange** is not **NULL**, **pDepthClampRange** **must** be a valid pointer to a valid [VkDepthClampRangeEXT](#) structure
- VUID-vkCmdSetDepthClampRangeEXT-commandBuffer-recording **commandBuffer** **must** be in the [recording state](#)
- VUID-vkCmdSetDepthClampRangeEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetDepthClampRangeEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

vkCmdSetDepthClampRangeEXT is not affected by [conditional rendering](#)

Both [VkPipelineViewportDepthClampControlCreateInfoEXT](#) and **vkCmdSetDepthClampRangeEXT** use [VkDepthClampRangeEXT](#) to set the viewport depth clamp range parameters.

The [VkDepthClampRangeEXT](#) structure is defined as:

```
// Provided by VK_EXT_depth_clamp_control
typedef struct VkDepthClampRangeEXT {
    float    minDepthClamp;
    float    maxDepthClamp;
} VkDepthClampRangeEXT;
```

- **minDepthClamp** sets $z_{\min}$ in the depth clamp range of the viewport.
- **maxDepthClamp** sets $z_{\max}$ in the depth clamp range of the viewport.

Valid Usage

- VUID-VkDepthClampRangeEXT-pDepthClampRange-00999
minDepthClamp **must** be less than or equal to **maxDepthClamp**
- VUID-VkDepthClampRangeEXT-pDepthClampRange-09648
If the `VK_EXT_depth_range_unrestricted` extension is not enabled, **minDepthClamp** **must** be greater than or equal to **0.0**
- VUID-VkDepthClampRangeEXT-pDepthClampRange-09649
If the `VK_EXT_depth_range_unrestricted` extension is not enabled, **maxDepthClamp** **must** be less than or equal to **1.0**

32.9.2. Depth Comparison

If the depth test is not enabled, as specified by `vkCmdSetDepthTestEnable` or `VkPipelineDepthStencilStateCreateInfo::depthTestEnable`, then this step is skipped.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetDepthCompareOp`, or by `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` during pipeline creation. z_f and z_a are used as the *reference* and *test* values, respectively, in the operation specified by the `VkCompareOp`.

If the comparison evaluates to false, the coverage for the sample is set to **0**.

32.9.3. Depth Attachment Writes

If depth writes are enabled, as specified by `vkCmdSetDepthWriteEnable` or `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable`, and the comparison evaluated to true, the depth attachment value z_a is set to the sample's depth value z_f . If there is no depth attachment, no value is written.

To **dynamically enable or disable** the depth test, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetDepthTestEnable(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthTestEnable);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetDepthTestEnable
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthTestEnable);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **depthTestEnable** specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineDepthStencilStateCreateInfo::depthTestEnable** value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthTestEnable-None-08971

At least one of the following **must** be true:

- the **extendedDynamicState** feature is enabled
- the **shaderObject** feature is enabled
- the value of **VkApplicationInfo::apiVersion** used to create the **VkInstance** parent of **commandBuffer** is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_GRAPHICS_BIT** operations
- VUID-vkCmdSetDepthTestEnable-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT VK_QUEUE_COMPUTE_BIT	State

Conditional Rendering

vkCmdSetDepthTestEnable is not affected by [conditional rendering](#)

To [dynamically set](#) the depth compare operator, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetDepthCompareOp(
    VkCommandBuffer          commandBuffer,
    VkCompareOp              depthCompareOp);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetDepthCompareOp
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer          commandBuffer,
    VkCompareOp              depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the [Depth Comparison](#) step of the [depth test](#).

This command sets the depth comparison operator for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthCompareOp-None-08971
At least one of the following **must** be true:
 - the `extendedDynamicState` feature is enabled
 - the `shaderObject` feature is enabled
 - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter `depthCompareOp` **must** be a valid `VkCompareOp` value
- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording `commandBuffer` **must** be in the `recording` state
- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetDepthCompareOp-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetDepthCompareOp` is not affected by `conditional rendering`

To `dynamically set` the depth write enable, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetDepthWriteEnable(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthWriteEnable);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetDepthWriteEnable
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                 depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthWriteEnable` specifies if depth writes are enabled.

This command sets the depth write enable for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthWriteEnable-None-08971

At least one of the following **must** be true:

- the `extendedDynamicState` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetDepthWriteEnable-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS HICS_BIT	State

Conditional Rendering

`vkCmdSetDepthWriteEnable` is not affected by [conditional rendering](#)

32.10. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in [Occlusion Queries](#).

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, sample mask, alpha to coverage, stencil, and depth tests.

32.11. Coverage Reduction

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

32.11.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of `rasterizationSamples` unique coverage samples for each pixel in the fragment area, each with a unique `sample index`. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If the `fragment shading rate` is set, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples with a `pixel index` matching that pixel, and each sample retains its unique `sample index i`.

32.11.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

The number of `rasterizationSamples` is identical to the number of samples in the color attachments. A color sample is covered if the pixel coverage sample with the same `sample index` `i` is covered.

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with the `multisampledRenderToSingleSampledEnable` field equal to `VK_TRUE`, sample coverage is calculated as if the attachment has `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples` samples.

Chapter 33. The Framebuffer

33.1. Blending

Blending combines the incoming *source* fragment's R, G, B, and A values with the *destination* R, G, B, and A values of each sample stored in the framebuffer at the fragment's (x_f, y_f) location. If any components are missing in the framebuffer attachment, they are replaced as described in [Component Substitution](#). Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the [blend operation](#), quadruplets of source and destination weighting factors determined by the [blend factors](#), and a [blend constant](#), to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by [Conversion from Normalized Fixed-Point to Floating-Point](#). Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. [Advanced blending operations](#) are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

NOTE

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by [VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT](#).

The pipeline blend state is included in the `VkPipelineColorBlendStateCreateInfo` structure during graphics pipeline creation:

The `VkPipelineColorBlendStateCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32                  logicOpEnable;
    VkLogicOp                 logicOp;
    uint32_t                  attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float                     blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkPipelineColorBlendStateCreateFlagBits](#) specifying additional color blending information.
- **logicOpEnable** controls whether to apply [Logical Operations](#).
- **logicOp** selects which logical operation to apply.
- **attachmentCount** is the number of [VkPipelineColorBlendAttachmentState](#) elements in **pAttachments**. It is ignored if the pipeline is created with [VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT](#), [VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT](#), and [VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT](#) dynamic states set, and either [VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT](#) set or the [advancedBlendCoherentOperations](#) feature is not enabled.
- **pAttachments** is a pointer to an array of [VkPipelineColorBlendAttachmentState](#) structures defining blend state for each color attachment. It is ignored if the pipeline is created with [VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT](#), [VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT](#), and [VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT](#) dynamic states set, and either [VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT](#) set or the [advancedBlendCoherentOperations](#) feature is not enabled.
- **blendConstants** is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the [blend factor](#).

Valid Usage

- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605
If the **independentBlend** feature is not enabled, all elements of **pAttachments** **must** be identical
- VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606
If the **logicOp** feature is not enabled, **logicOpEnable** **must** be [VK_FALSE](#)
- VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607
If **logicOpEnable** is [VK_TRUE](#), **logicOp** **must** be a valid [VkLogicOp](#) value
- VUID-VkPipelineColorBlendStateCreateInfo-rasterizationOrderColorAttachmentAccess-06465
If the **rasterizationOrderColorAttachmentAccess** feature is not enabled, **flags** **must** not include [VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT](#)
- VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353
If **attachmentCount** is not **0**, and any of [VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT](#), [VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT](#), [VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT](#), or

`VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` are not set, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures

Valid Usage (Implicit)

- `VUID-VkPipelineColorBlendStateCreateInfo-sType-sType`
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`
- `VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext`
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPipelineColorBlendAdvancedStateCreateInfoEXT` or `VkPipelineColorWriteCreateInfoEXT`
- `VUID-VkPipelineColorBlendStateCreateInfo-sType-unique`
The `sType` value of each structure in the `pNext` chain **must** be unique
- `VUID-VkPipelineColorBlendStateCreateInfo-flags-parameter`
`flags` **must** be a valid combination of `VkPipelineColorBlendStateCreateFlagBits` values
- `VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter`
If `attachmentCount` is not `0`, and `pAttachments` is not `NULL`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;
```

`VkPipelineColorBlendStateCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineColorBlendStateCreateFlagBits`.

Bits which **can** be set in the `VkPipelineColorBlendStateCreateInfo::flags` parameter are:

```
// Provided by VK_VERSION_1_0, VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineColorBlendStateCreateFlagBits {
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT
    = 0x00000001,
} VkPipelineColorBlendStateCreateFlagBits;
```

- `VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT` specifies that access to color and input attachments will have implicit framebuffer-local memory dependencies, allowing applications to express custom blending operations in a fragment shader.

When

`VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT`

T_EXT is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:

- The first **synchronization scope** includes the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage executed by all previous fragments (as defined by **primitive order**) in the corresponding **framebuffer regions** including those generated by the same draw command.
- The second **synchronization scope** includes the **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** pipeline stage executed by the generated fragment.
- The first **access scope** includes all writes to color attachments.
- The second **access scope** includes all reads from input attachments.

The **VkPipelineColorBlendAttachmentState** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32          blendEnable;
    VkBlendFactor      srcColorBlendFactor;
    VkBlendFactor      dstColorBlendFactor;
    VkBlendOp          colorBlendOp;
    VkBlendFactor      srcAlphaBlendFactor;
    VkBlendFactor      dstAlphaBlendFactor;
    VkBlendOp          alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- **blendEnable** controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- **srcColorBlendFactor** selects which blend factor is used to determine the source factors (S_r, S_g, S_b).
- **dstColorBlendFactor** selects which blend factor is used to determine the destination factors (D_r, D_g, D_b).
- **colorBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.
- **srcAlphaBlendFactor** selects which blend factor is used to determine the source factor S_a .
- **dstAlphaBlendFactor** selects which blend factor is used to determine the destination factor D_a .
- **alphaBlendOp** selects which blend operation is used to calculate the alpha values to write to the color attachment.
- **colorWriteMask** is a bitmask of **VkColorComponentFlagBits** specifying which of the R, G, B, and/or A components are enabled for writing, as described for the **Color Write Mask**.

Valid Usage

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608

If the `dualSrcBlend` feature is not enabled, `srcColorBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`

- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609

If the `dualSrcBlend` feature is not enabled, `dstColorBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`

- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610

If the `dualSrcBlend` feature is not enabled, `srcAlphaBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`

- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611

If the `dualSrcBlend` feature is not enabled, `dstAlphaBlendFactor` **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`

- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01406

If either of `colorBlendOp` or `alphaBlendOp` is an `advanced blend operation`, then `colorBlendOp` **must** equal `alphaBlendOp`

- VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01407

If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend` is `VK_FALSE` and `colorBlendOp` is an `advanced blend operation`, then `colorBlendOp` **must** be the same for all attachments

- VUID-VkPipelineColorBlendAttachmentState-advancedBlendIndependentBlend-01408

If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend` is `VK_FALSE` and `alphaBlendOp` is an `advanced blend operation`, then `alphaBlendOp` **must** be the same for all attachments

- VUID-VkPipelineColorBlendAttachmentState-advancedBlendAllOperations-01409

If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendAllOperations` is `VK_FALSE`, then `colorBlendOp` **must** not be `VK_BLEND_OP_ZERO_EXT`, `VK_BLEND_OP_SRC_EXT`, `VK_BLEND_OP_DST_EXT`, `VK_BLEND_OP_SRC_OVER_EXT`, `VK_BLEND_OP_DST_OVER_EXT`, `VK_BLEND_OP_SRC_IN_EXT`, `VK_BLEND_OP_DST_IN_EXT`, `VK_BLEND_OP_SRC_OUT_EXT`, `VK_BLEND_OP_DST_OUT_EXT`, `VK_BLEND_OP_SRC_ATOP_EXT`, `VK_BLEND_OP_DST_ATOP_EXT`, `VK_BLEND_OP_XOR_EXT`, `VK_BLEND_OP_INVERT_EXT`, `VK_BLEND_OP_INVERT_RGB_EXT`, `VK_BLEND_OP_LINEARODDGE_EXT`, `VK_BLEND_OP_LINEARBURN_EXT`, `VK_BLEND_OP_VIVIDLIGHT_EXT`, `VK_BLEND_OP_LINEARLIGHT_EXT`, `VK_BLEND_OP_PINLIGHT_EXT`, `VK_BLEND_OP_HARDMIX_EXT`, `VK_BLEND_OP_PLUS_EXT`, `VK_BLEND_OP_PLUS_CLAMPED_EXT`, `VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT`, `VK_BLEND_OP_PLUS_DARKER_EXT`, `VK_BLEND_OP_MINUS_EXT`, `VK_BLEND_OP_MINUS_CLAMPED_EXT`, `VK_BLEND_OP_CONTRAST_EXT`, `VK_BLEND_OP_INVERT_OVG_EXT`, `VK_BLEND_OP_RED_EXT`, `VK_BLEND_OP_GREEN_EXT`, or `VK_BLEND_OP_BLUE_EXT`

- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-01410

If `colorBlendOp` or `alphaBlendOp` is an `advanced blend operation`, then `colorAttachmentCount` of the subpass this pipeline is compiled against **must** be less than or equal to

VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments

- VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04454
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `srcColorBlendFactor` **must** not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`
- VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04455
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor` **must** not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter `srcColorBlendFactor` **must** be a valid `VkBlendFactor` value
- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter `dstColorBlendFactor` **must** be a valid `VkBlendFactor` value
- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter `colorBlendOp` **must** be a valid `VkBlendOp` value
- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter `srcAlphaBlendFactor` **must** be a valid `VkBlendFactor` value
- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter `dstAlphaBlendFactor` **must** be a valid `VkBlendFactor` value
- VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter `alphaBlendOp` **must** be a valid `VkBlendOp` value
- VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter `colorWriteMask` **must** be a valid combination of `VkColorComponentFlagBits` values

To dynamically set `blendEnable`, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEnableEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstAttachment,
    uint32_t                 attachmentCount,
    const VkBool32*          pColorBlendEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blending enable applies.
- `attachmentCount` the number of color blending enables in the `pColorBlendEnables` array.

- `pColorBlendEnables` an array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::blendEnable` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendEnableEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3ColorBlendEnable` feature is enabled
 - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetColorBlendEnableEXT-pColorBlendEnables-parameter
`pColorBlendEnables` **must** be a valid pointer to an array of `attachmentCount` `VkBool32` values
- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetColorBlendEnableEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorBlendEnableEXT-attachmentCount-arraylength
`attachmentCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

vkCmdSetColorBlendEnableEXT is not affected by [conditional rendering](#)

To [dynamically set](#) color blend factors and operations, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEquationEXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       firstAttachment,
    uint32_t                       attachmentCount,
    const VkColorBlendEquationEXT* pColorBlendEquations);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstAttachment** the first color attachment the color blend factors and operations apply to.
- **attachmentCount** the number of [VkColorBlendEquationEXT](#) elements in the **pColorBlendEquations** array.
- **pColorBlendEquations** an array of [VkColorBlendEquationEXT](#) structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineColorBlendAttachmentState::srcColorBlendFactor](#), [VkPipelineColorBlendAttachmentState::dstColorBlendFactor](#), [VkPipelineColorBlendAttachmentState::colorBlendOp](#), [VkPipelineColorBlendAttachmentState::srcAlphaBlendFactor](#), [VkPipelineColorBlendAttachmentState::dstAlphaBlendFactor](#), and [VkPipelineColorBlendAttachmentState::alphaBlendOp](#) values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendEquationEXT-None-09423
At least one of the following **must** be true:
 - The [extendedDynamicState3ColorBlendEquation](#) feature is enabled

- The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter
`pColorBlendEquations` **must** be a valid pointer to an array of `attachmentCount` valid `VkColorBlendEquationEXT` structures
- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetColorBlendEquationEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorBlendEquationEXT-attachmentCount-arraylength
`attachmentCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetColorBlendEquationEXT` is not affected by `conditional rendering`

The `VkColorBlendEquationEXT` structure is defined as:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendEquationEXT {
    VkBlendFactor    srcColorBlendFactor;
    VkBlendFactor    dstColorBlendFactor;
    VkBlendOp        colorBlendOp;
    VkBlendFactor    srcAlphaBlendFactor;
    VkBlendFactor    dstAlphaBlendFactor;
    VkBlendOp        alphaBlendOp;
} VkColorBlendEquationEXT;
```

- **srcColorBlendFactor** selects which blend factor is used to determine the source factors (S_r, S_g, S_b).
- **dstColorBlendFactor** selects which blend factor is used to determine the destination factors (D_r, D_g, D_b).
- **colorBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.
- **srcAlphaBlendFactor** selects which blend factor is used to determine the source factor S_a .
- **dstAlphaBlendFactor** selects which blend factor is used to determine the destination factor D_a .
- **alphaBlendOp** selects which blend operation is use to calculate the alpha values to write to the color attachment.

Valid Usage

- VUID-VkColorBlendEquationEXT-dualSrcBlend-07357
If the **dualSrcBlend** feature is not enabled, **srcColorBlendFactor** **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkColorBlendEquationEXT-dualSrcBlend-07358
If the **dualSrcBlend** feature is not enabled, **dstColorBlendFactor** **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkColorBlendEquationEXT-dualSrcBlend-07359
If the **dualSrcBlend** feature is not enabled, **srcAlphaBlendFactor** **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkColorBlendEquationEXT-dualSrcBlend-07360
If the **dualSrcBlend** feature is not enabled, **dstAlphaBlendFactor** **must** not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
- VUID-VkColorBlendEquationEXT-colorBlendOp-07361
colorBlendOp and **alphaBlendOp** **must** not be `VK_BLEND_OP_ZERO_EXT`, `VK_BLEND_OP_SRC_EXT`, `VK_BLEND_OP_DST_EXT`, `VK_BLEND_OP_SRC_OVER_EXT`, `VK_BLEND_OP_DST_OVER_EXT`, `VK_BLEND_OP_SRC_IN_EXT`, `VK_BLEND_OP_DST_IN_EXT`, `VK_BLEND_OP_SRC_OUT_EXT`, `VK_BLEND_OP_DST_OUT_EXT`,

VK_BLEND_OP_SRC_ATOP_EXT, VK_BLEND_OP_DST_ATOP_EXT, VK_BLEND_OP_XOR_EXT,
 VK_BLEND_OP_MULTIPLY_EXT, VK_BLEND_OP_SCREEN_EXT,
 VK_BLEND_OP_OVERLAY_EXT, VK_BLEND_OP_DARKEN_EXT,
 VK_BLEND_OP_LIGHTEN_EXT, VK_BLEND_OP_COLORBURN_EXT,
 VK_BLEND_OP_SOFTLIGHT_EXT, VK_BLEND_OP_HARDLIGHT_EXT,
 VK_BLEND_OP_EXCLUSION_EXT, VK_BLEND_OP_DIFFERENCE_EXT,
 VK_BLEND_OP_INVERT_EXT, VK_BLEND_OP_LINEARLIGHT_EXT,
 VK_BLEND_OP_INVERT_RGB_EXT, VK_BLEND_OP_LINEARBURN_EXT,
 VK_BLEND_OP_VIVIDLIGHT_EXT,
 VK_BLEND_OP_PINLIGHT_EXT,
 VK_BLEND_OP_HSL_HUE_EXT,
 VK_BLEND_OP_HSL_SATURATION_EXT, VK_BLEND_OP_HSL_COLOR_EXT,
 VK_BLEND_OP_HSL_LUMINOSITY_EXT, VK_BLEND_OP_PLUS_EXT,
 VK_BLEND_OP_PLUS_CLAMPED_EXT, VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT,
 VK_BLEND_OP_PLUS_DARKER_EXT, VK_BLEND_OP_MINUS_EXT,
 VK_BLEND_OP_MINUS_CLAMPED_EXT, VK_BLEND_OP_CONTRAST_EXT,
 VK_BLEND_OP_INVERT_OVG_EXT, VK_BLEND_OP_RED_EXT, VK_BLEND_OP_GREEN_EXT,
 or VK_BLEND_OP_BLUE_EXT

- VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07362

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `srcColorBlendFactor` **must** not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`

- VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07363

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor` **must** not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`

Valid Usage (Implicit)

- VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter

`srcColorBlendFactor` **must** be a valid `VkBlendFactor` value

- VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter

`dstColorBlendFactor` **must** be a valid `VkBlendFactor` value

- VUID-VkColorBlendEquationEXT-colorBlendOp-parameter

`colorBlendOp` **must** be a valid `VkBlendOp` value

- VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter

`srcAlphaBlendFactor` **must** be a valid `VkBlendFactor` value

- VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter

`dstAlphaBlendFactor` **must** be a valid `VkBlendFactor` value

- VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter

`alphaBlendOp` **must** be a valid `VkBlendOp` value

To [dynamically set](#) the color write masks, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorWriteMaskEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 firstAttachment,
    uint32_t                 attachmentCount,
    const VkColorComponentFlags* pColorWriteMasks);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color write masks apply to.
- `attachmentCount` the number of `VkColorComponentFlags` values in the `pColorWriteMasks` array.
- `pColorWriteMasks` an array of `VkColorComponentFlags` values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::colorWriteMask` values used to create the currently active pipeline.

NOTE

Formats with bits that are shared between components specified by `VkColorComponentFlagBits`, such as `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, cannot have their channels individually masked by this functionality; either all components that share bits have to be enabled, or none of them.

Valid Usage

- VUID-vkCmdSetColorWriteMaskEXT-None-09423

At least one of the following **must** be true:

- The `extendedDynamicState3ColorWriteMask` feature is enabled
- The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter `pColorWriteMasks` **must** be a valid pointer to an array of `attachmentCount` valid combinations of `VkColorComponentFlagBits` values
- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations

- VUID-vkCmdSetColorWriteMaskEXT-vidcoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength
`attachmentCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT HICS_BIT	State

Conditional Rendering

`vkCmdSetColorWriteMaskEXT` is not affected by [conditional rendering](#)

33.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

Table 38. Blend Factors

VkBlendFactor	RGB Blend Factors (S_r, S_g, S_b) or (D_r, D_g, D_b)	Alpha Blend Factor (S_a or D_a)
VK_BLEND_FACTOR_ZERO	(0,0,0)	0
VK_BLEND_FACTOR_ONE	(1,1,1)	1
VK_BLEND_FACTOR_SRC_COLOR	(R_{s0}, G_{s0}, B_{s0})	A_{s0}
VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR	($1-R_{s0}, 1-G_{s0}, 1-B_{s0}$)	$1-A_{s0}$
VK_BLEND_FACTOR_DST_COLOR	(R_d, G_d, B_d)	A_d
VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR	($1-R_d, 1-G_d, 1-B_d$)	$1-A_d$
VK_BLEND_FACTOR_SRC_ALPHA	(A_{s0}, A_{s0}, A_{s0})	A_{s0}
VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA	($1-A_{s0}, 1-A_{s0}, 1-A_{s0}$)	$1-A_{s0}$
VK_BLEND_FACTOR_DST_ALPHA	(A_d, A_d, A_d)	A_d
VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA	($1-A_d, 1-A_d, 1-A_d$)	$1-A_d$
VK_BLEND_FACTOR_CONSTANT_COLOR	(R_c, G_c, B_c)	A_c
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR	($1-R_c, 1-G_c, 1-B_c$)	$1-A_c$
VK_BLEND_FACTOR_CONSTANT_ALPHA	(A_c, A_c, A_c)	A_c

VkBlendFactor	RGB Blend Factors (S_r, S_g, S_b) or (D_r, D_g, D_b)	Alpha Blend Factor (S_a or D_a)
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA	$(1-A_c, 1-A_c, 1-A_c)$	$1-A_c$
VK_BLEND_FACTOR_SRC_ALPHA_SATURATE	$(f, f, f); f = \min(A_{s0}, 1-A_d)$	1
VK_BLEND_FACTOR_SRC1_COLOR	(R_{s1}, G_{s1}, B_{s1})	A_{s1}
VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR	$(1-R_{s1}, 1-G_{s1}, 1-B_{s1})$	$1-A_{s1}$
VK_BLEND_FACTOR_SRC1_ALPHA	(A_{s1}, A_{s1}, A_{s1})	A_{s1}
VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA	$(1-A_{s1}, 1-A_{s1}, 1-A_{s1})$	$1-A_{s1}$

In this table, the following conventions are used:

- R_{s0}, G_{s0}, B_{s0} and A_{s0} represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.
- R_{s1}, G_{s1}, B_{s1} and A_{s1} represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.
- R_d, G_d, B_d and A_d represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- R_c, G_c, B_c and A_c represent the blend constant R, G, B, and A components, respectively.

To [dynamically set and change](#) the blend constants, call:

```
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer          commandBuffer,
    const float               blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `blendConstants` is a pointer to an array of four values specifying the R_c , G_c , B_c , and A_c components of the blend constant color used in blending, depending on the [blend factor](#).

This command sets blend constants for subsequent drawing commands when when drawing using [shader objects](#), or the graphics pipeline is created with [VK_DYNAMIC_STATE_BLEND_CONSTANTS](#) set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::blendConstants` values used to create the currently active pipeline.

Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter `commandBuffer` **must** be a valid [VkCommandBuffer](#) handle

- VUID-vkCmdSetBlendConstants-commandBuffer-recording
`commandBuffer` **must** be in the [recording state](#)
- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetBlendConstants-vidcoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetBlendConstants` is not affected by [conditional rendering](#)

33.1.2. Dual-Source Blending

Blend factors that use the secondary color input ($R_{s1}, G_{s1}, B_{s1}, A_{s1}$) ([VK_BLEND_FACTOR_SRC1_COLOR](#), [VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR](#), [VK_BLEND_FACTOR_SRC1_ALPHA](#), and [VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA](#)) **may** consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that **can** be used in a framebuffer **may** be lower when using dual-source blending.

Dual-source blending is only supported if the `dualSrcBlend` feature is enabled.

The maximum number of color attachments that **can** be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the `maxFragmentDualSrcAttachments` member of `VkPhysicalDeviceLimits`.

Color outputs **can** be bound to the first and second inputs of the blender using the `Index` decoration, as described in [Fragment Output Interface](#). If the second color input to the blender is not written in

the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.

33.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components **can** use different operations. Possible values of `VkBlendOp`, specifying the operations, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_ZERO_EXT = 1000148000,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_EXT = 1000148001,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_EXT = 1000148002,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OVER_EXT = 1000148003,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OVER_EXT = 1000148004,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_IN_EXT = 1000148005,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_IN_EXT = 1000148006,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_OUT_EXT = 1000148007,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_OUT_EXT = 1000148008,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SRC_ATOP_EXT = 1000148009,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DST_ATOP_EXT = 1000148010,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_XOR_EXT = 1000148011,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_MULTIPLY_EXT = 1000148012,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_SCREEN_EXT = 1000148013,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_OVERLAY_EXT = 1000148014,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_DARKEN_EXT = 1000148015,
    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_LIGHTEN_EXT = 1000148016,
```

```
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_COLORDODGE_EXT = 1000148017,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_COLORBURN_EXT = 1000148018,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDLIGHT_EXT = 1000148019,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SOFTLIGHT_EXT = 1000148020,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DIFFERENCE_EXT = 1000148021,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_EXCLUSION_EXT = 1000148022,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_EXT = 1000148023,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_RGB_EXT = 1000148024,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARODDGE_EXT = 1000148025,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARBURN_EXT = 1000148026,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_VIVIDLIGHT_EXT = 1000148027,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARLIGHT_EXT = 1000148028,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PINLIGHT_EXT = 1000148029,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDMIX_EXT = 1000148030,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_HUE_EXT = 1000148031,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_SATURATION_EXT = 1000148032,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_COLOR_EXT = 1000148033,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_LUMINOSITY_EXT = 1000148034,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_EXT = 1000148035,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_EXT = 1000148036,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT = 1000148037,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_DARKER_EXT = 1000148038,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_EXT = 1000148039,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_CLAMPED_EXT = 1000148040,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_CONTRAST_EXT = 1000148041,
// Provided by VK_EXT_blend_operation_advanced
```

```
VK_BLEND_OP_INVERT_OVG_EXT = 1000148042,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_RED_EXT = 1000148043,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_GREEN_EXT = 1000148044,  
// Provided by VK_EXT_blend_operation_advanced  
VK_BLEND_OP_BLUE_EXT = 1000148045,  
} VkBlendOp;
```

The semantics of the basic blend operations are described in the table below:

Table 39. Basic Blend Operations

VkBlendOp	RGB Components	Alpha Component
VK_BLEND_OP_ADD	$R = R_{s0} \times S_r + R_d \times D_r$ $G = G_{s0} \times S_g + G_d \times D_g$ $B = B_{s0} \times S_b + B_d \times D_b$	$A = A_{s0} \times S_a + A_d \times D_a$
VK_BLEND_OP_SUBTRACT	$R = R_{s0} \times S_r - R_d \times D_r$ $G = G_{s0} \times S_g - G_d \times D_g$ $B = B_{s0} \times S_b - B_d \times D_b$	$A = A_{s0} \times S_a - A_d \times D_a$
VK_BLEND_OP_REVERSE_SUBTRACT	$R = R_d \times D_r - R_{s0} \times S_r$ $G = G_d \times D_g - G_{s0} \times S_g$ $B = B_d \times D_b - B_{s0} \times S_b$	$A = A_d \times D_a - A_{s0} \times S_a$
VK_BLEND_OP_MIN	$R = \min(R_{s0}, R_d)$ $G = \min(G_{s0}, G_d)$ $B = \min(B_{s0}, B_d)$	$A = \min(A_{s0}, A_d)$
VK_BLEND_OP_MAX	$R = \max(R_{s0}, R_d)$ $G = \max(G_{s0}, G_d)$ $B = \max(B_{s0}, B_d)$	$A = \max(A_{s0}, A_d)$

In this table, the following conventions are used:

- R_{s0} , G_{s0} , B_{s0} and A_{s0} represent the first source color R, G, B, and A components, respectively.
- R_d , G_d , B_d and A_d represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- S_r , S_g , S_b and S_a represent the source blend factor R, G, B, and A components, respectively.
- D_r , D_g , D_b and D_a represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B and A are assigned R_{s0} , G_{s0} , B_{s0} and A_{s0} , respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to [0,1] or [-1,1] respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the [numeric format](#) of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). If the format is not sRGB, no linearization is performed.

If the [numeric format](#) of a framebuffer attachment uses sRGB encoding, then the final R, G, and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF⁻¹” section of the Khronos Data Format

Specification.

If the [numeric format](#) of a framebuffer color attachment is not sRGB encoded, then the resulting c_s values for R, G, and B are unmodified.

The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is [VK_ATTACHMENT_UNUSED](#), no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the [VkSubpassDescription::colorAttachmentCount](#) or [VkSubpassDescription2::colorAttachmentCount](#) value.

33.1.4. Advanced Blend Operations

The *advanced blend operations* are those listed in tables [f/X/Y/Z Advanced Blend Operations](#), [Hue-Saturation-Luminosity Advanced Blend Operations](#), and [Additional RGB Blend Operations](#).

If the [pNext](#) chain of [VkPipelineColorBlendStateCreateInfo](#) includes a [VkPipelineColorBlendAdvancedStateCreateInfoEXT](#) structure, then that structure includes parameters that affect advanced blend operations.

The [VkPipelineColorBlendAdvancedStateCreateInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           srcPremultiplied;
    VkBool32           dstPremultiplied;
    VkBlendOverlapEXT  blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [srcPremultiplied](#) specifies whether the source color of the blend operation is treated as premultiplied.
- [dstPremultiplied](#) specifies whether the destination color of the blend operation is treated as premultiplied.
- [blendOverlap](#) is a [VkBlendOverlapEXT](#) value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, [srcPremultiplied](#) and [dstPremultiplied](#) are both considered to be [VK_TRUE](#), and [blendOverlap](#) is considered to be [VK_BLEND_OVERLAP_UNCORRELATED_EXT](#).

Valid Usage

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424
If the [non-premultiplied source color](#) property is not supported, `srcPremultiplied` **must** be `VK_TRUE`
- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-dstPremultiplied-01425
If the [non-premultiplied destination color](#) property is not supported, `dstPremultiplied` **must** be `VK_TRUE`
- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-01426
If the [correlated overlap](#) property is not supported, `blendOverlap` **must** be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-parameter
`blendOverlap` **must** be a valid `VkBlendOverlapEXT` value

Structure Chaining

Extends the structure

- [VkPipelineColorBlendStateCreateInfo](#)

To [dynamically set](#) the advanced blend state, call:

```
// Provided by VK_EXT_blend_operation_advanced with VK_EXT_extended_dynamic_state3,  
VK_EXT_blend_operation_advanced with VK_EXT_shader_object  
void vkCmdSetColorBlendAdvancedEXT(  
    VkCommandBuffer                commandBuffer,  
    uint32_t                       firstAttachment,  
    uint32_t                       attachmentCount,  
    const VkColorBlendAdvancedEXT* pColorBlendAdvanced);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the advanced blend parameters apply to.
- `attachmentCount` the number of `VkColorBlendAdvancedEXT` elements in the `pColorBlendAdvanced` array.
- `pColorBlendAdvanced` an array of `VkColorBlendAdvancedEXT` structs that specify the advanced color blend parameters for the corresponding attachments.

This command sets the advanced blend operation parameters of the specified attachments for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied](#), [VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied](#), and [VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap](#) values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendAdvancedEXT-None-09423

At least one of the following **must** be true:

- The [extendedDynamicState3ColorBlendAdvanced](#) feature is enabled
- The [shaderObject](#) feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-parameter [commandBuffer](#) **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdSetColorBlendAdvancedEXT-pColorBlendAdvanced-parameter [pColorBlendAdvanced](#) **must** be a valid pointer to an array of [attachmentCount](#) valid [VkColorBlendAdvancedEXT](#) structures
- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-recording [commandBuffer](#) **must** be in the [recording state](#)
- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** support [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdSetColorBlendAdvancedEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorBlendAdvancedEXT-attachmentCount-arraylength
[attachmentCount](#) **must** be greater than 0

Host Synchronization

- Host access to [commandBuffer](#) **must** be externally synchronized
- Host access to the [VkCommandPool](#) that [commandBuffer](#) was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT VK_QUEUE_COMPUTE_BIT	State

Conditional Rendering

vkCmdSetColorBlendAdvancedEXT is not affected by [conditional rendering](#)

The `VkColorBlendAdvancedEXT` structure is defined as:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendAdvancedEXT {
    VkBlendOp          advancedBlendOp;
    VkBool32           srcPremultiplied;
    VkBool32           dstPremultiplied;
    VkBlendOverlapEXT  blendOverlap;
    VkBool32           clampResults;
} VkColorBlendAdvancedEXT;
```

- `advancedBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcPremultiplied` specifies whether the source color of the blend operation is treated as premultiplied.
- `dstPremultiplied` specifies whether the destination color of the blend operation is treated as premultiplied.
- `blendOverlap` is a `VkBlendOverlapEXT` value specifying how the source and destination sample's coverage is correlated.
- `clampResults` specifies that results **must** be clamped to the [0,1] range before writing to the attachment, which is useful when the attachment format is not normalized fixed-point.

Valid Usage

- VUID-VkColorBlendAdvancedEXT-srcPremultiplied-07505
If the [non-premultiplied source color](#) property is not supported, `srcPremultiplied` **must** be `VK_TRUE`
- VUID-VkColorBlendAdvancedEXT-dstPremultiplied-07506
If the [non-premultiplied destination color](#) property is not supported, `dstPremultiplied` **must** be `VK_TRUE`
- VUID-VkColorBlendAdvancedEXT-blendOverlap-07507

If the `correlatedOverlap` property is not supported, `blendOverlap` must be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`

Valid Usage (Implicit)

- VUID-VkColorBlendAdvancedEXT-advancedBlendOp-parameter `advancedBlendOp` must be a valid `VkBlendOp` value
- VUID-VkColorBlendAdvancedEXT-blendOverlap-parameter `blendOverlap` must be a valid `VkBlendOverlapEXT` value

When using one of the operations in table [f/X/Y/Z Advanced Blend Operations](#) or [Hue-Saturation-Luminosity Advanced Blend Operations](#), blending is performed according to the following equations:

$$\begin{aligned} R &= f(R_s', R_d') * p_0(A_s, A_d) + Y * R_s' * p_1(A_s, A_d) + Z * R_d' * p_2(A_s, A_d) \\ G &= f(G_s', G_d') * p_0(A_s, A_d) + Y * G_s' * p_1(A_s, A_d) + Z * G_d' * p_2(A_s, A_d) \\ B &= f(B_s', B_d') * p_0(A_s, A_d) + Y * B_s' * p_1(A_s, A_d) + Z * B_d' * p_2(A_s, A_d) \\ A &= X * p_0(A_s, A_d) + Y * p_1(A_s, A_d) + Z * p_2(A_s, A_d) \end{aligned}$$

where the function *f* and terms *X*, *Y*, and *Z* are specified in the table. The *R*, *G*, and *B* components of the source color used for blending are derived according to `srcPremultiplied`. If `srcPremultiplied` is `VK_TRUE`, the fragment color components are considered to have been premultiplied by the *A* component prior to blending. The base source color (*R_s'*, *G_s'*, *B_s'*) is obtained by dividing through by the *A* component:

$$(R_s', G_s', B_s') = \begin{cases} (0, 0, 0) & A_s = 0 \\ (\frac{R_s}{A_s}, \frac{G_s}{A_s}, \frac{B_s}{A_s}) & \text{otherwise} \end{cases}$$

If `srcPremultiplied` is `VK_FALSE`, the fragment color components are used as the base color:

$$(R_s', G_s', B_s') = (R_s, G_s, B_s)$$

The *R*, *G*, and *B* components of the destination color used for blending are derived according to `dstPremultiplied`. If `dstPremultiplied` is `VK_TRUE`, the destination components are considered to have been premultiplied by the *A* component prior to blending. The base destination color (*R_d'*, *G_d'*, *B_d'*) is obtained by dividing through by the *A* component:

$$(R_d', G_d', B_d') = \begin{cases} (0, 0, 0) & A_d = 0 \\ (\frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d}) & \text{otherwise} \end{cases}$$

If `dstPremultiplied` is `VK_FALSE`, the destination color components are used as the base color:

$$(R_d', G_d', B_d') = (R_d, G_d, B_d)$$

When blending using advanced blend operations, we expect that the R, G, and B components of premultiplied source and destination color inputs be stored as the product of non-premultiplied R, G, and B component values and the A component of the color. If any R, G, or B component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If `dstPremultiplied` is `VK_FALSE`, that result color's R, G, and B components are divided by the A component before being written to the framebuffer. If any R, G, or B component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions p_0 , p_1 , and p_2 are defined in table [Advanced Blend Overlap Modes](#). In these functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions p_0 , p_1 , and p_2 approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.

Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the blend overlap functions, are:

```
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- `VK_BLEND_OVERLAP_UNCORRELATED_EXT` specifies that there is no correlation between the source and destination coverage.
- `VK_BLEND_OVERLAP_CONJOINT_EXT` specifies that the source and destination coverage are considered to have maximal overlap.
- `VK_BLEND_OVERLAP_DISJOINT_EXT` specifies that the source and destination coverage are considered to have minimal overlap.

Table 40. Advanced Blend Overlap Modes

Overlap Mode	Weighting Equations
<code>VK_BLEND_OVERLAP_UNCORRELATED_EXT</code>	$p_0(A_s, A_d) = A_s A_d$ $p_1(A_s, A_d) = A_s (1 - A_d)$ $p_2(A_s, A_d) = A_d (1 - A_s)$

Overlap Mode	Weighting Equations
VK_BLEND_OVERLAP_CONJOINT_EXT	$p_0(A_s, A_d) = \min(A_s, A_d)$ $p_1(A_s, A_d) = \max(A_s - A_d, 0)$ $p_2(A_s, A_d) = \max(A_d - A_s, 0)$
VK_BLEND_OVERLAP_DISJOINT_EXT	$p_0(A_s, A_d) = \max(A_s + A_d - 1, 0)$ $p_1(A_s, A_d) = \min(A_s, 1 - A_d)$ $p_2(A_s, A_d) = \min(A_d, 1 - A_s)$

Table 41. *f/X/Y/Z Advanced Blend Operations*

Mode	Blend Coefficients
VK_BLEND_OP_ZERO_EXT	$(X, Y, Z) = (0, 0, 0)$ $f(C_s, C_d) = 0$
VK_BLEND_OP_SRC_EXT	$(X, Y, Z) = (1, 1, 0)$ $f(C_s, C_d) = C_s$
VK_BLEND_OP_DST_EXT	$(X, Y, Z) = (1, 0, 1)$ $f(C_s, C_d) = C_d$
VK_BLEND_OP_SRC_OVER_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = C_s$
VK_BLEND_OP_DST_OVER_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = C_d$

When using one of the HSL blend operations in table [Hue-Saturation-Luminosity Advanced Blend Operations](#) as the blend operation, the RGB color components produced by the function f are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:

```

float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);
    float maxcol = maxv3(color);
    if (mincol < 0.0) {
        color = lum + ((color-lum)*lum) / (lum-mincol);
    }
}

```

```

    }
    if (maxcol > 1.0) {
        color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
    }
    return color;
}

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
    float lbase = lumv3(cbase);
    float llum = lumv3(clum);
    float ldiff = llum - lbase;
    vec3 color = cbase + vec3(ldiff);
    return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>. The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum)
{
    float minbase = minv3(cbase);
    float sbase = satv3(cbase);
    float ssat = satv3(csat);
    vec3 color;
    if (sbase > 0) {
        // Equivalent (modulo rounding errors) to setting the
        // smallest (R,G,B) component to 0, the largest to <ssat>,
        // and interpolating the "middle" component based on its
        // original value relative to the smallest/largest.
        color = (cbase - minbase) * ssat / sbase;
    } else {
        color = vec3(0.0);
    }
    return SetLum(color, clum);
}

```

Table 42. Hue-Saturation-Luminosity Advanced Blend Operations

Mode	Result
VK_BLEND_OP_HSL_HUE_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \text{SetLumSat}(C_s, C_d, C_d)$

Mode	Result
VK_BLEND_OP_HSL_LUMINOSITY_EXT	$(X, Y, Z) = (1, 1, 1)$ $f(C_s, C_d) = \text{SetLum}(C_d, C_s)$

When using one of the operations in table [Additional RGB Blend Operations](#) as the blend operation, the source and destination colors used by these blending operations are interpreted according to **srcPremultiplied** and **dstPremultiplied**. The blending operations below are evaluated where the RGB source and destination color components are both considered to have been premultiplied by the corresponding A component.

$$(R_s', G_s', B_s') = \begin{cases} (R_s, G_s, B_s) & \text{if srcPremultiplied is VK_TRUE} \\ (R_s A_s, G_s A_s, B_s A_s) & \text{if srcPremultiplied is VK_FALSE} \end{cases}$$

$$(R_d', G_d', B_d') = \begin{cases} (R_d, G_d, B_d) & \text{if dstPremultiplied is VK_TRUE} \\ (R_d A_d, G_d A_d, B_d A_d) & \text{if dstPremultiplied is VK_FALSE} \end{cases}$$

33.2. Logical Operations

The application **can** enable a *logical operation* between the fragment's color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOpEnable` state can also be controlled by `vkCmdSetLogicOpEnableEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. The `logicOp` state can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment's corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERTED = 12,
    VK_LOGIC_OP_OR_INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
```

The logical operations supported by Vulkan are summarized in the following table in which

- $\neg$ is bitwise invert,
- $\square$ is bitwise and,
- $\sqcup$ is bitwise or,
- $\oplus$ is bitwise exclusive or,
- s is the fragment's R_{s0} , G_{s0} , B_{s0} or A_{s0} component value for the fragment output corresponding to the color attachment being updated, and
- d is the color attachment's R, G, B or A component value:

Table 44. Logical Operations

Mode	Operation
VK_LOGIC_OP_CLEAR	0
VK_LOGIC_OP_AND	$s \square d$
VK_LOGIC_OP_AND_REVERSE	$s \square \neg d$
VK_LOGIC_OP_COPY	s
VK_LOGIC_OP_AND_INVERTED	$\neg s \square d$
VK_LOGIC_OP_NO_OP	d
VK_LOGIC_OP_XOR	$s \oplus d$
VK_LOGIC_OP_OR	$s \sqcup d$
VK_LOGIC_OP_NOR	$\neg (s \sqcup d)$
VK_LOGIC_OP_EQUIVALENT	$\neg (s \square d)$
VK_LOGIC_OP_INVERT	$\neg d$
VK_LOGIC_OP_OR_REVERSE	$s \sqcup \neg d$
VK_LOGIC_OP_COPY_INVERTED	$\neg s$
VK_LOGIC_OP_OR_INVERTED	$\neg s \sqcup d$
VK_LOGIC_OP_NAND	$\neg (s \square d)$
VK_LOGIC_OP_SET	all 1s

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in [Blend Operations](#).

To [dynamically set](#) whether logical operations are enabled, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetLogicOpEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                  logicOpEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOpEnable` specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOpEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLogicOpEnableEXT-None-09423
At least one of the following **must** be true:
 - The `extendedDynamicState3LogicOpEnable` feature is enabled
 - The `shaderObject` feature is enabled
- VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366
If the `logicOp` feature is not enabled, `logicOpEnable` **must** be `VK_FALSE`

Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetLogicOpEnableEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

vkCmdSetLogicOpEnableEXT is not affected by [conditional rendering](#)

To [dynamically set](#) the logical operation to apply for blend state, call:

```
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetLogicOpEXT(
    VkCommandBuffer          commandBuffer,
    VkLogicOp                logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_LOGIC_OP_EXT](#) set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-09422
At least one of the following **must** be true:
 - The `extendedDynamicState2LogicOp` feature is enabled
 - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
`logicOp` **must** be a valid `VkLogicOp` value
- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording

`commandBuffer` **must** be in the `recording` state

- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetLogicOpEXT-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetLogicOpEXT` is not affected by `conditional rendering`

33.3. Color Write Mask

Bits which **can** be set in `VkPipelineColorBlendAttachmentState::colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- `VK_COLOR_COMPONENT_R_BIT` specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_G_BIT` specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

- `VK_COLOR_COMPONENT_B_BIT` specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_A_BIT` specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if `Color Write Enable` is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

`VkColorComponentFlags` is a bitmask type for setting a mask of zero or more `VkColorComponentFlagBits`.

33.4. Color Write Enable

The `VkPipelineColorWriteCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           attachmentCount;
    const VkBool32*     pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the `pNext` chain of `VkPipelineColorBlendStateCreateInfo`, it defines per-attachment color write state. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with `attachmentCount` equal to the `attachmentCount` member of `VkPipelineColorBlendStateCreateInfo`, and `pColorWriteEnables` pointing to an array of as many `VK_TRUE` values.

If the `colorWriteEnable` feature is not enabled, all `VkBool32` elements in the `pColorWriteEnables` array **must** be `VK_TRUE`.

Color Write Enable interacts with the `Color Write Mask` as follows:

- If `colorWriteEnable` is `VK_TRUE`, writes to the attachment are determined by the `colorWriteMask`.
- If `colorWriteEnable` is `VK_FALSE`, the `colorWriteMask` is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a `colorWriteMask` of 0.

Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
If the `colorWriteEnable` feature is not enabled, all elements of `pColorWriteEnables` **must** be `VK_TRUE`
- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-07608
If the pipeline is being created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, or `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states not set, `attachmentCount` **must** be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation
- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-06655
`attachmentCount` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

Valid Usage (Implicit)

- VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT`
- VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
If `attachmentCount` is not 0, `pColorWriteEnables` **must** be a valid pointer to an array of `attachmentCount` `VkBool32` values

Structure Chaining

Extends the structure

- `VkPipelineColorBlendStateCreateInfo`

To [dynamically enable or disable](#) writes to a color attachment, call:

```
// Provided by VK_EXT_color_write_enable
void vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 attachmentCount,
    const VkBool32*          pColorWriteEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when drawing using `shader objects`, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorWriteEnableEXT-None-04803
The `colorWriteEnable` feature **must** be enabled
- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-06656
`attachmentCount` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
`pColorWriteEnables` **must** be a valid pointer to an array of `attachmentCount` `VkBool32` values
- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdSetColorWriteEnableEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
`attachmentCount` **must** be greater than `0`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_GRAP HICS_BIT	State

Conditional Rendering

vkCmdSetColorWriteEnableEXT is not affected by [conditional rendering](#)

Chapter 34. Dispatching Commands

The *dispatching commands* described in this chapter provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline **must** be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer          commandBuffer,
    uint32_t                 groupCountX,
    uint32_t                 groupCountY,
    uint32_t                 groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX` × `groupCountY` × `groupCountZ` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDispatch-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatch-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatch-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatch-unnormlizedCoordinates-09635
If a `VkSampler` created with `unnormlizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDispatch-None-08609
If a `VkSampler` created with `unnormlizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdDispatch-None-08610
If a `VkSampler` created with `unnormlizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name
- VUID-vkCmdDispatch-None-08611
If a `VkSampler` created with `unnormlizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values
- VUID-vkCmdDispatch-None-06479
If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
- VUID-vkCmdDispatch-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdDispatch-None-07888
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`
- VUID-vkCmdDispatch-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdDispatch-None-02693
If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- VUID-vkCmdDispatch-filterCubic-02694
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDispatch-filterCubicMinmax-02695
Any [VkImageView](#) being sampled with [VK_FILTER_CUBIC_EXT](#) with a reduction mode of either [VK_SAMPLER_REDUCTION_MODE_MIN](#) or [VK_SAMPLER_REDUCTION_MODE_MAX](#) as a result of this command **must** have a [VkImageViewType](#) and format that supports cubic filtering together with minmax filtering, as specified by [VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax](#) returned by [vkGetPhysicalDeviceImageFormatProperties2](#)
- VUID-vkCmdDispatch-OpTypeImage-07027
For any [VkImageView](#) being written as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDispatch-OpTypeImage-07028
For any [VkImageView](#) being read as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDispatch-OpTypeImage-07029
For any [VkBufferView](#) being written as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDispatch-OpTypeImage-07030
Any [VkBufferView](#) being read as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#) then the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)
- VUID-vkCmdDispatch-None-08600
If a [a bound shader](#) was created with a pipeline layout and statically uses a set *n*, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with layouts compatible for set *n* with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)
- VUID-vkCmdDispatch-None-08601
If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader
- VUID-vkCmdDispatch-None-10068
For each array of resources that is used by [a bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command
- VUID-vkCmdDispatch-None-08114
Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be

valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatch-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDispatch-None-08115

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatch-None-08116

Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed

- VUID-vkCmdDispatch-None-08117

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatch-None-08119

If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDispatch-None-08605

If a descriptor is dynamically used with a [VkShaderEXT](#) created with a [VkDescriptorSetLayout](#) that was created with [VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDispatch-None-08606

If the [shaderObject](#) feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDispatch-None-08608

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDispatch-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-None-08612

If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-storageBuffers-06936

If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS** or **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2** for **storageBuffers**, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-None-08613

If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatch-commandBuffer-02707

If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by **bound shaders** **must** not be a protected resource

- VUID-vkCmdDispatch-viewType-07752

If a **VkImageView** is accessed as a result of this command, then the image view's **viewType** **must** match the **Dim** operand of the **OpTypeImage** as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDispatch-format-07753

If a **VkImageView** or **VkBufferView** is accessed as a result of this command, then the **numeric type** of the view's **format** and the **Sampled Type** operand of the **OpTypeImage** **must** match

- VUID-vkCmdDispatch-OpImageWrite-08795

If a **VkImageView** created with a format other than **VK_FORMAT_A8_UNORM** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDispatch-OpImageWrite-08796

If a **VkImageView** created with the format **VK_FORMAT_A8_UNORM** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have four components

- VUID-vkCmdDispatch-OpImageWrite-04469

If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDispatch-SampledType-04470

If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- VUID-vkCmdDispatch-SampledType-04471
If a [VkImageView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32
- VUID-vkCmdDispatch-SampledType-04472
If a [VkBufferView](#) with a [VkFormat](#) that has a 64-bit component width is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 64
- VUID-vkCmdDispatch-SampledType-04473
If a [VkBufferView](#) with a [VkFormat](#) that has a component width less than 64-bit is accessed as a result of this command, the [SampledType](#) of the [OpTypeImage](#) operand of that instruction **must** have a [Width](#) of 32
- VUID-vkCmdDispatch-sparseImageInt64Atomics-04474
If the [sparseImageInt64Atomics](#) feature is not enabled, [VkImage](#) objects created with the [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command
- VUID-vkCmdDispatch-sparseImageInt64Atomics-04475
If the [sparseImageInt64Atomics](#) feature is not enabled, [VkBuffer](#) objects created with the [VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT](#) flag **must** not be accessed by atomic instructions through an [OpTypeImage](#) with a [SampledType](#) with a [Width](#) of 64 by this command
- VUID-vkCmdDispatch-None-07288
Any shader invocation executed by this command **must** [terminate](#)
- VUID-vkCmdDispatch-None-09600
If a descriptor with type equal to any of [VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE](#), [VK_DESCRIPTOR_TYPE_STORAGE_IMAGE](#), or [VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT](#) is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDispatch-micromap-11636
If an acceleration structure is accessed as a result of this command through an [OpRayQueryProceedKHR](#) operation, the [VK_EXT_opacity_micromap](#) extension is not enabled, and the acceleration structure is built using geometry with a [VkAccelerationStructureTrianglesOpacityMicromapKHR](#) structure included in its [pNext](#) chain, the shader **must** have specified a [OpacityMicromapIdKHR](#) execution mode with its specialization constant operand equal to [VK_TRUE](#)
- VUID-vkCmdDispatch-micromap-11637
If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device

- VUID-vkCmdDispatch-micromap-11638

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkPipeline` bound to the pipeline bind point used by this command **must** not have been created with `flags` that includes `VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR`

- VUID-vkCmdDispatch-micromap-11639

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkShaderEXT` that accessed the descriptor **must** not have been created with `flags` that includes `VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT`

- VUID-vkCmdDispatch-None-12472

Descriptors dynamically accessed in bound descriptor heaps **must** be valid

- VUID-vkCmdDispatch-None-11297

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a `OpTypeStruct` decorated with `Block` or `BufferBlock` using that mapping, the calculated offset for the resource heap **must** be a multiple of `bufferDescriptorAlignment`

- VUID-vkCmdDispatch-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeImage` or `OpTypeSampledImage` using that mapping, the calculated offset for the resource heap **must** be a multiple of `imageDescriptorAlignment`

- VUID-vkCmdDispatch-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeSampler` or `OpTypeSampledImage` using that mapping, the calculated offset for the sampler heap **must** be a multiple of `samplerDescriptorAlignment`

- VUID-vkCmdDispatch-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdDispatch-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDispatch-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDispatch-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdDispatch-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDispatch-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDispatch-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdDispatch-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the

`VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT` flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by `vkCmdBind*HeapEXT` commands

- VUID-vkCmdDispatch-None-11372

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2` for `uniformBuffers`, the `robustBufferAccess2` feature is not enabled, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via `VkDeviceAddressRangeKHR` when the descriptor was written

- VUID-vkCmdDispatch-None-11373

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2` for `storageBuffers`, the `robustBufferAccess2` feature is not enabled, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by `VkDeviceAddressRangeKHR` when the descriptor was written

- VUID-vkCmdDispatch-None-11374

If the `robustBufferAccess2` feature is not enabled, the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by `VkDeviceAddressRangeKHR` when the descriptor was written

- VUID-vkCmdDispatch-pBindInfo-11375

If any `bound shader` uses an embedded sampler via a `descriptor mapping`, the value of `pBindInfo->reservedRangeSize` set for `vkCmdBindSamplerHeapEXT` **must** be greater than or equal to `minSamplerHeapReservedRangeWithEmbedded`

- VUID-vkCmdDispatch-None-11376

If a `bound shader` was created as a `VkShaderEXT` with the `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` flag or as part of a pipeline with the `VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT` flag, and that shader statically uses a push constant value, that value **must** have been set by `vkCmdPushDataEXT`

- VUID-vkCmdDispatch-None-11398

If a `bound shader` was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the access **must** not be `out of bounds`

- VUID-vkCmdDispatch-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the [VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDispatch-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the [VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDispatch-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT](#) and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to `minUniformBufferOffsetAlignment`

- VUID-vkCmdDispatch-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** have been queried from a buffer created with the [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDispatch-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to `minStorageBufferOffsetAlignment`

- VUID-vkCmdDispatch-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound

to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a [VkAccelerationStructureKHR](#) object via [vkGetAccelerationStructureDeviceAddressKHR](#)

- VUID-vkCmdDispatch-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and that sampler descriptor uses a custom border color with an index defined by [VkSamplerCustomBorderColorIndexCreateInfoEXT](#), the value of [VkSamplerCustomBorderColorIndexCreateInfoEXT::index](#) **must** have been registered before this command was recorded, and still be registered during the sampling operation, with an identically defined color

- VUID-vkCmdDispatch-protectedNoFault-11455

If [protectedNoFault](#) is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), the address that the resource is mapped to **must** have been queried from a buffer created without the [VK_BUFFER_CREATE_PROTECTED_BIT](#) create flag set

- VUID-vkCmdDispatch-protectedNoFault-11456

If [protectedNoFault](#) is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), the address of the indirect memory **must** have been queried from a buffer created without the [VK_BUFFER_CREATE_PROTECTED_BIT](#) create flag set

- VUID-vkCmdDispatch-None-10672

this command **must** be called outside of a render pass instance

- VUID-vkCmdDispatch-None-10743

If there is no bound compute pipeline, a valid [VkShaderEXT](#) **must** be bound to the [VK_SHADER_STAGE_COMPUTE_BIT](#) stage

- VUID-vkCmdDispatch-commandBuffer-02712

If [commandBuffer](#) is a protected command buffer and [protectedNoFault](#) is not supported, any resource written to by the [VkPipeline](#) object bound to the pipeline bind point used by this command **must** not be an unprotected resource

- VUID-vkCmdDispatch-commandBuffer-02713

If [commandBuffer](#) is a protected command buffer and [protectedNoFault](#) is not supported, pipeline stages other than the framebuffer-space and compute stages in the [VkPipeline](#) object bound to the pipeline bind point used by this command **must** not write to any resource

- VUID-vkCmdDispatch-commandBuffer-04617
If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdDispatch-groupCountX-00386
`groupCountX` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
- VUID-vkCmdDispatch-groupCountY-00387
`groupCountY` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`
- VUID-vkCmdDispatch-groupCountZ-00388
`groupCountZ` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdDispatch-commandBuffer-recording
`commandBuffer` **must** be in the `recording` state
- VUID-vkCmdDispatch-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT` operations
- VUID-vkCmdDispatch-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDispatch-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT	Action

Conditional Rendering

vkCmdDispatch is affected by [conditional rendering](#)

VkDispatchIndirect2InfoKHR is defined as:

```
// Provided by VK_KHR_device_address_commands
typedef struct VkDispatchIndirect2InfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceAddressRangeKHR addressRange;
    VkAddressCommandFlagsKHR addressFlags;
} VkDispatchIndirect2InfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `addressRange` is the [VkDeviceAddressRangeKHR](#) containing dispatch parameters.
- `addressFlags` is a [VkAddressCommandFlagsKHR](#) value defining the flags for the address range.

Valid Usage

- VUID-VkDispatchIndirect2InfoKHR-addressRange-13097
If the range specified by `addressRange` is not bound completely to memory when accessed, `addressFlags` **must** not include [VK_ADDRESS_COMMAND_FULLY_BOUND_BIT_KHR](#)
- VUID-VkDispatchIndirect2InfoKHR-addressRange-13098
If the buffer from which the range specified by `addressRange` was created with [VK_BUFFER_CREATE_PROTECTED_BIT](#), and `protectedNoFault` is not supported, `addressFlags` **must** include [VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR](#)
- VUID-VkDispatchIndirect2InfoKHR-addressRange-13099
If the buffer from which the range specified by `addressRange` was created without [VK_BUFFER_CREATE_PROTECTED_BIT](#), and `protectedNoFault` is not supported, `addressFlags` **must** not include [VK_ADDRESS_COMMAND_PROTECTED_BIT_KHR](#)
- VUID-VkDispatchIndirect2InfoKHR-addressFlags-13100

<code>addressFlags</code>	must	not	include	both
VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR				and
VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR				
- VUID-VkDispatchIndirect2InfoKHR-addressRange-13122
If any buffer, which is bound to a range of [VkDeviceMemory](#) that overlaps the range backing `addressRange`, was created with [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#), `addressFlags` **must** include [VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR](#) or [VK_ADDRESS_COMMAND_UNKNOWN_STORAGE_BUFFER_USAGE_BIT_KHR](#)
- VUID-VkDispatchIndirect2InfoKHR-addressRange-13123
If any buffer, which is bound to a range of [VkDeviceMemory](#) that overlaps the range

backing `addressRange`, was created without `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_STORAGE_BUFFER_USAGE_BIT_KHR`

- VUID-VkDispatchIndirect2InfoKHR-addressFlags-13101
`addressFlags` **must** not include both `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR` and `VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`
- VUID-VkDispatchIndirect2InfoKHR-addressRange-13124
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created with `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`, `addressFlags` **must** include `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR` or `VK_ADDRESS_COMMAND_UNKNOWN_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`
- VUID-VkDispatchIndirect2InfoKHR-addressRange-13125
If any buffer, which is bound to a range of `VkDeviceMemory` that overlaps the range backing `addressRange`, was created without `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`, `addressFlags` **must** not include `VK_ADDRESS_COMMAND_TRANSFORM_FEEDBACK_BUFFER_USAGE_BIT_KHR`
- VUID-VkDispatchIndirect2InfoKHR-addressRange-13107
The buffer from which `addressRange` was queried **must** have been created with `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` usage flag
- VUID-VkDispatchIndirect2InfoKHR-protectedNoFault-13108
If `protectedNoFault` is not supported, the buffer from which `addressRange` was queried **must** not have been created with `VK_BUFFER_CREATE_PROTECTED_BIT`
- VUID-VkDispatchIndirect2InfoKHR-addressRange-13109
`addressRange.address` **must** be a multiple of 4

Valid Usage (Implicit)

- VUID-VkDispatchIndirect2InfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPATCH_INDIRECT_2_INFO_KHR`
- VUID-VkDispatchIndirect2InfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkDispatchIndirect2InfoKHR-addressFlags-parameter
`addressFlags` **must** be a valid combination of `VkAddressCommandFlagBitsKHR` values

To record an indirect dispatching command, call:

```
// Provided by VK_KHR_device_address_commands
void vkCmdDispatchIndirect2KHR(
    VkCommandBuffer                                commandBuffer,
    const VkDispatchIndirect2InfoKHR*               pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkDispatchIndirect2InfoKHR` structure defining parameters of this command.

`vkCmdDispatchIndirect2KHR` behaves similarly to `vkCmdDispatchIndirect` except that the parameters, encoded in a `VkDispatchIndirectCommand` structure, are read by the device from an address range during execution.

Valid Usage

- VUID-vkCmdDispatchIndirect2KHR-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchIndirect2KHR-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatchIndirect2KHR-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchIndirect2KHR-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatchIndirect2KHR-unnormalizedCoordinates-09635
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDispatchIndirect2KHR-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDispatchIndirect2KHR-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDispatchIndirect2KHR-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDispatchIndirect2KHR-None-06479

If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDispatchIndirect2KHR-None-02691

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDispatchIndirect2KHR-None-07888

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDispatchIndirect2KHR-None-02692

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDispatchIndirect2KHR-None-02693

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- VUID-vkCmdDispatchIndirect2KHR-filterCubic-02694

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDispatchIndirect2KHR-filterCubicMinmax-02695

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by

vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchIndirect2KHR-OpTypeImage-07027

For any [VkImageView](#) being written as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDispatchIndirect2KHR-OpTypeImage-07028

For any [VkImageView](#) being read as a storage image where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [format features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDispatchIndirect2KHR-OpTypeImage-07029

For any [VkBufferView](#) being written as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#), the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDispatchIndirect2KHR-OpTypeImage-07030

Any [VkBufferView](#) being read as a storage texel buffer where the image format field of the [OpTypeImage](#) is [Unknown](#) then the view's [buffer features](#) **must** contain [VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT](#)

- VUID-vkCmdDispatchIndirect2KHR-None-08600

If a [a bound shader](#) was created with a pipeline layout and statically uses a set *n*, a descriptor set **must** have been bound to *n* at the same pipeline bind point, with layouts compatible for set *n* with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDispatchIndirect2KHR-None-08601

If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader

- VUID-vkCmdDispatchIndirect2KHR-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDispatchIndirect2KHR-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatchIndirect2KHR-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDispatchIndirect2KHR-None-08115

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatchIndirect2KHR-None-08116
Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed
- VUID-vkCmdDispatchIndirect2KHR-None-08117
If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)
- VUID-vkCmdDispatchIndirect2KHR-None-08119
If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident
- VUID-vkCmdDispatchIndirect2KHR-None-08605
If a descriptor is dynamically used with a [VkShaderEXT](#) created with a [VkDescriptorSetLayout](#) that was created with [VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident
- VUID-vkCmdDispatchIndirect2KHR-None-08606
If the [shaderObject](#) feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdDispatchIndirect2KHR-None-08608
If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdDispatchIndirect2KHR-uniformBuffers-06935
If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchIndirect2KHR-None-08612
If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchIndirect2KHR-storageBuffers-06936
If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect2KHR-None-08613
If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdDispatchIndirect2KHR-commandBuffer-02707
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by **bound shaders** **must** not be a protected resource
- VUID-vkCmdDispatchIndirect2KHR-viewType-07752
If a **VkImageView** is accessed as a result of this command, then the image view's **viewType** **must** match the **Dim** operand of the **OpTypeImage** as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)
- VUID-vkCmdDispatchIndirect2KHR-format-07753
If a **VkImageView** or **VkBufferView** is accessed as a result of this command, then the **numeric type** of the view's **format** and the **Sampled Type** operand of the **OpTypeImage** **must** match
- VUID-vkCmdDispatchIndirect2KHR-OpImageWrite-08795
If a **VkImageView** created with a format other than **VK_FORMAT_A8_UNORM** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdDispatchIndirect2KHR-OpImageWrite-08796
If a **VkImageView** created with the format **VK_FORMAT_A8_UNORM** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have four components
- VUID-vkCmdDispatchIndirect2KHR-OpImageWrite-04469
If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdDispatchIndirect2KHR-SampledType-04470
If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdDispatchIndirect2KHR-SampledType-04471
If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32
- VUID-vkCmdDispatchIndirect2KHR-SampledType-04472
If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64
- VUID-vkCmdDispatchIndirect2KHR-SampledType-04473
If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- VUID-vkCmdDispatchIndirect2KHR-sparseImageInt64Atomics-04474
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatchIndirect2KHR-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatchIndirect2KHR-None-07288
Any shader invocation executed by this command **must terminate**
- VUID-vkCmdDispatchIndirect2KHR-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDispatchIndirect2KHR-micromap-11636
If an acceleration structure is accessed as a result of this command through an `OpRayQueryProceedKHR` operation, the `VK_EXT_opacity_micromap` extension is not enabled, and the acceleration structure is built using geometry with a `VkAccelerationStructureTrianglesOpacityMicromapKHR` structure included in its `pNext` chain, the shader **must** have specified a `OpacityMicromapIdKHR` execution mode with its specialization constant operand equal to `VK_TRUE`
- VUID-vkCmdDispatchIndirect2KHR-micromap-11637
If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device
- VUID-vkCmdDispatchIndirect2KHR-micromap-11638
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkPipeline` bound to the pipeline bind point used by this command **must** not have been created with `flags` that includes `VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR`
- VUID-vkCmdDispatchIndirect2KHR-micromap-11639
If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkShaderEXT` that accessed the descriptor **must** not have been created with

`flags` that includes
`VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT`

- VUID-vkCmdDispatchIndirect2KHR-None-12472

Descriptors dynamically accessed in bound descriptor heaps **must** be valid

- VUID-vkCmdDispatchIndirect2KHR-None-11297

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using

`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a `OpTypeStruct` decorated with `Block` or `BufferBlock` using that mapping, the calculated offset for the resource heap **must** be a multiple of `bufferDescriptorAlignment`

- VUID-vkCmdDispatchIndirect2KHR-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using

`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeImage` or `OpTypeSampledImage` using that mapping, the calculated offset for the resource heap **must** be a multiple of `imageDescriptorAlignment`

- VUID-vkCmdDispatchIndirect2KHR-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using

`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`,
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or
`VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses an `OpTypeSampler` or `OpTypeSampledImage` using that mapping, the calculated offset for the sampler heap **must** be a multiple of `samplerDescriptorAlignment`

- VUID-vkCmdDispatchIndirect2KHR-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdDispatchIndirect2KHR-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT` or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset

specified by each mapping

- VUID-vkCmdDispatchIndirect2KHR-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDispatchIndirect2KHR-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdDispatchIndirect2KHR-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDispatchIndirect2KHR-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDispatchIndirect2KHR-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdDispatchIndirect2KHR-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands

- VUID-vkCmdDispatchIndirect2KHR-None-11372

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDispatchIndirect2KHR-None-11373

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDispatchIndirect2KHR-None-11374

If the [robustBufferAccess2](#) feature is not enabled, the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDispatchIndirect2KHR-pBindInfo-11375

If any [bound shader](#) uses an embedded sampler via a [descriptor mapping](#), the value of [pBindInfo->reservedRangeSize](#) set for [vkCmdBindSamplerHeapEXT](#) **must** be greater than or equal to [minSamplerHeapReservedRangeWithEmbedded](#)

- VUID-vkCmdDispatchIndirect2KHR-None-11376

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, and that shader statically uses a push constant value, that value **must** have been set by [vkCmdPushDataEXT](#)

- VUID-vkCmdDispatchIndirect2KHR-None-11398

If a [bound shader](#) was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the access **must** not be [out of bounds](#)

- VUID-vkCmdDispatchIndirect2KHR-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the [VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT](#) usage flag set

- VUID-vkCmdDispatchIndirect2KHR-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#),

VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or
VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT usage flag set

- VUID-vkCmdDispatchIndirect2KHR-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to `minUniformBufferOffsetAlignment`

- VUID-vkCmdDispatchIndirect2KHR-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** have been queried from a buffer created with the VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag set

- VUID-vkCmdDispatchIndirect2KHR-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to `minStorageBufferOffsetAlignment`

- VUID-vkCmdDispatchIndirect2KHR-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a [VkAccelerationStructureKHR](#) object via [vkGetAccelerationStructureDeviceAddressKHR](#)

- VUID-vkCmdDispatchIndirect2KHR-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and that sampler descriptor uses a custom border color with an index defined by [VkSamplerCustomBorderColorIndexCreateInfoEXT](#), the value of [VkSamplerCustomBorderColorIndexCreateInfoEXT::index](#) **must** have been registered before this command was recorded, and still be registered during the sampling operation,

with an identically defined color

- VUID-vkCmdDispatchIndirect2KHR-protectedNoFault-11455

If **protectedNoFault** is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a **descriptor mapping** using **VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT**, **VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT**, or **VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT**, the address that the resource is mapped to **must** have been queried from a buffer created without the **VK_BUFFER_CREATE_PROTECTED_BIT** create flag set

- VUID-vkCmdDispatchIndirect2KHR-protectedNoFault-11456

If **protectedNoFault** is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a **descriptor mapping** using **VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT** or **VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT**, the address of the indirect memory **must** have been queried from a buffer created without the **VK_BUFFER_CREATE_PROTECTED_BIT** create flag set

- VUID-vkCmdDispatchIndirect2KHR-commandBuffer-13049

commandBuffer **must** not be a protected command buffer

- VUID-vkCmdDispatchIndirect2KHR-pInfo-13050

pInfo->addressRange.size **must** be greater than or equal to **sizeof(VkDispatchIndirectCommand)**

Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect2KHR-commandBuffer-parameter

commandBuffer **must** be a valid **VkCommandBuffer** handle

- VUID-vkCmdDispatchIndirect2KHR-pInfo-parameter

pInfo **must** be a valid pointer to a valid **VkDispatchIndirect2InfoKHR** structure

- VUID-vkCmdDispatchIndirect2KHR-commandBuffer-recording

commandBuffer **must** be in the **recording state**

- VUID-vkCmdDispatchIndirect2KHR-commandBuffer-cmdpool

The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_COMPUTE_BIT** operations

- VUID-vkCmdDispatchIndirect2KHR-renderpass

This command **must** only be called outside of a render pass instance

- VUID-vkCmdDispatchIndirect2KHR-suspended

This command **must** not be called between suspended render pass instances

- VUID-vkCmdDispatchIndirect2KHR-videocoding

This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Outside	Outside	VK_QUEUE_COMPUTE_BIT	Action

Conditional Rendering

`vkCmdDispatchIndirect2KHR` is affected by [conditional rendering](#)

To record an indirect dispatching command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to `vkCmdDispatch` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`.

Valid Usage

- VUID-vkCmdDispatchIndirect-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatchIndirect-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatchIndirect-mipmapMode-04770
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchIndirect-mipmapMode-09599
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`
- VUID-vkCmdDispatchIndirect-unnormalizedCoordinates-09635
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1
- VUID-vkCmdDispatchIndirect-None-08609
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdDispatchIndirect-None-08610
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name
- VUID-vkCmdDispatchIndirect-None-08611
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values
- VUID-vkCmdDispatchIndirect-None-06479
If a `VkImageView` is sampled with `depth comparison`, the image view's format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
- VUID-vkCmdDispatchIndirect-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdDispatchIndirect-None-07888

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDispatchIndirect-None-02692

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDispatchIndirect-None-02693

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- VUID-vkCmdDispatchIndirect-filterCubic-02694

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDispatchIndirect-filterCubicMinmax-02695

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDispatchIndirect-OpTypeImage-07027

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's `format features` **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchIndirect-OpTypeImage-07028

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's `format features` **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchIndirect-OpTypeImage-07029

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's `buffer features` **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchIndirect-OpTypeImage-07030

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's `buffer features` **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchIndirect-None-08600

If a `bound shader` was created with a pipeline layout and statically uses a set n , a descriptor set **must** have been bound to n at the same pipeline bind point, with layouts compatible for set n with the layout(s) used to create the shader, as described in `Pipeline`

Layout Compatibility

- VUID-vkCmdDispatchIndirect-None-08601

If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader

- VUID-vkCmdDispatchIndirect-None-10068

For each array of resources that is used by [a bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDispatchIndirect-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatchIndirect-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDispatchIndirect-None-08115

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatchIndirect-None-08116

Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed

- VUID-vkCmdDispatchIndirect-None-08117

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatchIndirect-None-08119

If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDispatchIndirect-None-08605

If a descriptor is dynamically used with a [VkShaderEXT](#) created with a [VkDescriptorSetLayout](#) that was created with [VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDispatchIndirect-None-08606

If the [shaderObject](#) feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDispatchIndirect-None-08608

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDispatchIndirect-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-None-08612

If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-None-08613

If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchIndirect-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDispatchIndirect-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDispatchIndirect-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match

- VUID-vkCmdDispatchIndirect-OpImageWrite-08795

If a [VkImageView](#) created with a format other than [VK_FORMAT_A8_UNORM](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDispatchIndirect-OpImageWrite-08796
If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components
- VUID-vkCmdDispatchIndirect-OpImageWrite-04469
If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdDispatchIndirect-SampledType-04470
If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDispatchIndirect-SampledType-04471
If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDispatchIndirect-SampledType-04472
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdDispatchIndirect-SampledType-04473
If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04474
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdDispatchIndirect-None-07288
Any shader invocation executed by this command **must** `terminate`
- VUID-vkCmdDispatchIndirect-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written
- VUID-vkCmdDispatchIndirect-micromap-11636
If an acceleration structure is accessed as a result of this command through an

`OpRayQueryProceedKHR` operation, the `VK_EXT_opacity_micromap` extension is not enabled, and the acceleration structure is built using geometry with a `VkAccelerationStructureTrianglesOpacityMicromapKHR` structure included in its `pNext` chain, the shader **must** have specified a `OpacityMicromapIdKHR` execution mode with its specialization constant operand equal to `VK_TRUE`

- VUID-vkCmdDispatchIndirect-micromap-11637

If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device

- VUID-vkCmdDispatchIndirect-micromap-11638

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkPipeline` bound to the pipeline bind point used by this command **must** not have been created with `flags` that includes `VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR`

- VUID-vkCmdDispatchIndirect-micromap-11639

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an `indexBuffer` containing both `VkOpacityMicromapSpecialIndexKHR` values and indices into an associated micromap array, any `VkShaderEXT` that accessed the descriptor **must** not have been created with `flags` that includes `VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT`

- VUID-vkCmdDispatchIndirect-None-12472

Descriptors dynamically accessed in bound descriptor heaps **must** be valid

- VUID-vkCmdDispatchIndirect-None-11297

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader accesses a `OpTypeStruct` decorated with `Block` or `BufferBlock` using that mapping, the calculated offset for the resource heap **must** be a multiple of `bufferDescriptorAlignment`

- VUID-vkCmdDispatchIndirect-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, and a shader

accesses an [OpTypeImage](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [imageDescriptorAlignment](#)

- VUID-vkCmdDispatchIndirect-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeSampler](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the sampler heap **must** be a multiple of [samplerDescriptorAlignment](#)

- VUID-vkCmdDispatchIndirect-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdDispatchIndirect-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDispatchIndirect-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDispatchIndirect-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdDispatchIndirect-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDispatchIndirect-None-11306
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)
- VUID-vkCmdDispatchIndirect-None-11308
For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound
- VUID-vkCmdDispatchIndirect-None-11309
If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands
- VUID-vkCmdDispatchIndirect-None-11372
If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via [VkDeviceAddressRangeKHR](#) when the descriptor was written
- VUID-vkCmdDispatchIndirect-None-11373
If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written
- VUID-vkCmdDispatchIndirect-None-11374
If the [robustBufferAccess2](#) feature is not enabled, the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written
- VUID-vkCmdDispatchIndirect-pBindInfo-11375
If any [bound shader](#) uses an embedded sampler via a [descriptor mapping](#), the value of [pBindInfo->reservedRangeSize](#) set for [vkCmdBindSamplerHeapEXT](#) **must** be greater than or equal to [minSamplerHeapReservedRangeWithEmbedded](#)
- VUID-vkCmdDispatchIndirect-None-11376
If a [bound shader](#) was created as a [VkShaderEXT](#) with the

VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT flag or as part of a pipeline with the VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT flag, and that shader statically uses a push constant value, that value **must** have been set by vkCmdPushDataEXT

- VUID-vkCmdDispatchIndirect-None-11398

If a bound shader was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a resource using that mapping, the access **must** not be out of bounds

- VUID-vkCmdDispatchIndirect-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT usage flag set

- VUID-vkCmdDispatchIndirect-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT usage flag set

- VUID-vkCmdDispatchIndirect-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to minUniformBufferOffsetAlignment

- VUID-vkCmdDispatchIndirect-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must**

have been queried from a buffer created with the `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag set

- VUID-vkCmdDispatchIndirect-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to `minStorageBufferOffsetAlignment`

- VUID-vkCmdDispatchIndirect-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a [VkAccelerationStructureKHR](#) object via [vkGetAccelerationStructureDeviceAddressKHR](#)

- VUID-vkCmdDispatchIndirect-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and that sampler descriptor uses a custom border color with an index defined by [VkSamplerCustomBorderColorIndexCreateInfoEXT](#), the value of [VkSamplerCustomBorderColorIndexCreateInfoEXT::index](#) **must** have been registered before this command was recorded, and still be registered during the sampling operation, with an identically defined color

- VUID-vkCmdDispatchIndirect-protectedNoFault-11455

If `protectedNoFault` is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), the address that the resource is mapped to **must** have been queried from a buffer created without the `VK_BUFFER_CREATE_PROTECTED_BIT` create flag set

- VUID-vkCmdDispatchIndirect-protectedNoFault-11456

If `protectedNoFault` is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), the address of the indirect memory **must** have been queried from a buffer created without the `VK_BUFFER_CREATE_PROTECTED_BIT` create flag set

- VUID-vkCmdDispatchIndirect-None-10672

this command **must** be called outside of a render pass instance

- VUID-vkCmdDispatchIndirect-None-10743
If there is no bound compute pipeline, a valid **VkShaderEXT** **must** be bound to the **VK_SHADER_STAGE_COMPUTE_BIT** stage
- VUID-vkCmdDispatchIndirect-buffer-02708
If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdDispatchIndirect-buffer-02709
buffer **must** have been created with the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** usage flag set
- VUID-vkCmdDispatchIndirect-offset-02710
offset **must** be a multiple of 4
- VUID-vkCmdDispatchIndirect-commandBuffer-02711
commandBuffer **must** not be a protected command buffer
- VUID-vkCmdDispatchIndirect-offset-00407
The sum of **offset** and the size of **VkDispatchIndirectCommand** **must** be less than or equal to the size of **buffer**

Valid Usage (Implicit)

- VUID-vkCmdDispatchIndirect-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdDispatchIndirect-buffer-parameter
buffer **must** be a valid **VkBuffer** handle
- VUID-vkCmdDispatchIndirect-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
The **VkCommandPool** that **commandBuffer** was allocated from **must** support **VK_QUEUE_COMPUTE_BIT** operations
- VUID-vkCmdDispatchIndirect-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDispatchIndirect-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdDispatchIndirect-commonparent
Both of **buffer**, and **commandBuffer** **must** have been created, allocated, or retrieved from the same **VkDevice**

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally

synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT	Action

Conditional Rendering

vkCmdDispatchIndirect is affected by [conditional rendering](#)

The `VkDispatchIndirectCommand` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t    x;
    uint32_t    y;
    uint32_t    z;
} VkDispatchIndirectCommand;
```

- `x` is the number of local workgroups to dispatch in the X dimension.
- `y` is the number of local workgroups to dispatch in the Y dimension.
- `z` is the number of local workgroups to dispatch in the Z dimension.

The members of `VkDispatchIndirectCommand` have the same meaning as the corresponding parameters of [vkCmdDispatch](#).

Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
`x` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
- VUID-VkDispatchIndirectCommand-y-00418
`y` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`
- VUID-VkDispatchIndirectCommand-z-00419
`z` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

To record a dispatch using non-zero base values for the components of `WorkgroupId`, call:

```
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer                commandBuffer,
    uint32_t                       baseGroupX,
    uint32_t                       baseGroupY,
    uint32_t                       baseGroupZ,
    uint32_t                       groupCountX,
    uint32_t                       groupCountY,
    uint32_t                       groupCountZ);
```

```
// Provided by VK_KHR_device_group
// Equivalent to vkCmdDispatchBase
void vkCmdDispatchBaseKHR(
    VkCommandBuffer                commandBuffer,
    uint32_t                       baseGroupX,
    uint32_t                       baseGroupY,
    uint32_t                       baseGroupZ,
    uint32_t                       groupCountX,
    uint32_t                       groupCountY,
    uint32_t                       groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `baseGroupX` is the start value for the X component of `WorkgroupId`.
- `baseGroupY` is the start value for the Y component of `WorkgroupId`.
- `baseGroupZ` is the start value for the Z component of `WorkgroupId`.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX × groupCountY × groupCountZ` local workgroups is assembled, with `WorkgroupId` values ranging from [`baseGroup*`, `baseGroup* + groupCount*`) in each component. `vkCmdDispatch` is equivalent to `vkCmdDispatchBase(0,0,0,groupCountX,groupCountY,groupCountZ)`.

Valid Usage

- VUID-vkCmdDispatchBase-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- VUID-vkCmdDispatchBase-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and

`reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDispatchBase-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatchBase-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDispatchBase-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdDispatchBase-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDispatchBase-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdDispatchBase-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdDispatchBase-None-06479

If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDispatchBase-None-02691

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDispatchBase-None-07888

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features`

must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDispatchBase-None-02692

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDispatchBase-None-02693

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- VUID-vkCmdDispatchBase-filterCubic-02694

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDispatchBase-filterCubicMinmax-02695

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDispatchBase-OpTypeImage-07027

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchBase-OpTypeImage-07028

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchBase-OpTypeImage-07029

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchBase-OpTypeImage-07030

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchBase-None-08600

If a `bound shader` was created with a pipeline layout and statically uses a set n , a descriptor set **must** have been bound to n at the same pipeline bind point, with layouts compatible for set n with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdDispatchBase-None-08601

If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader

- VUID-vkCmdDispatchBase-None-10068

For each array of resources that is used by a [bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdDispatchBase-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatchBase-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdDispatchBase-None-08115

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatchBase-None-08116

Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed

- VUID-vkCmdDispatchBase-None-08117

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdDispatchBase-None-08119

If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDispatchBase-None-08605

If a descriptor is dynamically used with a [VkShaderEXT](#) created with a [VkDescriptorSetLayout](#) that was created with [VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdDispatchBase-None-08606

If the [shaderObject](#) feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDispatchBase-None-08608

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the [VkPipeline](#) object bound to the pipeline bind point used by this command, since that

pipeline was bound

- VUID-vkCmdDispatchBase-uniformBuffers-06935

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-None-08612

If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-storageBuffers-06936

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-None-08613

If the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-commandBuffer-02707

If [commandBuffer](#) is an unprotected command buffer and [protectedNoFault](#) is not supported, any resource accessed by [bound shaders](#) **must** not be a protected resource

- VUID-vkCmdDispatchBase-viewType-07752

If a [VkImageView](#) is accessed as a result of this command, then the image view's [viewType](#) **must** match the [Dim](#) operand of the [OpTypeImage](#) as described in [Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types](#)

- VUID-vkCmdDispatchBase-format-07753

If a [VkImageView](#) or [VkBufferView](#) is accessed as a result of this command, then the [numeric type](#) of the view's [format](#) and the [Sampled Type](#) operand of the [OpTypeImage](#) **must** match

- VUID-vkCmdDispatchBase-OpImageWrite-08795

If a [VkImageView](#) created with a format other than [VK_FORMAT_A8_UNORM](#) is accessed using [OpImageWrite](#) as a result of this command, then the [Type](#) of the [Texel](#) operand of that instruction **must** have at least as many components as the image view's format

- VUID-vkCmdDispatchBase-OpImageWrite-08796

If a [VkImageView](#) created with the format [VK_FORMAT_A8_UNORM](#) is accessed using

`OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components

- VUID-vkCmdDispatchBase-OpImageWrite-04469

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- VUID-vkCmdDispatchBase-SampledType-04470

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDispatchBase-SampledType-04471

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDispatchBase-SampledType-04472

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDispatchBase-SampledType-04473

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDispatchBase-None-07288

Any shader invocation executed by this command **must** `terminate`

- VUID-vkCmdDispatchBase-None-09600

If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written

- VUID-vkCmdDispatchBase-micromap-11636

If an acceleration structure is accessed as a result of this command through an `OpRayQueryProceedKHR` operation, the `VK_EXT_opacity_micromap` extension is not enabled, and the acceleration structure is built using geometry with a

[VkAccelerationStructureTrianglesOpacityMicromapKHR](#) structure included in its [pNext](#) chain, the shader **must** have specified a [OpacityMicromapIdKHR](#) execution mode with its specialization constant operand equal to [VK_TRUE](#)

- VUID-vkCmdDispatchBase-micromap-11637

If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device

- VUID-vkCmdDispatchBase-micromap-11638

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkPipeline](#) bound to the pipeline bind point used by this command **must** not have been created with [flags](#) that includes [VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR](#)

- VUID-vkCmdDispatchBase-micromap-11639

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkShaderEXT](#) that accessed the descriptor **must** not have been created with [flags](#) that includes [VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT](#)

- VUID-vkCmdDispatchBase-None-12472

Descriptors dynamically accessed in bound descriptor heaps **must** be valid

- VUID-vkCmdDispatchBase-None-11297

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a [OpTypeStruct](#) decorated with [Block](#) or [BufferBlock](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [bufferDescriptorAlignment](#)

- VUID-vkCmdDispatchBase-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeImage](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [imageDescriptorAlignment](#)

- VUID-vkCmdDispatchBase-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeSampler](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the sampler heap **must** be a multiple of [samplerDescriptorAlignment](#)

- VUID-vkCmdDispatchBase-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdDispatchBase-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDispatchBase-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDispatchBase-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdDispatchBase-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdDispatchBase-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound

to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdDispatchBase-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdDispatchBase-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands

- VUID-vkCmdDispatchBase-None-11372

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDispatchBase-None-11373

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDispatchBase-None-11374

If the [robustBufferAccess2](#) feature is not enabled, the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdDispatchBase-pBindInfo-11375

If any [bound shader](#) uses an embedded sampler via a [descriptor mapping](#), the value of [pBindInfo->reservedRangeSize](#) set for [vkCmdBindSamplerHeapEXT](#) **must** be greater than or equal to [minSamplerHeapReservedRangeWithEmbedded](#)

- VUID-vkCmdDispatchBase-None-11376

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, and that shader statically uses

a push constant value, that value **must** have been set by `vkCmdPushDataEXT`

- VUID-vkCmdDispatchBase-None-11398

If a `bound shader` was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the access **must** not be `out of bounds`

- VUID-vkCmdDispatchBase-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` usage flag set

- VUID-vkCmdDispatchBase-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` usage flag set

- VUID-vkCmdDispatchBase-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT` and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to `minUniformBufferOffsetAlignment`

- VUID-vkCmdDispatchBase-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a `descriptor mapping` using `VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT`, `VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT`, or `VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT`, and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** have been queried from a buffer created with the `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag set

- VUID-vkCmdDispatchBase-None-11442
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to [minStorageBufferOffsetAlignment](#)
- VUID-vkCmdDispatchBase-None-11485
If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a [VkAccelerationStructureKHR](#) object via [vkGetAccelerationStructureDeviceAddressKHR](#)
- VUID-vkCmdDispatchBase-index-11450
If a shader uses a sampler descriptor to sample an image as a result of this command, and that sampler descriptor uses a custom border color with an index defined by [VkSamplerCustomBorderColorIndexCreateInfoEXT](#), the value of [VkSamplerCustomBorderColorIndexCreateInfoEXT::index](#) **must** have been registered before this command was recorded, and still be registered during the sampling operation, with an identically defined color
- VUID-vkCmdDispatchBase-protectedNoFault-11455
If [protectedNoFault](#) is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), the address that the resource is mapped to **must** have been queried from a buffer created without the [VK_BUFFER_CREATE_PROTECTED_BIT](#) create flag set
- VUID-vkCmdDispatchBase-protectedNoFault-11456
If [protectedNoFault](#) is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), the address of the indirect memory **must** have been queried from a buffer created without the [VK_BUFFER_CREATE_PROTECTED_BIT](#) create flag set
- VUID-vkCmdDispatchBase-None-10672
this command **must** be called outside of a render pass instance
- VUID-vkCmdDispatchBase-None-10743
If there is no bound compute pipeline, a valid [VkShaderEXT](#) **must** be bound to the

VK_SHADER_STAGE_COMPUTE_BIT stage

- VUID-vkCmdDispatchBase-commandBuffer-02712
If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported, any resource written to by the **VkPipeline** object bound to the pipeline bind point used by this command **must** not be an unprotected resource
- VUID-vkCmdDispatchBase-commandBuffer-02713
If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported, pipeline stages other than the framebuffer-space and compute stages in the **VkPipeline** object bound to the pipeline bind point used by this command **must** not write to any resource
- VUID-vkCmdDispatchBase-commandBuffer-04617
If any of the shader stages of the **VkPipeline** bound to the pipeline bind point used by this command uses the **RayQueryKHR** capability, then **commandBuffer** **must** not be a protected command buffer
- VUID-vkCmdDispatchBase-baseGroupX-00421
baseGroupX **must** be less than **VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]**
- VUID-vkCmdDispatchBase-baseGroupY-00422
baseGroupY **must** be less than **VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]**
- VUID-vkCmdDispatchBase-baseGroupZ-00423
baseGroupZ **must** be less than **VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]**
- VUID-vkCmdDispatchBase-groupCountX-00424
groupCountX **must** be less than or equal to **VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]** minus **baseGroupX**
- VUID-vkCmdDispatchBase-groupCountY-00425
groupCountY **must** be less than or equal to **VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]** minus **baseGroupY**
- VUID-vkCmdDispatchBase-groupCountZ-00426
groupCountZ **must** be less than or equal to **VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]** minus **baseGroupZ**
- VUID-vkCmdDispatchBase-baseGroupX-00427
If any of **baseGroupX**, **baseGroupY**, or **baseGroupZ** are not zero, then the bound compute pipeline **must** have been created with the **VK_PIPELINE_CREATE_DISPATCH_BASE_BIT** flag or the bound compute shader object **must** have been created with the **VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT** flag

Valid Usage (Implicit)

- VUID-vkCmdDispatchBase-commandBuffer-parameter
commandBuffer **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdDispatchBase-commandBuffer-recording
commandBuffer **must** be in the **recording state**
- VUID-vkCmdDispatchBase-commandBuffer-cmdpool

The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT` operations

- VUID-vkCmdDispatchBase-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdDispatchBase-videocoding
This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary Secondary	Both	Outside	VK_QUEUE_COMPUTE_BIT	Action

Conditional Rendering

`vkCmdDispatchBase` is affected by [conditional rendering](#)

Chapter 35. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define a layout describing the sequence of commands which should be generated.
- Optionally set up device-bindable shaders.
- Retrieve device addresses for setting buffers on the device.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by the command layout.
- Create a `preprocess VkBuffer` using the device-queried allocation information.
- Optionally preprocess the input data in a separate action.
- Generate and execute the actual commands.

The preprocessing step executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they **must** be explicitly synchronized against the command execution. When not preprocessing in a separate step, the preprocessing is automatically synchronized against the command execution.

35.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```
// Provided by VK_EXT_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutEXT)
```

Each indirect command layout **must** have exactly one action command token and it **must** be the last token in the sequence.

NOTE

If the indirect commands layout contains only 1 token, it will be an action command token, and the contents of the indirect buffer will be a sequence of indirect command structures, similar to the ones used for indirect draws and dispatches. On some implementations, using indirect draws and dispatches for these cases will result in increased performance compared to using device-generated commands, due to the overhead that results from using the latter.

35.1.1. Creation and Deletion

Indirect command layouts for `VK_EXT_device_generated_commands` are created by:

```
// Provided by VK_EXT_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutEXT(
    VkDevice device,
    const VkIndirectCommandsLayoutCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkIndirectCommandsLayoutEXT* pIndirectCommandsLayout);
```

- **device** is the logical device that creates the indirect command layout.
- **pCreateInfo** is a pointer to a [VkIndirectCommandsLayoutCreateInfoEXT](#) structure containing parameters affecting creation of the indirect command layout.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pIndirectCommandsLayout** is a pointer to a [VkIndirectCommandsLayoutEXT](#) handle in which the resulting indirect command layout is returned.

Valid Usage

- VUID-vkCreateIndirectCommandsLayoutEXT-deviceGeneratedCommands-11089
The [VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands](#) feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateIndirectCommandsLayoutEXT-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateIndirectCommandsLayoutEXT-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkIndirectCommandsLayoutCreateInfoEXT](#) structure
- VUID-vkCreateIndirectCommandsLayoutEXT-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateIndirectCommandsLayoutEXT-pIndirectCommandsLayout-parameter
pIndirectCommandsLayout **must** be a valid pointer to a [VkIndirectCommandsLayoutEXT](#) handle
- VUID-vkCreateIndirectCommandsLayoutEXT-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkIndirectCommandsLayoutCreateInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsLayoutCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkIndirectCommandsLayoutUsageFlagsEXT flags;
    VkShaderStageFlags       shaderStages;
    uint32_t                 indirectStride;
    VkPipelineLayout          pipelineLayout;
    uint32_t                 tokenCount;
    const VkIndirectCommandsLayoutTokenEXT* pTokens;
} VkIndirectCommandsLayoutCreateInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [flags](#) is a bitmask of [VkIndirectCommandsLayoutUsageFlagBitsEXT](#) specifying usage rules for this layout.
- [shaderStages](#) is the [VkShaderStageFlags](#) that this layout supports.
- [indirectStride](#) is the distance in bytes between sequences in the indirect buffer
- [pipelineLayout](#) is the optional [VkPipelineLayout](#) that tokens in this layout use. If the [dynamicGeneratedPipelineLayout](#) feature is enabled, [pipelineLayout](#) **can** be [VK_NULL_HANDLE](#) and the layout **must** be specified by chaining the [VkPipelineLayoutCreateInfo](#) structure off the [pNext](#). If the [descriptorHeap](#) feature is enabled, [pipelineLayout](#) **can** be [VK_NULL_HANDLE](#) without providing a [VkPipelineLayoutCreateInfo](#) structure.
- [tokenCount](#) is the length of the individual command sequence.
- [pTokens](#) is a pointer to an array of [VkIndirectCommandsLayoutTokenEXT](#) describing each command token in detail.

The following code illustrates some of the flags:

```
void cmdProcessAllSequences(cmd, indirectExecutionSet, indirectCommandsLayout,
    indirectAddress, sequencesCount)
{
    for (s = 0; s < sequencesCount; s++)
    {
        sUsed = s;
```

```

    if (indirectCommandsLayout.flags &
VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT) {
        sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
    }

    cmdProcessSequence( cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, sUsed );
}
}

```

When tokens are consumed, an offset is computed based on token offset and stream stride. The resulting offset is required to be aligned. The alignment for a specific token is equal to the scalar alignment of the data type as defined in [Alignment Requirements](#), or 4, whichever is lower.

Valid Usage

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-indirectStride-11090
indirectStride must be less than or equal to [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectCommandsIndirectStride](#)
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11091
shaderStages must only contain stages supported by [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStages](#)
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-tokenCount-11092
tokenCount must be less than or equal to [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectCommandsTokenCount](#)
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11093
The number of tokens in the **pTokens** array with **type** equal to [VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT](#) must be less than or equal to 1
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11145
The number of tokens in the **pTokens** array with **type** equal to [VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT](#) must be less than or equal to 1
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11094
The number of tokens in the **pTokens** array with **type** equal to [VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT](#) or [VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT](#) must be less than or equal to 1
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11095
If the action command token in the **pTokens** array is not an indexed draw token, then **pTokens** must not contain a member with **type** set to

VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11096

If the action command token in the `pTokens` array is not a non-mesh draw token, then `pTokens` **must** not contain a member with `type` set to `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT`

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11097

If the `pTokens` array contains multiple tokens with `type` equal to `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT`, then there **must** be no duplicate `VkIndirectCommandsVertexBufferTokenEXT::vertexBindingUnit` values

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11099

For all `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT`, and `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` type tokens in `pTokens`, there **must** be no overlapping ranges between any specified push constant ranges

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11100

The action command token **must** be the last token in the `pTokens` array

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11139

If the `pTokens` array contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, then this token **must** be the first token in the array

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11101

For any element of `pTokens`, if `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT` or `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` and the `dynamicGeneratedPipelineLayout` feature is not enabled, then the `pipelineLayout` **must** not be `VK_NULL_HANDLE`

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11102

For any element of `pTokens`, if `type` is either `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT` or `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` and `pipelineLayout` is `VK_NULL_HANDLE`, then the `pNext` chain **must** include a `VkPipelineLayoutCreateInfo` struct

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11103

For any element of `pTokens`, the `offset` **must** be greater than or equal to the `offset` member of the previous tokens

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11104

For any element of `pTokens`, if `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_COUNT_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_COUNT_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_EXT`,

VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_COUNT_EXT, or
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_EXT, then **shaderStages** **must** contain
graphics stages

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11105

For any element of **pTokens**, if **type** is
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT, then **shaderStages** **must** be
VK_SHADER_STAGE_COMPUTE_BIT

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11106

For any element of **pTokens**, if **type** is
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_EXT or
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_COUNT_EXT, then
shaderStages **must** contain VK_SHADER_STAGE_MESH_BIT_EXT

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-11108

For any element of **pTokens**, if **type** is
VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT, then **shaderStages** **must**
contain ray tracing stages

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11109

If **shaderStages** contains graphics stages then the state tokens in **pTokens** **must** not include
VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11110

If **shaderStages** is VK_SHADER_STAGE_COMPUTE_BIT then the state tokens in **pTokens**
must only include VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT, or
VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11111

If **shaderStages** contains ray tracing stages then the state tokens in **pTokens** **must** only
include VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT,
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT, or
VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11112

The **shaderStages** **must** only contain stages from one of the following:

- VK_SHADER_STAGE_ALL (if the **descriptorHeap** feature is enabled)
- graphics stages
- VK_SHADER_STAGE_COMPUTE_BIT
- mesh stages and VK_SHADER_STAGE_FRAGMENT_BIT
- ray tracing stages

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-11113
If `shaderStages` contains `VK_SHADER_STAGE_FRAGMENT_BIT`, then `shaderStages` **must** also contain `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_EXT`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pNext-pNext
`pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineLayoutCreateInfo`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-flags-parameter
`flags` **must** be a valid combination of `VkIndirectCommandsLayoutUsageFlagBitsEXT` values
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-parameter
`shaderStages` **must** be a valid combination of `VkShaderStageFlagBits` values
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-shaderStages-requiredbitmask
`shaderStages` **must** not be `0`
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pipelineLayout-parameter
If `pipelineLayout` is not `VK_NULL_HANDLE`, `pipelineLayout` **must** be a valid `VkPipelineLayout` handle
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-pTokens-parameter
`pTokens` **must** be a valid pointer to an array of `tokenCount` valid `VkIndirectCommandsLayoutTokenEXT` structures
- VUID-VkIndirectCommandsLayoutCreateInfoEXT-tokenCount-arraylength
`tokenCount` **must** be greater than `0`

Bits which **can** be set in `VkIndirectCommandsLayoutCreateInfoEXT::flags`, specifying usage hints of an indirect command layout, are:

```
// Provided by VK_EXT_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsEXT {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT = 0x00000002,
} VkIndirectCommandsLayoutUsageFlagBitsEXT;
```

- `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT` specifies that the layout is always used with the manual preprocessing step through calling `vkCmdPreprocessGeneratedCommandsEXT` and executed by `vkCmdExecuteGeneratedCommandsEXT` with `isPreprocessed` set to `VK_TRUE`.
- `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT` specifies that

the processing of sequences will happen at an implementation-dependent order, which is not guaranteed to be deterministic using the same input data. This flag is ignored when the `shaderStages` is `VK_SHADER_STAGE_COMPUTE_BIT` as it is implied that the dispatch sequence is always unordered.

```
// Provided by VK_EXT_device_generated_commands
typedef VkFlags VkIndirectCommandsLayoutUsageFlagsEXT;
```

`VkIndirectCommandsLayoutUsageFlagsEXT` is a bitmask type for setting a mask of zero or more `VkIndirectCommandsLayoutUsageFlagBitsEXT`.

Indirect command layouts for `VK_EXT_device_generated_commands` are destroyed by:

```
// Provided by VK_EXT_device_generated_commands
void vkDestroyIndirectCommandsLayoutEXT(
    VkDevice device,
    VkIndirectCommandsLayoutEXT indirectCommandsLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the layout.
- `indirectCommandsLayout` is the layout to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-11114
All submitted commands that refer to `indirectCommandsLayout` **must** have completed execution
- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-11115
If `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-11116
If no `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyIndirectCommandsLayoutEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-parameter
If `indirectCommandsLayout` is not `VK_NULL_HANDLE`, `indirectCommandsLayout` **must** be a valid `VkIndirectCommandsLayoutEXT` handle
- VUID-vkDestroyIndirectCommandsLayoutEXT-pAllocator-parameter

If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- `VUID-vkDestroyIndirectCommandsLayoutEXT-indirectCommandsLayout-parent`
If `indirectCommandsLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `indirectCommandsLayout` **must** be externally synchronized

35.1.2. Token Input Streams

For `VK_EXT_device_generated_commands`, the input streams **can** contain raw `uint32_t` values, existing indirect commands such as:

- `VkDrawIndirectCommand`
- `VkDrawIndexedIndirectCommand`
- `VkDispatchIndirectCommand`
- `VkDrawMeshTasksIndirectCommandEXT`
- `VkTraceRaysIndirectCommandKHR`
- `VkTraceRaysIndirectCommand2KHR`

or additional commands as listed below. How the data is used is described in the next section.

The `VkBindIndexBufferIndirectCommandEXT` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT` token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandEXT {
    VkDeviceAddress    bufferAddress;
    uint32_t           size;
    VkIndexType        indexType;
} VkBindIndexBufferIndirectCommandEXT;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used as index buffer.
- `size` is the byte size range which is available for this operation from the provided address.
- `indexType` is a `VkIndexType` value specifying how indices are treated.

Valid Usage

- `VUID-VkBindIndexBufferIndirectCommandEXT-None-11117`
The buffer's usage flags from which the address was acquired **must** have the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` bit set

- VUID-VkBindIndexBufferIndirectCommandEXT-bufferAddress-11118
The **bufferAddress** **must** be aligned to the **VkIndexType** of the **indexType** used

Valid Usage (Implicit)

- VUID-VkBindIndexBufferIndirectCommandEXT-bufferAddress-parameter
bufferAddress **must** be a valid **VkDeviceAddress** value
- VUID-VkBindIndexBufferIndirectCommandEXT-indexType-parameter
indexType **must** be a valid **VkIndexType** value

The **VkBindVertexBufferIndirectCommandEXT** structure specifies the input data for the **VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT** token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandEXT {
    VkDeviceAddress    bufferAddress;
    uint32_t           size;
    uint32_t           stride;
} VkBindVertexBufferIndirectCommandEXT;
```

- **bufferAddress** specifies a physical address of the **VkBuffer** used as vertex input binding.
- **size** is the byte size range which is available for this operation from the provided address.
- **stride** is the byte size stride for this vertex input binding as in **VkVertexInputBindingDescription::stride**.

Valid Usage

- VUID-VkBindVertexBufferIndirectCommandEXT-None-11120
The buffer's usage flag from which the address was acquired **must** have the **VK_BUFFER_USAGE_VERTEX_BUFFER_BIT** bit set

Valid Usage (Implicit)

- VUID-VkBindVertexBufferIndirectCommandEXT-bufferAddress-parameter
bufferAddress **must** be a valid **VkDeviceAddress** value

The **VkDrawIndirectCountIndirectCommandEXT** structure specifies the input data for all draw-type tokens.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkDrawIndirectCountIndirectCommandEXT {
    VkDeviceAddress    bufferAddress;
    uint32_t           stride;
    uint32_t           commandCount;
} VkDrawIndirectCountIndirectCommandEXT;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used for draw commands.
- `stride` is the byte size stride for the command arguments
- `commandCount` is the number of commands to execute

The corresponding indirect draw structure data will be read from the buffer address.

Valid Usage

- VUID-VkDrawIndirectCountIndirectCommandEXT-None-11122
The buffer's usage flag from which the address was acquired **must** have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

Valid Usage (Implicit)

- VUID-VkDrawIndirectCountIndirectCommandEXT-bufferAddress-parameter
`bufferAddress` **must** be a valid `VkDeviceAddress` value

35.1.3. Tokenized Command Processing

The processing for `VK_EXT_device_generated_commands` is in principle illustrated below:

```
void cmdProcessSequence(cmd, indirectExecutionSet, indirectCommandsLayout,
    indirectAddress, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t offset = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride = indirectCommandsLayout.indirectStride;
        VkDeviceAddress streamData = indirectAddress;
        const void* input = streamData + stride * s + offset;

        // further details later
        indirectCommandsLayout.pTokens[t].command (cmd, indirectExecutionSet, input, s);
    }
}

void cmdProcessAllSequences(cmd, indirectExecutionSet, indirectCommandsLayout,
    indirectAddress, sequencesCount)
```

```

{
    for (s = 0; s < sequencesCount; s++)
    {
        sUsed = s;

        if (indirectCommandsLayout.flags &
VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT) {
            sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
        }

        cmdProcessSequence( cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, sUsed );
    }
}

```

The processing of each sequence is considered stateless, therefore all state changes **must** occur prior to action commands within the sequence. A single sequence is strictly targeting the [VkShaderStageFlags](#) it was created with.

The primary input data for each token is provided through [VkBuffer](#) content at preprocessing using [vkCmdPreprocessGeneratedCommandsEXT](#) or execution time using [vkCmdExecuteGeneratedCommandsEXT](#), however some functional arguments, for example push constant layouts, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the [VkIndirectCommandsLayoutCreateInfoEXT::pTokens](#) array specifying command tokens (other elements of the array specify command parameters) are:

```

// Provided by VK_EXT_device_generated_commands
typedef enum VkIndirectCommandsTokenTypeEXT {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_EXT = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_EXT = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_COUNT_EXT = 7,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_COUNT_EXT = 8,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT = 9,
    // Provided by VK_EXT_descriptor_heap with VK_EXT_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT = 1000135000,
    // Provided by VK_EXT_descriptor_heap with VK_EXT_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT = 1000135001,
    // Provided by VK_EXT_device_generated_commands with VK_EXT_mesh_shader
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_EXT = 1000328000,
    // Provided by VK_EXT_device_generated_commands with VK_EXT_mesh_shader
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_COUNT_EXT = 1000328001,
    // Provided by VK_KHR_ray_tracing_maintenance1 with VK_EXT_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT = 1000386004,
} VkIndirectCommandsTokenTypeEXT;

```

Table 45. Supported Indirect Command Tokens

Common Tokens	Command Data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT	u32[] array of indices into the indirect execution set
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT	u32[] raw data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT	u8[] raw data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT	u32 placeholder data (not accessed by shader)
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT	u32 placeholder data (not accessed by shader)
Compute Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT	VkDispatchIndirectCommand
Ray Tracing Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT	VkTraceRaysIndirectCommand2KHR

Common Tokens	Command Data
Graphics State Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT	VkBindIndexBufferIndirectCommandEXT
VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT	VkBindVertexBufferIndirectCommandEXT
Graphics Draw Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_EXT	VkDrawIndexedIndirectCommand
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_EXT	VkDrawIndirectCommand
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_EXT	VkDrawMeshTasksIndirectCommandEXT
Graphics Draw Count Tokens	
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_COUNT_EXT	VkDrawIndirectCountIndirectCommandEXT with VkDrawIndexedIndirectCommand
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_COUNT_EXT	VkDrawIndirectCountIndirectCommandEXT with VkDrawIndirectCommand
VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_COUNT_EXT	VkDrawIndirectCountIndirectCommandEXT with VkDrawMeshTasksIndirectCommandEXT

The [VkIndirectCommandsLayoutTokenEXT](#) structure specifies details to the function arguments that need to be known at layout creation time:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsLayoutTokenEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkIndirectCommandsTokenTypeEXT type;
    VkIndirectCommandsTokenDataEXT data;
    uint32_t             offset;
} VkIndirectCommandsLayoutTokenEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [type](#) specifies the [VkIndirectCommandsTokenTypeEXT](#) for [data](#).

- **data** specifies a [VkIndirectCommandsTokenDataEXT](#) containing token-specific details for command execution. It is ignored if **type** does not match any member of the [VkIndirectCommandsTokenDataEXT](#) union.
- **offset** is the relative byte offset for the token within one sequence of the indirect buffer. The data stored at that offset is the command data for the token, e.g. [VkDispatchIndirectCommand](#).

Valid Usage

- VUID-VkIndirectCommandsLayoutTokenEXT-offset-11124
offset **must** be less than or equal to [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectCommandsTokenOffset](#)
- VUID-VkIndirectCommandsLayoutTokenEXT-offset-11125
offset **must** be aligned to 4
- VUID-VkIndirectCommandsLayoutTokenEXT-meshShader-11126
If **meshShader** or **taskShader** are not enabled, **type** **must** not be [VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_EXT](#), [VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_COUNT_EXT](#), [VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV_EXT](#) or [VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_COUNT_NV_EXT](#)
- VUID-VkIndirectCommandsLayoutTokenEXT-rayTracingMaintenance1-11128
If the **rayTracingMaintenance1** feature is not enabled, **type** **must** not be [VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT](#)
- VUID-VkIndirectCommandsLayoutTokenEXT-deviceGeneratedCommandsMultiDrawIndirectCount-11129
If [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::deviceGeneratedCommandsMultiDrawIndirectCount](#) is not supported, **type** **must** not be [VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_COUNT_EXT](#) or [VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_COUNT_EXT](#)
- VUID-VkIndirectCommandsLayoutTokenEXT-deviceGeneratedCommandsMultiDrawIndirectCount-11130
If [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::deviceGeneratedCommandsMultiDrawIndirectCount](#) is not supported, **type** **must** not be [VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_COUNT_EXT](#)
- VUID-VkIndirectCommandsLayoutTokenEXT-descriptorHeap-11332
If the **descriptorHeap** feature is not enabled, **type** **must** not be [VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT](#) or [VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT](#)
- VUID-VkIndirectCommandsLayoutTokenEXT-type-11333
If **type** is [VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT](#) or [VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT](#) [VkIndirectCommandsPushConstantTokenEXT::updateRange.shaderStages](#) **must** be [VK_SHADER_STAGE_ALL](#)

Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutTokenEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_EXT`
- VUID-VkIndirectCommandsLayoutTokenEXT-type-parameter
`type` **must** be a valid `VkIndirectCommandsTokenTypeEXT` value
- VUID-VkIndirectCommandsLayoutTokenEXT-pPushConstant-parameter
If `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`,
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT`,
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT`, or
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT`, the
`pPushConstant` member of `data` **must** be a valid pointer to a valid
`VkIndirectCommandsPushConstantTokenEXT` structure
- VUID-VkIndirectCommandsLayoutTokenEXT-pVertexBuffer-parameter
If `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT`, the
`pVertexBuffer` member of `data` **must** be a valid pointer to a valid
`VkIndirectCommandsVertexBufferTokenEXT` structure
- VUID-VkIndirectCommandsLayoutTokenEXT-pIndexBuffer-parameter
If `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT`, the `pIndexBuffer`
member of `data` **must** be a valid pointer to a valid
`VkIndirectCommandsIndexBufferTokenEXT` structure
- VUID-VkIndirectCommandsLayoutTokenEXT-pExecutionSet-parameter
If `type` is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT`, the
`pExecutionSet` member of `data` **must** be a valid pointer to a valid
`VkIndirectCommandsExecutionSetTokenEXT` structure

The `VkIndirectCommandsTokenDataEXT` structure provides token-specific details used to generate the indirect execution layout.

```
// Provided by VK_EXT_device_generated_commands
typedef union VkIndirectCommandsTokenDataEXT {
    const VkIndirectCommandsPushConstantTokenEXT* pPushConstant;
    const VkIndirectCommandsVertexBufferTokenEXT* pVertexBuffer;
    const VkIndirectCommandsIndexBufferTokenEXT* pIndexBuffer;
    const VkIndirectCommandsExecutionSetTokenEXT* pExecutionSet;
} VkIndirectCommandsTokenDataEXT;
```

- `pPushConstant` is a pointer to a `VkIndirectCommandsPushConstantTokenEXT` structure needed for
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`,
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT`,
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT`, and
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` tokens
- `pVertexBuffer` is a pointer to a `VkIndirectCommandsVertexBufferTokenEXT` structure needed for
`VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT` tokens

- `pIndexBuffer` is a pointer to a `VkIndirectCommandsIndexBufferTokenEXT` structure needed for `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT` tokens
- `pExecutionSet` is a pointer to a `VkIndirectCommandsExecutionSetTokenEXT` structure needed for `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` tokens

The appropriate member of the union **must** be set for each token.

The following code provides detailed information on how an individual sequence is processed. For valid usage, all restrictions from the regular commands apply.

```
void cmdProcessSequence(cmd, indirectExecutionSet, indirectCommandsLayout,
indirectAddress, s)
{
    for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++) {
        VkIndirectCommandsLayoutTokenEXT *token = &indirectCommandsLayout.pTokens[t];

        uint32_t offset = token->offset;
        uint32_t stride = indirectCommandsLayout.indirectStride;
        VkDeviceAddress streamData = indirectAddress;
        const void* input = streamData + stride * s + offset;

        switch (token->tokenType) {
        case VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT:
            uint32_t *bind = input;
            VkIndirectCommandsExecutionSetTokenEXT *info = token->data.pExecutionSet;

            if (info->type == VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT) {
                vkCmdBindPipeline(cmd, indirectExecutionSet.pipelineBindPoint,
indirectExecutionSet.pipelines[*bind]);
            } else {
                VkShaderStageFlagBits stages[];
                VkShaderEXT shaders[];
                uint32_t i = 0;
                IterateBitmaskLSBToMSB(iter, info->shaderStages) {
                    stages[i] = iter;
                    shaders[i] = indirectExecutionSet.shaders[bind[i]].shaderObject;
                    i++;
                }
                vkCmdBindShadersEXT(cmd, i, stages, shaders);
            }
            break;

        case VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT:
            uint32_t* data = input;
            VkPushConstantsInfoKHR info = {
                VK_STRUCTURE_TYPE_PUSH_CONSTANTS_INFO_KHR,
                // this can also use 'dynamicGeneratedPipelineLayout' to pass a
VkPipelineLayoutCreateInfo from pNext
                indirectCommandsLayout.pipelineLayout,
                token->token.pushConstant.updateRange.shaderStages,
```

```

        token->token.pushConstant.updateRange.offset,
        token->token.pushConstant.updateRange.size,
        data
    };

    vkCmdPushConstants2KHR(cmd, &info);
    break;

case VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT:

    VkHostAddressRangeConstEXT addressRange = {
        token->token.pushConstant.updateRange.data.size,

    case VK_INDIRECT_COMMANDS_TOKEN_TYPE_TRACE_RAYS2_EXT:
        vkCmdTraceRaysIndirect2KHR(cmd, deriveBuffer(input));
        break;
}
}
}

```

The `VkIndirectCommandsPushConstantTokenEXT` structure specifies the layout token info for `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT`, and `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` tokens.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsPushConstantTokenEXT {
    VkPushConstantRange    updateRange;
} VkIndirectCommandsPushConstantTokenEXT;
```

- `updateRange` is the push constant range that will be updated by the token.

The `stageFlags` member of `updateRange` is ignored.

Valid Usage

- VUID-VkIndirectCommandsPushConstantTokenEXT-updateRange-11132
If the token type is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT` or `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT`, `updateRange` **must** be contained within the push constant info used by `VkIndirectCommandsLayoutCreateInfoEXT`
- VUID-VkIndirectCommandsPushConstantTokenEXT-size-11133
If the token type is `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT` or `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT`, the `size` member of `updateRange` **must** be 4

Valid Usage (Implicit)

- VUID-VkIndirectCommandsPushConstantTokenEXT-updateRange-parameter
`updateRange` **must** be a valid `VkPushConstantRange` structure

The `VkIndirectCommandsVertexBufferTokenEXT` structure specifies the layout token info for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT` token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsVertexBufferTokenEXT {
    uint32_t    vertexBindingUnit;
} VkIndirectCommandsVertexBufferTokenEXT;
```

- `vertexBindingUnit` is the vertex input binding number to be bound.

Valid Usage

- VUID-VkIndirectCommandsVertexBufferTokenEXT-vertexBindingUnit-11134
`vertexBindingUnit` **must** be less than the total number of vertex input bindings in use by the current graphics state

The `VkIndirectCommandsIndexBufferTokenEXT` structure specifies the layout token info for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT` token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsIndexBufferTokenEXT {
    VkIndirectCommandsInputModeFlagBitsEXT    mode;
} VkIndirectCommandsIndexBufferTokenEXT;
```

- `mode` specifies the mode to use with this token.

This allows for easy layering of Vulkan atop other APIs. When `VK_INDIRECT_COMMANDS_INPUT_MODE_DXGI_INDEX_BUFFER_EXT` is specified, the indirect buffer can contain a `D3D12_INDEX_BUFFER_VIEW` instead of `VkBindIndexBufferIndirectCommandEXT` as D3D's DXGI format value is mapped to the `VkIndexType`. It works as both structs are otherwise binary compatible.

Valid Usage

- VUID-VkIndirectCommandsIndexBufferTokenEXT-mode-11135
`mode` **must** be non-zero
- VUID-VkIndirectCommandsIndexBufferTokenEXT-mode-11136
`mode` **must** be one of the bits supported in `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsInputModes`

Valid Usage (Implicit)

- VUID-VkIndirectCommandsIndexBufferTokenEXT-mode-parameter
`mode` **must** be a valid `VkIndirectCommandsInputModeFlagBitsEXT` value

Bits which are set in `VkIndirectCommandsIndexBufferTokenEXT::mode`, specifying how an index buffer is used, are:

```
// Provided by VK_EXT_device_generated_commands
typedef enum VkIndirectCommandsInputModeFlagBitsEXT {
    VK_INDIRECT_COMMANDS_INPUT_MODE_VULKAN_INDEX_BUFFER_EXT = 0x00000001,
    VK_INDIRECT_COMMANDS_INPUT_MODE_DXGI_INDEX_BUFFER_EXT = 0x00000002,
} VkIndirectCommandsInputModeFlagBitsEXT;
```

- `VK_INDIRECT_COMMANDS_INPUT_MODE_VULKAN_INDEX_BUFFER_EXT` specifies that the indirect buffer contains `VkBindIndexBufferIndirectCommandEXT`.
- `VK_INDIRECT_COMMANDS_INPUT_MODE_DXGI_INDEX_BUFFER_EXT` specifies that the indirect buffer contains `D3D12_INDEX_BUFFER_VIEW`.

```
// Provided by VK_EXT_device_generated_commands
typedef VkFlags VkIndirectCommandsInputModeFlagsEXT;
```

`VkIndirectCommandsInputModeFlagsEXT` is a bitmask type for setting a mask of zero or more `VkIndirectCommandsInputModeFlagBitsEXT`.

The `VkIndirectCommandsExecutionSetTokenEXT` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token.

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectCommandsExecutionSetTokenEXT {
    VkIndirectExecutionSetInfoTypeEXT    type;
    VkShaderStageFlags                  shaderStages;
} VkIndirectCommandsExecutionSetTokenEXT;
```

- `type` describes the type of indirect execution set in use.
- `shaderStages` specifies the shaders that will be changed by this token.

Valid Usage

- VUID-VkIndirectCommandsExecutionSetTokenEXT-shaderStages-11137
Each bit in `shaderStages` must be supported by `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesPipelineBinding` or `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesShaderBinding`

Valid Usage (Implicit)

- VUID-VkIndirectCommandsExecutionSetTokenEXT-type-parameter `type` must be a valid `VkIndirectExecutionSetInfoTypeEXT` value
- VUID-VkIndirectCommandsExecutionSetTokenEXT-shaderStages-parameter

shaderStages **must** be a valid combination of **VkShaderStageFlagBits** values

- VUID-VkIndirectCommandsExecutionSetTokenEXT-shaderStages-requiredbitmask **shaderStages** **must** not be 0

35.2. Indirect Commands Generation and Execution

The generation of commands on the device requires a **preprocess** buffer.

With **VK_EXT_device_generated_commands**, to retrieve the memory size and alignment requirements of a particular execution state call:

```
// Provided by VK_EXT_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsEXT(
    VkDevice device,
    const VkGeneratedCommandsMemoryRequirementsInfoEXT* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- **device** is the logical device that owns the buffer.
- **pInfo** is a pointer to a **VkGeneratedCommandsMemoryRequirementsInfoEXT** structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a **VkMemoryRequirements2** structure in which the memory requirements of the buffer object are returned.

If the size returned is zero, the preprocessing step can be skipped for this layout.

Valid Usage (Implicit)

- VUID-vkGetGeneratedCommandsMemoryRequirementsEXT-device-parameter **device** **must** be a valid **VkDevice** handle
- VUID-vkGetGeneratedCommandsMemoryRequirementsEXT-pInfo-parameter **pInfo** **must** be a valid pointer to a valid **VkGeneratedCommandsMemoryRequirementsInfoEXT** structure
- VUID-vkGetGeneratedCommandsMemoryRequirementsEXT-pMemoryRequirements-parameter **pMemoryRequirements** **must** be a valid pointer to a **VkMemoryRequirements2** structure

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkGeneratedCommandsMemoryRequirementsInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkIndirectExecutionSetEXT indirectExecutionSet;
    VkIndirectCommandsLayoutEXT indirectCommandsLayout;
    uint32_t                 maxSequenceCount;
    uint32_t                 maxDrawCount;
} VkGeneratedCommandsMemoryRequirementsInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `indirectExecutionSet` is the indirect execution set to be used for binding shaders.
- `indirectCommandsLayout` is the `VkIndirectCommandsLayoutEXT` that this buffer memory is intended to be used with.
- `maxSequenceCount` is the maximum number of sequences that this buffer memory can be used with.
- `maxDrawCount` is the maximum number of indirect draws that can be executed by any COUNT-type multi-draw indirect tokens. The draw count in the indirect buffer is clamped to this value for these token types.

If the action command token for the layout is not a COUNT-type multi-draw indirect token, `maxDrawCount` is ignored.

Valid Usage

- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-maxSequencesCount-11009
`maxSequencesCount` **must** be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectSequenceCount`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectCommandsLayout-11010
 If `indirectCommandsLayout` was created with a token sequence that contained the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, `indirectExecutionSet` **must** not be `VK_NULL_HANDLE`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectCommandsLayout-11151
 If `indirectCommandsLayout` was created with a token sequence that contained the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the shader stages used to create the initial shader state of `indirectExecutionSet` **must** equal the `VkIndirectCommandsExecutionSetTokenEXT::shaderStages` used to create `indirectCommandsLayout`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectCommandsLayout-11011
 If `indirectCommandsLayout` was not created with a token sequence that contained the

VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT

token,

`indirectExecutionSet` **must** be `VK_NULL_HANDLE`

- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-maxDrawCount-11146
When not ignored, `maxDrawCount` × `maxSequenceCount` **must** be less than 2^{24}
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectExecutionSet-11012
If `indirectExecutionSet` is `VK_NULL_HANDLE`, either a `VkGeneratedCommandsPipelineInfoEXT` or a `VkGeneratedCommandsShaderInfoEXT` **must** be included in the `pNext` chain

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_EXT`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkGeneratedCommandsPipelineInfoEXT` or `VkGeneratedCommandsShaderInfoEXT`
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectExecutionSet-parameter
If `indirectExecutionSet` is not `VK_NULL_HANDLE`, `indirectExecutionSet` **must** be a valid `VkIndirectExecutionSetEXT` handle
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-indirectCommandsLayout-parameter
`indirectCommandsLayout` **must** be a valid `VkIndirectCommandsLayoutEXT` handle
- VUID-VkGeneratedCommandsMemoryRequirementsInfoEXT-commonparent
Both of `indirectCommandsLayout`, and `indirectExecutionSet` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkGeneratedCommandsPipelineInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    VkPipeline          pipeline;
} VkGeneratedCommandsPipelineInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipeline` is a valid pipeline object.

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsPipelineInfoEXT-sType-sType
sType must be [VK_STRUCTURE_TYPE_GENERATED_COMMANDS_PIPELINE_INFO_EXT](#)
- VUID-VkGeneratedCommandsPipelineInfoEXT-pipeline-parameter
pipeline must be a valid [VkPipeline](#) handle

Structure Chaining

Extends the structures

- [VkGeneratedCommandsInfoEXT](#)
- [VkGeneratedCommandsMemoryRequirementsInfoEXT](#)

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkGeneratedCommandsShaderInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           shaderCount;
    const VkShaderEXT* pShaders;
} VkGeneratedCommandsShaderInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **shaderCount** is the size of the **pShaders** array.
- **pShaders** is a pointer to an array of shader objects.

Valid Usage

- VUID-VkGeneratedCommandsShaderInfoEXT-pShaders-11127
pShaders must not contain more than one shader object for a given [VkShaderStageFlagBits](#) stage

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsShaderInfoEXT-sType-sType
sType must be [VK_STRUCTURE_TYPE_GENERATED_COMMANDS_SHADER_INFO_EXT](#)
- VUID-VkGeneratedCommandsShaderInfoEXT-pShaders-parameter
pShaders must be a valid pointer to an array of **shaderCount** valid [VkShaderEXT](#) handles
- VUID-VkGeneratedCommandsShaderInfoEXT-shaderCount-arraylength
shaderCount must be greater than 0

Structure Chaining

Extends the structures

- [VkGeneratedCommandsInfoEXT](#)
- [VkGeneratedCommandsMemoryRequirementsInfoEXT](#)

35.2.1. Indirect Execution Sets

Indirect Execution Sets contain sets of pipelines or shader objects which can be bound individually.

```
// Provided by VK_EXT_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectExecutionSetEXT)
```

Indirect Execution Sets allow the device to bind different shaders and pipeline states using [Device-Generated Commands](#).

Indirect Execution Sets are created by calling:

```
// Provided by VK_EXT_device_generated_commands
VkResult vkCreateIndirectExecutionSetEXT(
    VkDevice device,
    const VkIndirectExecutionSetCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkIndirectExecutionSetEXT* pIndirectExecutionSet);
```

- **device** is the logical device that creates the indirect execution set.
- **pCreateInfo** is a pointer to a [VkIndirectExecutionSetCreateInfoEXT](#) structure containing parameters affecting creation of the indirect execution set.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pIndirectExecutionSet** is a pointer to a [VkIndirectExecutionSetEXT](#) handle in which the resulting indirect execution set is returned.

Valid Usage

- VUID-vkCreateIndirectExecutionSetEXT-deviceGeneratedCommands-11013
The [VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands](#) feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateIndirectExecutionSetEXT-device-parameter
device **must** be a valid [VkDevice](#) handle

- VUID-vkCreateIndirectExecutionSetEXT-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkIndirectExecutionSetCreateInfoEXT](#) structure
- VUID-vkCreateIndirectExecutionSetEXT-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateIndirectExecutionSetEXT-pIndirectExecutionSet-parameter
pIndirectExecutionSet **must** be a valid pointer to a [VkIndirectExecutionSetEXT](#) handle
- VUID-vkCreateIndirectExecutionSetEXT-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkIndirectExecutionSetCreateInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectExecutionSetCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkIndirectExecutionSetInfoTypeEXT type;
    VkIndirectExecutionSetInfoEXT info;
} VkIndirectExecutionSetCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **type** is a [VkIndirectExecutionSetInfoTypeEXT](#) describing the type of set being created and determining which field of the **info** union will be used.
- **info** is a [VkIndirectExecutionSetInfoEXT](#) union containing layout information for the set.

Valid Usage

- VUID-VkIndirectExecutionSetCreateInfoEXT-maxIndirectShaderObjectCount-11014
If [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectShaderObjectCount](#) is

zero or the `shaderObject` feature is not enabled **type must** not be `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT`

Valid Usage (Implicit)

- `VUID-VkIndirectExecutionSetCreateInfoEXT-sType-sType`
sType must be `VK_STRUCTURE_TYPE_INDIRECT_EXECUTION_SET_CREATE_INFO_EXT`
- `VUID-VkIndirectExecutionSetCreateInfoEXT-type-parameter`
type must be a valid `VkIndirectExecutionSetInfoTypeEXT` value
- `VUID-VkIndirectExecutionSetCreateInfoEXT-pPipelineInfo-parameter`
If **type** is `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT`, the **pPipelineInfo** member of **info must** be a valid pointer to a valid `VkIndirectExecutionSetPipelineInfoEXT` structure
- `VUID-VkIndirectExecutionSetCreateInfoEXT-pShaderInfo-parameter`
If **type** is `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT`, the **pShaderInfo** member of **info must** be a valid pointer to a valid `VkIndirectExecutionSetShaderInfoEXT` structure

Values which **can** be set in `VkIndirectExecutionSetCreateInfoEXT::type`, specifying contents of an indirect execution set, are:

```
// Provided by VK_EXT_device_generated_commands
typedef enum VkIndirectExecutionSetInfoTypeEXT {
    VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT = 0,
    VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT = 1,
} VkIndirectExecutionSetInfoTypeEXT;
```

- `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT` specifies that the indirect execution set contains `VkPipeline` objects.
- `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT` specifies that the indirect execution set contains `VkShaderEXT` objects.

The `VkIndirectExecutionSetInfoEXT` union is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef union VkIndirectExecutionSetInfoEXT {
    const VkIndirectExecutionSetPipelineInfoEXT* pPipelineInfo;
    const VkIndirectExecutionSetShaderInfoEXT* pShaderInfo;
} VkIndirectExecutionSetInfoEXT;
```

- **pPipelineInfo** is a pointer to a `VkIndirectExecutionSetPipelineInfoEXT` structure containing pipeline layout information for the set.
- **pShaderInfo** is a pointer to a `VkIndirectExecutionSetShaderInfoEXT` structure containing shader

object layout information for the set.

The `VkIndirectExecutionSetPipelineInfoEXT` structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectExecutionSetPipelineInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkPipeline          initialPipeline;
    uint32_t            maxPipelineCount;
} VkIndirectExecutionSetPipelineInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `initialPipeline` is the initial pipeline for the set. This pipeline will be automatically added to the set at index 0.
- `maxPipelineCount` is the maximum number of pipelines stored in the set.

The characteristics of `initialPipeline` will be used to validate all pipelines added to the set even if they are removed from the set or destroyed.

When an Indirect Execution Set created with pipelines is used, `initialPipeline` constitutes the initial shader state.

Valid Usage

- VUID-VkIndirectExecutionSetPipelineInfoEXT-supportedIndirectCommandsShaderStagesPipelineBinding-11015
If `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesPipelineBinding` does not contain `VK_SHADER_STAGE_COMPUTE_BIT`, the `VkPipelineBindPoint` of `initialPipeline` **must** not be `VK_PIPELINE_BIND_POINT_COMPUTE`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-supportedIndirectCommandsShaderStagesPipelineBinding-11016
If `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesPipelineBinding` does not contain `VK_SHADER_STAGE_FRAGMENT_BIT`, the `VkPipelineBindPoint` of `initialPipeline` **must** not be `VK_PIPELINE_BIND_POINT_GRAPHICS`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-supportedIndirectCommandsShaderStagesPipelineBinding-11017
If `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesPipelineBinding` does not contain ray tracing stages, the `VkPipelineBindPoint` of `initialPipeline` **must** not be `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-maxPipelineCount-11018

`maxPipelineCount` **must** be between `1` and `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectPipelineCount`

- VUID-VkIndirectExecutionSetPipelineInfoEXT-initialPipeline-11019
`initialPipeline` **must** not use descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-initialPipeline-11153
`initialPipeline` **must** have been created with `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkIndirectExecutionSetPipelineInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_EXECUTION_SET_PIPELINE_INFO_EXT`
- VUID-VkIndirectExecutionSetPipelineInfoEXT-initialPipeline-parameter
`initialPipeline` **must** be a valid `VkPipeline` handle

The `VkIndirectExecutionSetShaderInfoEXT` structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectExecutionSetShaderInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 shaderCount;
    const VkShaderEXT*        pInitialShaders;
    const VkIndirectExecutionSetShaderLayoutInfoEXT* pSetLayoutInfos;
    uint32_t                 maxShaderCount;
    uint32_t                 pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
} VkIndirectExecutionSetShaderInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderCount` is the number of members in the `pInitialShaders` and `pSetLayoutInfos` arrays.
- `pInitialShaders` is a pointer to an array containing a `VkShaderEXT` object for each shader stage that will be used in the set. These shaders will be automatically added to the set beginning at index `0`.
- `pSetLayoutInfos` is `NULL` or a pointer to an array containing a `VkIndirectExecutionSetShaderLayoutInfoEXT` used by each corresponding `pInitialShaders` shader stage in the set.
- `maxShaderCount` is the maximum number of shader objects stored in the set.
- `pushConstantRangeCount` is the number of members in the `pPushConstantRanges` array.

- `pPushConstantRanges` is a pointer to the array of `VkPushConstantRange` ranges used by all shaders in the set.

The characteristics of `pInitialShaders` will be used to validate all shaders added to the set even if they are removed from the set or destroyed.

When an Indirect Execution Set created with shader objects is used, `pInitialShaders` constitutes the initial shader state.

If `pSetLayoutInfos` is `NULL`, the descriptor layout parameters are inherited from the shader object.

Valid Usage

- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-11020
All members of `pInitialShaders` **must** have a `stage` supported by `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesShaderBinding`
- VUID-VkIndirectExecutionSetShaderInfoEXT-maxShaderCount-11021
`maxShaderCount` **must** not be zero
- VUID-VkIndirectExecutionSetShaderInfoEXT-maxShaderCount-11022
`maxShaderCount` **must** be less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectShaderObjectCount`
- VUID-VkIndirectExecutionSetShaderInfoEXT-maxShaderCount-11036
`maxShaderCount` **must** be greater than or equal to `shaderCount`
- VUID-VkIndirectExecutionSetShaderInfoEXT-stage-11023
The `stage` of each element in the `pInitialShaders` array **must** be unique
- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-11154
Each member of `pInitialShaders` **must** have been created with `VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT`
- VUID-VkIndirectExecutionSetShaderInfoEXT-pSetLayoutInfos-10929
If `pSetLayoutInfos` is not `NULL`, the descriptor layout values specified **must** be compatible with the descriptor set layouts defined at the creation of the shader object
- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-11321
If any element of `pInitialShaders` was created with `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, all elements of `pInitialShaders` **must** have been created with `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`
- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-11322
If any element of `pInitialShaders` was created without `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, all elements of `pInitialShaders` **must** have been created without `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`
- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-11323
If elements of `pInitialShaders` were created with `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`, `pSetLayoutInfos` **must** be `NULL`

Valid Usage (Implicit)

- VUID-VkIndirectExecutionSetShaderInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_EXECUTION_SET_SHADER_INFO_EXT`
- VUID-VkIndirectExecutionSetShaderInfoEXT-pInitialShaders-parameter
`pInitialShaders` **must** be a valid pointer to an array of `shaderCount` valid `VkShaderEXT` handles
- VUID-VkIndirectExecutionSetShaderInfoEXT-pSetLayoutInfos-parameter
If `pSetLayoutInfos` is not `NULL`, `pSetLayoutInfos` **must** be a valid pointer to an array of `shaderCount` valid `VkIndirectExecutionSetShaderLayoutInfoEXT` structures
- VUID-VkIndirectExecutionSetShaderInfoEXT-pPushConstantRanges-parameter
If `pushConstantRangeCount` is not `0`, `pPushConstantRanges` **must** be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures
- VUID-VkIndirectExecutionSetShaderInfoEXT-shaderCount-arraylength
`shaderCount` **must** be greater than `0`

The `VkIndirectExecutionSetShaderLayoutInfoEXT` structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkIndirectExecutionSetShaderLayoutInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
} VkIndirectExecutionSetShaderLayoutInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `setLayoutCount` is the number of members in the `pSetLayouts` array
- `pSetLayouts` is a pointer to an array containing `VkDescriptorSetLayout` objects used by the shader stage. The implementation **must** not access these objects outside of the duration of the command this structure is passed to.

Valid Usage

- VUID-VkIndirectExecutionSetShaderLayoutInfoEXT-pSetLayouts-11024
All members of `pSetLayouts` **must** not contain descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`

Valid Usage (Implicit)

- VUID-VkIndirectExecutionSetShaderLayoutInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_INDIRECT_EXECUTION_SET_SHADER_LAYOUT_INFO_EXT`
- VUID-VkIndirectExecutionSetShaderLayoutInfoEXT-pSetLayouts-parameter
If `setLayoutCount` is not 0, `pSetLayouts` **must** be a valid pointer to an array of `setLayoutCount` valid or `VK_NULL_HANDLE` `VkDescriptorSetLayout` handles

Destroy an Indirect Execution Set by calling:

```
// Provided by VK_EXT_device_generated_commands
void vkDestroyIndirectExecutionSetEXT(
    VkDevice device,
    VkIndirectExecutionSetEXT indirectExecutionSet,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that owns the indirect execution set.
- `indirectExecutionSet` is the indirect execution set to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Valid Usage

- VUID-vkDestroyIndirectExecutionSetEXT-indirectExecutionSet-11025
All submitted commands that refer to `indirectExecutionSet` **must** have completed execution

Valid Usage (Implicit)

- VUID-vkDestroyIndirectExecutionSetEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyIndirectExecutionSetEXT-indirectExecutionSet-parameter
If `indirectExecutionSet` is not `VK_NULL_HANDLE`, `indirectExecutionSet` **must** be a valid `VkIndirectExecutionSetEXT` handle
- VUID-vkDestroyIndirectExecutionSetEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyIndirectExecutionSetEXT-indirectExecutionSet-parent
If `indirectExecutionSet` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `indirectExecutionSet` **must** be externally synchronized

The `VkWriteIndirectExecutionSetPipelineEXT` structure is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkWriteIndirectExecutionSetPipelineEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           index;
    VkPipeline          pipeline;
} VkWriteIndirectExecutionSetPipelineEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `index` is the element of the set to update
- `pipeline` is the pipeline to store in the indirect execution set

Valid Usage

- VUID-VkWriteIndirectExecutionSetPipelineEXT-index-11026
`index` **must** be less than the value of `VkIndirectExecutionSetPipelineInfoEXT::maxPipelineCount` used to create the set
- VUID-VkWriteIndirectExecutionSetPipelineEXT-pipeline-11027
`pipeline` **must** have been created with `VK_PIPELINE_CREATE_2_INDIRECT_BINDABLE_BIT_EXT`
- VUID-VkWriteIndirectExecutionSetPipelineEXT-index-11029
`index` **must** not be referenced by submitted command buffers
- VUID-VkWriteIndirectExecutionSetPipelineEXT-pipeline-11030
The shader stages contained in `pipeline` **must** be supported by `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStagesPipelineBinding`

Valid Usage (Implicit)

- VUID-VkWriteIndirectExecutionSetPipelineEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_WRITE_INDIRECT_EXECUTION_SET_PIPELINE_EXT`
- VUID-VkWriteIndirectExecutionSetPipelineEXT-pipeline-parameter
`pipeline` **must** be a valid `VkPipeline` handle

The `VkWriteIndirectExecutionSetShaderEXT` structure is defined as:

```
// Provided by VK_EXT_device_generated_commands with VK_EXT_shader_object
typedef struct VkWriteIndirectExecutionSetShaderEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           index;
    VkShaderEXT        shader;
} VkWriteIndirectExecutionSetShaderEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `index` is the element of the set to update
- `shader` is the shader to store in the indirect execution set

Shaders need not be stored in the Indirect Execution Set according to their stage. The only restriction for shader indices within a set is that the value of the index **must** be less than the maximum number of shaders in the set.

Valid Usage

- VUID-VkWriteIndirectExecutionSetShaderEXT-index-11031
`index` **must** be less than `VkIndirectExecutionSetShaderInfoEXT::maxShaderCount`
- VUID-VkWriteIndirectExecutionSetShaderEXT-shader-11032
`shader` **must** have been created with `VK_SHADER_CREATE_INDIRECT_BINDABLE_BIT_EXT`
- VUID-VkWriteIndirectExecutionSetShaderEXT-pInitialShaders-11033
A shader created with the same `VkShaderStageFlagBits` **must** have been passed in the `VkIndirectExecutionSetShaderInfoEXT::pInitialShaders` array
- VUID-VkWriteIndirectExecutionSetShaderEXT-index-11034
`index` **must** not be in use by submitted command buffers

Valid Usage (Implicit)

- VUID-VkWriteIndirectExecutionSetShaderEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_WRITE_INDIRECT_EXECUTION_SET_SHADER_EXT`
- VUID-VkWriteIndirectExecutionSetShaderEXT-shader-parameter
`shader` **must** be a valid `VkShaderEXT` handle

Pipeline elements in an Indirect Execution Set can be updated by calling:

```
// Provided by VK_EXT_device_generated_commands
void vkUpdateIndirectExecutionSetPipelineEXT(
    VkDevice device,
    VkIndirectExecutionSetEXT indirectExecutionSet,
    uint32_t executionSetWriteCount,
    const VkWriteIndirectExecutionSetPipelineEXT* pExecutionSetWrites);
```

- **device** is the logical device that owns the indirect execution set.
- **indirectExecutionSet** is the indirect execution set being updated.
- **executionSetWriteCount** is the number of elements in the **pExecutionSetWrites** array.
- **pExecutionSetWrites** is a pointer to an array of **VkWriteIndirectExecutionSetPipelineEXT** structures describing the elements to update.

Valid Usage

- VUID-vkUpdateIndirectExecutionSetPipelineEXT-indirectExecutionSet-11035
indirectExecutionSet **must** have been created with type **VK_INDIRECT_EXECUTION_SET_INFO_TYPE_PIPELINES_EXT**
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-executionSetWriteCount-11037
executionSetWriteCount **must** be less than or equal to **VkIndirectExecutionSetPipelineInfoEXT::maxPipelineCount**
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-pExecutionSetWrites-11042
Each element in the **pExecutionSetWrites** array must have a unique **VkWriteIndirectExecutionSetPipelineEXT::index**
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-None-11038
Each member of the Indirect Execution Set referenced by the update command **must** not be in use by the device
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11324
If **initialPipeline** was created without **VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT**, each pipeline in **pExecutionSetWrites** **must** also have been created without **VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT**
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11325
If **initialPipeline** was created with **VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT**, each pipeline in **pExecutionSetWrites** **must** also have been created with **VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT**
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-None-11039
If **initialPipeline** was created without **VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT**, the layout of each pipeline in **pExecutionSetWrites** **must** be **compatible** with the **initialPipeline** used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-None-11040

Each pipeline in the Indirect Execution Set **must** have identically defined static and dynamic state values to the **initialPipeline** used to create the Indirect Execution Set

- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11147
Each pipeline in the Indirect Execution Set **must** have identically defined **fragment outputs interface** to the **initialPipeline** used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11152
Each pipeline in the Indirect Execution Set **must** match the **initialPipeline** used to create the Indirect Execution Set in its included shader stages
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11098
Each pipeline in the Indirect Execution Set **must** match the **initialPipeline** used to create the Indirect Execution Set in its use of **FragDepth**
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11086
Each pipeline in the Indirect Execution Set **must** match the **initialPipeline** used to create the Indirect Execution Set in its use of **SampleMask**
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-initialPipeline-11085
Each pipeline in the Indirect Execution Set **must** match the **initialPipeline** used to create the Indirect Execution Set in its use of **StencilExportEXT**

Valid Usage (Implicit)

- VUID-vkUpdateIndirectExecutionSetPipelineEXT-device-parameter **device** **must** be a valid **VkDevice** handle
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-indirectExecutionSet-parameter **indirectExecutionSet** **must** be a valid **VkIndirectExecutionSetEXT** handle
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-pExecutionSetWrites-parameter **pExecutionSetWrites** **must** be a valid pointer to an array of **executionSetWriteCount** valid **VkWriteIndirectExecutionSetPipelineEXT** structures
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-executionSetWriteCount-arraylength **executionSetWriteCount** **must** be greater than 0
- VUID-vkUpdateIndirectExecutionSetPipelineEXT-indirectExecutionSet-parent **indirectExecutionSet** **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **indirectExecutionSet** **must** be externally synchronized

Shader object elements in an Indirect Execution Set can be updated by calling:

```
// Provided by VK_EXT_device_generated_commands
void vkUpdateIndirectExecutionSetShaderEXT(
    VkDevice                                device,
    VkIndirectExecutionSetEXT               indirectExecutionSet,
    uint32_t                                executionSetWriteCount,
    const VkWriteIndirectExecutionSetShaderEXT* pExecutionSetWrites);
```

- **device** is the logical device that owns the indirect execution set.
- **indirectExecutionSet** is the indirect execution set being updated.
- **executionSetWriteCount** is the number of elements in the **pExecutionSetWrites** array.
- **pExecutionSetWrites** is a pointer to an array of **VkWriteIndirectExecutionSetShaderEXT** structures describing the elements to update.

Valid Usage

- VUID-vkUpdateIndirectExecutionSetShaderEXT-indirectExecutionSet-11041
indirectExecutionSet **must** have been created with type **VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT**
- VUID-vkUpdateIndirectExecutionSetShaderEXT-pExecutionSetWrites-11043
Each element in the **pExecutionSetWrites** array must have a unique **VkWriteIndirectExecutionSetShaderEXT::index**
- VUID-vkUpdateIndirectExecutionSetShaderEXT-None-11044
Each member of the Indirect Execution Set referenced by the update command **must** not be in use by the device
- VUID-vkUpdateIndirectExecutionSetShaderEXT-pInitialShaders-11326
If the shaders in **pInitialShaders** were created without **VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT**, each shader in **pExecutionSetWrites** **must** also have been created without **VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT**
- VUID-vkUpdateIndirectExecutionSetShaderEXT-pInitialShaders-11327
If the shaders in **pInitialShaders** were created with **VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT**, each pipeline in **pExecutionSetWrites** **must** also have been created with **VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT**
- VUID-vkUpdateIndirectExecutionSetShaderEXT-pExecutionSetWrites-11140
If the shaders in **pInitialShaders** were created without **VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT**, the descriptor layout of each shader in **pExecutionSetWrites** **must** be **compatible** with the initial layout info used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetShaderEXT-None-11148
Each fragment shader element in the Indirect Execution Set **must** have **identically defined fragment outputs interface** to the initial shader state used to create the Indirect Execution Set
- VUID-vkUpdateIndirectExecutionSetShaderEXT-FragDepth-11054
Each fragment shader element in the Indirect Execution Set **must** match the initial shader

state used to create the Indirect Execution Set in its use of **FragDepth**

- VUID-vkUpdateIndirectExecutionSetShaderEXT-SampleMask-11050

Each fragment shader element in the Indirect Execution Set **must** match the initial shader state used to create the Indirect Execution Set in its use of **SampleMask**

- VUID-vkUpdateIndirectExecutionSetShaderEXT-StencilExportEXT-11003

Each fragment shader element in the Indirect Execution Set **must** match the initial shader state used to create the Indirect Execution Set in its use of **StencilExportEXT**

Valid Usage (Implicit)

- VUID-vkUpdateIndirectExecutionSetShaderEXT-device-parameter **device** **must** be a valid **VkDevice** handle
- VUID-vkUpdateIndirectExecutionSetShaderEXT-indirectExecutionSet-parameter **indirectExecutionSet** **must** be a valid **VkIndirectExecutionSetEXT** handle
- VUID-vkUpdateIndirectExecutionSetShaderEXT-pExecutionSetWrites-parameter **pExecutionSetWrites** **must** be a valid pointer to an array of **executionSetWriteCount** valid **VkWriteIndirectExecutionSetShaderEXT** structures
- VUID-vkUpdateIndirectExecutionSetShaderEXT-executionSetWriteCount-arraylength **executionSetWriteCount** **must** be greater than 0
- VUID-vkUpdateIndirectExecutionSetShaderEXT-indirectExecutionSet-parent **indirectExecutionSet** **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **indirectExecutionSet** **must** be externally synchronized

It is legal to update an Indirect Execution Set that is in flight as long as the element indices in **pExecutionSetWrites** are not in use. Any change to an indirect execution set requires recalculating memory requirements by calling **vkGetGeneratedCommandsMemoryRequirementsEXT** for commands that use that modified state. Commands that are in flight or those not using updated elements require no changes.

The lifetimes of pipelines and shader objects contained in a set **must** match or exceed the lifetime of the set.

With **VK_EXT_device_generated_commands**, the actual generation of commands as well as their execution on the device is handled as single action with:

```
// Provided by VK_EXT_device_generated_commands
void vkCmdExecuteGeneratedCommandsEXT(
    VkCommandBuffer                      commandBuffer,
    VkBool32                             isPreprocessed,
    const VkGeneratedCommandsInfoEXT*    pGeneratedCommandsInfo);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **isPreprocessed** represents whether the input data has already been preprocessed on the device. If it is **VK_FALSE** this command will implicitly trigger the preprocessing step, otherwise not.
- **pGeneratedCommandsInfo** is a pointer to a **VkGeneratedCommandsInfoEXT** structure containing parameters affecting the generation of commands.

If the **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_EXT** flag was used to create the **VkGeneratedCommandsInfoEXT::indirectCommandsLayout** then the execution of sequences through this command **may** use implementation-defined ordering which is not guaranteed to be coherent using the same input data. It does not affect the order of token processing within a sequence. This is the implied ordering with **VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_EXT**.

After a call to **vkCmdExecuteGeneratedCommandsEXT**, command buffer state will become undefined according to the tokens executed. This table specifies the relationship between tokens used and state invalidation.

Table 46. Indirect Execution State Invalidation

Common Tokens	States Invalidated
VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT	Bound shaders and pipelines
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT	Push constant data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT	Push constant data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_EXT	Push data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_DATA_SEQUENCE_INDEX_EXT	Push data
VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_EXT	Index buffer
VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT	Vertex buffer

Valid Usage

- VUID-vkCmdExecuteGeneratedCommandsEXT-magFilter-04553

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-magFilter-09598

If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-mipmapMode-04770

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-mipmapMode-09599

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-unnormalizedCoordinates-09635

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08609

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08610

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08611

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06479

If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-02691
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07888
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-02693
If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it **must** not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`
- VUID-vkCmdExecuteGeneratedCommandsEXT-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdExecuteGeneratedCommandsEXT-filterCubicMinmax-02695
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07027
For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's `format features` **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07028
For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's `format features` **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07029
For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's `buffer features` **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07030
Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's `buffer features` **must** contain

VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08600

If a [a bound shader](#) was created with a pipeline layout and statically uses a set n , a descriptor set **must** have been bound to n at the same pipeline bind point, with layouts compatible for set n with the layout(s) used to create the shader, as described in [Pipeline Layout Compatibility](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08601

If a [a bound shader](#) was created with a pipeline layout or specified push constant ranges and statically uses a push constant value, that value **must** have been set for the same pipeline bind point, with push constant ranges that are [compatible](#) with the push constant range used to create the shader

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10068

For each array of resources that is used by [a bound shader](#), the indices used to access members of the array **must** be less than the descriptor count for the identified binding in the descriptor sets used by this command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08114

Descriptors in each bound descriptor set, specified via [vkCmdBindDescriptorSets](#), **must** be valid if they are accessed as described by [descriptor validity](#) by the [VkPipeline](#) bound to the pipeline bind point used by this command and the bound [VkPipeline](#) was not created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageLayout-00344

If an image descriptor is accessed by a shader, the [VkImageLayout](#) **must** match the subresource accessible from the [VkImageView](#) as defined by the [image layout matching rules](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08115

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdBindDescriptorSets](#), the bound [VkPipeline](#) **must** have been created without [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08116

Descriptors in bound descriptor buffers, specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), **must** be valid if they are dynamically accessed

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08117

If the descriptors used by the [VkPipeline](#) bound to the pipeline bind point were specified via [vkCmdSetDescriptorBufferOffsetsEXT](#), the bound [VkPipeline](#) **must** have been created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08119

If a descriptor is dynamically used with a [VkPipeline](#) created with [VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08605

If a descriptor is dynamically used with a [VkShaderEXT](#) created with a [VkDescriptorSetLayout](#) that was created with [VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT](#), the descriptor memory **must** be resident

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08606
If the **shaderObject** feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08608
If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state specified statically in the **VkPipeline** object bound to the pipeline bind point used by this command, since that pipeline was bound
- VUID-vkCmdExecuteGeneratedCommandsEXT-uniformBuffers-06935
If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS** or **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2** for **uniformBuffers**, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08612
If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsEXT-storageBuffers-06936
If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS** or **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2** for **storageBuffers**, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08613
If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-02707
If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by **bound shaders** **must** not be a protected resource
- VUID-vkCmdExecuteGeneratedCommandsEXT-viewType-07752
If a **VkImageView** is accessed as a result of this command, then the image view's **viewType** **must** match the **Dim** operand of the **OpTypeImage** as described in **Compatibility Between SPIR-V Image Dimensions and Vulkan ImageView Types**
- VUID-vkCmdExecuteGeneratedCommandsEXT-format-07753
If a **VkImageView** or **VkBufferView** is accessed as a result of this command, then the **numeric type** of the view's **format** and the **Sampled Type** operand of the **OpTypeImage** **must** match

- VUID-vkCmdExecuteGeneratedCommandsEXT-OpImageWrite-08795
If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpImageWrite-08796
If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components
- VUID-vkCmdExecuteGeneratedCommandsEXT-OpImageWrite-04469
If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format
- VUID-vkCmdExecuteGeneratedCommandsEXT-SampledType-04470
If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdExecuteGeneratedCommandsEXT-SampledType-04471
If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdExecuteGeneratedCommandsEXT-SampledType-04472
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
- VUID-vkCmdExecuteGeneratedCommandsEXT-SampledType-04473
If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32
- VUID-vkCmdExecuteGeneratedCommandsEXT-sparseImageInt64Atomics-04474
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07288
Any shader invocation executed by this command **must** `terminate`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09600
If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, all

image subresources identified by that descriptor **must** be in the image layout identified when the descriptor was written

- VUID-vkCmdExecuteGeneratedCommandsEXT-micromap-11636

If an acceleration structure is accessed as a result of this command through an [OpRayQueryProceedKHR](#) operation, the [VK_EXT_opacity_micromap](#) extension is not enabled, and the acceleration structure is built using geometry with a [VkAccelerationStructureTrianglesOpacityMicromapKHR](#) structure included in its [pNext](#) chain, the shader **must** have specified a [OpacityMicromapIdKHR](#) execution mode with its specialization constant operand equal to [VK_TRUE](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-micromap-11637

If an acceleration structure is accessed as a result of this command and the acceleration structure was constructed through deserialization, all micromap arrays referenced by the acceleration structure that were not replaced by an acceleration structure update command **must** have been deserialized using the serialized data of the corresponding micromaps used to originally build the acceleration structure prior to the execution of this command on the device

- VUID-vkCmdExecuteGeneratedCommandsEXT-micromap-11638

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkPipeline](#) bound to the pipeline bind point used by this command **must** not have been created with [flags](#) that includes [VK_PIPELINE_CREATE_2_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_KHR](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-micromap-11639

If an acceleration structure is accessed as a result of this command and the acceleration structure is built using geometry with an [indexBuffer](#) containing both [VkOpacityMicromapSpecialIndexKHR](#) values and indices into an associated micromap array, any [VkShaderEXT](#) that accessed the descriptor **must** not have been created with [flags](#) that includes [VK_SHADER_CREATE_OPACITY_MICROMAP_DISALLOW_MIXED_SPECIAL_INDEX_BIT_EXT](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-12472

Descriptors dynamically accessed in bound descriptor heaps **must** be valid

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11297

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a [OpTypeStruct](#) decorated with [Block](#) or [BufferBlock](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [bufferDescriptorAlignment](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11298

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#)

using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeImage](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the resource heap **must** be a multiple of [imageDescriptorAlignment](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11299

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_PUSH_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_SHADER_RECORD_INDEX_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses an [OpTypeSampler](#) or [OpTypeSampledImage](#) using that mapping, the calculated offset for the sampler heap **must** be a multiple of [samplerDescriptorAlignment](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11300

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 4

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11301

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11302

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11304

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a multiple of 8

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11305

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#)

using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address at the expected location in push data **must** be a valid [VkDeviceAddress](#) backed by physical memory at every offset specified by each mapping

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11306

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a resource using that mapping, the value of the address pointed to by the address in push data **must** be a valid [VkDeviceAddress](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11308

For each [descriptor heap](#) that is statically used by a [bound shader](#), either directly or via a [descriptor mapping](#), a valid descriptor heap **must** be bound

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11309

If a [bound shader](#) was created as a [VkShaderEXT](#) with the [VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT](#) flag or as part of a pipeline with the [VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT](#) flag, execution of this command **must** not result in any descriptor read accessing data outside of the user range of the respective heap bound by [vkCmdBind*HeapEXT](#) commands

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11372

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a uniform buffer or uniform texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [uniformBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified via [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11373

If any stage of the [VkPipeline](#) object bound to the pipeline bind point used by this command accesses a storage buffer or storage texel buffer through a descriptor in the bound resource heap, that stage was created without enabling either [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS](#) or [VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2](#) for [storageBuffers](#), the [robustBufferAccess2](#) feature is not enabled, and the [robustBufferAccess](#) feature is not enabled, that stage **must** not access values outside of the range of the descriptor specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11374

If the [robustBufferAccess2](#) feature is not enabled, the [robustBufferAccess](#) feature is not enabled, and any [VkShaderEXT](#) bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, uniform texel buffer, storage buffer, or storage texel buffer, that shader **must** not access values outside of the range of the buffer as specified by [VkDeviceAddressRangeKHR](#) when the descriptor was written

- VUID-vkCmdExecuteGeneratedCommandsEXT-pBindInfo-11375

If any [bound shader](#) uses an embedded sampler via a [descriptor mapping](#), the value of

pBindInfo->reservedRangeSize set for vkCmdBindSamplerHeapEXT **must** be greater than or equal to minSamplerHeapReservedRangeWithEmbedded

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11376

If a bound shader was created as a VkShaderEXT with the VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT flag or as part of a pipeline with the VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT flag, and that shader statically uses a push constant value, that value **must** have been set by vkCmdPushDataEXT

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11398

If a bound shader was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_DATA_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_DATA_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a resource using that mapping, the access **must** not be out of bounds

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11437

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a resource using that mapping, the buffer from which the address in push data was queried **must** have been created with the VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT usage flag set

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11438

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** have been queried from a buffer created with the VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT usage flag set

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11441

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a descriptor mapping using VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT, VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT, or VK_DESCRIPTOR_MAPPING_SOURCE_RESOURCE_HEAP_DATA_EXT and a shader accesses a uniform buffer using that mapping, the address that the uniform buffer is mapped to **must** be aligned to minUniformBufferOffsetAlignment

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11439

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound

to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** have been queried from a buffer created with the [VK_BUFFER_USAGE_STORAGE_BUFFER_BIT](#) usage flag set

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11442

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses a storage buffer using that mapping, the address that the storage buffer is mapped to **must** be aligned to [minStorageBufferOffsetAlignment](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11485

If a pipeline is bound to the pipeline bind point used by this command, or shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), and a shader accesses an acceleration structure using that mapping, the address that the acceleration structure is mapped to **must** be an acceleration structure address retrieved from a [VkAccelerationStructureKHR](#) object via [vkGetAccelerationStructureDeviceAddressKHR](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-index-11450

If a shader uses a sampler descriptor to sample an image as a result of this command, and that sampler descriptor uses a custom border color with an index defined by [VkSamplerCustomBorderColorIndexCreateInfoEXT](#), the value of [VkSamplerCustomBorderColorIndexCreateInfoEXT::index](#) **must** have been registered before this command was recorded, and still be registered during the sampling operation, with an identically defined color

- VUID-vkCmdExecuteGeneratedCommandsEXT-protectedNoFault-11455

If [protectedNoFault](#) is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_PUSH_ADDRESS_EXT](#), [VK_DESCRIPTOR_MAPPING_SOURCE_SHADER_RECORD_ADDRESS_EXT](#), or [VK_DESCRIPTOR_MAPPING_SOURCE_INDIRECT_ADDRESS_EXT](#), the address that the resource is mapped to **must** have been queried from a buffer created without the [VK_BUFFER_CREATE_PROTECTED_BIT](#) create flag set

- VUID-vkCmdExecuteGeneratedCommandsEXT-protectedNoFault-11456

If [protectedNoFault](#) is not supported, a pipeline is bound to the pipeline bind point used by this command, or a shader is bound to a shader stage used by this command, and it was created with a [descriptor mapping](#) using [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_EXT](#) or [VK_DESCRIPTOR_MAPPING_SOURCE_HEAP_WITH_INDIRECT_INDEX_ARRAY_EXT](#), the

address of the indirect memory **must** have been queried from a buffer created without the `VK_BUFFER_CREATE_PROTECTED_BIT` create flag set

- VUID-vkCmdExecuteGeneratedCommandsEXT-renderPass-02684

The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdExecuteGeneratedCommandsEXT-subpass-02685

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdExecuteGeneratedCommandsEXT-OpTypeImage-07468

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07469

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments` [`InputAttachmentIndex`] in the bound `VkFramebuffer` as specified by `Fragment Input Attachment Compatibility`

- VUID-vkCmdExecuteGeneratedCommandsEXT-pDepthInputAttachmentIndex-09595

Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfo`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` are `NULL`, **must** be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`

- VUID-vkCmdExecuteGeneratedCommandsEXT-pDepthInputAttachmentIndex-09596

Input attachment views accessed in a dynamic render pass via a shader object **must** have an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` are non-`NULL`

- VUID-vkCmdExecuteGeneratedCommandsEXT-InputAttachmentIndex-09597

If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` **must** match an index in `VkRenderingInputAttachmentIndexInfo`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06537

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10795

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and `feedback loop` is not enabled for `VK_IMAGE_ASPECT_COLOR_BIT` on that attachment, it **must** not be accessed in any way other than as an attachment by this command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10796
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10797
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, it **must** not be accessed in any way other than as an attachment by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-12338
If a color attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_COLOR_BIT](#) on that attachment, the color attachment **must** not be written to by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-12339
If a depth attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_DEPTH_BIT](#) on that attachment, the depth attachment **must** not be written to by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-12340
If a stencil attachment is read in this command in any way other than as an attachment, or has been read by any prior command in this subpass as a non-attachment, and [feedback loop](#) is not enabled for [VK_IMAGE_ASPECT_STENCIL_BIT](#) on that attachment, the stencil attachment **must** not be written to by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, [depth writes](#) **must** be disabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back [writeMask](#) are not zero, and stencil test is enabled, [all stencil ops](#) **must** be [VK_STENCIL_OP_KEEP](#)
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07831
If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_VIEWPORT](#) dynamic state enabled then [vkCmdSetViewport](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07832
If the bound graphics pipeline state was created with the [VK_DYNAMIC_STATE_SCISSOR](#) dynamic state enabled then [vkCmdSetScissor](#) **must** have been called and not

subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08617

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **effective rasterization input topology** is in the line topology class, then **vkCmdSetLineWidth** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07834

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBiasEnable** is **VK_TRUE**, then **vkCmdSetDepthBias** or **vkCmdSetDepthBias2EXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07835

If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_BLEND_CONSTANTS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and an active color attachment **current value** of **blendEnable** is **VK_TRUE** with a blend equations where any **VkBlendFactor** member is **VK_BLEND_FACTOR_CONSTANT_COLOR**, **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR**, **VK_BLEND_FACTOR_CONSTANT_ALPHA**, or **VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA**, then **vkCmdSetBlendConstants** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07836

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_BOUNDS** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **depthBoundsTestEnable** is **VK_TRUE**, then **vkCmdSetDepthBounds** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07837

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **stencilTestEnable** is **VK_TRUE**, then **vkCmdSetStencilCompareMask** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07838

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **stencilTestEnable** is **VK_TRUE**, then **vkCmdSetStencilWriteMask** **must** have been called

and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07839

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_STENCIL_REFERENCE** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, the **current value** of **stencilTestEnable** is **VK_TRUE**, then **vkCmdSetStencilReference** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-maxMultiviewInstanceIndex-02688

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to **VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex**

- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-02689

If the bound graphics pipeline was created with **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** set to **VK_TRUE**, then the active depth attachment **must** have been created with the **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** bit set

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07634

If the **VK_EXT_sample_locations** extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT** dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, then **vkCmdSetSampleLocationsEnableEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-06666

If the **VK_EXT_sample_locations** extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** dynamic state enabled, the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, and the **current value** of **sampleLocationsEnable** is **VK_TRUE**, then **vkCmdSetSampleLocationsEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07840

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_CULL_MODE** dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, then **vkCmdSetCullMode** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07841

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_FRONT_FACE** dynamic state enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, then **vkCmdSetFrontFace** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07843

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, `vkCmdSetDepthTestEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07844

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthWriteEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07845

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and the **current value** of `depthTestEnable` is `VK_TRUE`, then `vkCmdSetDepthCompareOp` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07846

If the `depthBounds` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07847

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, and the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetStencilTestEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07848

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, the **current value** of `stencilTestEnable` is `VK_TRUE`, then `vkCmdSetStencilOp` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-viewportCount-03417

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-scissorCount-03418

If a shader object is bound to any graphics stage or a graphics pipeline is bound which

was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing

- VUID-vkCmdExecuteGeneratedCommandsEXT-viewportCount-03419

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled, then the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-04876

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-04877

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-logicOp-04878

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `logicOpEnable` is `VK_TRUE`, then `vkCmdSetLogicOpEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-primitiveFragmentShadingRateWithMultipleViewports-04552

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdExecuteGeneratedCommandsEXT-primitiveFragmentShadingRateWithMultipleViewports-08642

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1

- VUID-vkCmdExecuteGeneratedCommandsEXT-blendEnable-04727

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics

pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, then for each color attachment, if the corresponding image view's **format features** do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding **current value** of `blendEnable` **must** be `VK_FALSE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08644

If a shader object is bound to any graphics stage or a graphics pipeline is bound, the **current value** of `rasterizerDiscardEnable` is `VK_FALSE`, and none of the following is enabled:

- the `multisampledRenderToSingleSampled` feature

then the **current value** of `rasterizationSamples` **must** be the same as the current color and/or depth/stencil attachments

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08876

If a shader object is bound to any graphics stage, the current render pass instance **must** have been begun with `vkCmdBeginRendering`

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06172

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06173

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06174

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06175

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06176

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06177
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment
- VUID-vkCmdExecuteGeneratedCommandsEXT-viewMask-06178
If the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`
- VUID-vkCmdExecuteGeneratedCommandsEXT-colorAttachmentCount-06179
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08910
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08912
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08911
If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07749
If the `colorWriteEnable` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state

enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-attachmentCount-07750

If the `colorWriteEnable` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer **must** be greater than or equal to the number of active color attachments

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07751

If the `VK_EXT_discard_rectangles` extension is enabled, a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled and the `pNext` chain of `VkGraphicsPipelineCreateInfo` included a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`

- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizerDiscardEnable-09236

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled and the `pNext` chain of `VkGraphicsPipelineCreateInfo` did not include a `VkPipelineDiscardRectangleStateCreateInfoEXT` structure, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for each discard rectangle in `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07880

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07881

If the `VK_EXT_discard_rectangles` extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and the `current value` of `discardRectangleEnable` is `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this

drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08913

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08914

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08915

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08916

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08917

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-08918

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the bound

graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06183

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingLocalRead-11797

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingLocalRead` feature is enabled, the `VK_RENDERING_LOCAL_READ_CONCURRENT_ACCESS_CONTROL_BIT_KHR` flag is specified, and an attachment is being used as a feedback loop as specified by `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`, `VkRenderingAttachmentFlagsInfoKHR::flags` for that attachment **must** include `VK_RENDERING_ATTACHMENT_INPUT_ATTACHMENT_FEEDBACK_BIT_KHR`

- VUID-vkCmdExecuteGeneratedCommandsEXT-imageView-06184

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-multisampledRenderToSingleSampled-07285

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsEXT-multisampledRenderToSingleSampled-07286

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdExecuteGeneratedCommandsEXT-multisampledRenderToSingleSampled-07287

If the `multisampledRenderToSingleSampled` feature is not enabled, and `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdExecuteGeneratedCommandsEXT-pNext-07935
If this command is called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`
- VUID-vkCmdExecuteGeneratedCommandsEXT-renderPass-06198
If the current render pass instance was begun with `vkCmdBeginRendering`, the bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`
- VUID-vkCmdExecuteGeneratedCommandsEXT-pColorAttachments-08963
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteGeneratedCommandsEXT-pColorAttachments-11539
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->resolveImageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteGeneratedCommandsEXT-pDepthAttachment-08964
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteGeneratedCommandsEXT-pDepthAttachment-11540
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, depth test is enabled, and the `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteGeneratedCommandsEXT-pStencilAttachment-08965
If the current render pass instance was begun with `vkCmdBeginRendering`,

`vkCmdBeginCustomResolveEXT` has not yet been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-pStencilAttachment-11860

If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, then the `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the pipeline **must** not be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-flags-10582

If the current render pass instance was begun with a `vkCmdBeginRendering` call in `commandBuffer`, its `VkRenderingInfo::flags` parameter **must** not have `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` set unless `VK_RENDERING_CONTENTS_INLINE_BIT_KHR` is also set

- VUID-vkCmdExecuteGeneratedCommandsEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, `rasterization discard` **must** not be enabled

- VUID-vkCmdExecuteGeneratedCommandsEXT-primitivesGeneratedQueryWithNonZeroStreams-06709

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07620

If the `depthClamp` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07621

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetPolygonModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07622

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then

`vkCmdSetRasterizationSamplesEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07623

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetSampleMaskEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-alphaToCoverageEnable-08919

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location 0` at `Index 0`

- VUID-vkCmdExecuteGeneratedCommandsEXT-alphaToCoverageEnable-08920

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the `Fragment Output Interface` **must** contain a variable for the alpha `Component` word in `Location 0` at `Index 0`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07624

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07625

If the `alphaToOne` feature is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07626

If the `logicOp` feature is enabled, a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07627

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` **must** have been called and not subsequently

[invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07629

If a shader object is bound to the [VK_SHADER_STAGE_FRAGMENT_BIT](#) stage or a graphics pipeline is bound which was created with [VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and there are color attachments bound, then [vkCmdSetColorWriteMaskEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07630

If the [geometryStreams](#) feature is enabled, and a shader object is bound to the [VK_SHADER_STAGE_GEOMETRY_BIT](#) stage or a graphics pipeline is bound which was created with both a [VK_SHADER_STAGE_GEOMETRY_BIT](#) stage and the [VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT](#) dynamic state enabled, then [vkCmdSetRasterizationStreamEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07631

If the [VK_EXT_conservative_rasterization](#) extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT](#) dynamic state enabled, and the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), then [vkCmdSetConservativeRasterizationModeEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07632

If the [VK_EXT_conservative_rasterization](#) extension is enabled, a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT](#) dynamic state enabled, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [current value](#) of [conservativeRasterizationMode](#) is [VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT](#), then [vkCmdSetExtraPrimitiveOverestimationSizeEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-conservativePointAndLineRasterization-07499

If the [VK_EXT_conservative_rasterization](#) extension is enabled, [conservativePointAndLineRasterization](#) is not supported, a shader object is bound to any graphics stage or a graphics pipeline is bound, the [current value](#) of [rasterizerDiscardEnable](#) is [VK_FALSE](#), and the [effective rasterization input topology](#) is in the line or point topology class, then the [current value](#) of [conservativeRasterizationMode](#) **must** be [VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT](#)

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07633

If the [depthClipEnable](#) feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the [VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT](#) dynamic state, then [vkCmdSetDepthClipEnableEXT](#) **must** have been called and not subsequently [invalidated](#) in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07636

If the `VK_EXT_provoking_vertex` extension is enabled, a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08666

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineRasterizationModeEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08669

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the effective rasterization input topology is in the line topology class, then `vkCmdSetLineStippleEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07849

If any of the `stippledRectangularLines`, `stippledBresenhamLines` or `stippledSmoothLines` features are enabled and a shader object is bound to any graphics stage, or a bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE` dynamic state enabled, the current value of `rasterizerDiscardEnable` is `VK_FALSE`, and the current value of `stippledLineEnable` is `VK_TRUE`, then `vkCmdSetLineStipple` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10608

If a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled, the effective rasterization input topology is in the line topology class, and the current `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the current `alphaToCoverageEnable`, `alphaToOneEnable` and `sampleShadingEnable` states **must** all be `VK_FALSE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-07639

If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled, then `vkCmdSetDepthClipNegativeOneToOneEXT` **must** have been called and not

subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09650

If the **depthClampControl** feature is enabled, and a shader object is bound to any graphics stage or a graphics pipeline is bound which was created with the **VK_DYNAMIC_STATE_DEPTH_CLAMP_RANGE_EXT** dynamic state enabled, and the **current value** of **depthClampEnable** is **VK_TRUE**, then **vkCmdSetDepthClampRangeEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizationSamples-07471

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the **rasterizationSamples** in the last call to **vkCmdSetRasterizationSamplesEXT** **must** follow the rules for a **zero-attachment subpass**

- VUID-vkCmdExecuteGeneratedCommandsEXT-samples-07472

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** state enabled and the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state disabled, then the **samples** parameter in the last call to **vkCmdSetSampleMaskEXT** **must** be greater or equal to the **VkPipelineMultisampleStateCreateInfo::rasterizationSamples** parameter used to create the bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsEXT-samples-07473

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** state and **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** states enabled, then the **samples** parameter in the last call to **vkCmdSetSampleMaskEXT** **must** be greater or equal to the **rasterizationSamples** parameter in the last call to **vkCmdSetRasterizationSamplesEXT**

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09211

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a **VkMultisampledRenderToSingleSampledInfoEXT** structure with **multisampledRenderToSingleSampledEnable** equal to **VK_TRUE**, then the **rasterizationSamples** in the last call to **vkCmdSetRasterizationSamplesEXT** **must** be the same as the **rasterizationSamples** member of that structure

- VUID-vkCmdExecuteGeneratedCommandsEXT-firstAttachment-07476

If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage or a graphics pipeline is bound was created with the **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** dynamic states enabled, and the **current value** of **rasterizerDiscardEnable** is **VK_FALSE**, then the last call to **vkCmdSetColorBlendEnableEXT** in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdExecuteGeneratedCommandsEXT-firstAttachment-07478

If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage or a graphics pipeline is bound was created with the **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT**

dynamic states enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then the last call to `vkCmdSetColorWriteMaskEXT` in the current command buffer prior to this drawing command **must** have set a value for all active color attachments

- VUID-vkCmdExecuteGeneratedCommandsEXT-advancedBlendMaxColorAttachments-07480

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled, the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, and an active color attachment `current value` of `blendEnable` is `VK_TRUE`, then the number of active color attachments **must** not exceed `advancedBlendMaxColorAttachments`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10862

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable current value` of `VK_TRUE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-rasterizerDiscardEnable-10863

If a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, but not the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetColorBlendAdvancedEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable current value` of `VK_TRUE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10864

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound was created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled, and the `current value` of `rasterizerDiscardEnable` is `VK_FALSE`, then either `vkCmdSetColorBlendAdvancedEXT` or `vkCmdSetColorBlendEquationEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command for all active color attachments with the `blendEnable current value` of `VK_TRUE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-primitivesGeneratedQueryWithNonZeroStreams-07481

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` **must** have set the `rasterizationStream` to zero

- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsPerPixel-07482

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, and the current value of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with

- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsPerPixel-07483

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current value of `sampleLocationsEnable` is `VK_TRUE`, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` **must** equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07484

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT` then the current active depth attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07485

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07486

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.maxSampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07487
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07936
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the **current** value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.width` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07937
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the **current** value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationGridSize.height` **must** evenly divide `VkMultisamplePropertiesEXT::maxSampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-sampleLocationsEnable-07938
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the **current** value of `sampleLocationsEnable` is `VK_TRUE`, then `sampleLocationsInfo.sampleLocationsPerPixel` **must** equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-stippledLineEnable-07495
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR`, then the `stippledRectangularLines` feature **must** be enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-stippledLineEnable-07496
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM`, then the `stippledBresenhamLines` feature **must** be enabled

- VUID-vkCmdExecuteGeneratedCommandsEXT-stippledLineEnable-07497
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH`, then the `stippledSmoothLines` feature **must** be enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-stippledLineEnable-07498
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`
- VUID-vkCmdExecuteGeneratedCommandsEXT-stage-07073
If the bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then `Mesh Shader Queries` **must** not be active
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08877
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage or a graphics pipeline is bound which was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state enabled, and the current value of `rasterizerDiscardEnable` is `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
- VUID-vkCmdExecuteGeneratedCommandsEXT-nextStage-10745
For each shader object bound to a graphics stage, except for shader object bound to the last graphics stage in the logical pipeline, it **must** have been created with a `nextStage` including the corresponding bit to the shader object bound to the following graphics stage in the logical pipeline
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08684
If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08685
If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08686
If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08687

If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08688

If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08689

If there is no bound graphics pipeline, and the `taskShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TASK_BIT_EXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08690

If there is no bound graphics pipeline, and the `meshShader` feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08693

If there is no bound graphics pipeline, and at least one of the `taskShader` and `meshShader` features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages **must** have a valid `VkShaderEXT` bound, and the other **must** have no `VkShaderEXT` bound

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08696

If there is no bound graphics pipeline, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, there **must** be no `VkShaderEXT` bound to either the `VK_SHADER_STAGE_TASK_BIT_EXT` stage or the `VK_SHADER_STAGE_MESH_BIT_EXT` stage

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08698

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call **must** also be bound

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08699

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call **must** not have any `VkShaderEXT` bound

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08878

All bound graphics shader objects **must** have been created with identical or `identically defined` push constant ranges

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-08879

All bound graphics shader objects **must** have either been created with the `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT` flag set, or with identical or `identically defined` arrays of descriptor set layouts

- VUID-vkCmdExecuteGeneratedCommandsEXT-pDynamicStates-08715

If the bound graphics pipeline state includes a fragment shader stage, was created with

`VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` **must** be `VK_FALSE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-pDynamicStates-08716

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` **must** be `0`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09116

If a shader object is bound to any graphics stage or the bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` **must** either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, `VK_COLOR_COMPONENT_B_BIT`, and `VK_COLOR_COMPONENT_A_BIT`, or none of them

- VUID-vkCmdExecuteGeneratedCommandsEXT-maxFragmentDualSrcAttachments-09239

If `blending` is enabled for any attachment where either the source or destination blend factors for that attachment [use the secondary color input](#), the maximum value of `Location` for any output attachment [statically used](#) in the `Fragment Execution Model` executed by this command **must** be less than `maxFragmentDualSrcAttachments`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09548

If the current render pass was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfo::pColorAttachmentLocations` in the bound pipeline **must** match the value for the corresponding locations set currently in the current render pass instance

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09549

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingInputAttachmentIndexInfo::pColorAttachmentInputIndices` in the bound pipeline **must** match the value for the corresponding index set currently in the current render pass instance

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10927

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of `VkRenderingInputAttachmentIndexInfo::pDepthInputAttachmentIndex` in the bound pipeline **must** match the value set currently in the current render pass instance

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10928

If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of `VkRenderingInputAttachmentIndexInfo::pStencilInputAttachmentIndex` in the bound pipeline **must** match the value set currently in the current render pass instance

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09642

If the current render pass was begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag, the bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-09643

If the bound graphics pipeline was created with `VK_PIPELINE_CREATE_2_ENABLE_LEGACY_DITHERING_BIT_EXT`, the current render pass **must** have begun with `vkCmdBeginRendering` with the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flag

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-10772

If a shader object is bound to any graphics stage, *multiview* functionality **must** not be enabled in the current render pass

- VUID-vkCmdExecuteGeneratedCommandsEXT-flags-11521

If current render pass instance was begun with `vkCmdBeginRendering` with `VkRenderingInfo::flags` which includes `VK_RENDERING_FRAGMENT_REGION_BIT_EXT`, and if *sample shading* is enabled (explicitly or implicitly), then the minimum fraction for sample shading **must** equal 0.0

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11522

If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and the *dynamicRenderingUnusedAttachments* feature is not enabled, the graphics pipeline bound **must** have been created with a `VkCustomResolveCreateInfoEXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11523

If the current render pass instance was begun with `vkCmdBeginRendering` and does not contain a custom resolve, and the *dynamicRenderingUnusedAttachments* feature is not enabled, the graphics pipeline bound **must** not have been created with a `VkCustomResolveCreateInfoEXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-customResolve-11524

If the current render pass instance was begun with `vkCmdBeginRendering` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-customResolve-11525

If the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, and `vkCmdBeginCustomResolveEXT` has not been recorded in the render pass instance, the graphics pipeline bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11861

If the *dynamicRenderingUnusedAttachments* feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, the bound graphics pipeline **must** have been created with a `VkCustomResolveCreateInfoEXT::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11862

If the *dynamicRenderingUnusedAttachments* feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and

`VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11863

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-11864

If the `dynamicRenderingUnusedAttachments` feature is enabled, the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `resolveImageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats` used to create the bound graphics pipeline, or the corresponding element of `VkCustomResolveCreateInfoEXT::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11865

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11866

If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`

- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-11867

If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::depthAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11868
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11869
If current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`
- VUID-vkCmdExecuteGeneratedCommandsEXT-dynamicRenderingUnusedAttachments-11870
If the current render pass instance was begun with `vkCmdBeginRendering`, it contains a custom resolve, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, and the value of `VkCustomResolveCreateInfoEXT::stencilAttachmentFormat` used to create the bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`
- VUID-vkCmdExecuteGeneratedCommandsEXT-colorAttachmentCount-11871
If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than `0` and `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, then for each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE`, the `resolveImageView` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the bound graphics pipeline
- VUID-vkCmdExecuteGeneratedCommandsEXT-pDepthAttachment-11872
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, and `VkRenderingInfo::pDepthAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->resolveImageView`
- VUID-vkCmdExecuteGeneratedCommandsEXT-pStencilAttachment-11873
If the current render pass instance was begun with `vkCmdBeginRendering`, `vkCmdBeginCustomResolveEXT` has been recorded in the render pass instance, `VkRenderingInfo::pStencilAttachment->resolveImageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->resolveImageView`
- VUID-vkCmdExecuteGeneratedCommandsEXT-customResolve-11529
If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering`, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has been called, then the fragment shader object bound

must have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_TRUE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-customResolve-11530

If a shader object is bound to the fragment stage, the current render pass instance was begun with `vkCmdBeginRendering` and contains a custom resolve, a fragment density map attachment is active, and `vkCmdBeginCustomResolveEXT` has not yet been called, then the fragment shader object bound **must** have been created with `VkCustomResolveCreateInfoEXT::customResolve` as `VK_FALSE`

- VUID-vkCmdExecuteGeneratedCommandsEXT-flags-13361

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, then all bound shader objects **must** have been created with the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit

- VUID-vkCmdExecuteGeneratedCommandsEXT-flags-13362

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `setLayoutCount` not equal to 0, and with `pSetLayouts` not equal to `NULL`, then the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdExecuteGeneratedCommandsEXT-flags-12491

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, with a `pushConstantRangeCount` not equal to 0, and with `pPushConstantRanges` not equal to `NULL`, then the pipeline layout of the bound push constants **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT` set

- VUID-vkCmdExecuteGeneratedCommandsEXT-flags-13363

If there are any shader objects bound that were created with `flags` that includes the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` bit, and any of the descriptor set layouts used to create the pipeline layout of the bound descriptor sets were created with any binding's `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then there **must** be no binding with `VkDescriptorSetLayoutBinding::stageFlags` set with `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-flags-13364

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, the pipeline layout of the bound descriptor sets **must** have been created with `VK_PIPELINE_LAYOUT_CREATE_NO_TASK_SHADER_BIT_KHR` set

- VUID-vkCmdExecuteGeneratedCommandsEXT-flags-13365

If there are any shader objects bound that were created with `flags` that includes both the `VK_SHADER_CREATE_INDEPENDENT_SETS_BIT_KHR` and `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` bits, there **must** be no shader object bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage

- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-11045
`commandBuffer` **must** not be a protected command buffer
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11046
If `isPreprocessed` is `VK_TRUE` and `vkGetGeneratedCommandsMemoryRequirementsEXT` did not return a required size of zero then `vkCmdPreprocessGeneratedCommandsEXT` **must** have already been executed on the device before this command executes, and the preprocessing command **must** have used the same `pGeneratedCommandsInfo` content as well as the content of the input buffers it references (all except `VkGeneratedCommandsInfoEXT::preprocessAddress`)
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11047
If `isPreprocessed` is `VK_TRUE` then the `indirectCommandsLayout` member of `pGeneratedCommandsInfo` **must** have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT` bit set
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-11141
If the `indirectCommandsLayout` member of `pGeneratedCommandsInfo` was created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT` bit set, then `isPreprocessed` **must** be `VK_TRUE`
- VUID-vkCmdExecuteGeneratedCommandsEXT-preprocessAddress-11142
The contents of the `preprocessAddress` member of `pGeneratedCommandsInfo` **must** not have been previously used to record another `vkCmdExecuteGeneratedCommandsEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11048
If `isPreprocessed` is `VK_TRUE` then the bound descriptor sets and push constants **must** match identically with those bound during recording of the corresponding call to `vkCmdPreprocessGeneratedCommandsEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-10198
If `isPreprocessed` is `VK_TRUE` then the conditional render state and its predicate value **must** match identically with the state and value set during execution of the corresponding call to `vkCmdPreprocessGeneratedCommandsEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11049
If `isPreprocessed` is `VK_TRUE` and the `indirectCommandsLayout` member of `pGeneratedCommandsInfo` contains a draw token, then the graphics state bound on `commandBuffer` **must** match identically with the graphics state bound on the `stateCommandBuffer` passed to `vkCmdPreprocessGeneratedCommandsEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11149
If `isPreprocessed` is `VK_TRUE`, then the queue family index of `commandBuffer` **must** be the same as the queue family index used to allocate the `stateCommandBuffer` passed to `vkCmdPreprocessGeneratedCommandsEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11051
If `isPreprocessed` is `VK_TRUE` and the `indirectCommandsLayout` member of `pGeneratedCommandsInfo` contains a dispatch token, then the compute state bound on `commandBuffer` **must** match identically with the compute state bound on the `stateCommandBuffer` passed to `vkCmdPreprocessGeneratedCommandsEXT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11052
If `isPreprocessed` is `VK_TRUE` and the `indirectCommandsLayout` member of

`pGeneratedCommandsInfo` contains a ray tracing token, then the ray tracing state bound on `commandBuffer` **must** match identically with the ray tracing state bound on the `stateCommandBuffer` passed to `vkCmdPreprocessGeneratedCommandsEXT`

- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-11053
If the token sequence of the passed `VkGeneratedCommandsInfoEXT::indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the initial shader state of `VkGeneratedCommandsInfoEXT::indirectExecutionSet` **must** be bound on `commandBuffer`
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-11004
If `indirectCommandsLayout` was created with a token sequence that contained the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token and `indirectExecutionSet` was created using `VK_INDIRECT_EXECUTION_SET_INFO_TYPE_SHADER_OBJECTS_EXT`, every executed `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token **must** bind all the shader stages set in the `VkIndirectCommandsExecutionSetTokenEXT::shaderStages` used to create `indirectCommandsLayout`
- VUID-vkCmdExecuteGeneratedCommandsEXT-isPreprocessed-11055
If `isPreprocessed` is `VK_TRUE` and the token sequence of the passed `VkGeneratedCommandsInfoEXT::indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the members of `VkGeneratedCommandsInfoEXT::indirectExecutionSet` accessed by this command **must** not have been modified since the preprocess buffer was generated
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-11056
If the `indirectCommandsLayout` member of `pGeneratedCommandsInfo` contains a draw token, then the active render pass **must** not have a specified fragment density map
- VUID-vkCmdExecuteGeneratedCommandsEXT-deviceGeneratedCommandsTransformFeedback-11057
If `deviceGeneratedCommandsTransformFeedback` is not supported on device, transform feedback **must** not be active
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectExecutionSet-11058
If transform feedback is active, `VkGeneratedCommandsInfoEXT::indirectExecutionSet` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdExecuteGeneratedCommandsEXT-deviceGeneratedCommands-11059
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands` feature **must** be enabled
- VUID-vkCmdExecuteGeneratedCommandsEXT-supportedIndirectCommandsShaderStages-11060
The bound shader stages **must** be supported by `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStages`
- VUID-vkCmdExecuteGeneratedCommandsEXT-supportedIndirectCommandsShaderStages-11061
Only stages specified in `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT`

`::supportedIndirectCommandsShaderStages` **can** be set in `pGeneratedCommandsInfo->shaderStages`

- VUID-vkCmdExecuteGeneratedCommandsEXT-None-11062
If a rendering pass is currently active, either the view mask **must** be `0` or `indirectExecutionSet` **must** be `VK_NULL_HANDLE`
- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-11143
`commandBuffer` **must** not have been recorded with `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-10769
If the `indirectCommandsLayout` member of `pGeneratedCommandsInfo` contains a draw token, this command **must** not be called outside a render pass instance
- VUID-vkCmdExecuteGeneratedCommandsEXT-indirectCommandsLayout-12202
If the `indirectCommandsLayout` member of `pGeneratedCommandsInfo` does not contain a draw token, this command **must** not be called inside a render pass instance

Valid Usage (Implicit)

- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-parameter
`commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdExecuteGeneratedCommandsEXT-pGeneratedCommandsInfo-parameter
`pGeneratedCommandsInfo` **must** be a valid pointer to a valid `VkGeneratedCommandsInfoEXT` structure
- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-recording
`commandBuffer` **must** be in the `recording state`
- VUID-vkCmdExecuteGeneratedCommandsEXT-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from **must** support `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` operations
- VUID-vkCmdExecuteGeneratedCommandsEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdExecuteGeneratedCommandsEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdExecuteGeneratedCommandsEXT-bufferlevel
`commandBuffer` **must** be a primary `VkCommandBuffer`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Both	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT HICS_BIT	Action Indirection

Conditional Rendering

`vkCmdExecuteGeneratedCommandsEXT` is affected by [conditional rendering](#)

The `VkGeneratedCommandsInfoEXT` is defined as:

```
// Provided by VK_EXT_device_generated_commands
typedef struct VkGeneratedCommandsInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkShaderStageFlags        shaderStages;
    VkIndirectExecutionSetEXT  indirectExecutionSet;
    VkIndirectCommandsLayoutEXT indirectCommandsLayout;
    VkDeviceAddress            indirectAddress;
    VkDeviceSize               indirectAddressSize;
    VkDeviceAddress            preprocessAddress;
    VkDeviceSize               preprocessSize;
    uint32_t                   maxSequenceCount;
    VkDeviceAddress            sequenceCountAddress;
    uint32_t                   maxDrawCount;
} VkGeneratedCommandsInfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderStages` is the mask of shader stages used by the commands.
- `indirectExecutionSet` is the indirect execution set to be used for binding shaders.
- `indirectCommandsLayout` is the [VkIndirectCommandsLayoutEXT](#) that specifies the command sequence data.
- `indirectAddress` is an address that holds the indirect buffer data.
- `indirectAddressSize` is the size in bytes of indirect buffer data starting at `indirectAddress`.
- `preprocessAddress` specifies a physical address of the `VkBuffer` used for preprocessing the input data for execution. If this structure is used with `vkCmdExecuteGeneratedCommandsEXT` with its `isPreprocessed` set to `VK_TRUE`, then the preprocessing step is skipped but data in this

address **may** still be modified. The contents and the layout of this address are opaque to applications and **must** not be modified outside functions related to device-generated commands or copied to another buffer for reuse.

- `preprocessSize` is the maximum byte size within `preprocessAddress` that is available for preprocessing.
- `maxSequenceCount` is used to determine the number of sequences to execute.
- `sequenceCountAddress` specifies an optional physical address of a single `uint32_t` value containing the requested number of sequences to execute.
- `maxDrawCount` is the maximum number of indirect draws that can be executed by any COUNT-type multi-draw indirect tokens. The draw count in the indirect buffer is clamped to this value for these token types.

If `sequenceCountAddress` is not `NULL`, then `maxSequenceCount` is the maximum number of sequences that can be executed. The actual number is `min(maxSequenceCount, *sequenceCountAddress)`. If `sequenceCountAddress` is `NULL`, then `maxSequenceCount` is the exact number of sequences to execute.

If the action command token for the layout is not a COUNT-type multi-draw indirect token, `maxDrawCount` is ignored.

Valid Usage

- VUID-VkGeneratedCommandsInfoEXT-preprocessAddress-11063
If `vkGetGeneratedCommandsMemoryRequirementsEXT` returns a non-zero size, `preprocessAddress` **must** not be 0
- VUID-VkGeneratedCommandsInfoEXT-preprocessAddress-11064
`VkDeviceMemory` objects bound to the underlying buffer for `preprocessAddress` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned by `vkGetGeneratedCommandsMemoryRequirementsEXT`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11065
If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT`, then the `indirectExecutionSet`'s push constant layout **must** contain the `updateRange` specified in `VkIndirectCommandsPushConstantTokenEXT`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11066
If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT`, then the `indirectExecutionSet`'s push constant layout **must** contain the `updateRange` specified in `VkIndirectCommandsPushConstantTokenEXT`
- VUID-VkGeneratedCommandsInfoEXT-maxSequenceCount-11067
`maxSequenceCount` **must** be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectSequenceCount` and `VkGeneratedCommandsMemoryRequirementsInfoEXT::maxSequenceCount` that was used to determine the `preprocessSize`

- VUID-VkGeneratedCommandsInfoEXT-sequenceCountAddress-11068
If `sequenceCountAddress` is not `NULL`, the value contained in the address **must** be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::maxIndirectSequenceCount` and `VkGeneratedCommandsMemoryRequirementsInfoEXT::maxSequenceCount` that was used to determine the `preprocessSize`
- VUID-VkGeneratedCommandsInfoEXT-maxSequenceCount-10246
`maxSequenceCount` **must** not be zero
- VUID-VkGeneratedCommandsInfoEXT-preprocessAddress-11069
`preprocessAddress` **must** be a device address allocated to the application from a buffer created with the `VK_BUFFER_USAGE_2_PREPROCESS_BUFFER_BIT_EXT` usage flag set
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11144
If the `indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, and there is a descriptor and push constant layout info provided either by `pipelineLayout` or through a `VkPipelineLayoutCreateInfo` in `pNext` of the `VkIndirectCommandsLayoutCreateInfoEXT` used to create `indirectCommandsLayout`, the pipeline layout **must** be `compatible` with the descriptor and push constant layout info used by `indirectExecutionSet`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11328
If the `indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, and there was no descriptor and push constant layout info provided either by `pipelineLayout` or through a `VkPipelineLayoutCreateInfo` in `pNext` of the `VkIndirectCommandsLayoutCreateInfoEXT` used to create `indirectCommandsLayout`, pipelines in `indirectExecutionSet` **must** have been created with `VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11329
If the `indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, and there was a descriptor and push constant layout info provided either by `pipelineLayout` or through a `VkPipelineLayoutCreateInfo` in `pNext` of the `VkIndirectCommandsLayoutCreateInfoEXT` used to create `indirectCommandsLayout`, pipelines in `indirectExecutionSet` **must** have been created without `VK_PIPELINE_CREATE_2_DESCRIPTOR_HEAP_BIT_EXT`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11330
If the `indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, and there was no descriptor and push constant layout info provided either by `pipelineLayout` or through a `VkPipelineLayoutCreateInfo` in `pNext` of the `VkIndirectCommandsLayoutCreateInfoEXT` used to create `indirectCommandsLayout`, shaders in `indirectExecutionSet` **must** have been created with `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11331
If the `indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, and there was a descriptor and push constant layout info provided either by `pipelineLayout` or through a `VkPipelineLayoutCreateInfo` in `pNext` of the `VkIndirectCommandsLayoutCreateInfoEXT` used to create `indirectCommandsLayout`, shaders in `indirectExecutionSet` **must** have been created without `VK_SHADER_CREATE_DESCRIPTOR_HEAP_BIT_EXT`

- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11002
If `indirectCommandsLayout` was created with a token sequence that contained the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the shader stages used to create the initial shader state of `indirectExecutionSet` **must** equal the `VkIndirectCommandsExecutionSetTokenEXT::shaderStages` used to create `indirectCommandsLayout`
- VUID-VkGeneratedCommandsInfoEXT-preprocessSize-11071
`preprocessSize` **must** be greater than or equal to the memory requirement's size returned by `vkGetGeneratedCommandsMemoryRequirementsEXT` using the matching inputs (`indirectCommandsLayout`, ...) as within this structure
- VUID-VkGeneratedCommandsInfoEXT-sequenceCountAddress-11072
The underlying buffer for `sequenceCountAddress` **must** have the `VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR` bit set in its usage flag
- VUID-VkGeneratedCommandsInfoEXT-sequenceCountAddress-11073
If `sequenceCountAddress` is not `NULL`, `sequenceCountAddress` **must** be aligned to 4
- VUID-VkGeneratedCommandsInfoEXT-indirectAddress-12407
The underlying buffer for `indirectAddress` **must** have the `VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR` bit set in its usage flag
- VUID-VkGeneratedCommandsInfoEXT-indirectAddress-11074
`indirectAddress` **must** be aligned to 4
- VUID-VkGeneratedCommandsInfoEXT-indirectAddressSize-11077
`indirectAddressSize` **must** be greater than zero
- VUID-VkGeneratedCommandsInfoEXT-maxDrawCount-11078
When not ignored, $\text{maxDrawCount} \times \text{maxSequenceCount}$ **must** be less than 2^{24}
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11079
If `indirectCommandsLayout` was created using a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_EXT` token and shader objects are not bound then the bound graphics pipeline **must** have been created with `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` in `pDynamicStates`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-11083
If the token sequence of the passed `indirectCommandsLayout` contains a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the `indirectExecutionSet` **must** not be `VK_NULL_HANDLE`
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-10241
If the token sequence of the passed `indirectCommandsLayout` does not contain a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT` token, the `indirectExecutionSet` **must** be `VK_NULL_HANDLE`
- VUID-VkGeneratedCommandsInfoEXT-indirectExecutionSet-11080
If `indirectExecutionSet` is `VK_NULL_HANDLE`, a `VkGeneratedCommandsPipelineInfoEXT` or `VkGeneratedCommandsShaderInfoEXT` **must** be included in the `pNext` chain

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_EXT`
- VUID-VkGeneratedCommandsInfoEXT-shaderStages-parameter
`shaderStages` **must** be a valid combination of `VkShaderStageFlagBits` values
- VUID-VkGeneratedCommandsInfoEXT-shaderStages-requiredbitmask
`shaderStages` **must** not be `0`
- VUID-VkGeneratedCommandsInfoEXT-indirectExecutionSet-parameter
If `indirectExecutionSet` is not `VK_NULL_HANDLE`, `indirectExecutionSet` **must** be a valid `VkIndirectExecutionSetEXT` handle
- VUID-VkGeneratedCommandsInfoEXT-indirectCommandsLayout-parameter
`indirectCommandsLayout` **must** be a valid `VkIndirectCommandsLayoutEXT` handle
- VUID-VkGeneratedCommandsInfoEXT-indirectAddress-parameter
`indirectAddress` **must** be a valid `VkDeviceAddress` value
- VUID-VkGeneratedCommandsInfoEXT-preprocessAddress-parameter
If `preprocessAddress` is not `0`, `preprocessAddress` **must** be a valid `VkDeviceAddress` value
- VUID-VkGeneratedCommandsInfoEXT-sequenceCountAddress-parameter
If `sequenceCountAddress` is not `0`, `sequenceCountAddress` **must** be a valid `VkDeviceAddress` value
- VUID-VkGeneratedCommandsInfoEXT-commonparent
Both of `indirectCommandsLayout`, and `indirectExecutionSet` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Referencing the functions defined in [Indirect Commands Layout](#), `vkCmdExecuteGeneratedCommandsEXT` behaves as:

```
uint32_t sequencesCount = sequenceCountAddress ?
    min(maxSequenceCount, sequenceCountAddress.load_uint32()) :
    maxSequenceCount;

cmdProcessAllSequences(commandBuffer, indirectExecutionSet,
                      indirectCommandsLayout, indirectAddress,
                      sequencesCount);

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)
```

NOTE

It is important to note that the affected values of all state related to the `shaderStages` used are undefined after this command. This means that e.g., if this command

indirectly alters push constants, the push constant state becomes undefined.

Commands **can** be preprocessed prior execution using the following command:

```
// Provided by VK_EXT_device_generated_commands
void vkCmdPreprocessGeneratedCommandsEXT(
    VkCommandBuffer                commandBuffer,
    const VkGeneratedCommandsInfoEXT* pGeneratedCommandsInfo,
    VkCommandBuffer                stateCommandBuffer);
```

- **commandBuffer** is the command buffer which does the preprocessing.
- **pGeneratedCommandsInfo** is a pointer to a **VkGeneratedCommandsInfoEXT** structure containing parameters affecting the preprocessing step.
- **stateCommandBuffer** is a command buffer from which to snapshot current states affecting the preprocessing step. When a graphics command action token is used, graphics state is snapshotted. When a compute action command token is used, compute state is snapshotted. When a ray tracing action command token is used, ray tracing state is snapshotted. It can be deleted at any time after this command has been recorded.

NOTE

stateCommandBuffer access is not synchronized by the driver, meaning that this command buffer **must** not be modified between threads in an unsafe manner.

Valid Usage

- VUID-vkCmdPreprocessGeneratedCommandsEXT-commandBuffer-11081
commandBuffer **must** not be a protected command buffer
- VUID-vkCmdPreprocessGeneratedCommandsEXT-pGeneratedCommandsInfo-11082
pGeneratedCommandsInfo's **indirectCommandsLayout** **must** have been created with the **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_EXT** bit set
- VUID-vkCmdPreprocessGeneratedCommandsEXT-indirectCommandsLayout-11084
If the token sequence of the passed **VkGeneratedCommandsInfoEXT::indirectCommandsLayout** contains a **VK_INDIRECT_COMMANDS_TOKEN_TYPE_EXECUTION_SET_EXT** token, the initial shader state of **VkGeneratedCommandsInfoEXT::indirectExecutionSet** **must** be bound on **stateCommandBuffer**
- VUID-vkCmdPreprocessGeneratedCommandsEXT-stateCommandBuffer-11138
stateCommandBuffer **must** be in the recording state
- VUID-vkCmdPreprocessGeneratedCommandsEXT-deviceGeneratedCommands-11087
The **VkPhysicalDeviceDeviceGeneratedCommandsFeaturesEXT::deviceGeneratedCommands** feature **must** be enabled
- VUID-vkCmdPreprocessGeneratedCommandsEXT-supportedIndirectCommandsShaderStages-11088
Only stages specified in **VkPhysicalDeviceDeviceGeneratedCommandsPropertiesEXT::supportedIndirectCommandsShaderStages** **can** be set in **pGeneratedCommandsInfo-**

Valid Usage (Implicit)

- VUID-vkCmdPreprocessGeneratedCommandsEXT-commandBuffer-parameter **commandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdPreprocessGeneratedCommandsEXT-pGeneratedCommandsInfo-parameter **pGeneratedCommandsInfo** **must** be a valid pointer to a valid [VkGeneratedCommandsInfoEXT](#) structure
- VUID-vkCmdPreprocessGeneratedCommandsEXT-stateCommandBuffer-parameter **stateCommandBuffer** **must** be a valid [VkCommandBuffer](#) handle
- VUID-vkCmdPreprocessGeneratedCommandsEXT-commandBuffer-recording **commandBuffer** **must** be in the [recording state](#)
- VUID-vkCmdPreprocessGeneratedCommandsEXT-commandBuffer-cmdpool
The [VkCommandPool](#) that **commandBuffer** was allocated from **must** support [VK_QUEUE_COMPUTE_BIT](#), or [VK_QUEUE_GRAPHICS_BIT](#) operations
- VUID-vkCmdPreprocessGeneratedCommandsEXT-renderpass
This command **must** only be called outside of a render pass instance
- VUID-vkCmdPreprocessGeneratedCommandsEXT-suspended
This command **must** not be called between suspended render pass instances
- VUID-vkCmdPreprocessGeneratedCommandsEXT-videocoding
This command **must** only be called outside of a video coding scope
- VUID-vkCmdPreprocessGeneratedCommandsEXT-bufferlevel
commandBuffer **must** be a primary [VkCommandBuffer](#)
- VUID-vkCmdPreprocessGeneratedCommandsEXT-commonparent
Both of **commandBuffer**, and **stateCommandBuffer** **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to **stateCommandBuffer** **must** be externally synchronized
- Host access to the [VkCommandPool](#) that **commandBuffer** was allocated from **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
Primary	Outside	Outside	VK_QUEUE_COMPUTE_BIT VK_QUEUE_GRAPHICS_BIT HICS_BIT	Action

Conditional Rendering

`vkCmdPreprocessGeneratedCommandsEXT` is not affected by [conditional rendering](#)

The bound descriptor sets and push constants that will be used with indirect command generation **must** already be specified on `stateCommandBuffer` at the time of preprocessing commands with `vkCmdPreprocessGeneratedCommandsEXT`. They **must** match the bound descriptor sets and push constants used in the execution of indirect commands with `vkCmdExecuteGeneratedCommandsEXT`.

If push constants for shader stages are also specified in the `VkGeneratedCommandsInfoEXT::indirectCommandsLayout` with a `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_EXT` or `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SEQUENCE_INDEX_EXT` token, then those values override the push constants that were previously pushed.

All [State-setting commands](#) that are bound on `stateCommandBuffer` will be used. Any parameters set by those commands **must** be set identically in a command buffer that `vkCmdExecuteGeneratedCommandsEXT` is recorded into, at the point `vkCmdExecuteGeneratedCommandsEXT` is recorded. If conditional rendering is used, the predicate value at preprocessing time **must** match the one at execution time. The queue family index `stateCommandBuffer` was allocated from **must** be the same as the queue family index of the command buffer used in `vkCmdExecuteGeneratedCommandsEXT`.

On some implementations, preprocessing **may** have no effect on performance.

`vkCmdExecuteGeneratedCommandsEXT` **may** write to the preprocess buffer, no matter the `isPreprocess` parameter. In this case, the implementation **must** insert appropriate synchronization automatically, which corresponds to the following pseudocode:

- Barrier
 - `srcStageMask = DRAW_INDIRECT`
 - `srcAccessMask = 0`
 - `dstStageMask = COMMAND_PREPROCESS_BIT`
 - `dstAccessMask = COMMAND_PREPROCESS_WRITE_BIT | COMMAND_PREPROCESS_READ_BIT`

- Do internal writes
- Barrier
 - srcStageMask = COMMAND_PREPROCESS_BIT
 - srcAccessMask = COMMAND_PREPROCESS_WRITE_BIT
 - dstStageMask = DRAW_INDIRECT
 - dstAccessMask = INDIRECT_COMMAND_READ_BIT
- Execute

Chapter 36. Sparse Resources

As documented in [Resource Memory Association](#), [VkBuffer](#) and [VkImage](#) resources in Vulkan **must** be bound completely and contiguously to a single [VkDeviceMemory](#) object. This binding **must** be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources **can** be bound non-contiguously to one or more [VkDeviceMemory](#) allocations.
- Sparse resources **can** be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources **can** have descriptors generated and used orthogonally with memory binding commands.

36.1. Sparse Resource Features

Sparse resources have several features that **must** be enabled explicitly at resource creation time. The features are enabled by including bits in the [flags](#) parameter of [VkImageCreateInfo](#) or [VkBufferCreateInfo](#). Each feature also has one or more corresponding feature enables specified in [VkPhysicalDeviceFeatures](#).

- The [sparseBinding](#) feature is the base, and provides the following capabilities:
 - Resources **can** be bound at some defined (sparse block) granularity.
 - The entire resource **must** be bound to memory before use regardless of regions actually accessed.
 - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
 - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
 - Requested via the [VK_IMAGE_CREATE_SPARSE_BINDING_BIT](#) and [VK_BUFFER_CREATE_SPARSE_BINDING_BIT](#) bits.
 - A sparse image created using [VK_IMAGE_CREATE_SPARSE_BINDING_BIT](#) (but not [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#)) supports all formats that non-sparse usage supports, and supports both [VK_IMAGE_TILING_OPTIMAL](#) and [VK_IMAGE_TILING_LINEAR](#) tiling.
- *Sparse Residency* builds on (and requires) the [sparseBinding](#) feature. It includes the following capabilities:
 - Resources do not have to be completely bound to memory before use on the device.
 - Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
 - Consistency of access to unbound regions of the resource is defined by the absence or presence of [VkPhysicalDeviceSparseProperties::residencyNonResidentStrict](#). If this property is

present, accesses to unbound regions of the resource are well defined and behave as if the data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.
- Sparse residency support is advertised on a finer grain via the following features:
 - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
 - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only **required** to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is **optional** and **can** be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats **may** also be supported and **can** be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.
- The `sparseResidencyAliased` feature provides the following capability that **can** be enabled per resource:

Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

See [Sparse Memory Aliasing](#) for more information.

36.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits **can** be thought of as a linear region of address

space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource **must** be bound to one or more `VkDeviceMemory` objects before use.

36.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`. `alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

36.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use. After creating a `VkBuffer` with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`, the entire buffer region is considered unbound.

36.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the `mip tail`) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block. After creating a `VkImage` with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, all image subresources are considered unbound.

NOTE

Applications **can** use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application **can** unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application **can** also use this functionality to access subregions of the image in a “megatexture” fashion. The application **can** create a large image and only populate the region of the image that is currently being used in the scene.

36.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered *safe* and will not affect other resources or populated regions of the image.

If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

[Image operations](#) performed on unbound memory **may** still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked [VK_FORMAT_R8_UNORM](#) image will return a value of 1.0f.

If a value was previously written to the same unbound sparse memory location in the same shader invocation, that value **may** be returned instead; using the [VolatileTexel](#) image operand, the [Volatile](#) memory semantic, or the [Volatile](#) decoration to load the value will prevent prior stored values from being returned.

NOTE

Getting the value of the previous store is possible as implementations are free to optimize multiple accesses in the general case. There are other ways this **can** be prevented, but using volatile loads is by far the simplest.

See [Physical Device Enumeration](#) for instructions for retrieving physical device properties.

Implementor's Note

For implementations that **cannot** natively handle access to unbound regions of a resource, the implementation **may** allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations **may** use the same physical memory for all unbound regions of multiple resources within the same process.

36.4.2. Mip Tail Regions

Sparse images created using [VK_IMAGE_CREATE_SPARSE_BINDING_BIT](#) (without also using [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#)) have no specific mapping of image region or image subresource to memory offset defined, so the entire image **can** be thought of as a linear opaque address region. However, images created with [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) do have a prescribed sparse image block layout, and hence each image subresource **must** start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a *mip tail region*.

If the [VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT](#) flag is present in the [flags](#) member of

`VkSparseImageFormatProperties`, for the image's `format`, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` **may** affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. **must** be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and **may** be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.

An implementation **may** choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

Figure 17. Sparse Image

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions **can** be bound

individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks **must** still have their full sparse block size in bytes allocated in memory.

Figure 18. Sparse Image with Single Mip Tail

When [VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT](#) is present all array layers will share a single mip tail region.

Figure 19. Sparse Image with Aligned Mip Size

NOTE

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When [VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT](#) is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first N mip levels whose dimensions are an exact multiple of the sparse image block dimensions **can** be bound and unbound on a sparse block basis.

Figure 20. Sparse Image with Aligned Mip Size and Single Mip Tail

NOTE

The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both [VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT](#) and [VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT](#) are present the constraints from each of these flags are in effect.

36.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. [VK_FORMAT_BC5_UNORM_BLOCK](#)), the texel size is the size of the compressed texel block (e.g. 128-bit for [BC5](#)) thus the dimensions of the standard sparse image block shapes apply in terms of compressed texel blocks.

NOTE

For block-compressed formats, the dimensions of a sparse image block in terms of texels **can** be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.

Table 47. Standard Sparse Image Block Shapes (Single Sample)

TEXEL SIZE (bits)	Block Shape (2D)	Block Shape (3D)
8-Bit	$256 \times 256 \times 1$	$64 \times 32 \times 32$
16-Bit	$256 \times 128 \times 1$	$32 \times 32 \times 32$
32-Bit	$128 \times 128 \times 1$	$32 \times 32 \times 16$
64-Bit	$128 \times 64 \times 1$	$32 \times 16 \times 16$
128-Bit	$64 \times 64 \times 1$	$16 \times 16 \times 16$

Table 48. Standard Sparse Image Block Shapes (MSAA)

TEXEL SIZE (bits)	Block Shape (2X)	Block Shape (4X)	Block Shape (8X)	Block Shape (16X)
8-Bit	$128 \times 256 \times 1$	$128 \times 128 \times 1$	$64 \times 128 \times 1$	$64 \times 64 \times 1$
16-Bit	$128 \times 128 \times 1$	$128 \times 64 \times 1$	$64 \times 64 \times 1$	$64 \times 32 \times 1$
32-Bit	$64 \times 128 \times 1$	$64 \times 64 \times 1$	$32 \times 64 \times 1$	$32 \times 32 \times 1$
64-Bit	$64 \times 64 \times 1$	$64 \times 32 \times 1$	$32 \times 32 \times 1$	$32 \times 16 \times 1$
128-Bit	$32 \times 64 \times 1$	$32 \times 32 \times 1$	$16 \times 32 \times 1$	$16 \times 16 \times 1$

Implementations that support the standard sparse image block shape for all formats listed in the [Standard Sparse Image Block Shapes \(Single Sample\)](#) and [Standard Sparse Image Block Shapes \(MSAA\)](#) tables **may** advertise the following `VkPhysicalDeviceSparseProperties`:

- `residencyStandard2DBlockShape`
- `residencyStandard2DMultisampleBlockShape`
- `residencyStandard3DBlockShape`

Reporting each of these features does *not* imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

36.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image **may** choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in `VkSparseImageFormatProperties::imageGranularity`. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in `VkMemoryRequirements::alignment`.

Custom sparse image block dimensions are reported through `vkGetPhysicalDeviceSparseImageFormatProperties` and `vkGetImageSparseMemoryRequirements`.

An implementation **must** not support both the standard sparse image block shape and a custom

sparse image block shape for the same image. The standard sparse image block shape **must** be used if it is supported.

36.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private *metadata* associated with the image. See the figure below:

Figure 21. Multiple Aspect Sparse Image

NOTE

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The per-texel stencil data is $\frac{1}{4}$ the size of the depth data, hence the stencil sparse blocks include $4 \times$ the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by

`VkMemoryRequirements::alignment`.

Metadata

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata **must** be bound prior to device use of the sparse image.

36.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

`VkDevice` objects that have the `sparseResidencyAliased` feature enabled are able to use the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care **must** be taken when performing a write operation to aliased physical memory. Memory dependencies **must** be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing **must** abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory **must** be created with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` / `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flag.
- All resources that access aliased physical memory **must** interpret the memory in the same way. This implies the following:
 - Buffers and images **cannot** alias the same physical memory in a data consistent fashion. The physical memory ranges **must** be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
 - Memory in sparse image mip tail regions **cannot** access aliased memory in a data consistent fashion.
 - Sparse images that alias the same physical memory **must** have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource [aliasing rules](#). In this case memory **cannot** be accessed in a data consistent fashion.

NOTE

Enabling sparse resource memory aliasing **can** be a way to lower physical memory use, but it **may** reduce performance on some implementations. An application

developer **can** test on their target HW and balance the memory / performance trade-offs measured.

36.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors' understanding of sparse resources.

Device Virtual Address

The basic `sparseBinding` feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages **must** be bound to physical memory before the device accesses the resource.

The `sparseResidency` features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault **may** support `residencyNonResidentStrict`.

Not faulting on access to unbound pages is not enough to support `residencyNonResidentStrict`. An implementation **must** also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this **may** not always be possible.

Any implementation that does not fault, but does not guarantee correct read values **must** not support `residencyNonResidentStrict`.

Any implementation that **cannot** access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory **may** be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process **must** not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations **may** allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in `VkMemoryRequirements::size` **must** be greater than or equal to the amount of physical memory **required** to fully populate the resource. Some implementations require "holes" in the device virtual address range that are never accessed. These holes **may** be included in the `size` reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for `VkSparseImageOpaqueMemoryBindInfo`. This operation **must** be supported for all sparse images, even ones created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- If the holes are included in the size, this bind function becomes very easy. In most cases the `resourceOffset` is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application **may** allocate more physical memory for the resource than it needs.
- If the holes are not included in the size, the application **can** allocate less physical memory than otherwise for the resource. However, in this case the implementation **must** account for the holes when mapping `resourceOffset` to the actual device virtual address intended to be mapped.

If the application always uses `VkSparseImageMemoryBindInfo` to bind memory for the non-tail mip levels, any holes that are present in the resource size **may** never be bound.

NOTE

Since `VkSparseImageMemoryBindInfo` uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

Binding Metadata Memory

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the [Multiaspect](#) section for details.

Given that metadata is in a mip tail region, and the mip tail region **must** be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling `VkSparseImageOpaqueMemoryBindInfo`.

To make this easier on the implementation, the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` explicitly specifies when metadata is bound with `VkSparseImageOpaqueMemoryBindInfo`. When this flag is not present, the `resourceOffset` **may** be treated as a strict device virtual address offset.

When `VK_SPARSE_MEMORY_BIND_METADATA_BIT` is present, the `resourceOffset` **must** have been derived explicitly from the `imageMipTailOffset` in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for `imageMipTailOffset`, the `resourceOffset` does not have to correlate directly to a device virtual address offset, and **may** instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.

36.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- [Physical Device Features](#)
- [Physical Device Sparse Properties](#)
- [Sparse Image Format Properties](#)
- [Sparse Resource Creation](#)
- [Sparse Resource Memory Requirements](#)
- [Binding Resource Memory](#)

36.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in `VkPhysicalDeviceFeatures`. These features **must** be supported and enabled on the `VkDevice` object before applications **can** use them. See [Physical Device Features](#) for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- `sparseBinding`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flags, respectively.
- `sparseResidencyBuffer`: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag.
- `sparseResidencyImage2D`: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyImage3D`: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency2Samples`: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency4Samples`: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency8Samples`: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidency16Samples`: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- `sparseResidencyAliased`: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags, respectively.

36.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32    residencyStandard2DBlockShape;
    VkBool32    residencyStandard2DMultisampleBlockShape;
    VkBool32    residencyStandard3DBlockShape;
    VkBool32    residencyAlignedMipSize;
    VkBool32    residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- `residencyStandard2DBlockShape` is `VK_TRUE` if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the [Standard Sparse Image Block Shapes \(Single Sample\)](#) table. If this property is not supported the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyStandard2DMultisampleBlockShape` is `VK_TRUE` if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the [Standard Sparse Image Block Shapes \(MSAA\)](#) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyStandard3DBlockShape` is `VK_TRUE` if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the [Standard Sparse Image Block Shapes \(Single Sample\)](#) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not **required** to match the standard sparse image block dimensions listed in the table.
- `residencyAlignedMipSize` is `VK_TRUE` if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block **may** be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the `flags` member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.
- `residencyNonResidentStrict` specifies whether the physical device **can** consistently access non-resident regions of a resource. If this property is `VK_TRUE`, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.

36.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions,

may be implementation-dependent, [vkGetPhysicalDeviceSparseImageFormatProperties](#) **can** be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

Sparse Image Format Properties API

The [VkSparseImageFormatProperties](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags    aspectMask;
    VkExtent3D            imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- [aspectMask](#) is a bitmask [VkImageAspectFlagBits](#) specifying which aspects of the image the properties apply to.
- [imageGranularity](#) is the width, height, and depth of the sparse image block in texels.
- [flags](#) is a bitmask of [VkSparseImageFormatFlagBits](#) specifying additional information about the sparse resource.

Bits which **may** be set in [VkSparseImageFormatProperties::flags](#), specifying additional information about the sparse resource, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- [VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT](#) specifies that the image uses a single mip tail region for all array layers.
- [VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT](#) specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- [VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT](#) specifies that the image uses non-standard sparse image block dimensions, and the [imageGranularity](#) values do not match the standard sparse image block dimensions for the given format.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseImageFormatFlags;
```

[VkSparseImageFormatFlags](#) is a bitmask type for setting a mask of zero or more

[VkSparseImageFormatFlagBits](#).

`vkGetPhysicalDeviceSparseImageFormatProperties` returns an array of [VkSparseImageFormatProperties](#). Each element describes properties for one set of image aspects that are bound simultaneously for a [VkImage](#) created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

WARNING This functionality is superseded by [vkGetPhysicalDeviceSparseImageFormatProperties2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice    physicalDevice,
    VkFormat             format,
    VkImageType          type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags    usage,
    VkImageTiling         tiling,
    uint32_t*            pPropertyCount,
    VkSparseImageFormatProperties* pProperties);
```

- `physicalDevice` is the physical device from which to query the sparse image format properties.
- `format` is the image format.
- `type` is the dimensionality of the image.
- `samples` is a [VkSampleCountFlagBits](#) value specifying the number of samples per texel.
- `usage` is a bitmask describing the intended usage of the image.
- `tiling` is the tiling arrangement of the texel blocks in memory.
- `pPropertyCount` is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of [VkSparseImageFormatProperties](#) structures.

If `pProperties` is `NULL`, then the number of sparse format properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of sparse format properties available, at most `pPropertyCount` structures will be written.

If [VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT](#) is not supported for the given arguments, `pPropertyCount` will be zero upon return, and no data will be written to `pProperties`.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique

`VkSparseImageFormatProperties` data.

Depth/stencil images with depth and stencil data interleaved into a single plane will return a single `VkSparseImageFormatProperties` structure with the `aspectMask` set to `VK_IMAGE_ASPECT_DEPTH_BIT` | `VK_IMAGE_ASPECT_STENCIL_BIT`.

Valid Usage

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094
`samples` **must** be a valid `VkSampleCountFlagBits` value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter
`format` **must** be a valid `VkFormat` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter
`type` **must** be a valid `VkImageType` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter
`samples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter
`usage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask
`usage` **must** not be `0`
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter
`tiling` **must** be a valid `VkImageTiling` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter
If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties` structures

`vkGetPhysicalDeviceSparseImageFormatProperties2` returns an array of `VkSparseImageFormatProperties2`. Each element describes properties for one set of image aspects that are bound simultaneously for a `VkImage` created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

```
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceSparseImageFormatProperties2(
    VkPhysicalDevice                physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t*                        pPropertyCount,
    VkSparseImageFormatProperties2*  pProperties);
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to vkGetPhysicalDeviceSparseImageFormatProperties2
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice                physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t*                        pPropertyCount,
    VkSparseImageFormatProperties2*  pProperties);
```

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **pFormatInfo** is a pointer to a [VkPhysicalDeviceSparseImageFormatInfo2](#) structure containing input parameters to the command.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of [VkSparseImageFormatProperties2](#) structures.

[vkGetPhysicalDeviceSparseImageFormatProperties2](#) behaves identically to [vkGetPhysicalDeviceSparseImageFormatProperties](#), with the ability to return extended information by adding extending structures to the **pNext** chain of its **pProperties** parameter.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter **physicalDevice** **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter **pFormatInfo** **must** be a valid pointer to a valid [VkPhysicalDeviceSparseImageFormatInfo2](#) structure
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter **pPropertyCount** **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter
If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not **NULL**, **pProperties** **must** be a valid pointer to an array of **pPropertyCount** [VkSparseImageFormatProperties2](#) structures

The [VkPhysicalDeviceSparseImageFormatInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType      sType;
    const void*          pNext;
    VkFormat              format;
    VkImageType           type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags     usage;
    VkImageTiling          tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to VkPhysicalDeviceSparseImageFormatInfo2
typedef VkPhysicalDeviceSparseImageFormatInfo2
VkPhysicalDeviceSparseImageFormatInfo2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **format** is the image format.
- **type** is the dimensionality of the image.
- **samples** is a **VkSampleCountFlagBits** value specifying the number of samples per texel.
- **usage** is a bitmask of **VkImageUsageFlagBits** describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.

Only usage flags representable in **VkImageUsageFlagBits** are returned in **usage**. If the **pNext** chain includes a **VkImageUsageFlags2CreateInfoKHR** structure, all usage flags are returned in **VkImageUsageFlags2CreateInfoKHR::usage**.

Valid Usage

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095
samples **must** be a valid **VkSampleCountFlagBits** value that is set in **VkImageFormatProperties::sampleCounts** returned by **vkGetPhysicalDeviceImageFormatProperties** with **format**, **type**, **tiling**, and **usage** equal to those in this command

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2**
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext

pNext **must** be **NULL** or a pointer to a valid instance of [VkImageUsageFlags2CreateInfoKHR](#)

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter
format **must** be a valid [VkFormat](#) value
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter
type **must** be a valid [VkImageType](#) value
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter
samples **must** be a valid [VkSampleCountFlagBits](#) value
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter
usage **must** be a valid combination of [VkImageUsageFlagBits](#) values
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmask
usage **must** not be 0
- VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter
tiling **must** be a valid [VkImageTiling](#) value

The [VkSparseImageFormatProperties2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType      sType;
    void*                pNext;
    VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

```
// Provided by VK_KHR_get_physical_device_properties2
// Equivalent to VkSparseImageFormatProperties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **properties** is a [VkSparseImageFormatProperties](#) structure which is populated with the same values as in [vkGetPhysicalDeviceSparseImageFormatProperties](#).

Valid Usage (Implicit)

- VUID-VkSparseImageFormatProperties2-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2](#)
- VUID-VkSparseImageFormatProperties2-pNext-pNext
pNext **must** be **NULL**

36.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the `VkPhysicalDeviceFeatures` structure described previously in the [Physical Device Features](#) section) when calling `vkCreateDevice`. When the appropriate device features are enabled, the `VK_BUFFER_CREATE_SPARSE_*` and `VK_IMAGE_CREATE_SPARSE_*` flags **can** be used. See [vkCreateBuffer](#) and [vkCreateImage](#) for details of the resource creation APIs.

NOTE	Specifying	<code>VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT</code>	or
	<code>VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT</code>	requires	specifying
	<code>VK_BUFFER_CREATE_SPARSE_BINDING_BIT</code>		or
	<code>VK_IMAGE_CREATE_SPARSE_BINDING_BIT</code> , respectively, as well. This means that resources must be created with the appropriate <code>*_SPARSE_BINDING_BIT</code> to be used with the sparse binding command (<code>vkQueueBindSparse</code>).		

36.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for `VkBuffer` objects and `VkImage` objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images **can** be bound to memory using only the data from `VkMemoryRequirements`. For all sparse resources the `VkMemoryRequirements::alignment` member specifies both the binding granularity in bytes and the **required** alignment of `VkDeviceMemory`.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the `VkMemoryRequirements::alignment` field specifies the binding granularity in bytes for the image.

Requesting sparse memory requirements for `VkImage` objects using `vkGetImageSparseMemoryRequirements` will return an array of one or more `VkSparseImageMemoryRequirements` structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image **must** have been created using the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The `VkSparseImageMemoryRequirements` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties    formatProperties;
    uint32_t                        imageMipTailFirstLod;
    VkDeviceSize                    imageMipTailSize;
    VkDeviceSize                    imageMipTailOffset;
    VkDeviceSize                    imageMipTailStride;
} VkSparseImageMemoryRequirements;
```

- `formatProperties` is a `VkSparseImageFormatProperties` structure specifying properties of the image format.
- `imageMipTailFirstLod` is the first mip level at which image subresources are included in the mip tail region.
- `imageMipTailSize` is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.
- `imageMipTailOffset` is the opaque memory offset used with `VkSparseImageOpaqueMemoryBindInfo` to bind the mip tail region(s).
- `imageMipTailStride` is the offset stride between each array-layer's mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice                device,
    VkImage                 image,
    uint32_t*               pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `image` is the `VkImage` object to get the memory requirements for.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements` structures.

If `pSparseMemoryRequirements` is `NULL`, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` **must** point to a variable set by the application to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse

memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be zero and `pSparseMemoryRequirements` will not be written to.

NOTE

It is legal for an implementation to report a larger value in `VkMemoryRequirements::size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`. This **may** occur when the implementation requires unused padding in the address range describing the resource.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkGetImageSparseMemoryRequirements-image-parameter `image` **must** be a valid `VkImage` handle
- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter `pSparseMemoryRequirementCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by `pSparseMemoryRequirementCount` is not `0`, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` **must** be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements` structures
- VUID-vkGetImageSparseMemoryRequirements-image-parent `image` **must** have been created, allocated, or retrieved from `device`

To query sparse memory requirements for an image, call:

```
// Provided by VK_VERSION_1_1
void vkGetImageSparseMemoryRequirements2(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

```
// Provided by VK_KHR_get_memory_requirements2
// Equivalent to vkGetImageSparseMemoryRequirements2
void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- **device** is the logical device that owns the image.
- **pInfo** is a pointer to a [VkImageSparseMemoryRequirementsInfo2](#) structure containing parameters required for the memory requirements query.
- **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- **pSparseMemoryRequirements** is either **NULL** or a pointer to an array of [VkSparseImageMemoryRequirements2](#) structures.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements2-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter **pInfo** **must** be a valid pointer to a valid [VkImageSparseMemoryRequirementsInfo2](#) structure
- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter **pSparseMemoryRequirementCount** **must** be a valid pointer to a **uint32_t** value
- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter
If the value referenced by **pSparseMemoryRequirementCount** is not **0**, and **pSparseMemoryRequirements** is not **NULL**, **pSparseMemoryRequirements** **must** be a valid pointer to an array of **pSparseMemoryRequirementCount** [VkSparseImageMemoryRequirements2](#) structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(
    VkDevice                device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t*               pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

```
// Provided by VK_KHR_maintenance4
// Equivalent to vkGetDeviceImageSparseMemoryRequirements
void vkGetDeviceImageSparseMemoryRequirementsKHR(
    VkDevice                device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t*               pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- **device** is the logical device intended to own the image.
- **pInfo** is a pointer to a [VkDeviceImageMemoryRequirements](#) structure containing parameters required for the memory requirements query.
- **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
- **pSparseMemoryRequirements** is either **NULL** or a pointer to an array of [VkSparseImageMemoryRequirements2](#) structures.

Valid Usage (Implicit)

- VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter **device** **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter **pInfo** **must** be a valid pointer to a valid [VkDeviceImageMemoryRequirements](#) structure
- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter **pSparseMemoryRequirementCount** **must** be a valid pointer to a **uint32_t** value

- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter

If the value referenced by **pSparseMemoryRequirementCount** is not **0**, and **pSparseMemoryRequirements** is not **NULL**, **pSparseMemoryRequirements** **must** be a valid pointer to an array of **pSparseMemoryRequirementCount** [VkSparseImageMemoryRequirements2](#) structures

The [VkImageSparseMemoryRequirementsInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkImage             image;
} VkImageSparseMemoryRequirementsInfo2;
```

```
// Provided by VK_KHR_get_memory_requirements2
// Equivalent to VkImageSparseMemoryRequirementsInfo2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **image** is the image to query.

Valid Usage (Implicit)

- VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType
sType must be [VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2](#)
- VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext
pNext must be `NULL`
- VUID-VkImageSparseMemoryRequirementsInfo2-image-parameter
image must be a valid [VkImage](#) handle

The [VkSparseImageMemoryRequirements2](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType    sType;
    void*              pNext;
    VkSparseImageMemoryRequirements    memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

```
// Provided by VK_KHR_get_memory_requirements2
// Equivalent to VkSparseImageMemoryRequirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **memoryRequirements** is a [VkSparseImageMemoryRequirements](#) structure describing the memory requirements of the sparse image.

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryRequirements2-sType-sType
sType must be [VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2](#)
- VUID-VkSparseImageMemoryRequirements2-pNext-pNext
pNext must be `NULL`

36.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via [vkBindImageMemory](#) or [vkBindBufferMemory](#)), and their backing **must** not be changed. On the other hand, sparse resources **can** be bound to memory non-contiguously and these bindings **can** be altered during the lifetime of the resource.

NOTE It is important to note that freeing a [VkDeviceMemory](#) object with [vkFreeMemory](#) will not

cause resources (or resource regions) bound to the memory object to become unbound. Applications **must** not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the [VK_QUEUE_SPARSE_BINDING_BIT](#) bit. Applications **must** use [synchronization primitives](#) to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

NOTE

Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include [VK_QUEUE_SPARSE_BINDING_BIT](#) support in queue families that also include graphics and compute support, other implementations **may** only expose a [VK_QUEUE_SPARSE_BINDING_BIT](#)-only queue family. In either case, applications **must** use [synchronization primitives](#) to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the [VK_IMAGE_ASPECT_METADATA_BIT](#) the application **must** use the [VK_SPARSE_MEMORY_BIND_METADATA_BIT](#) in the `VkSparseMemoryBind::flags` field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the [VK_SPARSE_MEMORY_BIND_METADATA_BIT](#) flag.

Binding the mip tail for any aspect **must** only be performed using `VkSparseImageOpaqueMemoryBindInfo`. If `formatProperties.flags` contains [VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT](#), then it **can** be bound with a single `VkSparseMemoryBind` structure, with `resourceOffset = imageMipTailOffset` and `size = imageMipTailSize`.

If `formatProperties.flags` does not contain [VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT](#) then the offset for the mip tail in each array layer is given as:

```
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail **can** be bound with `layerCount` `VkSparseMemoryBind` structures, each using `size = imageMipTailSize` and `resourceOffset = arrayMipTailOffset` as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

Sparse Memory Binding Functions

The `VkSparseMemoryBind` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize      resourceOffset;
    VkDeviceSize      size;
    VkDeviceMemory    memory;
    VkDeviceSize      memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;
```

- **resourceOffset** is the offset into the resource.
- **size** is the size of the memory region to be bound.
- **memory** is the [VkDeviceMemory](#) object that the range of the resource is bound to. If **memory** is [VK_NULL_HANDLE](#), the range is unbound.
- **memoryOffset** is the offset into the [VkDeviceMemory](#) object to bind the resource range to. If **memory** is [VK_NULL_HANDLE](#), this value is ignored.
- **flags** is a bitmask of [VkSparseMemoryBindFlagBits](#) specifying usage of the binding operation.

The *binding range* [**resourceOffset**, **resourceOffset** + **size**) has different constraints based on **flags**. If **flags** contains [VK_SPARSE_MEMORY_BIND_METADATA_BIT](#), the binding range **must** be within the mip tail region of the metadata aspect. This metadata region is defined by:

$$\text{metadataRegion} = [\text{base}, \text{base} + \text{imageMipTailSize})$$

$$\text{base} = \text{imageMipTailOffset} + \text{imageMipTailStride} \times n$$

and **imageMipTailOffset**, **imageMipTailSize**, and **imageMipTailStride** values are from the [VkSparseImageMemoryRequirements](#) corresponding to the metadata aspect of the image, and **n** is a valid array layer index for the image,

imageMipTailStride is considered to be zero for aspects where [VkSparseImageMemoryRequirements::formatProperties.flags](#) contains [VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT](#).

If **flags** does not contain [VK_SPARSE_MEMORY_BIND_METADATA_BIT](#), the binding range **must** be within the range [0, [VkMemoryRequirements::size](#)).

Valid Usage

- VUID-VkSparseMemoryBind-memory-01096
If **memory** is not [VK_NULL_HANDLE](#), **memory** and **memoryOffset** **must** match the memory requirements of the resource, as described in section [Resource Memory Association](#)
- VUID-VkSparseMemoryBind-resourceOffset-09491
If the resource being bound is a [VkBuffer](#), **resourceOffset**, **memoryOffset** and **size** **must** be an integer multiple of the **alignment** of the [VkMemoryRequirements](#) structure returned from a call to [vkGetBufferMemoryRequirements](#) with the buffer resource

- VUID-VkSparseMemoryBind-resourceOffset-09492
If the resource being bound is a `VkImage`, `resourceOffset` and `memoryOffset` **must** be an integer multiple of the `alignment` of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the image resource
- VUID-VkSparseMemoryBind-memory-01097
If `memory` is not `VK_NULL_HANDLE`, `memory` **must** not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set
- VUID-VkSparseMemoryBind-size-01098
`size` **must** be greater than 0
- VUID-VkSparseMemoryBind-resourceOffset-01099
`resourceOffset` **must** be less than the size of the resource
- VUID-VkSparseMemoryBind-size-01100
`size` **must** be less than or equal to the size of the resource minus `resourceOffset`
- VUID-VkSparseMemoryBind-memoryOffset-01101
`memoryOffset` **must** be less than the size of `memory`
- VUID-VkSparseMemoryBind-size-01102
`size` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- VUID-VkSparseMemoryBind-memory-02730
If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained **must** also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created
- VUID-VkSparseMemoryBind-memory-02731
If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created

Valid Usage (Implicit)

- VUID-VkSparseMemoryBind-memory-parameter
If `memory` is not `VK_NULL_HANDLE`, `memory` **must** be a valid `VkDeviceMemory` handle
- VUID-VkSparseMemoryBind-flags-parameter
`flags` **must** be a valid combination of `VkSparseMemoryBindFlagBits` values

Bits which **can** be set in `VkSparseMemoryBind::flags`, specifying usage of a sparse memory binding operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```

- `VK_SPARSE_MEMORY_BIND_METADATA_BIT` specifies that the memory being bound is only for the metadata aspect.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseMemoryBindFlags;
```

`VkSparseMemoryBindFlags` is a bitmask type for setting a mask of zero or more `VkSparseMemoryBindFlagBits`.

Memory is bound to `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer          buffer;
    uint32_t          bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;
```

- `buffer` is the `VkBuffer` object to be bound.
- `bindCount` is the number of `VkSparseMemoryBind` structures in the `pBinds` array.
- `pBinds` is a pointer to an array of `VkSparseMemoryBind` structures.

Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter `buffer` **must** be a valid `VkBuffer` handle
- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter `pBinds` **must** be a valid pointer to an array of `bindCount` valid `VkSparseMemoryBind` structures
- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength `bindCount` **must** be greater than 0

Memory is bound to opaque regions of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage          image;
    uint32_t          bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;
```

- `image` is the `VkImage` object to be bound.

- `bindCount` is the number of `VkSparseMemoryBind` structures in the `pBinds` array.
- `pBinds` is a pointer to an array of `VkSparseMemoryBind` structures.

NOTE

This structure is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it **can** also be used to bind memory for the entire binding range of partially resident images.

If the `pBinds[i].flags` of an element `i` of `pBinds` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the `resourceOffset` is in the range `[0, VkMemoryRequirements::size)`. This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the `resourceOffset` is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

If the `pBinds[i].flags` of an element `i` of `pBinds` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range specified **must** be within the mip tail region of the metadata aspect. In this case the `resourceOffset` is not **required** to be a simple device address offset within the resource. However, it is defined to be within `[imageMipTailOffset, imageMipTailOffset + imageMipTailSize)` for the metadata aspect. See `VkSparseMemoryBind` for the full constraints on binding region with this flag present.

Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103

If the `flags` member of any element of `pBinds` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range defined **must** be within the mip tail region of the metadata aspect of `image`

Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
`pBinds` **must** be a valid pointer to an array of `bindCount` valid `VkSparseMemoryBind` structures
- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
`bindCount` **must** be greater than 0

Memory **can** be bound to sparse image blocks of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag using the following structure:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
    VkImage          image;
    uint32_t         bindCount;
    const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;
```

- `image` is the `VkImage` object to be bound
- `bindCount` is the number of `VkSparseImageMemoryBind` structures in `pBinds` array
- `pBinds` is a pointer to an array of `VkSparseImageMemoryBind` structures

Valid Usage

- VUID-VkSparseImageMemoryBindInfo-subresource-01722
The `subresource.mipLevel` member of each element of `pBinds` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkSparseImageMemoryBindInfo-subresource-01723
The `subresource.arrayLayer` member of each element of `pBinds` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkSparseImageMemoryBindInfo-subresource-01106
The `subresource.aspectMask` member of each element of `pBinds` **must** be valid for the `format` specified in `VkImageCreateInfo` when `image` was created
- VUID-VkSparseImageMemoryBindInfo-image-02901
`image` **must** have been created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBindInfo-image-parameter
`image` **must** be a valid `VkImage` handle
- VUID-VkSparseImageMemoryBindInfo-pBinds-parameter
`pBinds` **must** be a valid pointer to an array of `bindCount` valid `VkSparseImageMemoryBind` structures
- VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength
`bindCount` **must** be greater than 0

The `VkSparseImageMemoryBind` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource      subresource;
    VkOffset3D              offset;
    VkExtent3D              extent;
    VkDeviceMemory          memory;
    VkDeviceSize            memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;
```

- **subresource** is the image *aspect* and region of interest in the image.
- **offset** are the coordinates of the first texel within the image subresource to bind.
- **extent** is the size in texels of the region within the image subresource to bind. The extent **must** be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it **can** instead be such that any coordinate of **offset** + **extent** equals the corresponding dimensions of the image subresource.
- **memory** is the [VkDeviceMemory](#) object that the sparse image blocks of the image are bound to. If **memory** is [VK_NULL_HANDLE](#), the sparse image blocks are unbound.
- **memoryOffset** is an offset into [VkDeviceMemory](#) object. If **memory** is [VK_NULL_HANDLE](#), this value is ignored.
- **flags** are sparse memory binding flags.

Valid Usage

- VUID-VkSparseImageMemoryBind-memory-01104
If the [sparseResidencyAliased](#) feature is not enabled, and if any other resources are bound to ranges of **memory**, the range of **memory** being bound **must** not overlap with those bound ranges
- VUID-VkSparseImageMemoryBind-memory-01105
memory and **memoryOffset** **must** match the memory requirements of the calling command's **image**, as described in section [Resource Memory Association](#)
- VUID-VkSparseImageMemoryBind-offset-01107
offset.x **must** be a multiple of the sparse image block width ([VkSparseImageFormatProperties::imageGranularity.width](#)) of the image
- VUID-VkSparseImageMemoryBind-extent-09388
extent.width **must** be greater than 0
- VUID-VkSparseImageMemoryBind-extent-01108
extent.width **must** either be a multiple of the sparse image block width of the image, or else (**extent.width** + **offset.x**) **must** equal the width of the image subresource
- VUID-VkSparseImageMemoryBind-offset-01109
offset.y **must** be a multiple of the sparse image block height ([VkSparseImageFormatProperties::imageGranularity.height](#)) of the image

- VUID-VkSparseImageMemoryBind-extent-09389
`extent.height` **must** be greater than 0
- VUID-VkSparseImageMemoryBind-extent-01110
`extent.height` **must** either be a multiple of the sparse image block height of the image, or else (`extent.height + offset.y`) **must** equal the height of the image subresource
- VUID-VkSparseImageMemoryBind-offset-01111
`offset.z` **must** be a multiple of the sparse image block depth (`VkSparseImageFormatProperties::imageGranularity.depth`) of the image
- VUID-VkSparseImageMemoryBind-extent-09390
`extent.depth` **must** be greater than 0
- VUID-VkSparseImageMemoryBind-extent-01112
`extent.depth` **must** either be a multiple of the sparse image block depth of the image, or else (`extent.depth + offset.z`) **must** equal the depth of the image subresource
- VUID-VkSparseImageMemoryBind-memory-02732
If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained **must** also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when the image was created
- VUID-VkSparseImageMemoryBind-memory-02733
If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBind-subresource-parameter
`subresource` **must** be a valid `VkImageSubresource` structure
- VUID-VkSparseImageMemoryBind-memory-parameter
If `memory` is not `VK_NULL_HANDLE`, `memory` **must** be a valid `VkDeviceMemory` handle
- VUID-VkSparseImageMemoryBind-flags-parameter
`flags` **must** be a valid combination of `VkSparseMemoryBindFlagBits` values

To submit sparse binding operations to a queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue          queue,
    uint32_t         bindInfoCount,
    const VkBindSparseInfo* pBindInfo,
    VkFence          fence);
```

- `queue` is the queue that the sparse binding operations will be submitted to.
- `bindInfoCount` is the number of elements in the `pBindInfo` array.

- **pBindInfo** is a pointer to an array of **VkBindSparseInfo** structures, each specifying a sparse binding submission batch.
- **fence** is an **optional** handle to a fence to be signaled. If **fence** is not **VK_NULL_HANDLE**, it defines a **fence signal operation**.

vkQueueBindSparse is a **queue submission command**, with each batch defined by an element of **pBindInfo** as a **VkBindSparseInfo** structure. Batches begin execution in the order they appear in **pBindInfo**, but **may** complete out of order.

Within a batch, a given range of a resource **must** not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application **must** guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to **vkQueueBindSparse** causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in [the synchronization chapter](#).

Valid Usage

- VUID-vkQueueBindSparse-fence-01113
If **fence** is not **VK_NULL_HANDLE**, **fence** **must** be unsignaled
- VUID-vkQueueBindSparse-fence-01114
If **fence** is not **VK_NULL_HANDLE**, **fence** **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkQueueBindSparse-pSignalSemaphores-01115
Each element of the **pSignalSemaphores** member of each element of **pBindInfo** **must** be unsignaled when the semaphore signal operation it defines is executed on the device
- VUID-vkQueueBindSparse-pWaitSemaphores-01116
When a semaphore wait operation referring to a binary semaphore defined by any element of the **pWaitSemaphores** member of any element of **pBindInfo** executes on **queue**, there **must** be no other queues waiting on the same semaphore
- VUID-vkQueueBindSparse-pWaitSemaphores-03245
All elements of the **pWaitSemaphores** member of all elements of **pBindInfo** referring to a semaphore created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY** **must** reference a semaphore signal operation that has been submitted for execution and any **semaphore signal operations** on which it depends **must** have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueueBindSparse-queue-parameter

queue **must** be a valid [VkQueue](#) handle

- VUID-vkQueueBindSparse-pBindInfo-parameter

If **bindInfoCount** is not 0, **pBindInfo** **must** be a valid pointer to an array of **bindInfoCount** valid [VkBindSparseInfo](#) structures

- VUID-vkQueueBindSparse-fence-parameter

If **fence** is not [VK_NULL_HANDLE](#), **fence** **must** be a valid [VkFence](#) handle

- VUID-vkQueueBindSparse-queueType

The **queue** **must** support [VK_QUEUE_SPARSE_BINDING_BIT](#) operations

- VUID-vkQueueBindSparse-commonparent

Both of **fence**, and **queue** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **queue** **must** be externally synchronized if it was not created with [VK_DEVICE_QUEUE_CREATE INTERNALLY SYNCHRONIZED_BIT_KHR](#)
- Host access to **fence** **must** be externally synchronized

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	VK_QUEUE_SPARSE_BINDING_BIT	-

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkBindSparseInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  waitSemaphoreCount;
    const VkSemaphore*        pWaitSemaphores;
    uint32_t                  bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t                  imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t                  imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
    uint32_t                  signalSemaphoreCount;
    const VkSemaphore*        pSignalSemaphores;
} VkBindSparseInfo;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.
- `pWaitSemaphores` is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a [semaphore wait operation](#).
- `bufferBindCount` is the number of sparse buffer bindings to perform in the batch.
- `pBufferBinds` is a pointer to an array of [VkSparseBufferMemoryBindInfo](#) structures.
- `imageOpaqueBindCount` is the number of opaque sparse image bindings to perform.
- `pImageOpaqueBinds` is a pointer to an array of [VkSparseImageOpaqueMemoryBindInfo](#) structures, indicating opaque sparse image bindings to perform.
- `imageBindCount` is the number of sparse image bindings to perform.
- `pImageBinds` is a pointer to an array of [VkSparseImageMemoryBindInfo](#) structures, indicating sparse image bindings to perform.
- `signalSemaphoreCount` is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.
- `pSignalSemaphores` is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a [semaphore signal operation](#).

The first [synchronization scope](#) of each [semaphore signal operation](#) defined by this structure includes all sparse binding operations defined by this structure.

The second [synchronization scope](#) of each [semaphore wait operation](#) defined by this structure includes all sparse binding operations defined by this structure.

Valid Usage

- VUID-VkBindSparseInfo-pWaitSemaphores-03246

If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then the `pNext` chain **must** include a `VkTimelineSemaphoreSubmitInfo` structure

- VUID-VkBindSparseInfo-pNext-03247

If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `waitSemaphoreValueCount` member **must** equal `waitSemaphoreCount`

- VUID-VkBindSparseInfo-pNext-03248

If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `signalSemaphoreValueCount` member **must** equal `signalSemaphoreCount`

- VUID-VkBindSparseInfo-pSignalSemaphores-03249

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed

- VUID-VkBindSparseInfo-pWaitSemaphores-03250

For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- VUID-VkBindSparseInfo-pSignalSemaphores-03251

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

Valid Usage (Implicit)

- VUID-VkBindSparseInfo-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_BIND_SPARSE_INFO`

- VUID-VkBindSparseInfo-pNext-pNext

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupBindSparseInfo`,

[VkFrameBoundaryEXT](#), or [VkTimelineSemaphoreSubmitInfo](#)

- VUID-VkBindSparseInfo-sType-unique
The [sType](#) value of each structure in the [pNext](#) chain **must** be unique
- VUID-VkBindSparseInfo-pWaitSemaphores-parameter
If [waitSemaphoreCount](#) is not 0, [pWaitSemaphores](#) **must** be a valid pointer to an array of [waitSemaphoreCount](#) valid [VkSemaphore](#) handles
- VUID-VkBindSparseInfo-pBufferBinds-parameter
If [bufferBindCount](#) is not 0, [pBufferBinds](#) **must** be a valid pointer to an array of [bufferBindCount](#) valid [VkSparseBufferMemoryBindInfo](#) structures
- VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter
If [imageOpaqueBindCount](#) is not 0, [pImageOpaqueBinds](#) **must** be a valid pointer to an array of [imageOpaqueBindCount](#) valid [VkSparseImageOpaqueMemoryBindInfo](#) structures
- VUID-VkBindSparseInfo-pImageBinds-parameter
If [imageBindCount](#) is not 0, [pImageBinds](#) **must** be a valid pointer to an array of [imageBindCount](#) valid [VkSparseImageMemoryBindInfo](#) structures
- VUID-VkBindSparseInfo-pSignalSemaphores-parameter
If [signalSemaphoreCount](#) is not 0, [pSignalSemaphores](#) **must** be a valid pointer to an array of [signalSemaphoreCount](#) valid [VkSemaphore](#) handles
- VUID-VkBindSparseInfo-commonparent
Both of the elements of [pSignalSemaphores](#), and the elements of [pWaitSemaphores](#) that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkDevice](#)

To specify the values to use when waiting for and signaling semaphores created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_TIMELINE](#), add a [VkTimelineSemaphoreSubmitInfo](#) structure to the [pNext](#) chain of the [VkBindSparseInfo](#) structure.

If the [pNext](#) chain of [VkBindSparseInfo](#) includes a [VkDeviceGroupBindSparseInfo](#) structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The [VkDeviceGroupBindSparseInfo](#) structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           resourceDeviceIndex;
    uint32_t           memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

```
// Provided by VK_KHR_device_group
// Equivalent to VkDeviceGroupBindSparseInfo
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **resourceDeviceIndex** is a device index indicating which instance of the resource is bound.
- **memoryDeviceIndex** is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the **resourceDeviceIndex**.

If this structure is not present, **resourceDeviceIndex** and **memoryDeviceIndex** are assumed to be zero.

Valid Usage

- VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118
resourceDeviceIndex and **memoryDeviceIndex** **must** both be valid device indices
- VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119
Each memory allocation bound in this batch **must** have allocated an instance for **memoryDeviceIndex**

Valid Usage (Implicit)

- VUID-VkDeviceGroupBindSparseInfo-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO](#)

Structure Chaining

Extends the structure

- [VkBindSparseInfo](#)

Chapter 37. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API **can** be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions **must** be enabled in order to use each of the functions described in this chapter.

37.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API **may** be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the [Window System-Specific Header Control](#) appendix.

In order for an application to be compiled to use WSI with a given platform, it **must** either:

- `#define` the appropriate preprocessor symbol prior to including the `vulkan.h` header file, or
- include `vulkan_core.h` and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the [Window System Extensions and Headers](#) table.

Each platform-specific extension is an instance extension. The application **must** enable instance extensions with `vkCreateInstance` before using them.

37.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by `VkSurfaceKHR` handles:

```
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The `VK_KHR_surface` extension declares the `VkSurfaceKHR` object, and provides a function for destroying `VkSurfaceKHR` objects. Separate platform-specific extensions each provide a function for creating a `VkSurfaceKHR` object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.

NOTE

On certain platforms, the Vulkan loader and ICDs **may** have conventions that treat

the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers **may** wrap `VkSurfaceKHR` objects.

37.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance                                instance,
    const VkAndroidSurfaceCreateInfoKHR*      pCreateInfo,
    const VkAllocationCallbacks*              pAllocator,
    VkSurfaceKHR*                             pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `ANativeWindow` handle any attempts to create another surface for the same `ANativeWindow` and any attempts to connect to the same `ANativeWindow` through other platform mechanisms will fail.

NOTE

In particular, only one `VkSurfaceKHR` **can** exist at a time for a given window. Similarly, a native window **cannot** be used by both a `VkSurfaceKHR` and `EGLSurface` simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the `ANativeWindow`'s reference count, and `vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain's `imageExtent` does not match the surface's `currentExtent`, the presentable images will be scaled to the surface's dimensions during presentation. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum image size supported by the consumer. For the system compositor, `currentExtent` is the window size (i.e. the consumer's preferred size).

Valid Usage (Implicit)

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkAndroidSurfaceCreateInfoKHR` structure

- VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkAndroidSurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkAndroidSurfaceCreateFlagsKHR flags;
    struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `window` is a pointer to the `ANativeWindow` to associate the surface with.

Valid Usage

- VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
`window` **must** point to a valid Android `ANativeWindow`

Valid Usage (Implicit)

- VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR`

- `VOID-VkAndroidSurfaceCreateInfoKHR-pNext-pNext`
`pNext` **must** be `NULL`
- `VOID-VkAndroidSurfaceCreateInfoKHR-flags-zeroBitmask`
`flags` **must** be `0`

To remove an unnecessary compile time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers.

```
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

37.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance          instance,
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- `VOID-vkCreateWaylandSurfaceKHR-instance-parameter`
`instance` **must** be a valid `VkInstance` handle

- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkWaylandSurfaceCreateInfoKHR](#) structure
- VUID-vkCreateWaylandSurfaceKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateWaylandSurfaceKHR-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkWaylandSurfaceCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display*  display;
    struct wl_surface*  surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **display** and **surface** are pointers to the Wayland [wl_display](#) and [wl_surface](#) to associate the surface with.

Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304
display **must** point to a valid Wayland [wl_display](#)
- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305
surface **must** point to a valid Wayland [wl_surface](#)

Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR`
- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
`flags` **must** be `0`

On Wayland, `currentExtent` is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain's `imageExtent` to will be the size of the window, after the first image is presented. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum supported surface size. Any calls to `vkGetPhysicalDeviceSurfacePresentModesKHR` on a surface created with `vkCreateWaylandSurfaceKHR` are **required** to return `VK_PRESENT_MODE_MAILBOX_KHR` as one of the valid present modes.

Some Vulkan functions **may** send protocol over the specified `wl_display` connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to a `wl_surface`. Applications **must** therefore ensure that both the `wl_display` and the `wl_surface` remain valid for the lifetime of any `VkSwapchainKHR` objects created from a particular `wl_display` and `wl_surface`. Also, calling `vkQueuePresentKHR` will result in Vulkan sending `wl_surface.commit` requests to the underlying `wl_surface` of each. The `wl_surface.attach`, `wl_surface.damage`, and `wl_surface.commit` requests **must** be issued by the implementation during the call to `vkQueuePresentKHR` and **must** not be issued by the implementation outside of `vkQueuePresentKHR`. This ensures that any Wayland requests sent by the client after the call to `vkQueuePresentKHR` returns will be received by the compositor after the `wl_surface.commit`. Regardless of the mode of swapchain creation, a new `wl_event_queue` **must** be created for each successful `vkCreateWaylandSurfaceKHR` call, and every Wayland object created by the implementation **must** be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this **must** be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests **must** be sent to the Wayland display server prior to calling `vkQueuePresentKHR`.

The implementation **must** ensure that no `wp_color_management_surface_v1` object exists for a surface, which has no swapchains, or only swapchains with a `imageColorSpace` of `VK_COLOR_SPACE_PASS_THROUGH_EXT` associated with it.

```
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;
```

`VkWaylandSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

37.2.3. Win32 Platform

To create a `VkSurfaceKHR` object for a Win32 window, call:

```
// Provided by VK_KHR_win32_surface
VkResult vkCreateWin32SurfaceKHR(
    VkInstance          instance,
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWin32SurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkWin32SurfaceCreateInfoKHR` structure
- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Some Vulkan functions **may** call the `SendMessage` system API when interacting with a `VkSurfaceKHR`

through a `VkSwapchainKHR`. In a multithreaded environment, calling `SendMessage` from a thread that is not the thread associated with `pCreateInfo->hwnd` will block until the application has processed the window message. Thus, applications **should** either call these Vulkan functions on the message pump thread, or make sure their message pump is actively running. Failing to do so **may** result in deadlocks.

The functions subject to this requirement are:

- `vkCreateSwapchainKHR`
- `vkDestroySwapchainKHR`
- `vkAcquireNextImageKHR` and `vkAcquireNextImage2KHR`
- `vkQueuePresentKHR`
- `vkReleaseSwapchainImagesKHR`
- `vkAcquireFullScreenExclusiveModeEXT`
- `vkReleaseFullScreenExclusiveModeEXT`
- `vkSetHdrMetadataEXT`

The `VkWin32SurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE           hInstance;
    HWND               hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `hInstance` is the Win32 `HINSTANCE` for the window to associate the surface with.
- `hwnd` is the Win32 `HWND` for the window to associate the surface with.

Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
`hInstance` **must** be a valid Win32 `HINSTANCE`
- VUID-VkWin32SurfaceCreateInfoKHR-hwnd-01308
`hwnd` **must** be a valid Win32 `HWND`

Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`
- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkWin32SurfaceCreateInfoKHR-flags-zeroBitmask
`flags` **must** be `0`

With Win32, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of a Win32 surface **must** have both `width` and `height` greater than 0, or both of them 0.

NOTE

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoKHR` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

```
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

`VkWin32SurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

37.2.4. XCB Platform

To create a `VkSurfaceKHR` object for an X11 window, using the XCB client-side library, call:

```
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance          instance,
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR*        pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXcbSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is

no more specific allocator available (see [Memory Allocation](#)).

- **pSurface** is a pointer to a [VkSurfaceKHR](#) handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateXcbSurfaceKHR-instance-parameter
instance **must** be a valid [VkInstance](#) handle
- VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkXcbSurfaceCreateInfoKHR](#) structure
- VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateXcbSurfaceKHR-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkXcbSurfaceCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkXcbSurfaceCreateFlagsKHR flags;
    xcb_connection_t*   connection;
    xcb_window_t        window;
} VkXcbSurfaceCreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **connection** is a pointer to an [xcb_connection_t](#) to the X server.

- `window` is the `xcb_window_t` for the X11 window to associate the surface with.

Valid Usage

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
`connection` **must** point to a valid X11 `xcb_connection_t`
- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
`window` **must** be a valid X11 `xcb_window_t`

Valid Usage (Implicit)

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR`
- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkXcbSurfaceCreateInfoKHR-flags-zero bitmask
`flags` **must** be 0

With Xcb, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of an Xcb surface **must** have both `width` and `height` greater than 0, or both of them 0.

NOTE

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoKHR` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified xcb connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an xcb window. Applications **must** therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains **must**

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so **may** result in deadlock.

```
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

`VkXcbSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

37.2.5. Xlib Platform

To create a `VkSurfaceKHR` object for an X11 window, using the Xlib client-side library, call:

```
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance          instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXlibSurfaceCreateInfoKHR` structure containing the parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateXlibSurfaceKHR-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkXlibSurfaceCreateInfoKHR` structure
- VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateXlibSurfaceKHR-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The `VkXlibSurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_xlib_surface
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display*            dpy;
    Window              window;
} VkXlibSurfaceCreateInfoKHR;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dpy` is a pointer to an Xlib [Display](#) connection to the X server.
- `window` is an Xlib [Window](#) to associate the surface with.

Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
`dpy` **must** point to a valid Xlib [Display](#)
- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
`window` **must** be a valid Xlib [Window](#)

Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
`sType` **must** be [VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR](#)
- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkXlibSurfaceCreateInfoKHR-flags-zerobitmask
`flags` **must** be 0

With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of an Xlib surface **must** have both `width` and `height` greater than 0, or both of them 0.

NOTE

Due to above restrictions, unless [VkSwapchainPresentScalingCreateInfoKHR](#) is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in [VkSurfaceCapabilitiesKHR::currentExtent](#).

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified Xlib `Display` connection when using a swapchain or presentable images created from a [VkSurfaceKHR](#) referring to an Xlib window. Applications **must** therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains **must**

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so **may** result in deadlock.

Some implementations may require threads to implement some presentation modes so applications **must** call `XInitThreads()` before calling any other Xlib functions.

```
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;
```

`VkXlibSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

37.2.6. DirectFB Platform

To create a `VkSurfaceKHR` object for a DirectFB surface, call:

```
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(
    VkInstance                instance,
    const VkDirectFBSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a [VkDirectFBSurfaceCreateInfoEXT](#) structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a [VkSurfaceKHR](#) handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDirectFBSurfaceEXT-instance-parameter **instance** **must** be a valid [VkInstance](#) handle
- VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter **pCreateInfo** **must** be a valid pointer to a valid [VkDirectFBSurfaceCreateInfoEXT](#) structure
- VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter
pSurface **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkDirectFBSurfaceCreateInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_directfb_surface
typedef struct VkDirectFBSurfaceCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkDirectFBSurfaceCreateFlagsEXT  flags;
    IDirectFB*         dfb;
    IDirectFBSurface*  surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dfb** is a pointer to the [IDirectFB](#) main interface of DirectFB.
- **surface** is a pointer to a [IDirectFBSurface](#) surface interface.

Valid Usage

- VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117
dfb **must** point to a valid DirectFB **IDirectFB**
- VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118
surface **must** point to a valid DirectFB **IDirectFBSurface**

Valid Usage (Implicit)

- VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT**
- VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext
pNext **must** be **NULL**
- VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zero bitmask
flags **must** be **0**

With DirectFB, **minImageExtent**, **maxImageExtent**, and **currentExtent** **must** always equal the surface size.

```
// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;
```

VkDirectFBSurfaceCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

37.2.7. Metal Platform

To create a **VkSurfaceKHR** object for a **CAMetalLayer**, call:

```
// Provided by VK_EXT_metal_surface
VkResult vkCreateMetalSurfaceEXT(
    VkInstance                instance,
    const VkMetalSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance with which to associate the surface.
- **pCreateInfo** is a pointer to a **VkMetalSurfaceCreateInfoEXT** structure specifying parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see **Memory Allocation**).
- **pSurface** is a pointer to a **VkSurfaceKHR** handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateMetalSurfaceEXT-instance-parameter
`instance` **must** be a valid [VkInstance](#) handle
- VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid [VkMetalSurfaceCreateInfoEXT](#) structure
- VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateMetalSurfaceEXT-pSurface-parameter
`pSurface` **must** be a valid pointer to a [VkSurfaceKHR](#) handle

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_NATIVE_WINDOW_IN_USE_KHR](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkMetalSurfaceCreateInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_metal_surface
typedef struct VkMetalSurfaceCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkMetalSurfaceCreateFlagsEXT flags;
    const CAMetalLayer* pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pLayer` is a reference to a [CAMetalLayer](#) object representing a renderable surface.

Valid Usage (Implicit)

- VUID-VkMetalSurfaceCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT`
- VUID-VkMetalSurfaceCreateInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkMetalSurfaceCreateInfoEXT-flags-zeroBitmask
`flags` **must** be `0`

To remove an unnecessary compile time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:

```
// Provided by VK_EXT_metal_surface
#ifdef __OBJC__
@class CAMetalLayer;
#else
typedef void CAMetalLayer;
#endif
```

The actual `CAMetalLayer` type is defined in the QuartzCore framework.

```
// Provided by VK_EXT_metal_surface
typedef VkFlags VkMetalSurfaceCreateFlagsEXT;
```

`VkMetalSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

37.2.8. Platform-Independent Information

Once created, `VkSurfaceKHR` objects **can** be used in this and other extensions, in particular the `VK_KHR_swapchain` extension.

Several WSI functions return `VK_ERROR_SURFACE_LOST_KHR` if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) **should** be destroyed, as there is no way to restore them to a not-lost state. Applications **may** attempt to create a new `VkSurfaceKHR` using the same native platform window object, but whether such re-creation will succeed is platform-dependent and **may** depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be `lost`.

To destroy a `VkSurfaceKHR` object, call:

```
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance          instance,
    VkSurfaceKHR        surface,
    const VkAllocationCallbacks* pAllocator);
```

- **instance** is the instance used to create the surface.
- **surface** is the surface to destroy.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).

Destroying a **VkSurfaceKHR** merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
All **VkSwapchainKHR** objects created for **surface** **must** have been destroyed prior to destroying **surface**
- VUID-vkDestroySurfaceKHR-surface-01267
If **VkAllocationCallbacks** were provided when **surface** was created, a compatible set of callbacks **must** be provided here
- VUID-vkDestroySurfaceKHR-surface-01268
If no **VkAllocationCallbacks** were provided when **surface** was created, **pAllocator** **must** be **NULL**

Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
instance **must** be a valid **VkInstance** handle
- VUID-vkDestroySurfaceKHR-surface-parameter
If **surface** is not **VK_NULL_HANDLE**, **surface** **must** be a valid **VkSurfaceKHR** handle
- VUID-vkDestroySurfaceKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure
- VUID-vkDestroySurfaceKHR-surface-parent
If **surface** is a valid handle, it **must** have been created, allocated, or retrieved from **instance**

Host Synchronization

- Host access to **surface** **must** be externally synchronized

37.3. Presenting Directly to Display Devices

In some environments applications **can** also present Vulkan rendering directly to display devices without using an intermediate windowing system. This **can** be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The `VK_KHR_display` extension provides the functionality necessary to enumerate display devices and create `VkSurfaceKHR` objects that target displays.

37.3.1. Display Enumeration

Displays are represented by `VkDisplayKHR` handles:

```
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkDisplayPropertiesKHR*    pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter

If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayPropertiesKHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayPropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR          display;
    const char*           displayName;
    VkExtent2D            physicalDimensions;
    VkExtent2D            physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32              planeReorderPossible;
    VkBool32              persistentContent;
} VkDisplayPropertiesKHR;
```

- `display` is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.
- `displayName` is `NULL` or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If `NULL`, no suitable name is available. If not `NULL`, the string pointed to **must** remain accessible and unmodified as long as `display` is valid.
- `physicalDimensions` describes the physical width and height of the visible portion of the display, in millimeters.
- `physicalResolution` describes the physical, native, or preferred resolution of the display.

NOTE

For devices which have no natural value to return here, implementations **should** return the maximum resolution supported.

- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` describing which transforms are supported by this display.

- `planeReorderPossible` tells whether the planes on this display **can** have their z order changed. If this is `VK_TRUE`, the application **can** re-arrange the planes on this display in any order relative to each other.
- `persistentContent` tells whether the display supports self-refresh/internal buffering. If this is true, the application **can** submit persistent present operations on swapchains created against this display.

NOTE

Persistent presents **may** have higher latency, and **may** use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkDisplayProperties2KHR*   pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPropertiesKHR`, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayProperties2KHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkDisplayProperties2KHR](#) structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [displayProperties](#) is a [VkDisplayPropertiesKHR](#) structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR](#)
- VUID-VkDisplayProperties2KHR-pNext-pNext
[pNext](#) **must** be [NULL](#)

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT(
    VkPhysicalDevice    physicalDevice,
    Display*            dpy,
    VkDisplayKHR         display);
```

- [physicalDevice](#) is the physical device the display is on.
- [dpy](#) is a connection to the X11 server that currently owns [display](#).

- **display** is the display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with **physicalDevice** until the display is released or the X11 connection specified by **dpy** is terminated. Permission to access the display **may** be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to **display**. During such periods, operations which require access to the display **must** fail with an appropriate error code. If the X11 server associated with **dpy** does not own **display**, or if permission to access it has already been acquired by another entity, the call **must** return the error code **VK_ERROR_INITIALIZATION_FAILED**.

NOTE

One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

Valid Usage (Implicit)

- VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter **physicalDevice** **must** be a valid **VkPhysicalDevice** handle
- VUID-vkAcquireXlibDisplayEXT-dpy-parameter **dpy** **must** be a valid pointer to a **Display** value
- VUID-vkAcquireXlibDisplayEXT-display-parameter **display** **must** be a valid **VkDisplayKHR** handle
- VUID-vkAcquireXlibDisplayEXT-display-parent **display** **must** have been created, allocated, or retrieved from **physicalDevice**

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a **VkDisplayKHR** handle. To determine the **VkDisplayKHR** handle corresponding to an X11 RandR Output, call:

```
// Provided by VK_EXT_acquire_xlib_display
VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice      physicalDevice,
    Display*              dpy,
    RROutput               rrOutput,
    VkDisplayKHR*         pDisplay);
```

- **physicalDevice** is the physical device to query the display handle on.
- **dpy** is a connection to the X11 server from which **rrOutput** was queried.
- **rrOutput** is an X11 RandR output ID.
- **pDisplay** is a pointer to a **VkDisplayKHR** handle where the display is returned.

If there is no **VkDisplayKHR** corresponding to **rrOutput** on **physicalDevice**, **VK_NULL_HANDLE** will be returned in **pDisplay**.

Valid Usage (Implicit)

- VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter **physicalDevice** **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetRandROutputDisplayEXT-dpy-parameter **dpy** **must** be a valid pointer to a **Display** value
- VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter **pDisplay** **must** be a valid pointer to a **VkDisplayKHR** handle

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

To acquire permission to directly control a display in Vulkan from the Direct Rendering Manager (DRM) interface, call:

```
// Provided by VK_EXT_acquire_drm_display
VkResult vkAcquireDrmDisplayEXT(
    VkPhysicalDevice      physicalDevice,
    int32_t               drmFd,
    VkDisplayKHR           display);
```

- `physicalDevice` is the physical device the display is on.
- `drmFd` is the DRM primary file descriptor.
- `display` is the display the caller wishes Vulkan to control.

All permissions necessary to control the display are granted to the Vulkan instance associated with the provided `physicalDevice` until the display is either released or the connector is unplugged. The provided `drmFd` **must** correspond to the one owned by the `physicalDevice`. If not, the error code `VK_ERROR_UNKNOWN` **must** be returned. The DRM FD must have DRM master permissions. If any error is encountered during the acquisition of the display, the call **must** return the error code `VK_ERROR_INITIALIZATION_FAILED`.

The provided DRM fd should not be closed before the display is released, attempting to do it may result in undefined behavior.

Valid Usage (Implicit)

- VUID-vkAcquireDrmDisplayEXT-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkAcquireDrmDisplayEXT-display-parameter `display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkAcquireDrmDisplayEXT-display-parent `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Before acquiring a display from the DRM interface, the caller may want to select a specific `VkDisplayKHR` handle by identifying it using a `connectorId`. To do so, call:

```
// Provided by VK_EXT_acquire_drm_display
VkResult vkGetDrmDisplayEXT(
    VkPhysicalDevice    physicalDevice,
    int32_t             drmFd,
    uint32_t            connectorId,
    VkDisplayKHR*       display);
```

- `physicalDevice` is the physical device to query the display from.

- `drmFd` is the DRM primary file descriptor.
- `connectorId` is the identifier of the specified DRM connector.
- `pDisplay` is a pointer to a `VkDisplayKHR` handle where the display is returned.

If there is no `VkDisplayKHR` corresponding to the `connectorId` on the `physicalDevice`, the returned `display` will be `VK_NULL_HANDLE`. The provided `drmFd` **must** correspond to the one owned by the `physicalDevice`. If not, the error code `VK_ERROR_UNKNOWN` will be returned. Master permissions are not required, because the file descriptor is just used for information gathering purposes. The given `connectorId` **must** be a resource owned by the provided `drmFd`. If not, the error code `VK_ERROR_UNKNOWN` will be returned. If any error is encountered during the identification of the display, the call **must** return the error code `VK_ERROR_INITIALIZATION_FAILED`.

Valid Usage (Implicit)

- VUID-vkGetDrmDisplayEXT-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDrmDisplayEXT-display-parameter `display` **must** be a valid pointer to a `VkDisplayKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To release a previously acquired display, call:

```
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice    physicalDevice,
    VkDisplayKHR        display);
```

- `physicalDevice` is the physical device the display is on.
- `display` is the display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkReleaseDisplayEXT-display-parameter
display **must** be a valid [VkDisplayKHR](#) handle
- VUID-vkReleaseDisplayEXT-display-parent
display **must** have been created, allocated, or retrieved from **physicalDevice**

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

Display Planes

Images are presented to individual planes on a display. Devices **must** support at least one plane on each display. Planes **can** be stacked and blended to composite multiple images on one display. Devices **may** support only a fixed stacking order and fixed mapping between planes and displays, or they **may** allow arbitrary application-specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice          physicalDevice,
    uint32_t*                 pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);
```

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display planes available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of [VkDisplayPlanePropertiesKHR](#) structures.

If **pProperties** is **NULL**, then the number of display planes available for **physicalDevice** is returned in **pPropertyCount**. Otherwise, **pPropertyCount** **must** point to a variable set by the application to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If the value of **pPropertyCount** is less than the number of display planes for **physicalDevice**, at most **pPropertyCount** structures will be written.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter

`physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayPlanePropertiesKHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayPlanePropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR    currentDisplay;
    uint32_t        currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.
- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device's display planes, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice    physicalDevice,
    uint32_t*           pPropertyCount,
    VkDisplayPlaneProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.

- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayPlaneProperties2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneProperties2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
`pNext` **must** be `NULL`

To determine which displays a plane is usable with, call

```
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice      physicalDevice,
    uint32_t              planeIndex,
    uint32_t*             pDisplayCount,
    VkDisplayKHR*         pDisplays);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and **must** be in the range `[0, physical device plane count - 1]`.
- `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.
- `pDisplays` is either `NULL` or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is `NULL`, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` **must** point to a variable set by the application to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount` handles will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available pairs were returned.

Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
`planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
`pDisplayCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
If the value referenced by `pDisplayCount` is not 0, and `pDisplays` is not `NULL`, `pDisplays` **must** be a valid pointer to an array of `pDisplayCount` `VkDisplayKHR` handles

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

Additional properties of displays are queried using specialized query functions.

Display Modes

Display modes are represented by `VkDisplayModeKHR` handles:

```
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice      physicalDevice,
    VkDisplayKHR          display,
    uint32_t*             pPropertyCount,
    VkDisplayModePropertiesKHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display modes available on the specified `display` for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display modes for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available display modes were returned.

Valid Usage (Implicit)

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter
`display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter
`pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayModePropertiesKHR` structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent
`display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplayModePropertiesKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR          displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device's built-in display modes, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice      physicalDevice,
    VkDisplayKHR          display,
    uint32_t*             pPropertyCount,
    VkDisplayModeProperties2KHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.

`vkGetDisplayModeProperties2KHR` behaves similarly to `vkGetDisplayModePropertiesKHR`, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModeProperties2KHR-display-parameter `display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayModeProperties2KHR` structures
- VUID-vkGetDisplayModeProperties2KHR-display-parent `display` **must** have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- [VK_INCOMPLETE](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkDisplayModeProperties2KHR](#) structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [displayModeProperties](#) is a [VkDisplayModePropertiesKHR](#) structure.

Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR](#)
- VUID-VkDisplayModeProperties2KHR-pNext-pNext
[pNext](#) **must** be [NULL](#)

The [VkDisplayModeParametersKHR](#) structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D    visibleRegion;
    uint32_t      refreshRate;
} VkDisplayModeParametersKHR;
```

- [visibleRegion](#) is the 2D extents of the visible region.
- [refreshRate](#) is a [uint32_t](#) that is the number of times the display is refreshed each second

multiplied by 1000.

NOTE For example, a 60Hz display mode would report a **refreshRate** of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
The **width** member of **visibleRegion** **must** be greater than 0
- VUID-VkDisplayModeParametersKHR-height-01991
The **height** member of **visibleRegion** **must** be greater than 0
- VUID-VkDisplayModeParametersKHR-refreshRate-01992
refreshRate **must** be greater than 0

Additional modes **may** also be created by calling:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice          physicalDevice,
    VkDisplayKHR              display,
    const VkDisplayModeCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDisplayModeKHR*         pMode);
```

- **physicalDevice** is the physical device associated with **display**.
- **display** is the display to create an additional mode for.
- **pCreateInfo** is a pointer to a **VkDisplayModeCreateInfoKHR** structure describing the new mode to create.
- **pAllocator** is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pMode** is a pointer to a **VkDisplayModeKHR** handle in which the mode created is returned.

Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkCreateDisplayModeKHR-display-parameter
display **must** be a valid **VkDisplayKHR** handle
- VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid **VkDisplayModeCreateInfoKHR** structure
- VUID-vkCreateDisplayModeKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkCreateDisplayModeKHR-pMode-parameter
pMode **must** be a valid pointer to a [VkDisplayModeKHR](#) handle
- VUID-vkCreateDisplayModeKHR-display-parent
display **must** have been created, allocated, or retrieved from **physicalDevice**

Host Synchronization

- Host access to **display** **must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkDisplayModeCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use, and **must** be zero.
- **parameters** is a [VkDisplayModeParametersKHR](#) structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation **must** return [VK_ERROR_INITIALIZATION_FAILED](#).

Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType

sType **must** be `VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR`

- `VOID-VkDisplayModeCreateInfoKHR-pNext-pNext`
pNext **must** be `NULL`
- `VOID-VkDisplayModeCreateInfoKHR-flags-zeroBitmask`
flags **must** be `0`
- `VOID-VkDisplayModeCreateInfoKHR-parameters-parameter`
parameters **must** be a valid `VkDisplayModeParametersKHR` structure

Applications that wish to present directly to a display **must** select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice          physicalDevice,
    VkDisplayModeKHR          mode,
    uint32_t                  planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- **physicalDevice** is the physical device associated with the display specified by **mode**
- **mode** is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- **planeIndex** is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
- **pCapabilities** is a pointer to a `VkDisplayPlaneCapabilitiesKHR` structure in which the capabilities are returned.

Valid Usage (Implicit)

- `VOID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter`
physicalDevice **must** be a valid `VkPhysicalDevice` handle
- `VOID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter`
mode **must** be a valid `VkDisplayModeKHR` handle
- `VOID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter`
pCapabilities **must** be a valid pointer to a `VkDisplayPlaneCapabilitiesKHR` structure
- `VOID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent`
mode **must** have been created, allocated, or retrieved from **physicalDevice**

Host Synchronization

- Host access to **mode** **must** be externally synchronized

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkDisplayPlaneCapabilitiesKHR](#) structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR    supportedAlpha;
    VkOffset2D                     minSrcPosition;
    VkOffset2D                     maxSrcPosition;
    VkExtent2D                     minSrcExtent;
    VkExtent2D                     maxSrcExtent;
    VkOffset2D                     minDstPosition;
    VkOffset2D                     maxDstPosition;
    VkExtent2D                     minDstExtent;
    VkExtent2D                     maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- [supportedAlpha](#) is a bitmask of [VkDisplayPlaneAlphaFlagBitsKHR](#) describing the supported alpha blending modes.
- [minSrcPosition](#) is the minimum source rectangle offset supported by this plane using the specified mode.
- [maxSrcPosition](#) is the maximum source rectangle offset supported by this plane using the specified mode. The [x](#) and [y](#) components of [maxSrcPosition](#) **must** each be greater than or equal to the [x](#) and [y](#) components of [minSrcPosition](#), respectively.
- [minSrcExtent](#) is the minimum source rectangle size supported by this plane using the specified mode.
- [maxSrcExtent](#) is the maximum source rectangle size supported by this plane using the specified mode.
- [minDstPosition](#), [maxDstPosition](#), [minDstExtent](#), [maxDstExtent](#) all have similar semantics to their corresponding **Src** equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the **Src** offsets, [minDstPosition](#) and [maxDstPosition](#) **may** contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors **may** support displaying a subset of a

swapchain's presentable images on the specified display plane. This is expressed by returning `minSrcPosition`, `maxSrcPosition`, `minSrcExtent`, and `maxSrcExtent` values that indicate a range of possible positions and sizes which **may** be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors **may** also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning `minDstPosition`, `maxDstPosition`, `minDstExtent` and `maxDstExtent` values that indicate a range of possible positions and sizes which **may** be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors **may** support only a 1-1 mapping between pixels in the presentable images and the display mode. This **may** be indicated by returning (0,0) for `minSrcPosition`, `maxSrcPosition`, `minDstPosition`, and `maxDstPosition`, and (display mode width, display mode height) for `minSrcExtent`, `maxSrcExtent`, `minDstExtent`, and `maxDstExtent`.

The value `supportedAlpha` **must** contain at least one valid `VkDisplayPlaneAlphaFlagBitsKHR` bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in `VkDisplayPlaneCapabilitiesKHR` are guaranteed to be supported. Presentation requests specifying unsupported combinations **may** fail.

To query the capabilities of a given mode and plane combination, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice          physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

- `physicalDevice` is the physical device associated with `pDisplayPlaneInfo`.
- `pDisplayPlaneInfo` is a pointer to a `VkDisplayPlaneInfo2KHR` structure describing the plane and mode.
- `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilities2KHR` structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to `vkGetDisplayPlaneCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter `pDisplayPlaneInfo` **must** be a valid pointer to a valid `VkDisplayPlaneInfo2KHR` structure

- VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter
pCapabilities **must** be a valid pointer to a [VkDisplayPlaneCapabilities2KHR](#) structure

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkDisplayPlaneInfo2KHR](#) structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType    sType;
    const void*        pNext;
    VkDisplayModeKHR    mode;
    uint32_t            planeIndex;
} VkDisplayPlaneInfo2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **mode** is the display mode the application intends to program when using the specified plane.

NOTE This parameter also implicitly specifies a display.

- **planeIndex** is the plane which the application intends to use with the display.

The members of [VkDisplayPlaneInfo2KHR](#) correspond to the arguments to [vkGetDisplayPlaneCapabilitiesKHR](#), with **sType** and **pNext** added for extensibility.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneInfo2KHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR](#)
- VUID-VkDisplayPlaneInfo2KHR-pNext-pNext
pNext **must** be **NULL**
- VUID-VkDisplayPlaneInfo2KHR-mode-parameter
mode **must** be a valid [VkDisplayModeKHR](#) handle

Host Synchronization

- Host access to **mode** **must** be externally synchronized

The `VkDisplayPlaneCapabilities2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType      sType;
    void*                pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `capabilities` is a `VkDisplayPlaneCapabilitiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneCapabilities2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR`
- VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext
`pNext` **must** be `NULL`

37.3.2. Display Control

To set the power state of a display, call:

```
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice          device,
    VkDisplayKHR      display,
    const VkDisplayPowerInfoEXT* pDisplayPowerInfo);
```

- `device` is a logical device associated with `display`.
- `display` is the display whose power state is modified.
- `pDisplayPowerInfo` is a pointer to a `VkDisplayPowerInfoEXT` structure specifying the new power state of `display`.

Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter

device **must** be a valid [VkDevice](#) handle

- VUID-vkDisplayPowerControlEXT-display-parameter
display **must** be a valid [VkDisplayKHR](#) handle
- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
pDisplayPowerInfo **must** be a valid pointer to a valid [VkDisplayPowerInfoEXT](#) structure
- VUID-vkDisplayPowerControlEXT-commonparent
Both of **device**, and **display** **must** have been created, allocated, or retrieved from the same [VkPhysicalDevice](#)

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkDisplayPowerInfoEXT](#) structure is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is [NULL](#) or a pointer to a structure extending this structure.
- **powerState** is a [VkDisplayPowerStateEXT](#) value specifying the new power state of the display.

Valid Usage (Implicit)

- VUID-VkDisplayPowerInfoEXT-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT](#)
- VUID-VkDisplayPowerInfoEXT-pNext-pNext
pNext **must** be [NULL](#)
- VUID-VkDisplayPowerInfoEXT-powerState-parameter
powerState **must** be a valid [VkDisplayPowerStateEXT](#) value

Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it **may** be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state **may** be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.

37.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance                instance,
    const VkDisplaySurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR*             pSurface);
```

- `instance` is the instance corresponding to the physical device the targeted display is on.
- `pCreateInfo` is a pointer to a `VkDisplaySurfaceCreateInfoKHR` structure specifying which mode, plane, and other parameters to use, as described below.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface is returned.

Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter `instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter `pCreateInfo` **must** be a valid pointer to a valid `VkDisplaySurfaceCreateInfoKHR` structure

- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR    displayMode;
    uint32_t            planeIndex;
    uint32_t            planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float               globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D          imageExtent;
} VkDisplaySurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and **must** be zero.
- `displayMode` is a `VkDisplayModeKHR` handle specifying the mode to use when displaying this surface.
- `planeIndex` is the plane on which this surface appears.
- `planeStackIndex` is the z-order of the plane.
- `transform` is a `VkSurfaceTransformFlagBitsKHR` value specifying the transformation to apply to images as part of the scanout operation.

- `globalAlpha` is the global alpha value. This value is ignored if `alphaMode` is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`.
- `alphaMode` is a `VkDisplayPlaneAlphaFlagBitsKHR` value specifying the type of alpha blending to use.
- `imageExtent` is the size of the presentable images to use with the surface.

NOTE

Creating a display surface **must** not modify the state of the displays, planes, or other resources it names. For example, it **must** not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

Valid Usage

- VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252
`planeIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`
- VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253
If the `planeReorderPossible` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to `displayMode` is `VK_TRUE` then `planeStackIndex` **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise `planeStackIndex` **must** equal the `currentStackIndex` member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
If `alphaMode` is `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` then `globalAlpha` **must** be between 0 and 1, inclusive
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
`alphaMode` **must** be one of the bits present in the `supportedAlpha` member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740
`transform` **must** be one of the bits present in the `supportedTransforms` member of `VkDisplayPropertiesKHR` for the display corresponding to `displayMode`
- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
The `width` and `height` members of `imageExtent` **must** be less than or equal to `VkPhysicalDeviceLimits::maxImageDimension2D`

Valid Usage (Implicit)

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`
- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
`pNext` **must** be `NULL`

- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zeroBitmask
flags **must** be 0
- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
displayMode **must** be a valid [VkDisplayModeKHR](#) handle
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
transform **must** be a valid [VkSurfaceTransformFlagBitsKHR](#) value
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
alphaMode **must** be a valid [VkDisplayPlaneAlphaFlagBitsKHR](#) value

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;
```

[VkDisplaySurfaceCreateFlagsKHR](#) is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in [VkDisplaySurfaceCreateInfoKHR::alphaMode](#), specifying the type of alpha blending to use on a display, are:

```
// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;
```

- [VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR](#) specifies that the source image will be treated as opaque.
- [VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR](#) specifies that a global alpha value **must** be specified that will be applied to all pixels in the source image.
- [VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR](#) specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
- [VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR](#) is equivalent to [VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR](#), except the source alpha values are assumed to be premultiplied into the source image's other color components.

```
// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;
```

[VkDisplayPlaneAlphaFlagsKHR](#) is a bitmask type for setting a mask of zero or more [VkDisplayPlaneAlphaFlagBitsKHR](#).

37.3.4. Presenting to Headless Surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

NOTE

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customizable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless `VkSurfaceKHR` object, call:

```
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance                                instance,
    const VkHeadlessSurfaceCreateInfoEXT*    pCreateInfo,
    const VkAllocationCallbacks*             pAllocator,
    VkSurfaceKHR*                             pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkHeadlessSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateHeadlessSurfaceEXT-instance-parameter
`instance` **must** be a valid `VkInstance` handle
- VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter
`pCreateInfo` **must** be a valid pointer to a valid `VkHeadlessSurfaceCreateInfoEXT` structure
- VUID-vkCreateHeadlessSurfaceEXT-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter
`pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkHeadlessSurfaceCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
- VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zero bitmask
`flags` **must** be 0

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain's `imageExtent` to will be the size of the surface, after the first image is presented.

```
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

37.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility **can** be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally **may** be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice    physicalDevice,
    uint32_t            queueFamilyIndex,
    VkSurfaceKHR        surface,
    VkBool32*           pSupported);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family.
- `surface` is the surface.
- `pSupported` is a pointer to a `VkBool32`. `VK_TRUE` indicates support, and `VK_FALSE` indicates no support.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
`pSupported` **must** be a valid pointer to a `VkBool32` value
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

37.4.1. Android Platform

On Android, all physical devices and queue families **must** be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

37.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice    physicalDevice,
    uint32_t            queueFamilyIndex,
    struct wl_display*  display);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306 `queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter

physicalDevice must be a valid [VkPhysicalDevice](#) handle

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter **display** must be a valid pointer to a [wl_display](#) value

37.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice    physicalDevice,
    uint32_t            queueFamilyIndex);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family index.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309 **queueFamilyIndex** must be less than [pQueueFamilyPropertyCount](#) returned by [vkGetPhysicalDeviceQueueFamilyProperties](#) for the given **physicalDevice**

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter **physicalDevice** must be a valid [VkPhysicalDevice](#) handle

37.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

```
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice    physicalDevice,
    uint32_t            queueFamilyIndex,
    xcb_connection_t*    connection,
    xcb_visualid_t       visual_id);
```

- **physicalDevice** is the physical device.

- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
- `visual_id` is an X11 visual (`xcb_visualid_t`).

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter-`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter-`connection` **must** be a valid pointer to an `xcb_connection_t` value

37.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice    physicalDevice,
    uint32_t            queueFamilyIndex,
    Display*            dpy,
    VisualID             visualID);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dpy` is a pointer to an Xlib `Display` connection to the server.
- `visualID` is an X11 visual (`VisualID`).

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315
`queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter **physicalDevice** **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter **dpy** **must** be a valid pointer to a [Display](#) value

37.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(
    VkPhysicalDevice    physicalDevice,
    uint32_t            queueFamilyIndex,
    IDirectFB*          dfb);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family index.
- **dfb** is a pointer to the [IDirectFB](#) main interface of DirectFB.

This platform-specific function **can** be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-queueFamilyIndex-04119 **queueFamilyIndex** **must** be less than [pQueueFamilyPropertyCount](#) returned by [vkGetPhysicalDeviceQueueFamilyProperties](#) for the given **physicalDevice**

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-physicalDevice-parameter **physicalDevice** **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-dfb-parameter **dfb** **must** be a valid pointer to an [IDirectFB](#) value

37.4.7. Metal Platform

On Apple platforms with Metal support, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no Apple-specific query for these capabilities.

37.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities **can** be obtained with the queries listed below in this section.

NOTE

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by [vkGetPhysicalDeviceImageFormatProperties](#). As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

37.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

WARNING

This functionality is superseded by [vkGetPhysicalDeviceSurfaceCapabilities2KHR](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created. See [vkCreateSwapchainKHR](#) for details of swapchain creation.
- **surface** is the surface that will be associated with the swapchain.
- **pSurfaceCapabilities** is a pointer to a [VkSurfaceCapabilitiesKHR](#) structure in which the capabilities are returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211 **surface** must be supported by **physicalDevice**, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter **physicalDevice** must be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter **surface** must be a valid [VkSurfaceKHR](#) handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter **pSurfaceCapabilities** **must** be a valid pointer to a [VkSurfaceCapabilitiesKHR](#) structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
Both of **physicalDevice**, and **surface** **must** have been created, allocated, or retrieved from the same [VkInstance](#)

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSurfaceCapabilitiesKHR](#) structure is defined as:

WARNING

This functionality is superseded by [VK_KHR_get_surface_capabilities2](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t          minImageCount;
    uint32_t          maxImageCount;
    VkExtent2D        currentExtent;
    VkExtent2D        minImageExtent;
    VkExtent2D        maxImageExtent;
    uint32_t          maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to **minImageCount**. A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.

- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The **width** and **height** of the extent will each be less than or equal to the corresponding **width** and **height** of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **minImageExtent**. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **currentExtent**, unless **currentExtent** has the special value described above.
- **maxImageArrayLayers** is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.
- **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- **currentTransform** is **VkSurfaceTransformFlagBitsKHR** value indicating the surface's current transform relative to the presentation engine's natural orientation.
- **supportedCompositeAlpha** is a bitmask of **VkCompositeAlphaFlagBitsKHR**, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- **supportedUsageFlags** is a bitmask of **VkImageUsageFlagBits** representing the ways the application **can** use the presentable images of a swapchain created with **VkPresentModeKHR** set to **VK_PRESENT_MODE_FIFO_LATEST_READY_KHR**, **VK_PRESENT_MODE_IMMEDIATE_KHR**, **VK_PRESENT_MODE_MAILBOX_KHR**, **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR** for the surface on the specified device. **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** **must** be included in the set. Implementations **may** support additional usages.

NOTE	Supported usage flags of a presentable image when using VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR presentation mode are provided by VkSharedPresentSurfaceCapabilities2KHR or VkSharedPresentSurfaceCapabilitiesKHR .
NOTE	Formulas such as $\min(N, \text{maxImageCount})$ are not correct, since maxImageCount may be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- **pSurfaceInfo** is a pointer to a [VkPhysicalDeviceSurfaceInfo2KHR](#) structure describing the surface and other fixed parameters that would be consumed by [vkCreateSwapchainKHR](#).
- **pSurfaceCapabilities** is a pointer to a [VkSurfaceCapabilities2KHR](#) structure in which the capabilities are returned.

[vkGetPhysicalDeviceSurfaceCapabilities2KHR](#) behaves similarly to [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#), with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521
pSurfaceInfo->surface **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522
pSurfaceInfo->surface **must** be supported by **physicalDevice**, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671
If a [VkSurfaceCapabilitiesFullScreenExclusiveEXT](#) structure is included in the **pNext** chain of **pSurfaceCapabilities**, a [VkSurfaceFullScreenExclusiveWin32InfoEXT](#) structure **must** be included in the **pNext** chain of **pSurfaceInfo**
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07776
If a [VkSurfacePresentModeCompatibilityKHR](#) structure is included in the **pNext** chain of **pSurfaceCapabilities**, a [VkSurfacePresentModeKHR](#) structure **must** be included in the **pNext** chain of **pSurfaceInfo**
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07777
If a [VkSurfacePresentScalingCapabilitiesKHR](#) structure is included in the **pNext** chain of **pSurfaceCapabilities**, a [VkSurfacePresentModeKHR](#) structure **must** be included in the **pNext** chain of **pSurfaceInfo**

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
pSurfaceInfo **must** be a valid pointer to a valid [VkPhysicalDeviceSurfaceInfo2KHR](#)

structure

- `VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter pSurfaceCapabilities` **must** be a valid pointer to a `VkSurfaceCapabilities2KHR` structure

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPhysicalDeviceSurfaceInfo2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSurfaceKHR       surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surface` is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Additional capabilities of a surface **may** be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities **can** be queried by adding a `VkSurfaceFullScreenExclusiveInfoEXT` structure to the `pNext` chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **may** also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the `pNext` chain of `VkSwapchainCreateInfoKHR`.

Valid Usage

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672
If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **must** be included in the `pNext` chain
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919
If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, or `VkSurfacePresentModeKHR`
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application's preferred full-screen transition behavior.

The `VkSurfaceFullScreenExclusiveInfoEXT` structure is defined as:

```
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    VkFullScreenExclusiveEXT fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fullScreenExclusive` is a `VkFullScreenExclusiveEXT` value specifying the preferred full-screen transition behavior.

If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT`
- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter
`fullScreenExclusive` **must** be a valid `VkFullScreenExclusiveEXT` value

Structure Chaining

Extends the structures

- `VkPhysicalDeviceSurfaceInfo2KHR`
- `VkSwapchainCreateInfoKHR`

Possible values of `VkSurfaceFullScreenExclusiveInfoEXT::fullScreenExclusive` are:

```
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT` specifies that the implementation **should** determine the appropriate full-screen method by whatever means it deems appropriate.
- `VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT` specifies that the implementation **may** use full-screen exclusive mechanisms when available. Such mechanisms **may** result in better performance and/or the availability of different presentation capabilities, but **may** require a more disruptive transition during swapchain initialization, first presentation and/or destruction.
- `VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT` specifies that the implementation **should** avoid using full-screen mechanisms which rely on disruptive transitions.
- `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` specifies that the application will manage full-screen exclusive mode by using the `vkAcquireFullScreenExclusiveModeEXT` and `vkReleaseFullScreenExclusiveModeEXT` commands.

The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```
// Provided by VK_KHR_win32_surface with VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    HMONITOR            hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hmonitor` is the Win32 `HMONITOR` handle identifying the display to create the surface with.

NOTE If `hmonitor` is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return `VK_ERROR_OUT_OF_DATE_KHR`.

NOTE It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes **may** alter the surface capabilities reported for the created surface.

Valid Usage

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673
`hmonitor` **must** be a valid `HMONITOR`

Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT`

Structure Chaining

Extends the structures

- `VkPhysicalDeviceSurfaceInfo2KHR`
- `VkSwapchainCreateInfoKHR`

The `VkSurfaceCapabilities2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCapabilities` is a `VkSurfaceCapabilitiesKHR` structure describing the capabilities of the specified surface.

Only usage flags representable in `VkImageUsageFlagBits` are returned in `surfaceCapabilities.supportedUsageFlags`. If the `pNext` chain includes a `VkImageUsageFlags2CreateInfoKHR` structure, all usage flags are returned in `VkImageUsageFlags2CreateInfoKHR::usage`.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2KHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`
- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkImageUsageFlags2CreateInfoKHR`, `VkPresentTimingSurfaceCapabilitiesEXT`, `VkSharedPresentSurfaceCapabilities2KHR`, `VkSharedPresentSurfaceCapabilitiesKHR`, `VkSurfaceCapabilitiesFullScreenExclusiveEXT`, `VkSurfaceCapabilitiesPresentId2KHR`, `VkSurfaceCapabilitiesPresentWait2KHR`, `VkSurfacePresentModeCompatibilityKHR`, `VkSurfacePresentScalingCapabilitiesKHR`, `VkSurfaceProtectedCapabilitiesKHR`, or `VkSwapchainFlagsSurfaceCapabilitiesEXT`
- VUID-VkSurfaceCapabilities2KHR-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique

An application queries if a protected `VkSurfaceKHR` is displayable on a specific windowing system using `VkSurfaceProtectedCapabilitiesKHR`, which **can** be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportsProtected` specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system **can** be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set **must** be supported for `surface`.

Valid Usage (Implicit)

- VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

Structure Chaining

Extends the structure

- `VkSurfaceCapabilities2KHR`

The `VkSurfacePresentScalingCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_surface_maintenance1
typedef struct VkSurfacePresentScalingCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkPresentScalingFlagsKHR supportedPresentScaling;
    VkPresentGravityFlagsKHR supportedPresentGravityX;
    VkPresentGravityFlagsKHR supportedPresentGravityY;
    VkExtent2D         minScaledImageExtent;
    VkExtent2D         maxScaledImageExtent;
} VkSurfacePresentScalingCapabilitiesKHR;
```

```
// Provided by VK_EXT_surface_maintenance1
// Equivalent to VkSurfacePresentScalingCapabilitiesKHR
typedef VkSurfacePresentScalingCapabilitiesKHR VkSurfacePresentScalingCapabilitiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportedPresentScaling` is a bitmask of `VkPresentScalingFlagBitsKHR` representing the scaling methods supported by the surface, or `0` if application-defined scaling is not supported.
- `supportedPresentGravityX` is a bitmask of `VkPresentGravityFlagBitsKHR` representing the X-axis pixel gravity supported by the surface, or `0` if Vulkan-defined pixel gravity is not supported for the X axis.
- `supportedPresentGravityY` is a bitmask of `VkPresentGravityFlagBitsKHR` representing the Y-axis

pixel gravity supported by the surface, or 0 if Vulkan-defined pixel gravity is not supported for the Y axis.

- **minScaledImageExtent** contains the smallest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in **supportedPresentScaling** is used, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface. The **width** and **height** of the extent will each be smaller than or equal to the corresponding **width** and **height** of **VkSurfaceCapabilitiesKHR::minImageExtent**.
- **maxScaledImageExtent** contains the largest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in **supportedPresentScaling** is used, or the special value described above for **minScaledImageExtent**. The **width** and **height** of the extent will each be greater than or equal to the corresponding **width** and **height** of **VkSurfaceCapabilitiesKHR::maxImageExtent**.

To query the set of supported scaling modes for a given present mode, add a **VkSurfacePresentModeKHR** structure in the **pNext** chain of **VkPhysicalDeviceSurfaceInfo2KHR** when calling **vkGetPhysicalDeviceSurfaceCapabilities2KHR**. The implementation **must** return the same values in **VkSurfacePresentScalingCapabilitiesKHR** for any of the compatible present modes as obtained through **VkSurfacePresentModeCompatibilityKHR**.

The application **can** specify the scaling mode when creating a swapchain through the use of **VkSwapchainPresentScalingCreateInfoKHR**.

Valid Usage (Implicit)

- VUID-VkSurfacePresentScalingCapabilitiesKHR-sType-sType **sType** **must** be **VK_STRUCTURE_TYPE_SURFACE_PRESENT_SCALING_CAPABILITIES_KHR**
- VUID-VkSurfacePresentScalingCapabilitiesKHR-supportedPresentScaling-parameter **supportedPresentScaling** **must** be a valid combination of **VkPresentScalingFlagBitsKHR** values
- VUID-VkSurfacePresentScalingCapabilitiesKHR-supportedPresentGravityX-parameter **supportedPresentGravityX** **must** be a valid combination of **VkPresentGravityFlagBitsKHR** values
- VUID-VkSurfacePresentScalingCapabilitiesKHR-supportedPresentGravityY-parameter **supportedPresentGravityY** **must** be a valid combination of **VkPresentGravityFlagBitsKHR** values

Structure Chaining

Extends the structure

- **VkSurfaceCapabilities2KHR**

Bits which **may** be set in **VkSurfacePresentScalingCapabilitiesKHR::supportedPresentScaling**, specifying scaling modes supported by the surface, are:

```
// Provided by VK_KHR_surface_maintenance1
typedef enum VkPresentScalingFlagBitsKHR {
    VK_PRESENT_SCALING_ONE_TO_ONE_BIT_KHR = 0x00000001,
    VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_KHR = 0x00000002,
    VK_PRESENT_SCALING_STRETCH_BIT_KHR = 0x00000004,
    VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT = VK_PRESENT_SCALING_ONE_TO_ONE_BIT_KHR,
    VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT =
VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_KHR,
    VK_PRESENT_SCALING_STRETCH_BIT_EXT = VK_PRESENT_SCALING_STRETCH_BIT_KHR,
} VkPresentScalingFlagBitsKHR;
```

```
// Provided by VK_EXT_surface_maintenance1
// Equivalent to VkPresentScalingFlagBitsKHR
typedef VkPresentScalingFlagBitsKHR VkPresentScalingFlagBitsEXT;
```

- [VK_PRESENT_SCALING_ONE_TO_ONE_BIT_KHR](#) specifies that no scaling occurs, and pixels in the swapchain image are mapped to one and only one pixel in the surface. The mapping between pixels is defined by the chosen presentation gravity.
- [VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_KHR](#) specifies that the swapchain image will be minified or magnified such that at least one of the resulting width or height is equal to the corresponding surface dimension, and the other resulting dimension is less than or equal to the corresponding surface dimension, with the aspect ratio of the resulting image being identical to that of the original swapchain image.
- [VK_PRESENT_SCALING_STRETCH_BIT_KHR](#) specifies that the swapchain image will be minified or magnified such that the resulting image dimensions are equal to those of the surface.

```
// Provided by VK_KHR_surface_maintenance1
typedef VkFlags VkPresentScalingFlagsKHR;
```

```
// Provided by VK_EXT_surface_maintenance1
// Equivalent to VkPresentScalingFlagsKHR
typedef VkPresentScalingFlagsKHR VkPresentScalingFlagsEXT;
```

[VkPresentScalingFlagsKHR](#) is a bitmask type for setting a mask of zero or more [VkPresentScalingFlagBitsKHR](#).

Bits which **may** be set in the [VkSurfacePresentScalingCapabilitiesKHR::supportedPresentGravityX](#) or [supportedPresentGravityY](#) fields, specifying the gravity of presented pixels supported by the surface, are:

```
// Provided by VK_KHR_surface_maintenance1
typedef enum VkPresentGravityFlagBitsKHR {
    VK_PRESENT_GRAVITY_MIN_BIT_KHR = 0x00000001,
    VK_PRESENT_GRAVITY_MAX_BIT_KHR = 0x00000002,
    VK_PRESENT_GRAVITY_CENTERED_BIT_KHR = 0x00000004,
    VK_PRESENT_GRAVITY_MIN_BIT_EXT = VK_PRESENT_GRAVITY_MIN_BIT_KHR,
    VK_PRESENT_GRAVITY_MAX_BIT_EXT = VK_PRESENT_GRAVITY_MAX_BIT_KHR,
    VK_PRESENT_GRAVITY_CENTERED_BIT_EXT = VK_PRESENT_GRAVITY_CENTERED_BIT_KHR,
} VkPresentGravityFlagBitsKHR;
```

```
// Provided by VK_EXT_surface_maintenance1
// Equivalent to VkPresentGravityFlagBitsKHR
typedef VkPresentGravityFlagBitsKHR VkPresentGravityFlagBitsEXT;
```

- [VK_PRESENT_GRAVITY_MIN_BIT_KHR](#) means that the pixels will gravitate towards the top or left side of the surface.
- [VK_PRESENT_GRAVITY_MAX_BIT_KHR](#) means that the pixels will gravitate towards the bottom or right side of the surface.
- [VK_PRESENT_GRAVITY_CENTERED_BIT_KHR](#) means that the pixels will be centered in the surface.

If the value in [VkSurfaceCapabilitiesKHR::currentTransform](#) is not [VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR](#), it is implementation-defined whether the gravity configuration applies to the presented image before or after transformation.

```
// Provided by VK_KHR_surface_maintenance1
typedef VkFlags VkPresentGravityFlagsKHR;
```

```
// Provided by VK_EXT_surface_maintenance1
// Equivalent to VkPresentGravityFlagsKHR
typedef VkPresentGravityFlagsKHR VkPresentGravityFlagsEXT;
```

[VkPresentGravityFlagsKHR](#) is a bitmask type for setting a mask of zero or more [VkPresentGravityFlagBitsKHR](#).

The [VkSurfacePresentModeKHR](#) structure is defined as:

```
// Provided by VK_KHR_surface_maintenance1
typedef struct VkSurfacePresentModeKHR {
    VkStructureType    sType;
    void*              pNext;
    VkPresentModeKHR    presentMode;
} VkSurfacePresentModeKHR;
```

```
// Provided by VK_EXT_surface_maintenance1
// Equivalent to VkSurfacePresentModeKHR
typedef VkSurfacePresentModeKHR VkSurfacePresentModeEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **presentMode** is the presentation mode the swapchain will use.

If the [VkSurfacePresentModeKHR](#) structure is included in the **pNext** chain of [VkPhysicalDeviceSurfaceInfo2KHR](#), the values returned in [VkSurfaceCapabilitiesKHR::minImageCount](#), [VkSurfaceCapabilitiesKHR::maxImageCount](#), [VkSurfacePresentScalingCapabilitiesKHR::minScaledImageExtent](#), and [VkSurfacePresentScalingCapabilitiesKHR::maxScaledImageExtent](#) are valid only for the specified **presentMode**. If **presentMode** is [VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR](#) or [VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR](#), the per-present mode image counts **must** both be one. The per-present mode image counts **may** be less-than or greater-than the image counts returned when [VkSurfacePresentModeKHR](#) is not provided.

NOTE

If [VkSwapchainPresentModesCreateInfoKHR](#) is provided to swapchain creation, the requirements for forward progress may be less strict. For example, a FIFO swapchain might only require 2 images to guarantee forward progress, but a MAILBOX one might require 4. Without the per-present image counts, such an implementation would have to return 4 in [VkSurfaceCapabilitiesKHR::minImageCount](#), which pessimizes FIFO. Conversely, an implementation may return a low number for **minImageCount**, but internally bump the image count when application queries [vkGetSwapchainImagesKHR](#), which can surprise applications, and is not discoverable until swapchain creation. Using [VkSurfacePresentModeKHR](#) and [VkSwapchainPresentModesCreateInfoKHR](#) together effectively removes this problem.

[VkSwapchainPresentModesCreateInfoKHR](#) is required for the specification to be backwards compatible with applications that do not know about, or make use of this feature.

Valid Usage

- VUID-VkSurfacePresentModeKHR-presentMode-07780
presentMode **must** be a value reported by [vkGetPhysicalDeviceSurfacePresentModesKHR](#) for the specified surface

Valid Usage (Implicit)

- VUID-VkSurfacePresentModeKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_KHR](#)

- VUID-VkSurfacePresentModeKHR-presentMode-parameter
`presentMode` **must** be a valid [VkPresentModeKHR](#) value

Structure Chaining

Extends the structure

- [VkPhysicalDeviceSurfaceInfo2KHR](#)

The [VkSurfacePresentModeCompatibilityKHR](#) structure is defined as:

```
// Provided by VK_KHR_surface_maintenance1
typedef struct VkSurfacePresentModeCompatibilityKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           presentModeCount;
    VkPresentModeKHR*  pPresentModes;
} VkSurfacePresentModeCompatibilityKHR;
```

```
// Provided by VK_EXT_surface_maintenance1
// Equivalent to VkSurfacePresentModeCompatibilityKHR
typedef VkSurfacePresentModeCompatibilityKHR VkSurfacePresentModeCompatibilityEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentModeCount` is an integer related to the number of present modes available or queried, as described below.
- `pPresentModes` is a pointer to an array of [VkPresentModeKHR](#) in which present modes compatible with a given present mode are returned.

If `pPresentModes` is `NULL`, then the number of present modes that are compatible with the one specified in [VkSurfacePresentModeKHR](#) is returned in `presentModeCount`. Otherwise, `presentModeCount` **must** be set by the application to the number of elements in the `pPresentModes` array, and on return is overwritten with the number of values actually written to `pPresentModes`. If the value of `presentModeCount` is less than the number of compatible present modes that are supported, at most `presentModeCount` values will be written to `pPresentModes`. The implementation **must** include the present mode passed to [VkSurfacePresentModeKHR](#) in `pPresentModes`, unless `presentModeCount` is zero.

To query the set of present modes compatible with a given initial present mode, add a [VkSurfacePresentModeKHR](#) structure in the `pNext` chain of [VkPhysicalDeviceSurfaceInfo2KHR](#) when calling [vkGetPhysicalDeviceSurfaceCapabilities2KHR](#).

The application **can** create a swapchain whose present mode **can** be modified through the use of [VkSwapchainPresentModesCreateInfoKHR](#).

Valid Usage (Implicit)

- VUID-VkSurfacePresentModeCompatibilityKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_COMPATIBILITY_KHR`
- VUID-VkSurfacePresentModeCompatibilityKHR-pPresentModes-parameter
If `presentModeCount` is not 0, and `pPresentModes` is not `NULL`, `pPresentModes` **must** be a valid pointer to an array of `presentModeCount` `VkPresentModeKHR` values

Structure Chaining

Extends the structure

- `VkSurfaceCapabilities2KHR`

The `VkSharedPresentSurfaceCapabilitiesKHR` structure is defined as:

```
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType    sType;
    void*              pNext;
    VkImageUsageFlags  sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sharedPresentSupportedUsageFlags` is a bitmask of `VkImageUsageFlagBits` representing the ways the application **can** use the shared presentable image from a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` **must** be included in the set but implementations **may** support additional usages.

This structure **can** be included in the `pNext` chain of `VkSurfaceCapabilities2KHR` to determine supported usage when using `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` presentation mode.

Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

Structure Chaining

Extends the structure

- [VkSurfaceCapabilities2KHR](#)

The [VkSharedPresentSurfaceCapabilities2KHR](#) structure is defined as:

```
// Provided by VK_KHR_extended_flags with VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilities2KHR {
    VkStructureType      sType;
    void*                pNext;
    VkImageUsageFlags2KHR sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilities2KHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [sharedPresentSupportedUsageFlags](#) is a bitmask of [VkImageUsageFlagBits2KHR](#) representing the ways the application **can** use the shared presentable image from a swapchain created with [VkPresentModeKHR](#) set to [VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR](#) or [VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR](#) for the surface on the specified device. [VK_IMAGE_USAGE_2_COLOR_ATTACHMENT_BIT_KHR](#) **must** be included in the set but implementations **may** support additional usages.

This structure **can** be included in the [pNext](#) chain of [VkSurfaceCapabilities2KHR](#) to determine supported usage when using [VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR](#) or [VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR](#) presentation mode.

Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilities2KHR-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_2_KHR](#)

Structure Chaining

Extends the structure

- [VkSurfaceCapabilities2KHR](#)

The [VkSwapchainFlagsSurfaceCapabilitiesEXT](#) structure is defined as:

```
// Provided by VK_EXT_multisampled_render_to_swapchain
typedef struct VkSwapchainFlagsSurfaceCapabilitiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkSwapchainCreateFlagsKHR    swapchainSupportedFlags;
} VkSwapchainFlagsSurfaceCapabilitiesEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **swapchainSupportedFlags** is a bitmask of [VkSwapchainCreateFlagsKHR](#) representing the supported flags in [VkSwapchainCreateInfoKHR](#) when creating a swapchain for the surface on the specified device. If a [VkSurfacePresentModeKHR](#) structure is included in the **pNext** chain of [pSurfaceInfo](#) in [vkGetPhysicalDeviceSurfaceCapabilities2KHR](#), this value represents the supported flags for the specified present mode and those compatible with it as returned in [VkSurfacePresentModeCompatibilityKHR](#).

Valid Usage (Implicit)

- VUID-VkSwapchainFlagsSurfaceCapabilitiesEXT-sType-sType
sType must be [VK_STRUCTURE_TYPE_SWAPCHAIN_FLAGS_SURFACE_CAPABILITIES_EXT](#)

Structure Chaining

Extends the structure

- [VkSurfaceCapabilities2KHR](#)

The [VkSurfaceCapabilitiesFullScreenExclusiveEXT](#) structure is defined as:

```
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32            fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **fullScreenExclusiveSupported** is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure **can** be included in the **pNext** chain of [VkSurfaceCapabilities2KHR](#) to determine support for exclusive full-screen access. If **fullScreenExclusiveSupported** is [VK_FALSE](#), it indicates that exclusive full-screen access is not obtainable for this surface.

Applications **must** not attempt to create swapchains with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` set if `fullScreenExclusiveSupported` is `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`

Structure Chaining

Extends the structure

- `VkSurfaceCapabilities2KHR`

The `VkSurfaceCapabilitiesPresentId2KHR` structure is defined as:

```
// Provided by VK_KHR_present_id2
typedef struct VkSurfaceCapabilitiesPresentId2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           presentId2Supported;
} VkSurfaceCapabilitiesPresentId2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentId2Supported` is a boolean describing whether the surface is able to support the present-ID extension

This structure **can** be included in the `pNext` chain of `VkSurfaceCapabilities2KHR` to determine support for present-wait. If `presentId2Supported` is `VK_FALSE`, it indicates that attaching an ID to presentation requests is not possible for this surface.

Applications **must** not attempt to include `VkPresentId2KHR` in the `pNext` chain of a `VkPresentInfoKHR` if `presentId2Supported` is `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesPresentId2KHR-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_ID_2_KHR`

Structure Chaining

Extends the structure

- [VkSurfaceCapabilities2KHR](#)

The [VkSurfaceCapabilitiesPresentWait2KHR](#) structure is defined as:

```
// Provided by VK_KHR_present_wait2
typedef struct VkSurfaceCapabilitiesPresentWait2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           presentWait2Supported;
} VkSurfaceCapabilitiesPresentWait2KHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [presentWait2Supported](#) is a boolean describing whether the surface is able to support the present-wait extension

This structure **can** be included in the [pNext](#) chain of [VkSurfaceCapabilities2KHR](#) to determine support for present-wait. If [presentWait2Supported](#) is [VK_FALSE](#), it indicates that waiting for presentation is not possible for this surface.

Applications **must** not attempt to call [vkWaitForPresent2KHR](#) on a swapchain if [presentWait2Supported](#) is [VK_FALSE](#).

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesPresentWait2KHR-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_WAIT_2_KHR](#)

Structure Chaining

Extends the structure

- [VkSurfaceCapabilities2KHR](#)

The [VkPresentTimingSurfaceCapabilitiesEXT](#) structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkPresentTimingSurfaceCapabilitiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkBool32           presentTimingSupported;
    VkBool32           presentAtAbsoluteTimeSupported;
    VkBool32           presentAtRelativeTimeSupported;
    VkPresentStageFlagsEXT presentStageQueries;
} VkPresentTimingSurfaceCapabilitiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentTimingSupported` indicates whether querying presentation timestamps is supported for a swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface`.
- `presentAtAbsoluteTimeSupported` indicates whether a swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` supports presenting images with absolute times.
- `presentAtRelativeTimeSupported` indicates whether a swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` supports presenting images with relative times.
- `presentStageQueries` is a bitmask of `VkPresentStageFlagBitsEXT` indicating which present stages a swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` is able to provide timing information for.

If `presentTimingSupported` is `VK_TRUE`, the implementation **must** also advertise support for at least the `VK_PRESENT_STAGE_QUEUE_OPERATIONS_END_BIT_EXT` present stage in `presentStageQueries`.

Valid Usage (Implicit)

- VUID-VkPresentTimingSurfaceCapabilitiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_TIMING_SURFACE_CAPABILITIES_EXT`

Structure Chaining

Extends the structure

- `VkSurfaceCapabilities2KHR`

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice          physicalDevice,
    VkSurfaceKHR              surface,
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for [vkCreateSwapchainKHR](#).
- **surface** is the surface that will be associated with the swapchain.
- **pSurfaceCapabilities** is a pointer to a [VkSurfaceCapabilities2EXT](#) structure in which the capabilities are returned.

[vkGetPhysicalDeviceSurfaceCapabilities2EXT](#) behaves similarly to [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#), with the ability to return extended information by adding extending structures to the **pNext** chain of its **pSurfaceCapabilities** parameter.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06211
surface **must** be supported by **physicalDevice**, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter
physicalDevice **must** be a valid [VkPhysicalDevice](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter
surface **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter
pSurfaceCapabilities **must** be a valid pointer to a [VkSurfaceCapabilities2EXT](#) structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent
Both of **physicalDevice**, and **surface** **must** have been created, allocated, or retrieved from the same [VkInstance](#)

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)

- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSurfaceCapabilities2EXT](#) structure is defined as:

```
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType      sType;
    void*                pNext;
    uint32_t             minImageCount;
    uint32_t             maxImageCount;
    VkExtent2D           currentExtent;
    VkExtent2D           minImageExtent;
    VkExtent2D           maxImageExtent;
    uint32_t             maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags    supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [minImageCount](#) is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- [maxImageCount](#) is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to [minImageCount](#). A value of 0 means that there is no limit on the number of images, though there **may** be limits related to the total amount of memory used by presentable images.
- [currentExtent](#) is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- [minImageExtent](#) contains the smallest valid swapchain extent for the surface on the specified device. The [width](#) and [height](#) of the extent will each be less than or equal to the corresponding [width](#) and [height](#) of [currentExtent](#), unless [currentExtent](#) has the special value described above.
- [maxImageExtent](#) contains the largest valid swapchain extent for the surface on the specified device. The [width](#) and [height](#) of the extent will each be greater than or equal to the corresponding [width](#) and [height](#) of [minImageExtent](#). The [width](#) and [height](#) of the extent will each be greater than or equal to the corresponding [width](#) and [height](#) of [currentExtent](#), unless [currentExtent](#) has the special value described above.
- [maxImageArrayLayers](#) is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.

- **supportedTransforms** is a bitmask of [VkSurfaceTransformFlagBitsKHR](#) indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- **currentTransform** is [VkSurfaceTransformFlagBitsKHR](#) value indicating the surface's current transform relative to the presentation engine's natural orientation.
- **supportedCompositeAlpha** is a bitmask of [VkCompositeAlphaFlagBitsKHR](#), representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.
- **supportedUsageFlags** is a bitmask of [VkImageUsageFlagBits](#) representing the ways the application **can** use the presentable images of a swapchain created with [VkPresentModeKHR](#) set to [VK_PRESENT_MODE_FIFO_LATEST_READY_KHR](#), [VK_PRESENT_MODE_IMMEDIATE_KHR](#), [VK_PRESENT_MODE_MAILBOX_KHR](#), [VK_PRESENT_MODE_FIFO_KHR](#) or [VK_PRESENT_MODE_FIFO_RELAXED_KHR](#) for the surface on the specified device. [VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT](#) **must** be included in the set. Implementations **may** support additional usages.
- **supportedSurfaceCounters** is a bitmask of [VkSurfaceCounterFlagBitsEXT](#) indicating the supported surface counter types. It **must** not include [VK_SURFACE_COUNTER_VBLANK_BIT_EXT](#) unless the surface queried is a [display surface](#)

Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2EXT-sType-sType
sType must be [VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT](#)
- VUID-VkSurfaceCapabilities2EXT-pNext-pNext
pNext must be `NULL`

Bits which **can** be set in [VkSurfaceCapabilities2EXT::supportedSurfaceCounters](#), indicating supported surface counter types, are:

```
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    // VK_SURFACE_COUNTER_VBLANK_EXT is a legacy alias
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- [VK_SURFACE_COUNTER_VBLANK_BIT_EXT](#) specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

`VkSurfaceCounterFlagsEXT` is a bitmask type for setting a mask of zero or more `VkSurfaceCounterFlagBitsEXT`.

Bits which **may** be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface's current transform relative to the presentation engine's natural orientation, are:

```
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR` specifies that image content is presented without being transformed.
- `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` specifies that image content is rotated 90 degrees clockwise.
- `VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR` specifies that image content is rotated 180 degrees clockwise.
- `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR` specifies that image content is rotated 270 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR` specifies that image content is mirrored horizontally.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- `VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR` specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- `VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR` specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```
// Provided by VK_KHR_display, VK_KHR_surface
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

`VkSurfaceTransformFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSurfaceTransformFlagBitsKHR`.

The `supportedCompositeAlpha` member is of type `VkCompositeAlphaFlagBitsKHR`, containing the following values:

```
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- `VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR`: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.
- `VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR`: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.
- `VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR`: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.
- `VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR`: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

`VkCompositeAlphaFlagsKHR` is a bitmask type for setting a mask of zero or more `VkCompositeAlphaFlagBitsKHR`.

37.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

WARNING

This functionality is superseded by `vkGetPhysicalDeviceSurfaceFormats2KHR`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice          physicalDevice,
    VkSurfaceKHR              surface,
    uint32_t*                 pSurfaceFormatCount,
    VkSurfaceFormatKHR*       pSurfaceFormats);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created. See [vkCreateSwapchainKHR](#) for details of swapchain creation.
- **surface** is the surface that will be associated with the swapchain.
- **pSurfaceFormatCount** is a pointer to an integer related to the number of format pairs available or queried, as described below.
- **pSurfaceFormats** is either **NULL** or a pointer to an array of **VkSurfaceFormatKHR** structures.

If **pSurfaceFormats** is **NULL**, then the number of format pairs supported for the given **surface** is returned in **pSurfaceFormatCount**. Otherwise, **pSurfaceFormatCount** **must** point to a variable set by the application to the number of elements in the **pSurfaceFormats** array, and on return the variable is overwritten with the number of structures actually written to **pSurfaceFormats**. If the value of **pSurfaceFormatCount** is less than the number of format pairs supported, at most **pSurfaceFormatCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available format pairs were returned.

The number of format pairs supported **must** be greater than or equal to 1. **pSurfaceFormats** **must** not contain an entry whose value for **format** is **VK_FORMAT_UNDEFINED**.

If **pSurfaceFormats** includes an entry whose value for **colorSpace** is **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** and whose value for **format** is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for **VK_IMAGE_TILING_OPTIMAL**, then **pSurfaceFormats** **must** also contain an entry with the same value for **colorSpace** and **format** equal to the corresponding SRGB (or UNORM) format.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524
surface **must** be a valid **VkSurfaceKHR** handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525
surface **must** be supported by **physicalDevice**, as reported by **vkGetPhysicalDeviceSurfaceSupportKHR** or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
physicalDevice **must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter

If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter `pSurfaceFormatCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter
If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not `NULL`, `pSurfaceFormats` **must** be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormatKHR` structures
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSurfaceFormatKHR` structure is defined as:

WARNING

This functionality is superseded by `VK_KHR_get_surface_capabilities2`. See [Legacy Functionality](#) for more information.

```
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat          format;
    VkColorSpaceKHR   colorSpace;
} VkSurfaceFormatKHR;
```

- `format` is a `VkFormat` that is compatible with the specified surface.
- `colorSpace` is a presentation `VkColorSpaceKHR` that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t*                 pSurfaceFormatCount,
    VkSurfaceFormat2KHR*      pSurfaceFormats);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.
- `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormat2KHR` structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If `pSurfaceFormats` is `NULL`, then the number of format tuples supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` **must** point to a variable set by the application to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format tuples supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521
`pSurfaceInfo->surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522
`pSurfaceInfo->surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter
`pSurfaceInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure
- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter
`pSurfaceFormatCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not `NULL`, `pSurfaceFormats` **must** be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormat2KHR` structures

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSurfaceFormat2KHR` structure is defined as:

```
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType    sType;
    void*              pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.

If the `imageCompressionControlSwapchain` feature is supported and a `VkImageCompressionPropertiesEXT` structure is included in the `pNext` chain of this structure, then it will be filled with the compression properties that are supported for the `surfaceFormat`.

Valid Usage

- VUID-VkSurfaceFormat2KHR-pNext-06750
If the `VK_EXT_image_compression_control_swapchain` extension is not supported, the `pNext` chain **must** not include an `VkImageCompressionPropertiesEXT` structure

Valid Usage (Implicit)

- VUID-VkSurfaceFormat2KHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR](#)
- VUID-VkSurfaceFormat2KHR-pNext-pNext
pNext **must** be [NULL](#) or a pointer to a valid instance of [VkImageCompressionPropertiesEXT](#)
- VUID-VkSurfaceFormat2KHR-sType-unique
The **sType** value of each structure in the **pNext** chain **must** be unique

While the **format** of a presentable image refers to the encoding of each pixel, the **colorSpace** determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and transfer functions indicating the mapping between the image data and the colorimetry with respect to the given color space.

Possible values of [VkSurfaceFormatKHR::colorSpace](#), specifying the color spaces that a presentation engine can accept, are:

```

// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
    // Provided by VK_EXT_swapchain_colorspace
    // VK_COLOR_SPACE_DOLBYVISION_EXT is legacy, but no reason was given in the API XML
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
    // VK_COLORSPACE_SRGB_NONLINEAR_KHR is a legacy alias
    VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
    // Provided by VK_EXT_swapchain_colorspace
    // VK_COLOR_SPACE_DCI_P3_LINEAR_EXT is a legacy alias
    VK_COLOR_SPACE_DCI_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;

```

- [VK_COLOR_SPACE_SRGB_NONLINEAR_KHR](#) specifies support for the images in sRGB color space, encoded according to the sRGB specification.
- [VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT](#) specifies support for the images in Display-P3 color space, encoded using a Display-P3 transfer function.
- [VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT](#) specifies support for the images in extended sRGB color space, encoded using a linear transfer function.
- [VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT](#) specifies support for the images in extended sRGB color space, encoded according to the scRGB specification.

- [VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT](#) specifies support for the images in Display-P3 color space, encoded using a linear transfer function.
- [VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT](#) specifies support for the images in DCI-P3 color space, encoded according to the DCI-P3 specification. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.
- [VK_COLOR_SPACE_BT709_LINEAR_EXT](#) specifies support for the images in BT709 color space, encoded using a linear transfer function.
- [VK_COLOR_SPACE_BT709_NONLINEAR_EXT](#) specifies support for the images in BT709 color space, encoded according to the BT709 specification.
- [VK_COLOR_SPACE_BT2020_LINEAR_EXT](#) specifies support for the images in BT2020 color space, encoded using a linear transfer function.
- [VK_COLOR_SPACE_HDR10_ST2084_EXT](#) specifies support for the images in HDR10 (BT2020) color space, encoded according to SMPTE ST2084 Perceptual Quantizer (PQ) specification.
- [VK_COLOR_SPACE_HDR10_HLG_EXT](#) specifies support for the images in HDR10 (BT2020) color space, encoded according to the Hybrid Log Gamma (HLG) specification.
- [VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT](#) specifies support for images in Adobe RGB color space, encoded using a linear transfer function.
- [VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT](#) specifies support for the images in Adobe RGB color space, encoded according to the Adobe RGB specification (approximately Gamma 2.2).
- [VK_COLOR_SPACE_PASS_THROUGH_EXT](#) specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.

NOTE

In the initial release of the [VK_KHR_surface](#) and [VK_KHR_swapchain](#) extensions, the token [VK_COLORSPACE_SRGB_NONLINEAR_KHR](#) was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, [VK_COLOR_SPACE_SRGB_NONLINEAR_KHR](#) is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

NOTE

In older versions of this extension [VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT](#) was misnamed [VK_COLOR_SPACE_DCI_P3_LINEAR_EXT](#). This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is legacy but is maintained for backwards compatibility.

NOTE

In older versions of the [VK_EXT_swapchain_colorspace](#) extension, [VK_COLOR_SPACE_DOLBYVISION_EXT](#) was exposed. The intent was to indicate the presentation engine shall decode an image using the SMPTE ST 2084 Perceptual Quantizer (PQ) EOTF, and then apply a proprietary OOTF to process the image. However, Dolby Vision profile 8.4 describes an encoding using the Hybrid Log Gamma (HLG) OETF, and there is no swapchain extension for signaling Dolby Vision metadata to be used by a proprietary OOTF. This enum is legacy but is maintained for backwards compatibility.

NOTE

For a traditional “Linear” or non-gamma transfer function color space use [VK_COLOR_SPACE_PASS_THROUGH_EXT](#).

NOTE

On Wayland, [VK_COLOR_SPACE_PASS_THROUGH_EXT](#) can be used to disable color management by the WSI on a surface, which makes it possible for the application to create a `wp_color_management_surface_v1` object without triggering a `surface_exists` protocol error.

See [vkCreateWaylandSurfaceKHR](#)

The presentation engine interprets the pixel values of the R, G, and B components as having been encoded using an appropriate transfer function. Applications **should** ensure that the appropriate transfer function has been applied. [Texel encode](#) requires that all implementations implicitly apply the sRGB EOTF¹ on R, G, and B components when shaders write to an sRGB pixel format image, which is useful for sRGB color spaces. For sRGB color spaces with other pixel formats, or other non-linear color spaces, applications **can** apply the transfer function explicitly in a shader. The A channel is always interpreted as linearly encoded.

This extension defines enums for [VkColorSpaceKHR](#) that correspond to the following color spaces:

Table 49. Color Spaces and Attributes

Name	Red Primary	Green Primary	Blue Primary	White-point	Transfer function
DCI-P3	1.000, 0.000	0.000, 1.000	0.000, 0.000	0.3333, 0.3333	DCI P3
Display-P3	0.680, 0.320	0.265, 0.690	0.150, 0.060	0.3127, 0.3290 (D65)	Display-P3
BT709	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	BT709
sRGB	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	sRGB
extended sRGB	0.640, 0.330	0.300, 0.600	0.150, 0.060	0.3127, 0.3290 (D65)	scRGB
HDR10_ST2084	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	ST2084 PQ
HDR10_HLG	0.708, 0.292	0.170, 0.797	0.131, 0.046	0.3127, 0.3290 (D65)	HLG
Adobe RGB	0.640, 0.330	0.210, 0.710	0.150, 0.060	0.3127, 0.3290 (D65)	Adobe RGB

The transfer functions are described in the “Transfer Functions” chapter of the [Khronos Data Format Specification](#).

Except Display-P3 OETF, which is:

$$E = \begin{cases} 1.055 \times L^{\frac{1}{2.4}} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\ 12.92 \times L & \text{for } 0 \leq L < 0.0030186 \end{cases}$$

where L is the linear value of a color component and E is the encoded value (as stored in the image in memory).

NOTE For most uses, the sRGB OETF is equivalent.

37.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice      physicalDevice,
    VkSurfaceKHR          surface,
    uint32_t*             pPresentModeCount,
    VkPresentModeKHR*     pPresentModes);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created. See [vkCreateSwapchainKHR](#) for details of swapchain creation.
- **surface** is the surface that will be associated with the swapchain.
- **pPresentModeCount** is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- **pPresentModes** is either **NULL** or a pointer to an array of [VkPresentModeKHR](#) values, indicating the supported presentation modes.

If **pPresentModes** is **NULL**, then the number of presentation modes supported for the given **surface** is returned in **pPresentModeCount**. Otherwise, **pPresentModeCount** **must** point to a variable set by the application to the number of elements in the **pPresentModes** array, and on return the variable is overwritten with the number of values actually written to **pPresentModes**. If the value of **pPresentModeCount** is less than the number of presentation modes supported, at most **pPresentModeCount** values will be written, and [VK_INCOMPLETE](#) will be returned instead of [VK_SUCCESS](#), to indicate that not all the available modes were returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524
surface **must** be a valid [VkSurfaceKHR](#) handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525
surface **must** be supported by **physicalDevice**, as reported by [vkGetPhysicalDeviceSurfaceSupportKHR](#) or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
`pPresentModeCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
If the value referenced by `pPresentModeCount` is not `0`, and `pPresentModes` is not `NULL`, `pPresentModes` **must** be a valid pointer to an array of `pPresentModeCount` `VkPresentModeKHR` values
- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice          physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t*                 pPresentModeCount,
    VkPresentModeKHR*         pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

`vkGetPhysicalDeviceSurfacePresentModes2EXT` behaves similarly to `vkGetPhysicalDeviceSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06521
`pSurfaceInfo->surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06522
`pSurfaceInfo->surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter
`pSurfaceInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter
`pPresentModeCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter
If the value referenced by `pPresentModeCount` is not 0, and `pPresentModes` is not `NULL`, `pPresentModes` **must** be a valid pointer to an array of `pPresentModeCount` `VkPresentModeKHR` values

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

Possible values of elements of the [vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes](#) array, indicating the supported presentation modes for a surface, are:

```
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
    // Provided by VK_KHR_present_mode_fifo_latest_ready
    VK_PRESENT_MODE_FIFO_LATEST_READY_KHR = 1000361000,
    // Provided by VK_EXT_present_mode_fifo_latest_ready
    VK_PRESENT_MODE_FIFO_LATEST_READY_EXT = VK_PRESENT_MODE_FIFO_LATEST_READY_KHR,
} VkPresentModeKHR;
```

- [VK_PRESENT_MODE_IMMEDIATE_KHR](#) specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode **may** result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.
- [VK_PRESENT_MODE_MAILBOX_KHR](#) specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.
- [VK_PRESENT_MODE_FIFO_KHR](#) specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of [presentMode](#) that is **required** to be supported.
- [VK_PRESENT_MODE_FIFO_RELAXED_KHR](#) specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode **may** result in visible tearing in this case. This mode is useful for reducing visual stutter with an application

that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- [VK_PRESENT_MODE_FIFO_LATEST_READY_KHR](#) specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue. At each vertical blanking period, the presentation engine dequeues all successive requests that are ready to be presented from the beginning of the queue. If using the [presentAtAbsoluteTime](#) feature to provide a target present time, the presentation engine checks the specified time for each image. If the target present time is less-than or equal-to the current time, the presentation engine dequeues the image and checks the next one. The image of the last dequeued request is presented. The other dequeued requests are dropped.
- [VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR](#) specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application **must** make a presentation request whenever an update is required. However, the presentation engine **may** update the current image at any point, meaning this mode **may** result in visible tearing.
- [VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR](#) specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine **must** update the current image without any need for further presentation requests. The application **can** indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode **may** result in visible tearing if rendering to the image is not timed correctly.

The supported [VkImageUsageFlagBits](#) of the presentable images of a swapchain created for a surface **may** differ depending on the presentation mode, and can be determined as per the table below:

Table 50. Presentable Image Usage Queries

Presentation mode	Image usage flags
VK_PRESENT_MODE_IMMEDIATE_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_MAILBOX_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_FIFO_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_FIFO_RELAXED_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_FIFO_LATEST_READY_KHR	VkSurfaceCapabilitiesKHR::supportedUsageFlags
VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR	VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags

Presentation mode	Image usage flags
VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR	VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags

NOTE

For reference, the mode indicated by [VK_PRESENT_MODE_FIFO_KHR](#) is equivalent to the behavior of {wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by [VK_PRESENT_MODE_FIFO_RELAXED_KHR](#) is equivalent to the behavior of {wgl|glX}SwapBuffers with a swap interval of -1 (from the {WGL|GLX}_EXT_swap_control_tear extensions).

37.6. Full Screen Exclusive Control

Swapchains created with [fullScreenExclusive](#) set to [VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT](#) **must** acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- [device](#) is the device associated with [swapchain](#).
- [swapchain](#) is the swapchain to acquire exclusive full-screen access for.

Valid Usage

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674 [swapchain](#) **must** not be in the retired state
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675 [swapchain](#) **must** be a swapchain created with a [VkSurfaceFullScreenExclusiveInfoEXT](#) structure, with [fullScreenExclusive](#) set to [VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT](#)
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676 [swapchain](#) **must** not currently have exclusive full-screen access

A return value of [VK_SUCCESS](#) indicates that the [swapchain](#) successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with [vkReleaseFullScreenExclusiveModeEXT](#), destroys the swapchain, or if any of the swapchain commands return [VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT](#) indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then `VK_ERROR_INITIALIZATION_FAILED` is returned. An application **can** attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` has been returned by a swapchain command.

Valid Usage (Implicit)

- `VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter`
`device` **must** be a valid `VkDevice` handle
- `VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter`
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- `VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parent`
`swapchain` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To release exclusive full-screen access from a swapchain, call:

```
// Provided by VK_EXT_full_screen_exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
    VkDevice          device,
    VkSwapchainKHR    swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to release exclusive full-screen access from.

NOTE

Applications will not be able to present to `swapchain` after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimized or otherwise intends to stop presenting for a time.

Valid Usage

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677
swapchain **must** not be in the retired state
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678
swapchain **must** be a swapchain created with a [VkSurfaceFullScreenExclusiveInfoEXT](#) structure, with **fullScreenExclusive** set to [VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT](#)

Valid Usage (Implicit)

- VUID-vkReleaseFullScreenExclusiveModeEXT-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-parameter
swapchain **must** be a valid [VkSwapchainKHR](#) handle
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-parent
swapchain **must** have been created, allocated, or retrieved from **device**

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

37.7. Device Group Queries

A logical device that represents multiple physical devices **may** support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice device,
    VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- **device** is the logical device.
- **pDeviceGroupPresentCapabilities** is a pointer to a **VkDeviceGroupPresentCapabilitiesKHR** structure in which the device's capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter **device** must be a valid **VkDevice** handle
- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter **pDeviceGroupPresentCapabilities** must be a valid pointer to a **VkDeviceGroupPresentCapabilitiesKHR** structure

Return Codes

Success

- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The **VkDeviceGroupPresentCapabilitiesKHR** structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` **can** present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` **must** be set.
- `modes` is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

`modes` always has `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in `VkDeviceGroupPresentInfoKHR::mode`.

If a device group only includes a single physical device, then `modes` **must** equal `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`
- VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext
`pNext` **must** be `NULL`

Bits which **may** be set in `VkDeviceGroupPresentCapabilitiesKHR::modes`, indicating which device group presentation modes are supported, are:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
```

- `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` specifies that any physical device with a presentation engine **can** present its own swapchain images.
- `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR` specifies that any physical device with a presentation engine **can** present swapchain images from any physical device in its `presentMask`.
- `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR` specifies that any physical device with a presentation engine **can** present the sum of swapchain images from any physical devices in its `presentMask`.
- `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR` specifies that multiple physical devices with a presentation engine **can** each present their own swapchain images.

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
```

`VkDeviceGroupPresentModeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkDeviceGroupPresentModeFlagBitsKHR`.

Some surfaces **may** not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice device,
    VkSurfaceKHR surface,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- `device` is the logical device.
- `surface` is the surface.
- `pModes` is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded. These modes **must** be a subset of the modes returned by `vkGetDeviceGroupPresentCapabilitiesKHR`.

Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
`surface` **must** be supported by all physical devices associated with `device`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
`pModes` **must** be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value
- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
Both of `device`, and `surface` **must** have been created, allocated, or retrieved from the same

Host Synchronization

- Host access to **surface** **must** be externally synchronized

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

To query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```
// Provided by VK_EXT_full_screen_exclusive with VK_KHR_device_group or VK_VERSION_1_1
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice device,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- **device** is the logical device.
- **pSurfaceInfo** is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- **pModes** is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

Valid Usage

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-06213
pSurfaceInfo->surface **must** be supported by all physical devices associated with **device**, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-

specific mechanism

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter
pSurfaceInfo **must** be a valid pointer to a valid [VkPhysicalDeviceSurfaceInfo2KHR](#) structure
- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter
pModes **must** be a valid pointer to a [VkDeviceGroupPresentModeFlagsKHR](#) value

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

When using [VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR](#), the application **may** need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice    physicalDevice,
    VkSurfaceKHR        surface,
    uint32_t*          pRectCount,
    VkRect2D*          pRects);
```

- **physicalDevice** is the physical device.
- **surface** is the surface.
- **pRectCount** is a pointer to an integer related to the number of rectangles available or queried, as

described below.

- `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` **must** point to a variable set by the application to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command **must** not overlap.

Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
`surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
`physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
`pRectCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
If the value referenced by `pRectCount` is not 0, and `pRects` is not `NULL`, `pRects` **must** be a valid pointer to an array of `pRectCount` `VkRect2D` structures
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `surface` **must** be externally synchronized

Return Codes

Success

- [VK_INCOMPLETE](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

37.8. Present Timing Queries

Traditional game and real-time-animation applications frequently use [VK_PRESENT_MODE_FIFO_KHR](#) so that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine's display. On fixed refresh rate displays, this avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more RCs than other images.

In order to minimize stuttering, an application needs to: 1) render and present images at a consistent rate that is, on fixed refresh rate displays, a multiple of the presentation engine's refresh rate; 2) correctly position its geometry for when the presentable image will be displayed to the user. The [VK_EXT_present_timing](#) extension allows an application to satisfy these needs.

The presentation engine's display typically refreshes the pixels that are displayed to the user on a periodic basis. This period **may** be fixed (Fixed Refresh Rate, FRR) or variable (Variable Refresh Rate, VRR).

In order to collect timing information about presentation, a swapchain needs an internal queue to store asynchronously updated results until applications collect them.

To allocate the swapchain's internal timing results queue, call:

```
// Provided by VK_EXT_present_timing
VkResult vkSetSwapchainPresentTimingQueueSizeEXT(
    VkDevice          device,
    VkSwapchainKHR    swapchain,
    uint32_t          size);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to allocate a results queue for.
- **size** is the requested number of slots in the internal results queue.

If this function is called multiple times, the internal queue is reallocated to fit the new **size**. If the new **size** is less than the current number of outstanding results, **VK_NOT_READY** is returned and no allocation is performed.

Valid Usage

- VUID-vkSetSwapchainPresentTimingQueueSizeEXT-swapchain-12229
swapchain **must** have been created with **VkSwapchainCreateInfoKHR::flags** containing **VK_SWAPCHAIN_CREATE_PRESENT_TIMING_BIT_EXT**

Valid Usage (Implicit)

- VUID-vkSetSwapchainPresentTimingQueueSizeEXT-device-parameter
device **must** be a valid **VkDevice** handle
- VUID-vkSetSwapchainPresentTimingQueueSizeEXT-swapchain-parameter
swapchain **must** be a valid **VkSwapchainKHR** handle
- VUID-vkSetSwapchainPresentTimingQueueSizeEXT-swapchain-parent
swapchain **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **swapchain** **must** be externally synchronized

Return Codes

Success

- **VK_NOT_READY**
- **VK_SUCCESS**

Failure

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_UNKNOWN**
- **VK_ERROR_VALIDATION_FAILED**

The implementation maintains an internal monotonically increasing counter which updates when the presentation engine's timing properties are modified.

To query the presentation engine's current timing properties for a given swapchain, call:

```
// Provided by VK_EXT_present_timing
VkResult vkGetSwapchainTimingPropertiesEXT(
    VkDevice          device,
    VkSwapchainKHR    swapchain,
    VkSwapchainTimingPropertiesEXT* pSwapchainTimingProperties,
    uint64_t*         pSwapchainTimingPropertiesCounter);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to obtain timing properties for.
- **pSwapchainTimingProperties** is a pointer to an instance of the **VkSwapchainTimingPropertiesEXT** structure.
- **pSwapchainTimingPropertiesCounter** is **NULL** or a pointer to a 64-bit unsigned integer set by the implementation to the current value of the swapchain's internal timing properties counter.

If **vkGetSwapchainTimingPropertiesEXT** returns **VK_NOT_READY**, the implementation was not able to determine the current refresh cycle duration. Some platforms **may** not provide timing properties until after at least one image has been presented to the **swapchain**. If timing properties change for the **swapchain**, these platforms **may** not provide updated results until after at least one additional image has been presented to the **swapchain**.

Valid Usage (Implicit)

- VUID-vkGetSwapchainTimingPropertiesEXT-device-parameter **device** **must** be a valid **VkDevice** handle
- VUID-vkGetSwapchainTimingPropertiesEXT-swapchain-parameter **swapchain** **must** be a valid **VkSwapchainKHR** handle
- VUID-vkGetSwapchainTimingPropertiesEXT-pSwapchainTimingProperties-parameter **pSwapchainTimingProperties** **must** be a valid pointer to a **VkSwapchainTimingPropertiesEXT** structure
- VUID-vkGetSwapchainTimingPropertiesEXT-pSwapchainTimingPropertiesCounter-parameter
If **pSwapchainTimingPropertiesCounter** is not **NULL**, **pSwapchainTimingPropertiesCounter** **must** be a valid pointer to a **uint64_t** value
- VUID-vkGetSwapchainTimingPropertiesEXT-swapchain-parent **swapchain** **must** have been created, allocated, or retrieved from **device**

Host Synchronization

- Host access to **swapchain** **must** be externally synchronized

Return Codes

Success

- [VK_NOT_READY](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSwapchainTimingPropertiesEXT](#) structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkSwapchainTimingPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint64_t           refreshDuration;
    uint64_t           refreshInterval;
} VkSwapchainTimingPropertiesEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [refreshDuration](#) is zero or an indication of the duration of a refresh cycle.
- [refreshInterval](#) is zero or a duration in nanoseconds indicating the interval between refresh cycle durations.

If [refreshDuration](#) is zero, the presentation engine is not able to determine the duration of the refresh cycle. Similarly, if [refreshInterval](#) is zero, the presentation engine is not able to determine whether it is operating in VRR mode.

Otherwise, if [refreshInterval](#) is the same as [refreshDuration](#), the presentation engine is operating in FRR mode. In this case, [refreshDuration](#) is the number of nanoseconds from the start of one refresh cycle to the start of the next refresh cycle.

If [refreshInterval](#) is [UINT64_MAX](#), the presentation engine is operating in VRR mode, and [refreshDuration](#) is the minimum number of nanoseconds from the start of one refresh cycle to the start of the next refresh cycle.

If [refreshDuration](#) and [refreshInterval](#) are not zero, [refreshInterval](#) is a factor of [refreshDuration](#).

Valid Usage (Implicit)

- VUID-VkSwapchainTimingPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_TIMING_PROPERTIES_EXT`
- VUID-VkSwapchainTimingPropertiesEXT-pNext-pNext
`pNext` **must** be `NULL`

NOTE

Some display technologies allow the vblank interval to be decoupled from the display's effective refresh rate. In other words, presented images are visible for a fixed duration (`refreshDuration`) that is a multiple of the vblank interval (`refreshInterval`) which **may** be much smaller. This allows such displays, for example, to effectively operate at a fixed refresh rate with the ability to quickly change that refresh rate to adapt to the current system's workload.

Note that `VkSwapchainTimingPropertiesEXT` only represents the current swapchain's view of those capabilities, which **may** differ from the actual hardware capabilities, based e.g. on the current surface properties. For example, swapchains that render to a windowed surface requiring complex composition **may** not be able to reach their display hardware's full potential.

The rate at which an application renders and presents new images is known as the image present rate (IPR, a.k.a. frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD).

In order to provide a smooth, stutter-free animation on non-VRR displays, an application needs its IPD to be a multiple of `refreshInterval` that is at least equal to `refreshDuration`.

For example, if a FRR display has a set 60Hz refresh rate, where `refreshDuration` is equal to `refreshInterval`, `refreshDuration` will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of `refreshInterval`), or 33.33ms (2X multiplier of `refreshInterval`), or 50.0ms (3X multiplier of `refreshInterval`), etc.

NOTE

In order to determine a target IPD for a display (i.e. a multiple of `refreshInterval`), an application needs to determine when its images are actually displayed.

Consider an application that has an initial target IPD of 16.67ms (1X multiplier of `refreshDuration`). It will therefore position the geometry of a new image 16.67ms later than the previous image.

If this application is running on slower hardware, so that it actually takes 20ms to render each new image, the images will not be displayed to the user every 16.67ms, nor every 20ms, which will create visual anomalies. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of `refreshDuration`), and tell the presentation engine to not present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each

presentable image.

On VRR displays, where `refreshInterval` is `UINT64_MAX`, applications **should** target an IPD that is at least equal to `refreshDuration`.

Adjustments to an application's IPD may be needed because different views of an application's geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room.

In general, it is good to not frequently change IPD, as that can cause visual anomalies.

Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the periodic feedback of `VkPastPresentationTimingEXT` values indicates that the target IPD can be durably achieved.

The implementation maintains an internal monotonically increasing counter which updates when the presentation engine's list of supported time domains for a swapchain is modified.

To query the time domains supported by the presentation engine for a given swapchain, call:

```
// Provided by VK_EXT_present_timing
VkResult vkGetSwapchainTimeDomainPropertiesEXT(
    VkDevice          device,
    VkSwapchainKHR    swapchain,
    VkSwapchainTimeDomainPropertiesEXT* pSwapchainTimeDomainProperties,
    uint64_t*         pTimeDomainsCounter);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to obtain time domain properties for.
- `pSwapchainTimeDomainProperties` is a pointer to an instance of the `VkSwapchainTimeDomainPropertiesEXT` structure.
- `pTimeDomainsCounter` is `NULL` or a pointer to a 64-bit unsigned integer set by the implementation to the current value of the swapchain's internal time domain properties counter.

If upon return `VkSwapchainTimeDomainPropertiesEXT::timeDomainCount` is smaller than the number of time domains supported for the given `swapchain`, `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS` to indicate that not all the available values were returned.

Valid Usage (Implicit)

- VUID-vkGetSwapchainTimeDomainPropertiesEXT-device-parameter `device` **must** be a valid `VkDevice` handle
- VUID-vkGetSwapchainTimeDomainPropertiesEXT-swapchain-parameter `swapchain` **must** be a valid `VkSwapchainKHR` handle

- VUID-vkGetSwapchainTimeDomainPropertiesEXT-pSwapchainTimeDomainProperties-parameter
`pSwapchainTimeDomainProperties` **must** be a valid pointer to a `VkSwapchainTimeDomainPropertiesEXT` structure
- VUID-vkGetSwapchainTimeDomainPropertiesEXT-pTimeDomainsCounter-parameter
If `pTimeDomainsCounter` is not `NULL`, `pTimeDomainsCounter` **must** be a valid pointer to a `uint64_t` value
- VUID-vkGetSwapchainTimeDomainPropertiesEXT-swapchain-parent
`swapchain` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkSwapchainTimeDomainPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkSwapchainTimeDomainPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           timeDomainCount;
    VkTimeDomainKHR*   pTimeDomains;
    uint64_t*          pTimeDomainIds;
} VkSwapchainTimeDomainPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `timeDomainCount` is an integer related to the number of time domains available or queried, as

described below.

- **pTimeDomains** is a pointer to an array of **VkTimeDomainKHR** values representing time domains that are available for the swapchain.
- **pTimeDomainIds** is a pointer to an array of unique identifiers for each time domain.

When calling **vkGetSwapchainTimeDomainPropertiesEXT**, if **pTimeDomains** is **NULL** and **pTimeDomainIds** is **NULL**, then the number of time domains supported for the given **swapchain** is returned in **timeDomainCount**. Otherwise, **timeDomainCount** **must** specify the number of elements in **pTimeDomains** and **pTimeDomainIds**, and on return is overwritten with the number of values actually written to each array.

Implementations **must** advertise support for at least one time domain of **VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT**.

NOTE

Due to the dynamic nature of their underlying **VkSurfaceKHR** properties, swapchains may need to expose multiple swapchain-local opaque time domains using the same **VkTimeDomainKHR** value over time, for example when a surface is moved from one display hardware to another. Arbitrary identifiers, provided in **timeDomainIds**, are used by the implementation to differentiate opaque time domains of identical scopes.

Valid Usage

- VUID-VkSwapchainTimeDomainPropertiesEXT-pTimeDomains-12370
pTimeDomains and **pTimeDomainIds** **must** both be **NULL** or both not be **NULL**
- VUID-VkSwapchainTimeDomainPropertiesEXT-pTimeDomains-12371
If **pTimeDomains** and **pTimeDomainIds** are not **NULL**, then **timeDomainCount** **must** not be zero

Valid Usage (Implicit)

- VUID-VkSwapchainTimeDomainPropertiesEXT-sType-sType
sType **must** be **VK_STRUCTURE_TYPE_SWAPCHAIN_TIME_DOMAIN_PROPERTIES_EXT**
- VUID-VkSwapchainTimeDomainPropertiesEXT-pNext-pNext
pNext **must** be **NULL**

Because of the asynchronous nature of the presentation engine, the timing information for a given **vkQueuePresentKHR** command **may** only become available some time after the presentation has occurred. These time values **should** be asynchronously queried, and are returned if available. All time values are in nanoseconds, according to the time-domain being used.

To asynchronously query the presentation engine for newly-available timing information about one or more previous presents to a given swapchain, call:

```
// Provided by VK_EXT_present_timing
VkResult vkGetPastPresentationTimingEXT(
    VkDevice device,
    const VkPastPresentationTimingInfoEXT* pPastPresentationTimingInfo,
    VkPastPresentationTimingPropertiesEXT* pPastPresentationTimingProperties);
```

- `device` is the device associated with `swapchain`.
- `pPastPresentationTimingInfo` is a pointer to an instance of the `VkPastPresentationTimingInfoEXT` structure.
- `pPastPresentationTimingProperties` is a pointer to an instance of the `VkPastPresentationTimingPropertiesEXT` structure.

If upon return the value of `VkPastPresentationTimingPropertiesEXT::presentationTimingCount` is less than the number of available timing records for the given `VkPastPresentationTimingInfoEXT::swapchain`, `VK_INCOMPLETE` is returned instead of `VK_SUCCESS` to indicate that not all the available values were returned.

Upon return, zero or more slots of the `swapchain` internal timing results queue, equal to the number of entries written to `VkPastPresentationTimingPropertiesEXT::pPresentationTimings` for which `reportComplete` is `VK_TRUE`, are made available for future `vkQueuePresentKHR` calls. Elements of `pPresentationTimings` are arranged in ascending order of present ids.

Timing information **may** become available out of order with regards to their associated `vkQueuePresentKHR` order. `VK_PAST_PRESENTATION_TIMING_ALLOW_OUT_OF_ORDER_RESULTS_BIT_EXT` **can** be set in `VkPastPresentationTimingInfoEXT::flags` to allow `vkGetPastPresentationTimingEXT` to return results in that same order. Otherwise, results are returned in the order of their associated `vkQueuePresentKHR` calls.

There is no requirement for any precise timing relationship between the completion of a present stage and the availability of any associated timing information. However, results **must** be made available in finite time.

As an exception to the normal rules for objects which are externally synchronized, `swapchain` **may** be simultaneously used by other threads in calls to functions other than `vkDestroySwapchainKHR` and `vkCreateSwapchainKHR` with `swapchain` used as an `oldSwapchain`. Access to the swapchain timing information **must** be atomic within the implementation.

Valid Usage

- VUID-vkGetPastPresentationTimingEXT-flags-12230
If `VK_PAST_PRESENTATION_TIMING_ALLOW_OUT_OF_ORDER_RESULTS_BIT_EXT` is set in `VkPastPresentationTimingInfoEXT::flags`, the `presentStageCount` value of each element of `VkPastPresentationTimingPropertiesEXT::pPresentationTimings` **must** be at least the maximum number of present stages set in `VkPresentTimingInfoEXT::presentStageQueries` among all `vkQueuePresentKHR` calls, with a non-zero `presentStageQueries`, for which complete results have not been returned yet by a previous call

- VUID-vkGetPastPresentationTimingEXT-flags-12231

If `VK_PAST_PRESENTATION_TIMING_ALLOW_OUT_OF_ORDER_RESULTS_BIT_EXT` is not set in `VkPastPresentationTimingInfoEXT::flags`, the `presentStageCount` value of each element of `VkPastPresentationTimingPropertiesEXT::pPresentationTimings` **must** be at least the number of present stages set in `VkPresentTimingInfoEXT::presentStageQueries` for the earliest call to `vkQueuePresentKHR`, with a non-zero `presentStageQueries`, that corresponds to that element's index and for which complete results have not been returned yet by a previous call

Valid Usage (Implicit)

- VUID-vkGetPastPresentationTimingEXT-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkGetPastPresentationTimingEXT-pPastPresentationTimingInfo-parameter
`pPastPresentationTimingInfo` **must** be a valid pointer to a valid `VkPastPresentationTimingInfoEXT` structure
- VUID-vkGetPastPresentationTimingEXT-pPastPresentationTimingProperties-parameter
`pPastPresentationTimingProperties` **must** be a valid pointer to a `VkPastPresentationTimingPropertiesEXT` structure

Return Codes

Success

- `VK_INCOMPLETE`
- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPastPresentationTimingInfoEXT` structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkPastPresentationTimingInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkPastPresentationTimingFlagsEXT flags;
    VkSwapchainKHR            swapchain;
} VkPastPresentationTimingInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPastPresentationTimingFlagBitsEXT` specifying options for queries of past presentation timing information.
- `swapchain` is the swapchain to obtain presentation timing information for.

Valid Usage (Implicit)

- VUID-VkPastPresentationTimingInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PAST_PRESENTATION_TIMING_INFO_EXT`
- VUID-VkPastPresentationTimingInfoEXT-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkPastPresentationTimingInfoEXT-flags-parameter
`flags` **must** be a valid combination of `VkPastPresentationTimingFlagBitsEXT` values
- VUID-VkPastPresentationTimingInfoEXT-swapchain-parameter
`swapchain` **must** be a valid `VkSwapchainKHR` handle

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

```
// Provided by VK_EXT_present_timing
typedef VkFlags VkPastPresentationTimingFlagsEXT;
```

`VkPastPresentationTimingFlagsEXT` is a bitmask type for setting a mask of zero or more `VkPastPresentationTimingFlagBitsEXT`.

Bits which **can** be set in `VkPastPresentationTimingInfoEXT::flags`, specifying options for queries of past presentation timing information, are:

```
// Provided by VK_EXT_present_timing
typedef enum VkPastPresentationTimingFlagBitsEXT {
    VK_PAST_PRESENTATION_TIMING_ALLOW_PARTIAL_RESULTS_BIT_EXT = 0x00000001,
    VK_PAST_PRESENTATION_TIMING_ALLOW_OUT_OF_ORDER_RESULTS_BIT_EXT = 0x00000002,
} VkPastPresentationTimingFlagBitsEXT;
```

- `VK_PAST_PRESENTATION_TIMING_ALLOW_PARTIAL_RESULTS_BIT_EXT` specifies that `vkGetPastPresentationTimingEXT` **may** return partial results for presentation requests that have not completed all requested present stages.
- `VK_PAST_PRESENTATION_TIMING_ALLOW_OUT_OF_ORDER_RESULTS_BIT_EXT` specifies that `vkGetPastPresentationTimingEXT` **may** return results out of order with respect to the presentation order.

The `VkPastPresentationTimingPropertiesEXT` structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkPastPresentationTimingPropertiesEXT {
    VkStructureType      sType;
    void*                 pNext;
    uint64_t              timingPropertiesCounter;
    uint64_t              timeDomainsCounter;
    uint32_t              presentationTimingCount;
    VkPastPresentationTimingEXT* pPresentationTimings;
} VkPastPresentationTimingPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `timingPropertiesCounter` is a 64-bit unsigned integer set by the implementation to the current value of the swapchain's internal timing properties counter.
- `timeDomainsCounter` is a 64-bit unsigned integer set by the implementation to the current value of the swapchain's internal time domains list counter.
- `presentationTimingCount` is an integer related to the number of `VkPastPresentationTimingEXT` structures available or queried, as described below.
- `pPresentationTimings` is `NULL` or a pointer to an array of `VkPastPresentationTimingEXT` structures.

When calling `vkGetPastPresentationTimingEXT`, if `pPresentationTimings` is `NULL`, then the number of available timing records for the given `swapchain` is returned in `presentationTimingCount`. Otherwise, `presentationTimingCount` **must** specify the number of elements in the `pPresentationTimings` array, and on return is overwritten with the number of structures actually written to `pPresentationTimings`.

if `VK_PAST_PRESENTATION_TIMING_ALLOW_PARTIAL_RESULTS_BIT_EXT` is specified in `VkPastPresentationTimingInfoEXT::flags`, `vkGetPastPresentationTimingEXT` **may** return incomplete results, containing only information for a subset of the requested present stages. Further calls to `vkGetPastPresentationTimingEXT` will keep providing all available results for a previously incomplete entry until it is complete.

The implementation **must** return a `VkPastPresentationTimingEXT` for every `vkQueuePresentKHR` referencing `swapchain` where a non-zero `VkPresentTimingInfoEXT::presentStageQueries` was specified and at least one present stage has available results.

Valid Usage (Implicit)

- VUID-VkPastPresentationTimingPropertiesEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PAST_PRESENTATION_TIMING_PROPERTIES_EXT`
- VUID-VkPastPresentationTimingPropertiesEXT-pNext-pNext
`pNext` **must** be `NULL`

NOTE

The presentation engine **may** change the timing properties of the **swapchain** for a variety of reasons.

This **may** occur, for example, if the window system changes its mode, including the refresh rate of the display. Another example is if an application's surface is being composited with other windows of a window system, and then the surface's window becomes a borderless, full-screen window. While composited, the timing properties **may** be FRR, and while full-screen, the timing properties **may** be VRR.

The available time domains for a swapchain **may** change for similar or identical reasons. Therefore, it is possible that the same event will cause both the swapchain's internal timing properties counter and time domains list counter to update.

The **VkPastPresentationTimingEXT** structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkPastPresentationTimingEXT {
    VkStructureType      sType;
    void*                pNext;
    uint64_t             presentId;
    uint64_t             targetTime;
    uint32_t             presentStageCount;
    VkPresentStageTimeEXT* pPresentStages;
    VkTimeDomainKHR      timeDomain;
    uint64_t             timeDomainId;
    VkBool32             reportComplete;
} VkPastPresentationTimingEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **presentId** is zero or a value that was given to a previous **vkQueuePresentKHR** command via **VkPresentId2KHR::pPresentIds**.
- **targetTime** is the application-provided target absolute time or duration of the associated presentation request in **VkPresentTimingInfoEXT::targetTime**.
- **presentStageCount** is a count of items contained in **pPresentStages**.
- **pPresentStages** a pointer to an array of **VkPresentStageTimeEXT** providing timing information for the presentation request associated with **presentId**.
- **timeDomain** is the time domain used by the presentation engine to report times in **pPresentStages**.
- **timeDomainId** is the id associated with **timeDomain**.
- **reportComplete** is **VK_TRUE** if the presentation engine has reported all the requested results in **pPresentStages**.

When calling **vkGetPastPresentationTimingEXT**, the implementation sets **presentStageCount** to the number of present stages it has written results for. If

`VK_PAST_PRESENTATION_TIMING_ALLOW_PARTIAL_RESULTS_BIT_EXT` was specified in `VkPastPresentationTimingInfoEXT::flags`, the implementation **may** return an incomplete report containing fewer present stage results than were queried by the associated presentation request. Otherwise, results for all the present stages queried by the presentation request are written by the implementation.

Timing information for some present stages **may** have a time value of 0, indicating that results for that present stage are not available.

For systems with multiple entities operating within the presentation engine, such as multiple displays, `pPresentStages` will return timing results for one entity which has been affected by the presentation.

`timeDomainId` **may** be different than the time domain that was specified in `VkPresentTimingInfoEXT::timeDomainId` if the requirements for using this time domain could not be met at the time the presentation engine processed the presentation request. In such a case, the presentation engine **may** pick a time domain to fall back to, if one is available, and report results in that domain. Applications **can** continue to use this fallback time domain in future `vkQueuePresentKHR` calls, or they **can** call `vkGetSwapchainTimeDomainPropertiesEXT` to choose from the currently supported time domains.

Valid Usage (Implicit)

- VUID-VkPastPresentationTimingEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PAST_PRESENTATION_TIMING_EXT`
- VUID-VkPastPresentationTimingEXT-pNext-pNext
`pNext` **must** be `NULL`

The `VkPresentStageTimeEXT` structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkPresentStageTimeEXT {
    VkPresentStageFlagsEXT    stage;
    uint64_t                  time;
} VkPresentStageTimeEXT;
```

- `stage` is a `VkPresentStageFlagsEXT` value specifying a present stage.
- `time` is a time in nanoseconds associated with the `stage`.

37.9. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Providing a mechanism which allows applications to block, waiting for a specific step of the

presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The `VK_KHR_present_wait2` extension allows applications to tell the presentation engine at the `vkQueuePresentKHR` call that it plans on waiting for presentation by passing a `VkPresentId2KHR` structure. The `presentId` passed in that structure may then be passed to a future `vkWaitForPresent2KHR` call to cause the application to block until that presentation is finished.

This functionality was originally provided by the `VK_KHR_present_wait` extension, which has been deprecated and replaced by `VK_KHR_present_wait2`.

The `VkPresentWait2InfoKHR` structure is defined as:

```
// Provided by VK_KHR_present_wait2
typedef struct VkPresentWait2InfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           presentId;
    uint64_t           timeout;
} VkPresentWait2InfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentId` is the presentation `presentId` to wait for.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

Valid Usage (Implicit)

- VUID-VkPresentWait2InfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_WAIT_2_INFO_KHR`
- VUID-VkPresentWait2InfoKHR-pNext-pNext
`pNext` **must** be `NULL`

37.10. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface.

The presentable images are represented by `VkImage` objects created by the platform. One image (which **can** be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images **can** be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window **cannot** be associated with more than one non-retired swapchain at a time. Further, swapchains **cannot** be created for native windows that have a non-Vulkan graphics API surface associated with them.

NOTE

The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine **may** be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations **may** use the device's graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application **can** acquire use of a presentable image from the presentation engine. Use of a presentable image **must** occur only after the image is returned by `vkAcquireNextImageKHR`, and before it is released by `vkQueuePresentKHR`. This includes transitioning the image layout and rendering commands.

An application **can** acquire use of a presentable image with `vkAcquireNextImageKHR`. After acquiring a presentable image and before modifying it, the application **must** use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application **can** then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with `vkQueuePresentKHR`, which releases the acquisition of the image. The application **can** also release the acquisition of the image through `vkReleaseSwapchainImagesKHR`, if the image is not in use by the device, and skip the present operation.

The presentation engine controls the order in which presentable images are acquired for use by the application.

NOTE

This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with `presentMode` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, a single presentable image **can** be acquired, referred to as a shared presentable image. A shared presentable image **may** be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.

- With [VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR](#), the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application **must** call `vkQueuePresentKHR` to guarantee an update. However, the presentation engine **may** update from it at any time.
- With [VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR](#), the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to `vkQueuePresentKHR`, after which the presentation engine will update from it without any need for further present calls. The application **can** indicate the image contents have been updated by calling `vkQueuePresentKHR`, but this does not guarantee the timing of when updates will occur.

The presentation engine **may** access a shared presentable image at any time after it is first presented. To avoid tearing, an application **should** coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine's refresh cycle they are intended for.

NOTE

The [VK_KHR_shared_presentable_image](#) extension does not provide functionality for determining the timing of the presentation engine's refresh cycles.

In order to query a swapchain's status when rendering to a shared presentable image, call:

```
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice          device,
    VkSwapchainKHR    swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.

Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter `device` **must** be a valid [VkDevice](#) handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parameter `swapchain` **must** be a valid [VkSwapchainKHR](#) handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parent `swapchain` **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

Return Codes

Success

- [VK_SUBOPTIMAL_KHR](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT](#)
- [VK_ERROR_OUT_OF_DATE_KHR](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The possible return values for [vkGetSwapchainStatusKHR](#) **should** be interpreted as follows:

- [VK_SUCCESS](#) specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's [VkPresentModeKHR](#).
- [VK_SUBOPTIMAL_KHR](#) the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's [VkPresentModeKHR](#).
- [VK_ERROR_OUT_OF_DATE_KHR](#) the surface has changed in such a way that it is no longer compatible with the swapchain.
- [VK_ERROR_SURFACE_LOST_KHR](#) the surface is no longer available.

NOTE

The swapchain state **may** be cached by implementations, so applications **should** regularly call [vkGetSwapchainStatusKHR](#) when using a swapchain with [VkPresentModeKHR](#) equal to [VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR](#).

To create a swapchain, call:

```
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice                                device,
    const VkSwapchainCreateInfoKHR*         pCreateInfo,
    const VkAllocationCallbacks*           pAllocator,
    VkSwapchainKHR*                         pSwapchain);
```

- [device](#) is the device to create the swapchain for.

- **pCreateInfo** is a pointer to a [VkSwapchainCreateInfoKHR](#) structure specifying the parameters of the created swapchain.
- **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see [Memory Allocation](#)).
- **pSwapchain** is a pointer to a [VkSwapchainKHR](#) handle in which the created swapchain object will be returned.

As mentioned above, if **vkCreateSwapchainKHR** succeeds, it will return a handle to a swapchain containing an array of at least **pCreateInfo->minImageCount** presentable images.

While acquired by the application, presentable images **can** be used in any way that equivalent non-presentable images **can** be used. A presentable image is equivalent to a non-presentable image created with the following [VkImageCreateInfo](#) parameters:

VkImageCreateInfo Field	Value
flags	VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set VK_IMAGE_CREATE_PROTECTED_BIT is set if VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR is set VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR are both set if VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR is set VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT is set if VK_SWAPCHAIN_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT is set all other bits are unset
imageType	VK_IMAGE_TYPE_2D
format	pCreateInfo->imageFormat
extent	{ pCreateInfo->imageExtent.width , pCreateInfo->imageExtent.height , 1}
mipLevels	1
arrayLayers	pCreateInfo->imageArrayLayers
samples	VK_SAMPLE_COUNT_1_BIT

VkImageCreateInfo Field	Value
tiling	VK_IMAGE_TILING_OPTIMAL
usage	pCreateInfo->imageUsage
sharingMode	pCreateInfo->imageSharingMode
queueFamilyIndexCount	pCreateInfo->queueFamilyIndexCount
pQueueFamilyIndices	pCreateInfo->pQueueFamilyIndices
initialLayout	VK_IMAGE_LAYOUT_UNDEFINED

The `pCreateInfo->surface` **must** not be destroyed until after the swapchain is destroyed.

If `oldSwapchain` is `VK_NULL_HANDLE`, and the native window referred to by `pCreateInfo->surface` is already associated with a Vulkan swapchain, `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR` **must** be returned.

If `oldSwapchain` is a valid swapchain and there are outstanding calls to `vkWaitForPresent2KHR`, then `vkCreateSwapchainKHR` **may** block until those calls complete.

If the native window referred to by `pCreateInfo->surface` is already associated with a non-Vulkan graphics API surface, `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR` **must** be returned.

The native window referred to by `pCreateInfo->surface` **must** not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

`vkCreateSwapchainKHR` will return `VK_ERROR_DEVICE_LOST` if the logical device was lost. The `VkSwapchainKHR` is a child of the `device`, and **must** be destroyed before the `device`. However, `VkSurfaceKHR` is not a child of any `VkDevice` and is not affected by the lost device. After successfully recreating a `VkDevice`, the same `VkSurfaceKHR` **can** be used to create a new `VkSwapchainKHR`, provided the previous one was destroyed.

If the `oldSwapchain` parameter of `pCreateInfo` is a valid swapchain, which has exclusive full-screen access, that access is released from `pCreateInfo->oldSwapchain`. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from `pCreateInfo->oldSwapchain`.

NOTE

This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation **may** fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, `VK_ERROR_INITIALIZATION_FAILED` will be returned.

NOTE

In particular, it will fail if the `imageExtent` member of `pCreateInfo` does not match the extents of the monitor. Other reasons for failure may include the application not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
device **must** be a valid [VkDevice](#) handle
- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
pCreateInfo **must** be a valid pointer to a valid [VkSwapchainCreateInfoKHR](#) structure
- VUID-vkCreateSwapchainKHR-pAllocator-parameter
If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid [VkAllocationCallbacks](#) structure
- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
pSwapchain **must** be a valid pointer to a [VkSwapchainKHR](#) handle
- VUID-vkCreateSwapchainKHR-device-queuecount
The device **must** have been created with at least **1** queue

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_COMPRESSION_EXHAUSTED_EXT](#)
- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_INITIALIZATION_FAILED](#)
- [VK_ERROR_NATIVE_WINDOW_IN_USE_KHR](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkSwapchainCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR          surface;
    uint32_t              minImageCount;
    VkFormat              imageFormat;
    VkColorSpaceKHR       imageColorSpace;
    VkExtent2D            imageExtent;
    uint32_t              imageArrayLayers;
    VkImageUsageFlags     imageUsage;
    VkSharingMode          imageSharingMode;
    uint32_t              queueFamilyIndexCount;
    const uint32_t*        pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR       presentMode;
    VkBool32               clipped;
    VkSwapchainKHR         oldSwapchain;
} VkSwapchainCreateInfoKHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkSwapchainCreateFlagBitsKHR](#) indicating parameters of the swapchain creation.
- **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with **surface**.
- **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
- **imageFormat** is a [VkFormat](#) value specifying the format the swapchain image(s) will be created with.
- **imageColorSpace** is a [VkColorSpaceKHR](#) value specifying the way the swapchain interprets image data.
- **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface's **currentExtent** as returned by [vkGetPhysicalDeviceSurfaceCapabilitiesKHR](#).

NOTE

On some platforms, it is normal that **maxImageExtent** **may** become **(0, 0)**, for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements, unless scaling is selected through [VkSwapchainPresentScalingCreateInfoKHR](#), if supported.

- **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D

applications, this value is 1.

- **imageUsage** is a bitmask of **VkImageUsageFlagBits** describing the intended usage of the (acquired) swapchain images.
- **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.
- **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when **imageSharingMode** is **VK_SHARING_MODE_CONCURRENT**.
- **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the images(s) of the swapchain when **imageSharingMode** is **VK_SHARING_MODE_CONCURRENT**.
- **preTransform** is a **VkSurfaceTransformFlagBitsKHR** value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the **currentTransform** value returned by **vkGetPhysicalDeviceSurfaceCapabilitiesKHR**, the presentation engine will transform the image content as part of the presentation operation.
- **compositeAlpha** is a **VkCompositeAlphaFlagBitsKHR** value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.
- **presentMode** is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.
- **clipped** specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
 - If **clipped** is **VK_TRUE**, the presentable images associated with the swapchain **may** not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders **may** not execute for these pixels, and thus any side effects they would have had will not occur. Setting **VK_TRUE** does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.
 - If **clipped** is **VK_FALSE**, presentable images associated with the swapchain will own all of the pixels they contain.

NOTE

Applications **should** set this value to **VK_TRUE** if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- **oldSwapchain** is **VK_NULL_HANDLE**, or the existing non-retired swapchain currently associated with **surface**. Providing a valid **oldSwapchain** **may** aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling **vkCreateSwapchainKHR** with an **oldSwapchain** that is not **VK_NULL_HANDLE**, **oldSwapchain** is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not **oldSwapchain** is **VK_NULL_HANDLE**.

Upon calling **vkCreateSwapchainKHR** with an **oldSwapchain** that is not **VK_NULL_HANDLE**, any images from **oldSwapchain** that are not acquired by the application **may** be freed by the implementation,

which **may** occur even if creation of the new swapchain fails. The application **can** destroy **oldSwapchain** to free all memory associated with **oldSwapchain**.

NOTE

Multiple retired swapchains **can** be associated with the same **VkSurfaceKHR** through multiple uses of **oldSwapchain** that outnumber calls to **vkDestroySwapchainKHR**.

After **oldSwapchain** is retired, the application **can** pass to **vkQueuePresentKHR** any images it had already acquired from **oldSwapchain**. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, **vkQueuePresentKHR** **may** fail if **oldSwapchain** has entered a state that causes **VK_ERROR_OUT_OF_DATE_KHR** to be returned.

The application **can** continue to use a shared presentable image obtained from **oldSwapchain** until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return **VK_ERROR_OUT_OF_DATE_KHR**.

imageUsage defines the **effective usage flags** for the swapchain image(s). If the **pNext** chain includes a **VkImageUsageFlags2CreateInfoKHR** structure, **imageUsage** is ignored, and the effective usage flags are defined by **VkImageUsageFlags2CreateInfoKHR::usage**.

Valid Usage

- VUID-VkSwapchainCreateInfoKHR-surface-01270
surface **must** be a surface that is supported by the device as determined using **vkGetPhysicalDeviceSurfaceSupportKHR**
- VUID-VkSwapchainCreateInfoKHR-minImageCount-01272
minImageCount **must** be less than or equal to the value returned in the **maxImageCount** member of the **VkSurfaceCapabilitiesKHR** structure returned by **vkGetPhysicalDeviceSurfaceCapabilitiesKHR** for the surface if the returned **maxImageCount** is not zero
- VUID-VkSwapchainCreateInfoKHR-swapchainMaintenance1-10155
If the **swapchainMaintenance1** feature is not enabled, then the **pNext** chain **must** not include a **VkSwapchainPresentModesCreateInfoKHR** structure
- VUID-VkSwapchainCreateInfoKHR-presentMode-02839
If **presentMode** is not **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** nor **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**, then **minImageCount** **must** be greater than or equal to the value returned in the **minImageCount** member of the **VkSurfaceCapabilitiesKHR** structure returned by **vkGetPhysicalDeviceSurfaceCapabilitiesKHR** for the surface
- VUID-VkSwapchainCreateInfoKHR-minImageCount-01383
minImageCount **must** be **1** if **presentMode** is either **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**
- VUID-VkSwapchainCreateInfoKHR-imageFormat-01273
imageFormat and **imageColorSpace** **must** match the **format** and **colorSpace** members, respectively, of one of the **VkSurfaceFormatKHR** structures returned by

`vkGetPhysicalDeviceSurfaceFormatsKHR` for the surface

- VUID-VkSwapchainCreateInfoKHR-pNext-07781

If a `VkSwapchainPresentScalingCreateInfoKHR` structure was not included in the `pNext` chain, or it is included and `VkSwapchainPresentScalingCreateInfoKHR::scalingBehavior` is zero then `imageExtent` **must** be between `minImageExtent` and `maxImageExtent`, inclusive, where `minImageExtent` and `maxImageExtent` are members of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- VUID-VkSwapchainCreateInfoKHR-pNext-07782

If a `VkSwapchainPresentScalingCreateInfoKHR` structure was included in the `pNext` chain and `VkSwapchainPresentScalingCreateInfoKHR::scalingBehavior` is not zero then `imageExtent` **must** be between `minScaledImageExtent` and `maxScaledImageExtent`, inclusive, where `minScaledImageExtent` and `maxScaledImageExtent` are members of the `VkSurfacePresentScalingCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for the surface and `presentMode`

- VUID-VkSwapchainCreateInfoKHR-swapchainMaintenance1-10157

If the `swapchainMaintenance1` feature is not enabled, then `flags` **must** not include `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR`

- VUID-VkSwapchainCreateInfoKHR-imageExtent-01689

`imageExtent` members `width` and `height` **must** both be non-zero

- VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275

`imageArrayLayers` **must** be greater than 0 and less than or equal to the `maxImageArrayLayers` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface

- VUID-VkSwapchainCreateInfoKHR-presentMode-01427

If `presentMode` is `VK_PRESENT_MODE_FIFO_LATEST_READY_KHR`, `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`, `imageUsage` **must** be a subset of the supported usage flags present in the `supportedUsageFlags` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for `surface`

- VUID-VkSwapchainCreateInfoKHR-imageUsage-01384

If `presentMode` is `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, `imageUsage` **must** be a subset of the supported usage flags present in the `sharedPresentSupportedUsageFlags` member of the `VkSharedPresentSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for `surface`

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277

If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` **must** be a valid pointer to an array of `queueFamilyIndexCount` `uint32_t` values

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278

If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` **must** be greater than 1

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428

If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of

`pQueueFamilyIndices` **must** be unique and **must** be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create `device`

- VUID-VkSwapchainCreateInfoKHR-preTransform-01279
`preTransform` **must** be one of the bits present in the `supportedTransforms` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
`compositeAlpha` **must** be one of the bits present in the `supportedCompositeAlpha` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-presentMode-01281
`presentMode` **must** be one of the `VkPresentModeKHR` values returned by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the surface
- VUID-VkSwapchainCreateInfoKHR-presentModeFifoLatestReady-10161
If the `presentModeFifoLatestReady` feature is not enabled, `presentMode` **must** not be `VK_PRESENT_MODE_FIFO_LATEST_READY_KHR`
- VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429
If the logical device was created with `VkDeviceGroupDeviceCreateInfo::physicalDeviceCount` equal to 1, `flags` **must** not contain `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`
- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-01933
If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` **must** be a non-retired swapchain associated with native window referred to by `surface`
- VUID-VkSwapchainCreateInfoKHR-imageFormat-01778
The implied image creation parameters of the swapchain **must** be supported as reported by `vkGetPhysicalDeviceImageFormatProperties`
- VUID-VkSwapchainCreateInfoKHR-flags-03168
If `flags` contains `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` then the `pNext` chain **must** include a `VkImageFormatListCreateInfo` structure with a `viewFormatCount` greater than zero and `pViewFormats` **must** have an element equal to `imageFormat`
- VUID-VkSwapchainCreateInfoKHR-pNext-04099
If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo::viewFormatCount` is not zero then all of the formats in `VkImageFormatListCreateInfo::pViewFormats` **must** be compatible with the `format` as described in the compatibility table
- VUID-VkSwapchainCreateInfoKHR-flags-04100
If `flags` does not contain `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` and the `pNext` chain include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo::viewFormatCount` **must** be 0 or 1
- VUID-VkSwapchainCreateInfoKHR-flags-03187
If `flags` contains `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`, then

`VkSurfaceProtectedCapabilitiesKHR::supportsProtected` **must** be `VK_TRUE` in the `VkSurfaceProtectedCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for `surface`

- VUID-VkSwapchainCreateInfoKHR-pNext-02679
If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **must** be included in the `pNext` chain
- VUID-VkSwapchainCreateInfoKHR-pNext-06752
If the `imageCompressionControlSwapchain` feature is not enabled, the `pNext` chain **must** not include an `VkImageCompressionControlEXT` structure
- VUID-VkSwapchainCreateInfoKHR-multisampledRenderToSwapchain-12447
If the `multisampledRenderToSwapchain` feature is not enabled, `flags` **must** not contain `VK_SWAPCHAIN_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT`
- VUID-VkSwapchainCreateInfoKHR-flags-12448
`flags` **must** be a subset of flags returned in `VkSwapchainFlagsSurfaceCapabilitiesEXT::swapchainSupportedFlags`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeKHR`
- VUID-VkSwapchainCreateInfoKHR-presentTiming-12232
If none of the `presentTiming`, `presentAtAbsoluteTime`, or `presentAtRelativeTime` features are enabled, `flags` **must** not contain `VK_SWAPCHAIN_CREATE_PRESENT_TIMING_BIT_EXT`

Valid Usage (Implicit)

- VUID-VkSwapchainCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkSwapchainCreateInfoKHR-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupSwapchainCreateInfoKHR`, `VkImageCompressionControlEXT`, `VkImageFormatListCreateInfo`, `VkImageUsageFlags2CreateInfoKHR`, `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, `VkSwapchainCounterCreateInfoEXT`, `VkSwapchainPresentModesCreateInfoKHR`, or `VkSwapchainPresentScalingCreateInfoKHR`
- VUID-VkSwapchainCreateInfoKHR-sType-unique
The `sType` value of each structure in the `pNext` chain **must** be unique
- VUID-VkSwapchainCreateInfoKHR-flags-parameter
`flags` **must** be a valid combination of `VkSwapchainCreateFlagBitsKHR` values
- VUID-VkSwapchainCreateInfoKHR-surface-parameter
`surface` **must** be a valid `VkSurfaceKHR` handle
- VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter
`imageFormat` **must** be a valid `VkFormat` value

- VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter
`imageColorSpace` **must** be a valid `VkColorSpaceKHR` value
- VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter
`imageUsage` **must** be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask
`imageUsage` **must** not be 0
- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter
`imageSharingMode` **must** be a valid `VkSharingMode` value
- VUID-VkSwapchainCreateInfoKHR-preTransform-parameter
`preTransform` **must** be a valid `VkSurfaceTransformFlagBitsKHR` value
- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter
`compositeAlpha` **must** be a valid `VkCompositeAlphaFlagBitsKHR` value
- VUID-VkSwapchainCreateInfoKHR-presentMode-parameter
`presentMode` **must** be a valid `VkPresentModeKHR` value
- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter
If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-VkSwapchainCreateInfoKHR-commonparent
Both of `oldSwapchain`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Host Synchronization

- Host access to `surface` **must** be externally synchronized
- Host access to `oldSwapchain` **must** be externally synchronized

Bits which **can** be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```

// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
    VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_swapchain_mutable_format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
    // Provided by VK_EXT_present_timing
    VK_SWAPCHAIN_CREATE_PRESENT_TIMING_BIT_EXT = 0x00000200,
    // Provided by VK_KHR_present_id2
    VK_SWAPCHAIN_CREATE_PRESENT_ID_2_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_present_wait2
    VK_SWAPCHAIN_CREATE_PRESENT_WAIT_2_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_swapchain_maintenance1
    VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR = 0x00000008,
    // Provided by VK_EXT_multisampled_render_to_swapchain
    VK_SWAPCHAIN_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT = 0x00000100,
    // Provided by VK_EXT_swapchain_maintenance1
    VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT =
VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR,
} VkSwapchainCreateFlagBitsKHR;

```

- [VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR](#) specifies that images created from the swapchain (i.e. with the `swapchain` member of [VkImageSwapchainCreateInfoKHR](#) set to this swapchain's handle) **must** use [VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT](#).
- [VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR](#) specifies that images created from the swapchain are protected images.
- [VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR](#) specifies that the images of the swapchain **can** be used to create a [VkImageView](#) with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a [VkImageFormatListCreateInfo](#) structure to the `pNext` chain of [VkSwapchainCreateInfoKHR](#). In addition, this flag also specifies that the swapchain **can** be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.
- [VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR](#) specifies that the implementation **may** defer allocation of memory associated with each swapchain image until its index is to be returned from [vkAcquireNextImageKHR](#) or [vkAcquireNextImage2KHR](#) for the first time.
- [VK_SWAPCHAIN_CREATE_PRESENT_ID_2_BIT_KHR](#) specifies that applications **can** include the [VkPresentId2KHR](#) structure in the `pNext` chain of the [VkPresentInfoKHR](#) structure to associate an identifier with each presentation request.
- [VK_SWAPCHAIN_CREATE_PRESENT_WAIT_2_BIT_KHR](#) specifies that applications **can** use [vkWaitForPresent2KHR](#) to wait for the presentation engine to have begun presentation of the

presentation request associated with `VkPresentWait2InfoKHR::presentId` on `swapchain`.

- `VK_SWAPCHAIN_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT` specifies that an image **can** be used with multisampled rendering as a single-sampled render pass attachment
- `VK_SWAPCHAIN_CREATE_PRESENT_TIMING_BIT_EXT` specifies that features supported by the swapchain device in `VkPhysicalDevicePresentTimingFeaturesEXT` **can** be used to collect timing information or schedule presentation requests at specific times.

```
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

`VkSwapchainCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSwapchainCreateFlagBitsKHR`.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkDeviceGroupSwapchainCreateInfoKHR` structure, then that structure includes a set of device group present modes that the swapchain **can** be used with.

The `VkDeviceGroupSwapchainCreateInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `modes` is a bitfield of modes that the swapchain **can** be used with.

If this structure is not present, `modes` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter
`modes` **must** be a valid combination of `VkDeviceGroupPresentModeFlagBitsKHR` values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitmask
`modes` **must** not be 0

Structure Chaining

Extends the structure

- [VkSwapchainCreateInfoKHR](#)

If the `pNext` chain of [VkSwapchainCreateInfoKHR](#) includes a [VkSurfaceFullScreenExclusiveInfoEXT](#) structure, then that structure specifies the application's preferred full-screen presentation behavior. If this structure is not present, `fullScreenExclusive` is considered to be [VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT](#).

To enable surface counters when creating a swapchain, add a [VkSwapchainCounterCreateInfoEXT](#) structure to the `pNext` chain of [VkSwapchainCreateInfoKHR](#). [VkSwapchainCounterCreateInfoEXT](#) is defined as:

```
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```

- `sType` is a [VkStructureType](#) value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCounters` is a bitmask of [VkSurfaceCounterFlagBitsEXT](#) specifying surface counters to enable for the swapchain.

Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
The bits in `surfaceCounters` **must** be supported by [VkSwapchainCreateInfoKHR::surface](#), as reported by [vkGetPhysicalDeviceSurfaceCapabilities2EXT](#)

Valid Usage (Implicit)

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
`sType` **must** be [VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT](#)
- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
`surfaceCounters` **must** be a valid combination of [VkSurfaceCounterFlagBitsEXT](#) values

Structure Chaining

Extends the structure

- [VkSwapchainCreateInfoKHR](#)

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

```
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice          device,
    VkSwapchainKHR    swapchain,
    VkSurfaceCounterFlagBitsEXT counter,
    uint64_t*         pCounterValue);
```

- `device` is the [VkDevice](#) associated with `swapchain`.
- `swapchain` is the swapchain from which to query the counter value.
- `counter` is a [VkSurfaceCounterFlagBitsEXT](#) value specifying the counter to query.
- `pCounterValue` will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation **may** return [VK_ERROR_OUT_OF_DATE_KHR](#).

Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
One or more present commands on `swapchain` **must** have been processed by the presentation engine

Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
`device` **must** be a valid [VkDevice](#) handle
- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
`swapchain` **must** be a valid [VkSwapchainKHR](#) handle
- VUID-vkGetSwapchainCounterEXT-counter-parameter
`counter` **must** be a valid [VkSurfaceCounterFlagBitsEXT](#) value
- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
`pCounterValue` **must** be a valid pointer to a `uint64_t` value
- VUID-vkGetSwapchainCounterEXT-swapchain-parent
`swapchain` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- [VK_SUCCESS](#)

Failure

- [VK_ERROR_DEVICE_LOST](#)
- [VK_ERROR_OUT_OF_DATE_KHR](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

To specify compression properties for the swapchain images in this swapchain, add a [VkImageCompressionControlEXT](#) structure to the [pNext](#) chain of the [VkSwapchainCreateInfoKHR](#) structure.

Applications **can** modify the presentation mode used by the swapchain on a per-presentation basis. However, all presentation modes the application intends to use with the swapchain **must** be specified at swapchain creation time. To specify more than one presentation mode when creating a swapchain, include the [VkSwapchainPresentModesCreateInfoKHR](#) structure in the [pNext](#) chain of the [VkSwapchainCreateInfoKHR](#) structure.

The [VkSwapchainPresentModesCreateInfoKHR](#) structure is defined as:

```
// Provided by VK_KHR_swapchain_maintenance1
typedef struct VkSwapchainPresentModesCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           presentModeCount;
    const VkPresentModeKHR* pPresentModes;
} VkSwapchainPresentModesCreateInfoKHR;
```

```
// Provided by VK_EXT_swapchain_maintenance1
// Equivalent to VkSwapchainPresentModesCreateInfoKHR
typedef VkSwapchainPresentModesCreateInfoKHR VkSwapchainPresentModesCreateInfoEXT;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [presentModeCount](#) is the number of presentation modes provided.
- [pPresentModes](#) is a list of presentation modes with [presentModeCount](#) entries

Valid Usage

- VUID-VkSwapchainPresentModesCreateInfoKHR-None-07762
Each entry in pPresentModes **must** be one of the [VkPresentModeKHR](#) values returned by [vkGetPhysicalDeviceSurfacePresentModesKHR](#) for the surface
- VUID-VkSwapchainPresentModesCreateInfoKHR-presentModeFifoLatestReady-10160
If the [presentModeFifoLatestReady](#) feature is not enabled, pPresentModes **must** not contain [VK_PRESENT_MODE_FIFO_LATEST_READY_KHR](#)
- VUID-VkSwapchainPresentModesCreateInfoKHR-pPresentModes-07763
The entries in pPresentModes **must** be a subset of the present modes returned in [VkSurfacePresentModeCompatibilityKHR::pPresentModes](#), given [VkSwapchainCreateInfoKHR::presentMode](#) in [VkSurfacePresentModeKHR](#)
- VUID-VkSwapchainPresentModesCreateInfoKHR-presentMode-07764
[VkSwapchainCreateInfoKHR::presentMode](#) **must** be included in pPresentModes

Valid Usage (Implicit)

- VUID-VkSwapchainPresentModesCreateInfoKHR-sType-sType
[sType](#) **must** be [VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_MODES_CREATE_INFO_KHR](#)
- VUID-VkSwapchainPresentModesCreateInfoKHR-pPresentModes-parameter
[pPresentModes](#) **must** be a valid pointer to an array of [presentModeCount](#) valid [VkPresentModeKHR](#) values
- VUID-VkSwapchainPresentModesCreateInfoKHR-presentModeCount-arraylength
[presentModeCount](#) **must** be greater than 0

Structure Chaining

Extends the structure

- [VkSwapchainCreateInfoKHR](#)

When an application presents a swapchain image with dimensions different than those of the target surface, different behavior is possible on different platforms per their respective specifications:

- Presentation fails and [VK_ERROR_OUT_OF_DATE_KHR](#) is returned
- Scaling is done and [VK_SUCCESS](#) or [VK_SUBOPTIMAL_KHR](#) is returned
- Unspecified scaling using an arbitrary combination of stretching, centering and/or clipping.

Applications **can** define specific behavior when creating a swapchain by including the [VkSwapchainPresentScalingCreateInfoKHR](#) structure in the [pNext](#) chain of the [VkSwapchainCreateInfoKHR](#) structure.

The `VkSwapchainPresentScalingCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_swapchain_maintenance1
typedef struct VkSwapchainPresentScalingCreateInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkPresentScalingFlagsKHR scalingBehavior;
    VkPresentGravityFlagsKHR presentGravityX;
    VkPresentGravityFlagsKHR presentGravityY;
} VkSwapchainPresentScalingCreateInfoKHR;
```

```
// Provided by VK_EXT_swapchain_maintenance1
// Equivalent to VkSwapchainPresentScalingCreateInfoKHR
typedef VkSwapchainPresentScalingCreateInfoKHR VkSwapchainPresentScalingCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `scalingBehavior` is `0` or the scaling method to use when the dimensions of the surface and swapchain images differ.
- `presentGravityX` is `0` or the x-axis direction in which swapchain image pixels gravitate relative to the surface when `scalingBehavior` does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.
- `presentGravityY` is `0` or the y-axis direction in which swapchain image pixels gravitate relative to the surface when `scalingBehavior` does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.

If `scalingBehavior` is `0`, the result of presenting a swapchain image with dimensions that do not match the surface dimensions is implementation and platform-dependent. If `presentGravityX` or `presentGravityY` are `0`, the presentation gravity **must** match that defined by the native platform surface on platforms which define surface gravity.

Valid Usage

- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityX-07765
If `presentGravityX` is `0`, `presentGravityY` **must** be `0`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityX-07766
If `presentGravityX` is not `0`, `presentGravityY` **must** not be `0`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-scalingBehavior-07767
`scalingBehavior` **must** not have more than one bit set
- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityX-07768
`presentGravityX` **must** not have more than one bit set
- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityY-07769
`presentGravityY` **must** not have more than one bit set

- VUID-VkSwapchainPresentScalingCreateInfoKHR-scalingBehavior-07770
`scalingBehavior` **must** be 0 or a valid scaling method for the surface as returned in `VkSurfacePresentScalingCapabilitiesKHR::supportedPresentScaling`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeKHR`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-scalingBehavior-07771
 If the swapchain is created with `VkSwapchainPresentModesCreateInfoKHR`, `scalingBehavior` **must** be 0 or a valid scaling method for the surface as returned in `VkSurfacePresentScalingCapabilitiesKHR::supportedPresentScaling`, given each present mode in `VkSwapchainPresentModesCreateInfoKHR::pPresentModes` in `VkSurfacePresentModeKHR`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityX-07772
`presentGravityX` **must** be 0 or a valid x-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesKHR::supportedPresentGravityX`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeKHR`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityX-07773
 If the swapchain is created with `VkSwapchainPresentModesCreateInfoKHR`, `presentGravityX` **must** be 0 or a valid x-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesKHR::supportedPresentGravityX`, given each present mode in `VkSwapchainPresentModesCreateInfoKHR::pPresentModes` in `VkSurfacePresentModeKHR`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityY-07774
`presentGravityY` **must** be 0 or a valid y-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesKHR::supportedPresentGravityY`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeKHR`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityY-07775
 If the swapchain is created with `VkSwapchainPresentModesCreateInfoKHR`, `presentGravityY` **must** be 0 or a valid y-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesKHR::supportedPresentGravityY`, given each present mode in `VkSwapchainPresentModesCreateInfoKHR::pPresentModes` in `VkSurfacePresentModeKHR`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-swapchainMaintenance1-10154
 If the `swapchainMaintenance1` feature is not enabled, then `scalingBehavior`, `presentGravityX`, and `presentGravityY` **must** be 0

Valid Usage (Implicit)

- VUID-VkSwapchainPresentScalingCreateInfoKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_SCALING_CREATE_INFO_KHR`
- VUID-VkSwapchainPresentScalingCreateInfoKHR-scalingBehavior-parameter
`scalingBehavior` **must** be a valid combination of `VkPresentScalingFlagBitsKHR` values
- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityX-parameter
`presentGravityX` **must** be a valid combination of `VkPresentGravityFlagBitsKHR` values

- VUID-VkSwapchainPresentScalingCreateInfoKHR-presentGravityY-parameter **presentGravityY** **must** be a valid combination of [VkPresentGravityFlagBitsKHR](#) values

Structure Chaining

Extends the structure

- [VkSwapchainCreateInfoKHR](#)

To destroy a swapchain object call:

```
// Provided by VK_KHR_swapchain
void vkDestroySwapchainKHR(
    VkDevice          device,
    VkSwapchainKHR    swapchain,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the [VkDevice](#) associated with **swapchain**.
- **swapchain** is the swapchain to destroy.
- **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see [Memory Allocation](#)).

The application **must** not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. **swapchain** and all associated [VkImage](#) handles are destroyed, and **must** not be acquired or used any more by the application. The memory of each [VkImage](#) will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image **may** not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent [VkSurfaceKHR](#), and a new swapchain **can** be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface **must** be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources **must** be left in their current state.

If **swapchain** has exclusive full-screen access, it is released before the swapchain is destroyed.

Valid Usage

- VUID-vkDestroySwapchainKHR-swapchain-01282
All uses of presentable images acquired from **swapchain** **must** have completed execution
- VUID-vkDestroySwapchainKHR-swapchain-01283
If [VkAllocationCallbacks](#) were provided when **swapchain** was created, a compatible set of

callbacks **must** be provided here

- VUID-vkDestroySwapchainKHR-swapchain-01284

If no `VkAllocationCallbacks` were provided when `swapchain` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroySwapchainKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkDestroySwapchainKHR-swapchain-parameter
If `swapchain` is not `VK_NULL_HANDLE`, `swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkDestroySwapchainKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroySwapchainKHR-swapchain-parent
If `swapchain` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

When the `VK_KHR_display_swapchain` extension is enabled, multiple swapchains that share presentable images are created by calling:

```
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice          device,
    uint32_t          swapchainCount,
    const VkSwapchainCreateInfoKHR* pCreateInfos,
    const VkAllocationCallbacks*   pAllocator,
    VkSwapchainKHR*    pSwapchains);
```

- `device` is the device to create the swapchains for.
- `swapchainCount` is the number of swapchains to create.
- `pCreateInfos` is a pointer to an array of `VkSwapchainCreateInfoKHR` structures specifying the parameters of the created swapchains.
- `pAllocator` is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see [Memory Allocation](#)).
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` handles in which the created

swapchain objects will be returned.

`vkCreateSharedSwapchainsKHR` is similar to `vkCreateSwapchainKHR`, except that it takes an array of `VkSwapchainCreateInfoKHR` structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images **must** match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`. If any error occurs, no swapchains will be created. Images presented to multiple swapchains **must** be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images **can** continue to be used.

Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter
`pCreateInfos` **must** be a valid pointer to an array of `swapchainCount` valid `VkSwapchainCreateInfoKHR` structures
- VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter
`pSwapchains` **must** be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles
- VUID-vkCreateSharedSwapchainsKHR-device-queuecount
The device **must** have been created with at least `1` queue
- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than `0`

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`

- [VK_ERROR_VALIDATION_FAILED](#)

To obtain the array of presentable images associated with a swapchain, call:

```
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice          device,
    VkSwapchainKHR    swapchain,
    uint32_t*         pSwapchainImageCount,
    VkImage*          pSwapchainImages);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.
- `pSwapchainImageCount` is a pointer to an integer related to the number of presentable images available or queried, as described below.
- `pSwapchainImages` is either `NULL` or a pointer to an array of `VkImage` handles.

If `pSwapchainImages` is `NULL`, then the number of presentable images for `swapchain` is returned in `pSwapchainImageCount`. Otherwise, `pSwapchainImageCount` **must** point to a variable set by the application to the number of elements in the `pSwapchainImages` array, and on return the variable is overwritten with the number of structures actually written to `pSwapchainImages`. If the value of `pSwapchainImageCount` is less than the number of presentable images for `swapchain`, at most `pSwapchainImageCount` structures will be written, and [VK_INCOMPLETE](#) will be returned instead of [VK_SUCCESS](#), to indicate that not all the available presentable images were returned.

Valid Usage (Implicit)

- VUID-vkGetSwapchainImagesKHR-device-parameter `device` **must** be a valid [VkDevice](#) handle
- VUID-vkGetSwapchainImagesKHR-swapchain-parameter `swapchain` **must** be a valid [VkSwapchainKHR](#) handle
- VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter `pSwapchainImageCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter
If the value referenced by `pSwapchainImageCount` is not 0, and `pSwapchainImages` is not `NULL`, `pSwapchainImages` **must** be a valid pointer to an array of `pSwapchainImageCount` [VkImage](#) handles
- VUID-vkGetSwapchainImagesKHR-swapchain-parent `swapchain` **must** have been created, allocated, or retrieved from `device`

Return Codes

Success

- [VK_INCOMPLETE](#)
- [VK_SUCCESS](#)

Failure

- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

NOTE

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop. However, command buffers are not allowed to reference presentable images created with [VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR](#) until their indices have been returned from [vkAcquireNextImageKHR](#) at least once.

Images returned by [vkGetSwapchainImagesKHR](#) are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single [VkDeviceMemory](#) object, unless the swapchain is created with the [VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR](#) flag. All presentable images are initially in the [VK_IMAGE_LAYOUT_UNDEFINED](#) layout, thus before using presentable images, the application **must** transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications **must** not destroy a presentable image. See [vkDestroySwapchainKHR](#) for further details on the lifetime of presentable images.

Images **can** also be created by using [vkCreateImage](#) with [VkImageSwapchainCreateInfoKHR](#) and bound to swapchain memory using [vkBindImageMemory2](#) with [VkBindImageMemorySwapchainInfoKHR](#). These images **can** be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from [vkGetSwapchainImagesKHR](#), these images **must** be destroyed with [vkDestroyImage](#).

To acquire an available presentable image to use, and retrieve the index of that image, call:

```
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice                device,
    VkSwapchainKHR          swapchain,
    uint64_t                timeout,
    VkSemaphore              semaphore,
    VkFence                  fence,
    uint32_t*                pImageIndex);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the non-retired swapchain from which an image is being acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is **VK_NULL_HANDLE** or a semaphore defining a **semaphore signal operation**.
- **fence** is **VK_NULL_HANDLE** or a fence to signal.
- **pImageIndex** is a pointer to a **uint32_t** in which the index of the next image to use (i.e. an index into the array of images returned by **vkGetSwapchainImagesKHR**) is returned.

If the **swapchain** has been created with the **VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR** flag, the image whose index is returned in **pImageIndex** will be fully backed by memory before this call returns to the application, as if it is bound completely and contiguously to a single **VkDeviceMemory** object.

If **semaphore** defines a **semaphore signal operation**, its first **synchronization scope** includes acquisition of the image.

Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
swapchain **must** not be in the retired state
- VUID-vkAcquireNextImageKHR-semaphore-01286
If **semaphore** is not **VK_NULL_HANDLE**, it **must** be unsignaled
- VUID-vkAcquireNextImageKHR-semaphore-01779
If **semaphore** is not **VK_NULL_HANDLE**, it **must** not have any uncompleted signal or wait operations pending
- VUID-vkAcquireNextImageKHR-fence-01287
If **fence** is not **VK_NULL_HANDLE**, **fence** **must** be unsignaled
- VUID-vkAcquireNextImageKHR-fence-10066
If **fence** is not **VK_NULL_HANDLE**, **fence** **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-vkAcquireNextImageKHR-semaphore-01780
semaphore and **fence** **must** not both be equal to **VK_NULL_HANDLE**
- VUID-vkAcquireNextImageKHR-surface-07783
If **forward progress** cannot be guaranteed for the **surface** used to create the **swapchain**

member of `pAcquireInfo`, `timeout` **must** not be `UINT64_MAX`

- `VUID-vkAcquireNextImageKHR-semaphore-03265`
`semaphore` **must** have a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`

Valid Usage (Implicit)

- `VUID-vkAcquireNextImageKHR-device-parameter`
`device` **must** be a valid `VkDevice` handle
- `VUID-vkAcquireNextImageKHR-swapchain-parameter`
`swapchain` **must** be a valid `VkSwapchainKHR` handle
- `VUID-vkAcquireNextImageKHR-semaphore-parameter`
If `semaphore` is not `VK_NULL_HANDLE`, `semaphore` **must** be a valid `VkSemaphore` handle
- `VUID-vkAcquireNextImageKHR-fence-parameter`
If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle
- `VUID-vkAcquireNextImageKHR-pImageIndex-parameter`
`pImageIndex` **must** be a valid pointer to a `uint32_t` value
- `VUID-vkAcquireNextImageKHR-swapchain-parent`
`swapchain` **must** have been created, allocated, or retrieved from `device`
- `VUID-vkAcquireNextImageKHR-semaphore-parent`
If `semaphore` is a valid handle, it **must** have been created, allocated, or retrieved from `device`
- `VUID-vkAcquireNextImageKHR-fence-parent`
If `fence` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `swapchain` **must** be externally synchronized
- Host access to `semaphore` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

Return Codes

Success

- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`
- `VK_SUCCESS`
- `VK_TIMEOUT`

Failure

- `VK_ERROR_DEVICE_LOST`

- [VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT](#)
- [VK_ERROR_OUT_OF_DATE_KHR](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

If an image is acquired successfully, [vkAcquireNextImageKHR](#) **must** either return [VK_SUCCESS](#) or [VK_SUBOPTIMAL_KHR](#). The implementation **may** return [VK_SUBOPTIMAL_KHR](#) if the swapchain no longer matches the surface properties exactly, but **can** still be used for presentation.

When successful, [vkAcquireNextImageKHR](#) acquires a presentable image from [swapchain](#) that an application **can** use, and sets [pImageIndex](#) to the index of that image within the swapchain. The presentation engine **may** not have finished reading from the image at the time it is acquired, so the application **must** use [semaphore](#) and/or [fence](#) to ensure that the image layout and contents are not modified until the presentation engine reads have completed. Once [vkAcquireNextImageKHR](#) successfully acquires an image, the semaphore signal operation referenced by [semaphore](#), if not [VK_NULL_HANDLE](#), and the fence signal operation referenced by [fence](#), if not [VK_NULL_HANDLE](#), are submitted for execution. If [vkAcquireNextImageKHR](#) does not successfully acquire an image, [semaphore](#) and [fence](#) are unaffected. The order in which images are acquired is implementation-dependent, and **may** be different than the order the images were presented.

If [timeout](#) is zero, then [vkAcquireNextImageKHR](#) does not wait, and will either successfully acquire an image, or fail and return [VK_NOT_READY](#) if no image is available.

If the specified timeout period expires before an image is acquired, [vkAcquireNextImageKHR](#) returns [VK_TIMEOUT](#). If [timeout](#) is [UINT64_MAX](#), the timeout period is treated as infinite, and [vkAcquireNextImageKHR](#) will block until an image is acquired or an error occurs.

Let S be the number of images in [swapchain](#). If [swapchain](#) is created with [VkSwapchainPresentModesCreateInfoKHR](#), let M be the maximum of the values in [VkSurfaceCapabilitiesKHR::minImageCount](#) when queried with each present mode in [VkSwapchainPresentModesCreateInfoKHR::pPresentModes](#) in [VkSurfacePresentModeKHR](#). Otherwise, let M be the value of [VkSurfaceCapabilitiesKHR::minImageCount](#) without a [VkSurfacePresentModeKHR](#) as part of the query input.

[vkAcquireNextImageKHR](#) **should** not be called if the number of images that the application has currently acquired is greater than $S-M$. If [vkAcquireNextImageKHR](#) is called when the number of images that the application has currently acquired is less than or equal to $S-M$, [vkAcquireNextImageKHR](#) **must** return in finite time with an allowed [VkResult](#) code.

NOTE

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use [UINT64_MAX](#). For example, a scenario here is

when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

If the swapchain images no longer match native surface properties, either [VK_SUBOPTIMAL_KHR](#) or [VK_ERROR_OUT_OF_DATE_KHR](#) **must** be returned. If [VK_ERROR_OUT_OF_DATE_KHR](#) is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with [VK_ERROR_OUT_OF_DATE_KHR](#). Applications need to create a new swapchain for the surface to continue presenting if [VK_ERROR_OUT_OF_DATE_KHR](#) is returned.

NOTE [VK_SUBOPTIMAL_KHR](#) **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, [vkAcquireNextImageKHR](#) **must** return in finite time with either one of the allowed success codes, or [VK_ERROR_DEVICE_LOST](#).

If [semaphore](#) is not [VK_NULL_HANDLE](#), the semaphore **must** be unsignaled, with no signal or wait operations pending. It will become signaled when the application **can** use the image.

NOTE Use of [semaphore](#) allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If [fence](#) is not equal to [VK_NULL_HANDLE](#), the fence **must** be unsignaled, with no signal operations pending. It will become signaled when the application **can** use the image.

NOTE Applications **should** not rely on [vkAcquireNextImageKHR](#) blocking in order to meter their rendering speed. The implementation **may** return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications **can** use [fence](#) to meter their frame generation work to match the presentation rate.

An application **must** wait until either the [semaphore](#) or [fence](#) is signaled before accessing the image's data.

NOTE When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The [VkSubmitInfo](#) used to submit the image layout transition for execution includes [vkAcquireNextImageKHR::semaphore](#) in its [pWaitSemaphores](#) member, with the corresponding element of [pWaitDstStageMask](#) including S.
- The [synchronization command](#) that performs any necessary image layout transition includes S in both the [srcStageMask](#) and [dstStageMask](#).

After a successful return, the image indicated by [pImageIndex](#) and its data will be unmodified compared to when it was presented.

NOTE

Exclusive ownership of presentable images corresponding to a swapchain created with [VK_SHARING_MODE_EXCLUSIVE](#) as defined in [Resource Sharing](#) is not altered by a call to `vkAcquireNextImageKHR`. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for `vkAcquireNextImageKHR` depend on the `timeout` provided:

- [VK_SUCCESS](#) is returned if an image became available.
- [VK_ERROR_SURFACE_LOST_KHR](#) is returned if the surface becomes no longer available.
- [VK_NOT_READY](#) is returned if `timeout` is zero and no image was available.
- [VK_TIMEOUT](#) is returned if `timeout` is greater than zero and less than [UINT64_MAX](#), and no image became available within the time allowed.
- [VK_SUBOPTIMAL_KHR](#) **may** be returned if an image became available, and the swapchain no longer matches the surface properties exactly, but **can** still be used to present to the surface successfully.

NOTE

This **may** happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to re-create the swapchain to better match the platform surface properties.

- [VK_ERROR_OUT_OF_DATE_KHR](#) is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation **may** fail unless the swapchain is created with a non-zero value in [VkSwapchainPresentScalingCreateInfoKHR::scalingBehavior](#). If presentation does succeed, the mapping from the presented image to the native surface is defined by the [VkSwapchainPresentScalingCreateInfoKHR](#) structure if provided. Otherwise it is implementation-defined. It is the application's responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a [VK_ERROR_OUT_OF_DATE_KHR](#) error will be returned.

NOTE

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems **may** squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `pAcquireInfo` is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a `uint32_t` value specifying the index of the next image to use.

If the `swapchain` has been created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_KHR` flag, the image whose index is returned in `pImageIndex` will be fully backed by memory before this call returns to the application.

Valid Usage

- VUID-vkAcquireNextImage2KHR-surface-07784
If `forward progress` cannot be guaranteed for the `surface` used to create `swapchain`, the `timeout` member of `pAcquireInfo` **must** not be `UINT64_MAX`

Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter
`device` **must** be a valid `VkDevice` handle
- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
`pAcquireInfo` **must** be a valid pointer to a valid `VkAcquireNextImageInfoKHR` structure
- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
`pImageIndex` **must** be a valid pointer to a `uint32_t` value

Return Codes

Success

- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`
- `VK_SUCCESS`
- `VK_TIMEOUT`

Failure

- `VK_ERROR_DEVICE_LOST`

- [VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT](#)
- [VK_ERROR_OUT_OF_DATE_KHR](#)
- [VK_ERROR_OUT_OF_DEVICE_MEMORY](#)
- [VK_ERROR_OUT_OF_HOST_MEMORY](#)
- [VK_ERROR_SURFACE_LOST_KHR](#)
- [VK_ERROR_UNKNOWN](#)
- [VK_ERROR_VALIDATION_FAILED](#)

The [VkAcquireNextImageInfoKHR](#) structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
    uint64_t           timeout;
    VkSemaphore         semaphore;
    VkFence             fence;
    uint32_t           deviceMask;
} VkAcquireNextImageInfoKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is [NULL](#) or a pointer to a structure extending this structure.
- [swapchain](#) is a non-retired swapchain from which an image is acquired.
- [timeout](#) specifies how long the function waits, in nanoseconds, if no image is available.
- [semaphore](#) is [VK_NULL_HANDLE](#) or a semaphore that defines a [semaphore signal operation](#).
- [fence](#) is [VK_NULL_HANDLE](#) or a fence to signal.
- [deviceMask](#) is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If [vkAcquireNextImageKHR](#) is used, the device mask is considered to include all physical devices in the logical device.

NOTE

[vkAcquireNextImage2KHR](#) signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the [deviceMask](#). However, only a single physical device **can** wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) **can** wait upon.

Valid Usage

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
swapchain **must** not be in the retired state
- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
If **semaphore** is not [VK_NULL_HANDLE](#), it **must** be unsignaled
- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
If **semaphore** is not [VK_NULL_HANDLE](#), it **must** not have any uncompleted signal or wait operations pending
- VUID-VkAcquireNextImageInfoKHR-fence-01289
If **fence** is not [VK_NULL_HANDLE](#), **fence** **must** be unsignaled
- VUID-VkAcquireNextImageInfoKHR-fence-10067
If **fence** is not [VK_NULL_HANDLE](#), **fence** **must** not be associated with any other queue command that has not yet completed execution on that queue
- VUID-VkAcquireNextImageInfoKHR-semaphore-01782
semaphore and **fence** **must** not both be equal to [VK_NULL_HANDLE](#)
- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
deviceMask **must** be a valid device mask
- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
deviceMask **must** not be zero
- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
semaphore **must** have a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_BINARY](#)

Valid Usage (Implicit)

- VUID-VkAcquireNextImageInfoKHR-sType-sType
sType **must** be [VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR](#)
- VUID-VkAcquireNextImageInfoKHR-pNext-pNext
pNext **must** be [NULL](#)
- VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
swapchain **must** be a valid [VkSwapchainKHR](#) handle
- VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
If **semaphore** is not [VK_NULL_HANDLE](#), **semaphore** **must** be a valid [VkSemaphore](#) handle
- VUID-VkAcquireNextImageInfoKHR-fence-parameter
If **fence** is not [VK_NULL_HANDLE](#), **fence** **must** be a valid [VkFence](#) handle
- VUID-VkAcquireNextImageInfoKHR-commonparent
Each of **fence**, **semaphore**, and **swapchain** that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same [VkDevice](#)

Host Synchronization

- Host access to **swapchain** **must** be externally synchronized
- Host access to **semaphore** **must** be externally synchronized
- Host access to **fence** **must** be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

- **queue** is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.
- **pPresentInfo** is a pointer to a **VkPresentInfoKHR** structure specifying parameters of the presentation.

NOTE

There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.

NOTE

The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented **VkImage** at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR**, and the display standing the right way up).

The result codes **VK_ERROR_OUT_OF_DATE_KHR** and **VK_SUBOPTIMAL_KHR** have the same meaning when returned by **vkQueuePresentKHR** as they do when returned by **vkAcquireNextImageKHR**. If any **swapchain** member of **pPresentInfo** was created with **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT**, **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT** will be returned if that swapchain does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the application's control. If multiple swapchains are presented, the result code is determined by applying the following rules in order:

- If the device is lost, **VK_ERROR_DEVICE_LOST** is returned.
- If any of the target surfaces are no longer available the error **VK_ERROR_SURFACE_LOST_KHR** is returned.
- If any of the presents would have a result of **VK_ERROR_OUT_OF_DATE_KHR** if issued separately then **VK_ERROR_OUT_OF_DATE_KHR** is returned.

- If any of the presents would have a result of `VK_ERROR_PRESENT_TIMING_QUEUE_FULL_EXT` if issued separately then `VK_ERROR_PRESENT_TIMING_QUEUE_FULL_EXT` is returned.
- If any of the presents would have a result of `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.
- If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.
- Otherwise `VK_SUCCESS` is returned.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore wait operation, and happens-before the presentation engine accesses the image.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Calls to `vkQueuePresentKHR` **may** block, but **must** return in finite time. The processing of the presentation happens in issue order with other queue operations, but semaphores **must** be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue. However, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

Queueing an image for presentation defines a set of *queue operations*, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error [VK_ERROR_OUT_OF_DATE_KHR](#), [VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT](#), [VK_ERROR_PRESENT_TIMING_QUEUE_FULL_EXT](#), or [VK_ERROR_SURFACE_LOST_KHR](#), the set of queue operations are still considered to be enqueued and thus any [semaphore wait operation](#) specified in [VkPresentInfoKHR](#) will execute when the corresponding queue operation is complete.

[vkQueuePresentKHR](#) releases the acquisition of the images referenced by [imageIndices](#). The queue family corresponding to the queue [vkQueuePresentKHR](#) is executed on **must** have ownership of the presented images as defined in [Resource Sharing](#). [vkQueuePresentKHR](#) does not alter the queue family ownership, but the presented images **must** not be used again before they have been reacquired using [vkAcquireNextImageKHR](#).

NOTE

The application **can** continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes [vkQueuePresentKHR](#) to return [VK_ERROR_OUT_OF_DATE_KHR](#).

Valid Usage

- VUID-vkQueuePresentKHR-pSwapchains-01292
Each element of [pSwapchains](#) member of [pPresentInfo](#) **must** be a swapchain that is created for a surface for which presentation is supported from [queue](#) as determined using a call to [vkGetPhysicalDeviceSurfaceSupportKHR](#)
- VUID-vkQueuePresentKHR-pSwapchains-01293
If more than one member of [pSwapchains](#) was created from a display surface, all display surfaces referenced that refer to the same display **must** use the same display mode
- VUID-vkQueuePresentKHR-pWaitSemaphores-01294
When a semaphore wait operation referring to a binary semaphore defined by the elements of the [pWaitSemaphores](#) member of [pPresentInfo](#) executes on [queue](#), there **must** be no other queues waiting on the same semaphore
- VUID-vkQueuePresentKHR-pWaitSemaphores-03267
All elements of the [pWaitSemaphores](#) member of [pPresentInfo](#) **must** be created with a [VkSemaphoreType](#) of [VK_SEMAPHORE_TYPE_BINARY](#)
- VUID-vkQueuePresentKHR-pWaitSemaphores-03268
All elements of the [pWaitSemaphores](#) member of [pPresentInfo](#) **must** reference a semaphore signal operation that has been submitted for execution and any [semaphore signal operations](#) on which it depends **must** have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueuePresentKHR-queue-parameter
[queue](#) **must** be a valid [VkQueue](#) handle
- VUID-vkQueuePresentKHR-pPresentInfo-parameter
[pPresentInfo](#) **must** be a valid pointer to a valid [VkPresentInfoKHR](#) structure

Host Synchronization

- Host access to **queue** **must** be externally synchronized if it was not created with `VK_DEVICE_QUEUE_CREATE INTERNALLY_SYNCHRONIZED_BIT_KHR`

Command Properties

Command Buffer Levels	Render Pass Scope	Video Coding Scope	Supported Queue Types	Command Type
-	-	-	Any	-

Return Codes

Success

- `VK_SUBOPTIMAL_KHR`
- `VK_SUCCESS`

Failure

- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_PRESENT_TIMING_QUEUE_FULL_EXT`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_UNKNOWN`
- `VK_ERROR_VALIDATION_FAILED`

The `VkPresentInfoKHR` structure is defined as:

```
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t           swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t*     pImageIndices;
    VkResult*          pResults;
} VkPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number **may** be zero.
- `pWaitSemaphores` is `NULL` or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain's presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results **can** use `NULL` for `pResults`. If non-`NULL`, each entry in `pResults` will be set to the `VkResult` for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application **can** present an image, the image's layout **must** be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

NOTE

When transitioning the image to the appropriate layout, there is no need to delay subsequent processing, or perform any visibility operations (as `vkQueuePresentKHR` performs automatic visibility operations). To achieve this, the `dstAccessMask` member of the `VkImageMemoryBarrier` **should** be `0`, and the `dstStageMask` parameter **should** be `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.

The second `synchronization scope` of each `semaphore wait operation` defined by this structure includes presentation of each image indicated by `pSwapchains` and `pImageIndices`.

Valid Usage

- VUID-VkPresentInfoKHR-pSwapchain-09231

Elements of **pSwapchain** **must** be unique

- VUID-VkPresentInfoKHR-pImageIndices-01430

Each element of **pImageIndices** **must** be the index of a presentable image acquired from the swapchain specified by the corresponding element of the **pSwapchains** array, and the presented image subresource **must** be in the **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR** or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** layout at the time the operation is executed on a **VkDevice**

- VUID-VkPresentInfoKHR-pNext-06235

If a **VkPresentIdKHR** structure is included in the **pNext** chain, and the **presentId** feature is not enabled, each **presentIds** entry in that structure **must** be NULL

- VUID-VkPresentInfoKHR-swapchainMaintenance1-10158

If the **swapchainMaintenance1** feature is not enabled, then the **pNext** chain **must** not include a **VkSwapchainPresentFenceInfoKHR** structure

- VUID-VkPresentInfoKHR-pSwapchains-09199

If any element of the **pSwapchains** array has been created with **VkSwapchainPresentModesCreateInfoKHR**, all of the elements of this array **must** be created with **VkSwapchainPresentModesCreateInfoKHR**

- VUID-VkPresentInfoKHR-pNext-10821

If a **VkPresentId2KHR** structure is included in the **pNext** chain, and the **presentId2** feature is not enabled, each **presentIds** entry in that structure **must** be zero

- VUID-VkPresentInfoKHR-presentId2Supported-10822

If a **VkPresentId2KHR** structure is included and contains non-zero **presentIds**, **presentId2Supported** **must** be **VK_TRUE** in the **VkSurfaceCapabilitiesPresentId2KHR** structure returned by **vkGetPhysicalDeviceSurfaceCapabilities2KHR** for the **surface**

Valid Usage (Implicit)

- VUID-VkPresentInfoKHR-sType-sType

sType **must** be **VK_STRUCTURE_TYPE_PRESENT_INFO_KHR**

- VUID-VkPresentInfoKHR-pNext-pNext

Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of **VkDeviceGroupPresentInfoKHR**, **VkDisplayPresentInfoKHR**, **VkFrameBoundaryEXT**, **VkPresentId2KHR**, **VkPresentIdKHR**, **VkPresentRegionsKHR**, **VkPresentTimingsInfoEXT**, **VkSwapchainPresentFenceInfoKHR**, or **VkSwapchainPresentModeInfoKHR**

- VUID-VkPresentInfoKHR-sType-unique

The **sType** value of each structure in the **pNext** chain **must** be unique

- VUID-VkPresentInfoKHR-pWaitSemaphores-parameter

If **waitSemaphoreCount** is not 0, **pWaitSemaphores** **must** be a valid pointer to an array of **waitSemaphoreCount** valid **VkSemaphore** handles

- VUID-VkPresentInfoKHR-pSwapchains-parameter

pSwapchains **must** be a valid pointer to an array of **swapchainCount** valid **VkSwapchainKHR** handles

- VUID-VkPresentInfoKHR-pImageIndices-parameter
`pImageIndices` **must** be a valid pointer to an array of `swapchainCount uint32_t` values
- VUID-VkPresentInfoKHR-pResults-parameter
If `pResults` is not `NULL`, `pResults` **must** be a valid pointer to an array of `swapchainCount VkResult` values
- VUID-VkPresentInfoKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than `0`
- VUID-VkPresentInfoKHR-commonparent
Both of the elements of `pSwapchains`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to each member of `pWaitSemaphores` **must** be externally synchronized
- Host access to each member of `pSwapchains` **must** be externally synchronized

When the `VK_KHR_incremental_present` extension is enabled, additional fields **can** be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine **may** use to only update the region of a surface that is actually changing. The application still **must** ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application **can** provide this hint by adding a `VkPresentRegionsKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentRegionsKHR` structure is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pRegions` is `NULL` or a pointer to an array of `VkPresentRegionKHR` elements with `swapchainCount` entries. If not `NULL`, each element of `pRegions` contains the region that has changed since the last present to the swapchain in the corresponding entry in the `VkPresentInfoKHR::pSwapchains` array.

Valid Usage

- VUID-VkPresentRegionsKHR-swapchainCount-01260
`swapchainCount` **must** be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the `pNext` chain of this `VkPresentRegionsKHR` structure

Valid Usage (Implicit)

- VUID-VkPresentRegionsKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR`
- VUID-VkPresentRegionsKHR-pRegions-parameter
If `pRegions` is not `NULL`, `pRegions` **must** be a valid pointer to an array of `swapchainCount` valid `VkPresentRegionKHR` structures
- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than 0

Structure Chaining

Extends the structure

- `VkPresentInfoKHR`

For a given image and swapchain, the region to present is specified by the `VkPresentRegionKHR` structure, which is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
    uint32_t      rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;
```

- `rectangleCount` is the number of rectangles in `pRectangles`, or zero if the entire image has changed and should be presented.
- `pRectangles` is either `NULL` or a pointer to an array of `VkRectLayerKHR` structures. The `VkRectLayerKHR` structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and **must** be presented. If non-`NULL`, each entry in `pRectangles` is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles **must** be specified relative to `VkSurfaceCapabilitiesKHR::currentTransform`, regardless of the swapchain's `preTransform`. The presentation engine will apply the `preTransform` transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter

If `rectangleCount` is not 0, and `pRectangles` is not NULL, `pRectangles` **must** be a valid pointer to an array of `rectangleCount` valid `VkRectLayerKHR` structures

The `VkRectLayerKHR` structure is defined as:

```
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D    offset;
    VkExtent2D    extent;
    uint32_t      layer;
} VkRectLayerKHR;
```

- `offset` is the origin of the rectangle, in pixels.
- `extent` is the size of the rectangle, in pixels.
- `layer` is the layer of the image. For images with only one layer, the value of `layer` **must** be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. `VkRectLayerKHR` specifies pixels of the swapchain's image(s), which will be constant for the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864

The sum of `offset` and `extent`, after being transformed according to the `preTransform` member of the `VkSwapchainCreateInfoKHR` structure, **must** be no greater than the `imageExtent` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`

- VUID-VkRectLayerKHR-layer-01262

`layer` **must** be less than the `imageArrayLayers` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`

When the `VK_KHR_display_swapchain` extension is enabled, additional fields **can** be specified when presenting an image to a swapchain by setting `VkPresentInfoKHR::pNext` to point to a `VkDisplayPresentInfoKHR` structure.

The `VkDisplayPresentInfoKHR` structure is defined as:

```
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkRect2D           srcRect;
    VkRect2D           dstRect;
    VkBool32           persistent;
} VkDisplayPresentInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcRect** is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If **VkDisplayPresentInfoKHR** is not specified, this region will be assumed to be the entire presentable image.
- **dstRect** is a rectangular region within the visible region of the swapchain's display mode. If **VkDisplayPresentInfoKHR** is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.
- **persistent**: If this is **VK_TRUE**, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but **may** increase presentation latency. If **VkDisplayPresentInfoKHR** is not specified, persistent mode will not be used.

If the extent of the **srcRect** and **dstRect** are not equal, the presented pixels will be scaled accordingly.

Valid Usage

- VUID-VkDisplayPresentInfoKHR-srcRect-01257
srcRect **must** specify a rectangular region that is a subset of the image being presented
- VUID-VkDisplayPresentInfoKHR-dstRect-01258
dstRect **must** specify a rectangular region that is a subset of the **visibleRegion** parameter of the display mode the swapchain being presented uses
- VUID-VkDisplayPresentInfoKHR-persistentContent-01259
If the **persistentContent** member of the **VkDisplayPropertiesKHR** structure returned by **vkGetPhysicalDeviceDisplayPropertiesKHR** for the display the present operation targets is **VK_FALSE**, then **persistent** **must** be **VK_FALSE**

Valid Usage (Implicit)

- VUID-VkDisplayPresentInfoKHR-sType-sType
sType must be `VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR`

Structure Chaining

Extends the structure

- `VkPresentInfoKHR`

If the **pNext** chain of `VkPresentInfoKHR` includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           swapchainCount;
    const uint32_t*     pDeviceMasks;
    VkDeviceGroupPresentModeFlagsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **swapchainCount** is zero or the number of elements in **pDeviceMasks**.
- **pDeviceMasks** is a pointer to an array of device masks, one for each element of `VkPresentInfoKHR::pSwapchains`.
- **mode** is a `VkDeviceGroupPresentModeFlagsKHR` value specifying the device group present mode that will be used for this present.

If **mode** is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of **pDeviceMasks** selects which instance of the swapchain image is presented. Each element of **pDeviceMasks** **must** have exactly one bit set, and the corresponding physical device **must** have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If **mode** is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of **pDeviceMasks** selects which instance of the swapchain image is presented. Each element of **pDeviceMasks** **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If **mode** is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of **pDeviceMasks**

selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of `pDeviceMasks` **must** have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance(s) of the swapchain images are presented. For each bit set in each element of `pDeviceMasks`, the corresponding physical device **must** have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `VkDeviceGroupPresentInfoKHR` is not provided or `swapchainCount` is zero then the masks are considered to be 1. If `VkDeviceGroupPresentInfoKHR` is not provided, `mode` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage

- VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
`swapchainCount` **must** equal 0 or `VkPresentInfoKHR::swapchainCount`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01298
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` **must** have exactly one bit set, and the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` **must** be non-zero
- VUID-VkDeviceGroupPresentInfoKHR-mode-01299
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` **must** have exactly one bit set, and some physical device in the logical device **must** include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01300
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` **must** have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`
- VUID-VkDeviceGroupPresentInfoKHR-mode-01301
If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then for each bit set in each element of `pDeviceMasks`, the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` **must** be non-zero
- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
The value of each element of `pDeviceMasks` **must** be equal to the device mask passed in `VkAcquireNextImageInfoKHR::deviceMask` when the image index was last acquired
- VUID-VkDeviceGroupPresentInfoKHR-mode-01303
`mode` **must** have exactly one bit set, and that bit **must** have been included in `VkDeviceGroupSwapchainCreateInfoKHR::modes`

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentInfoKHR-sType-sType

sType must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`

- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
If `swapchainCount` is not 0, `pDeviceMasks` must be a valid pointer to an array of `swapchainCount` `uint32_t` values
- VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
`mode` must be a valid `VkDeviceGroupPresentModeFlagBitsKHR` value

Structure Chaining

Extends the structure

- `VkPresentInfoKHR`

When the `presentAtAbsoluteTime` or `presentAtRelativeTime` feature is enabled, an application can instruct the presentation engine to attempt to display an image at a specified time, or for a minimum duration, by including the `VkPresentTimingsInfoEXT` structure in the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentTimingsInfoEXT` structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkPresentTimingsInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           swapchainCount;
    const VkPresentTimingInfoEXT* pTimingInfos;
} VkPresentTimingsInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pTimingInfos** is `NULL` or a pointer to an array of `VkPresentTimingInfoEXT` elements with `swapchainCount` entries. If not `NULL`, each element of **pTimingInfos** contains timing information for the presentation of the image corresponding to the entry in the `VkPresentInfoKHR::pImageIndices` array.

Valid Usage

- VUID-VkPresentTimingsInfoEXT-swapchainCount-12233
`swapchainCount` must be equal to `VkPresentInfoKHR::swapchainCount`
- VUID-VkPresentTimingsInfoEXT-pSwapchains-12234
All swapchains in `VkPresentInfoKHR::pSwapchains` must have been created with the `VkSwapchainCreateInfoKHR::flags` field containing `VK_SWAPCHAIN_CREATE_PRESENT_TIMING_BIT_EXT`

- VUID-VkPresentTimingsInfoEXT-pSwapchains-12235

For each member of `VkPresentInfoKHR::pSwapchains`, if the associated `VkPresentTimingInfoEXT::targetTime` is not zero, the swapchain's current present mode **must** be `VK_PRESENT_MODE_FIFO_LATEST_READY_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`

Valid Usage (Implicit)

- VUID-VkPresentTimingsInfoEXT-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_TIMINGS_INFO_EXT`
- VUID-VkPresentTimingsInfoEXT-pTimingInfos-parameter
If `pTimingInfos` is not `NULL`, `pTimingInfos` **must** be a valid pointer to an array of `swapchainCount` valid `VkPresentTimingInfoEXT` structures
- VUID-VkPresentTimingsInfoEXT-swapchainCount-arraylength
`swapchainCount` **must** be greater than 0

Structure Chaining

Extends the structure

- `VkPresentInfoKHR`

The `VkPresentTimingInfoEXT` structure is defined as:

```
// Provided by VK_EXT_present_timing
typedef struct VkPresentTimingInfoEXT {
    VkStructureType      sType;
    const void*          pNext;
    VkPresentTimingInfoFlagsEXT flags;
    uint64_t             targetTime;
    uint64_t             timeDomainId;
    VkPresentStageFlagsEXT presentStageQueries;
    VkPresentStageFlagsEXT targetTimeDomainPresentStage;
} VkPresentTimingInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPresentTimingInfoFlagBitsEXT` specifying options for how to interpret the timing information.
- `targetTime` is zero or a value specifying the target present time or duration, in nanoseconds, of the presentation request.
- `timeDomainId` is the id of the time domain used to specify the absolute target present time and the timing results obtained in a subsequent `vkGetPastPresentationTimingEXT` call for the

current presentation request.

- `presentStageQueries` is zero or a valid `VkPresentStageFlagsEXT` value indicating which present stages the presentation engine will collect timing information for.
- `targetTimeDomainPresentStage` is a valid `VkPresentStageFlagsEXT` specifying a single present stage used to interpret `targetTime`.

If `targetTime` is not zero, the implementation attempts to align the `VK_PRESENT_STAGE_IMAGE_FIRST_PIXEL_VISIBLE_BIT_EXT` present stage of that presentation request with the time specified in `targetTime` according to the time domain used. If `VK_PRESENT_TIMING_INFO_PRESENT_AT_NEAREST_REFRESH_CYCLE_BIT_EXT` is not set in `flags`, it indicates that the application would strictly prefer the image to not be visible before `targetTime` has lapsed.

If `targetTime` is not zero and `timeDomainId` is associated with a `VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT` time domain, `targetTimeDomainPresentStage` is used to specify which present stage's time domain `targetTime` is specified for. Otherwise, `targetTimeDomainPresentStage` is ignored.

If `presentStageQueries` is not zero, a slot in the swapchain's internal results queue is reserved to hold the requested present timing data until the application retrieves them. If no slots are available, or if `vkSetSwapchainPresentTimingQueueSizeEXT` was never called, presentation fails and returns `VK_ERROR_PRESENT_TIMING_QUEUE_FULL_EXT`.

NOTE

Some platforms, due to hardware or system limitations, **may** not be able to accurately time `targetTime` with the actual physical event of the image becoming visible on the display. However, those timing capabilities **may** still be useful and result in improved animation quality.

As such, the `presentAtAbsoluteTime` and `presentAtRelativeTime` features do not provide a strict guarantee regarding the completion of the `VK_PRESENT_STAGE_IMAGE_FIRST_PIXEL_VISIBLE_BIT_EXT` present stage relative to the `targetTime`, and implementations **must** strive to make it as consistent and accurate as possible.

NOTE

Applications that specify an absolute present time **should** regularly rebase their calculations for their next target time on the feedback from `vkGetPastPresentationTimingEXT` to compensate for accumulated precision errors or potential clock drift. It is recommended that when targeting the time of a vertical blanking period, applications set `VK_PRESENT_TIMING_INFO_PRESENT_AT_NEAREST_REFRESH_CYCLE_BIT_EXT` to allow the implementation to compensate for small precision errors that may cause an image to be displayed one refresh cycle later than intended.

Some implementations **may** not provide timing data for the `VK_PRESENT_STAGE_IMAGE_FIRST_PIXEL_VISIBLE_BIT_EXT` present stage. Applications **should** use the supported present stage nearest to it to compute a desired target presentation time.

Valid Usage

- VUID-VkPresentTimingInfoEXT-targetTime-12236

If `targetTime` is not zero and `flags` does not contain `VK_PRESENT_TIMING_INFO_PRESENT_AT_RELATIVE_TIME_BIT_EXT`, the `presentAtAbsoluteTime` feature **must** be enabled and the `presentAtAbsoluteTimeSupported` member of the `VkPresentTimingSurfaceCapabilitiesEXT` returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for the surface associated with the swapchain **must** be `VK_TRUE`

- VUID-VkPresentTimingInfoEXT-targetTime-12237

If `targetTime` is not zero and `flags` contains `VK_PRESENT_TIMING_INFO_PRESENT_AT_RELATIVE_TIME_BIT_EXT`, the `presentAtRelativeTime` feature **must** be enabled and the `presentAtRelativeTimeSupported` member of the `VkPresentTimingSurfaceCapabilitiesEXT` returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for the surface associated with the swapchain **must** be `VK_TRUE`

- VUID-VkPresentTimingInfoEXT-timeDomainId-12238

If `timeDomainId` is associated with a `VK_TIME_DOMAIN_PRESENT_STAGE_LOCAL_EXT` time domain, and `targetTime` is not zero, `targetTimeDomainPresentStage` **must** be a single `VkPresentStageFlagsEXT` value

- VUID-VkPresentTimingInfoEXT-timeDomainId-12400

`timeDomainId` **must** be an id previously returned by `vkGetSwapchainTimeDomainPropertiesEXT`

Valid Usage (Implicit)

- VUID-VkPresentTimingInfoEXT-sType-sType

`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_TIMING_INFO_EXT`

- VUID-VkPresentTimingInfoEXT-pNext-pNext

`pNext` **must** be `NULL`

- VUID-VkPresentTimingInfoEXT-flags-parameter

`flags` **must** be a valid combination of `VkPresentTimingInfoFlagBitsEXT` values

- VUID-VkPresentTimingInfoEXT-presentStageQueries-parameter

`presentStageQueries` **must** be a valid combination of `VkPresentStageFlagBitsEXT` values

- VUID-VkPresentTimingInfoEXT-targetTimeDomainPresentStage-parameter

`targetTimeDomainPresentStage` **must** be a valid combination of `VkPresentStageFlagBitsEXT` values

Bits which **can** be set in `VkPresentTimingInfoEXT::flags`, specifying options for how to interpret timing information:

```
// Provided by VK_EXT_present_timing
typedef enum VkPresentTimingInfoFlagBitsEXT {
    VK_PRESENT_TIMING_INFO_PRESENT_AT_RELATIVE_TIME_BIT_EXT = 0x00000001,
    VK_PRESENT_TIMING_INFO_PRESENT_AT_NEAREST_REFRESH_CYCLE_BIT_EXT = 0x00000002,
} VkPresentTimingInfoFlagBitsEXT;
```

- [VK_PRESENT_TIMING_INFO_PRESENT_AT_RELATIVE_TIME_BIT_EXT](#) specifies that `VkPresentTimingInfoEXT::targetTime` is to be interpreted as a relative time from the previous presentation's [VK_PRESENT_STAGE_IMAGE_FIRST_PIXEL_VISIBLE_BIT_EXT](#) stage. If the `swapchain` has never been used to present an image, the provided `targetTime` is ignored.
- [VK_PRESENT_TIMING_INFO_PRESENT_AT_NEAREST_REFRESH_CYCLE_BIT_EXT](#) specifies that the application would prefer the image to be presented earlier than the time specified in `VkPresentTimingInfoEXT::targetTime` if that time falls within the first half of a refresh cycle. In that case, the presentation engine **may** choose to display the image at the start of that refresh cycle.

```
// Provided by VK_EXT_present_timing
typedef VkFlags VkPresentTimingInfoFlagsEXT;
```

`VkPresentTimingInfoFlagsEXT` is a bitmask type for setting a mask of zero or more [VkPresentTimingInfoFlagBitsEXT](#).

Presenting an image to the user typically involves multiple stages. Bits which **can** be set to specify present stages are:

```
// Provided by VK_EXT_present_timing
typedef enum VkPresentStageFlagBitsEXT {
    VK_PRESENT_STAGE_QUEUE_OPERATIONS_END_BIT_EXT = 0x00000001,
    VK_PRESENT_STAGE_REQUEST_DEQUEUED_BIT_EXT = 0x00000002,
    VK_PRESENT_STAGE_IMAGE_FIRST_PIXEL_OUT_BIT_EXT = 0x00000004,
    VK_PRESENT_STAGE_IMAGE_FIRST_PIXEL_VISIBLE_BIT_EXT = 0x00000008,
} VkPresentStageFlagBitsEXT;
```

- [VK_PRESENT_STAGE_QUEUE_OPERATIONS_END_BIT_EXT](#) marks the end of the set of queue operations enqueued by `vkQueuePresentKHR` on the provided `VkQueue` for a presentation request.
- [VK_PRESENT_STAGE_REQUEST_DEQUEUED_BIT_EXT](#) is the stage after which the presentation request has been dequeued from the swapchain's internal presentation request queue, if any, as specified by the present mode associated with that request.
- [VK_PRESENT_STAGE_IMAGE_FIRST_PIXEL_OUT_BIT_EXT](#) is the stage after which data for the first pixel of the presentation request associated with the image has left the presentation engine for a display hardware.
- [VK_PRESENT_STAGE_IMAGE_FIRST_PIXEL_VISIBLE_BIT_EXT](#) is the stage after which a display hardware has made the first pixel visible for the presentation request associated with the image

to be presented.

NOTE

The set of queue operations delimited by [VK_PRESENT_STAGE_QUEUE_OPERATIONS_END_BIT_EXT](#) includes the wait for the semaphores specified in [VkPresentInfoKHR::pWaitSemaphores](#), if any, and any work implicitly enqueued by the implementation.

```
// Provided by VK_EXT_present_timing
typedef VkFlags VkPresentStageFlagsEXT;
```

[VkPresentStageFlagsEXT](#) is a bitmask type for setting a mask of zero or more [VkPresentStageFlagBitsEXT](#).

The [VkPresentIdKHR](#) structure is defined as:

```
// Provided by VK_KHR_present_id
typedef struct VkPresentIdKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           swapchainCount;
    const uint64_t*     pPresentIds;
} VkPresentIdKHR;
```

- [sType](#) is a [VkStructureType](#) value identifying this structure.
- [pNext](#) is `NULL` or a pointer to a structure extending this structure.
- [swapchainCount](#) is the number of swapchains being presented to the [vkQueuePresentKHR](#) command.
- [pPresentIds](#) is `NULL` or a pointer to an array of [uint64_t](#) with [swapchainCount](#) entries. If not `NULL`, each non-zero value in [pPresentIds](#) specifies the present id to be associated with the presentation of the swapchain with the same index in the [vkQueuePresentKHR](#) call.

For applications to be able to reference specific presentation events queued by a call to [vkQueuePresentKHR](#), an identifier needs to be associated with them. When the [presentId](#) feature is enabled, applications **can** include the [VkPresentIdKHR](#) structure in the [pNext](#) chain of the [VkPresentInfoKHR](#) structure to supply identifiers.

Each [VkSwapchainKHR](#) has a [presentId](#) associated with it. This value is initially zero when the [VkSwapchainKHR](#) is created.

When a [VkPresentIdKHR](#) structure with a non-`NULL` [pPresentIds](#) is included in the [pNext](#) chain of a [VkPresentInfoKHR](#) structure, each [pSwapchains](#) entry has a [presentId](#) associated in the [pPresentIds](#) array at the same index as the swapchain in the [pSwapchains](#) array. If this [presentId](#) is non-zero, then the application **can** later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated [presentId](#). A non-zero [presentId](#) **must** be greater than any non-zero [presentId](#) passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the `presentId` value, but implementations **should** make this as close as possible to the presentation of the first pixel in the new image to the user.

Valid Usage

- VUID-VkPresentIdKHR-swapchainCount-04998
`swapchainCount` **must** be the same value as `VkPresentInfoKHR::swapchainCount`, where this `VkPresentIdKHR` is in the `pNext` chain of the `VkPresentInfoKHR` structure
- VUID-VkPresentIdKHR-presentIds-04999
Each non-zero entry in `presentIds` **must** be greater than all previously submitted present ids for the associated swapchain in `VkPresentInfoKHR::pSwapchains`

Valid Usage (Implicit)

- VUID-VkPresentIdKHR-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PRESENT_ID_KHR`
- VUID-VkPresentIdKHR-pPresentIds-parameter
If `pPresentIds` is not `NULL`, `pPresentIds` **must** be a valid pointer to an array of `swapchainCount uint64_t` values
- VUID-VkPresentIdKHR-swapchainCount-arraylength
`swapchainCount` **must** be greater than `0`

Structure Chaining

Extends the structure

- `VkPresentInfoKHR`

When the `presentWait` feature is enabled, an application **can** wait for an image to be presented to the user by first specifying a `presentId` for the target presentation by adding a `VkPresentIdKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure and then waiting for that presentation to complete by calling:

```
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice           device,
    VkSwapchainKHR     swapchain,
    uint64_t           presentId,
    uint64_t           timeout);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain on which an image was queued for presentation.

- `presentId` is the presentation `presentId` to wait for.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

The call to `vkWaitForPresentKHR` will block until either the `presentId` associated with `swapchain` is greater than or equal to `presentId`, or `timeout` nanoseconds passes. When the swapchain becomes `OUT_OF_DATE`, the call will either return `VK_SUCCESS` (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status `VK_ERROR_OUT_OF_DATE_KHR` (if the image could not be presented to the user).

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the `presentId` value, but implementations **should** make this as close as possible to the presentation of the first pixel in the next image being presented to the user.

For `VK_PRESENT_MODE_MAILBOX_KHR` (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image **must** be signaled no later than a wait associated with the replacing image would be signaled.
