To copy data from an image object to host memory, call:

```
// Provided by VK_VERSION_1_4
VkResult vkCopyImageToMemory(
    VkDevice                                device,
    const VkCopyImageToMemoryInfo*          pCopyImageToMemoryInfo);
```

```
// Provided by VK_EXT_host_image_copy
// Equivalent to vkCopyImageToMemory
VkResult vkCopyImageToMemoryEXT(
    VkDevice                                device,
    const VkCopyImageToMemoryInfo*          pCopyImageToMemoryInfo);
```

- `device` is the device which owns `pCopyImageToMemoryInfo->srcImage`.
- `pCopyImageToMemoryInfo` is a pointer to a `VkCopyImageToMemoryInfo` structure describing the copy parameters.

This command is functionally similar to `vkCmdCopyImageToBuffer2`, except it is executed on the host and writes to host memory instead of a buffer. The memory of `pCopyImageToMemoryInfo->srcImage` is accessed by the host as if `coherent`.

NOTE If the device has written to the image memory, it is not automatically made

available to the host. Before this copy command can be called, a memory barrier for this image **must** have been issued on the device with the second [synchronization scope](#) including [VK_PIPELINE_STAGE_HOST_BIT](#) and [VK_ACCESS_HOST_READ_BIT](#).

Each element of **VkCopyImageToMemoryInfo::pRegions** is a structure defined as:

```
// Provided by VK_VERSION_1_4
typedef struct VkImageToMemoryCopy {
    VkStructureType      sType;
    const void*          pNext;
    void*                pHostPointer;

} VkImageToMemoryCopy;
```

```
// Provided by VK_EXT_host_image_copy
// Equivalent to VkImageToMemoryCopy
typedef VkImageToMemoryCopy VkImageToMemoryCopyEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- `pHostPointer` is the host memory address which is the destination of the copy.
- `memoryRowLength` and `memoryImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in host memory, and control the addressing calculations. If either of these values is zero, that aspect of the host memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial `x`, `y`, `z` offsets in texels of the sub-region of the source image data.
- `imageExtent` is the size in texels of the image to copy in `width`, `height` and `depth`.

This structure is functionally similar to `VkBufferImageCopy2`, except it defines host memory as the target of copy instead of a buffer. In particular, the same data packing rules and restrictions as that structure apply here as well.

Valid Usage

- VUID-VkImageToMemoryCopy-pHostPointer-09066
`pHostPointer` **must** point to memory that is large enough to contain all memory locations that are accessed according to [Buffer and Image Addressing](#)
- VUID-VkImageToMemoryCopy-memoryRowLength-09101

- VUID-VkImageToMemoryCopy-memoryImageHeight-09102

- VUID-VkImageToMemoryCopy-aspectMask-09103

Valid Usage (Implicit)

- VUID-VkImageToMemoryCopy-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_TO_MEMORY_COPY`
- VUID-VkImageToMemoryCopy-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkImageToMemoryCopy-pHostPointer-parameter
`pHostPointer` **must** be a pointer value
- VUID-VkImageToMemoryCopy-imageSubresource-parameter

`imageSubresource` **must** be a valid `VkImageSubresourceLayers` structure

Bits which **can** be set in `VkCopyMemoryToImageInfo::flags`, `VkCopyImageToMemoryInfo::flags`, and `VkCopyImageToImageInfo::flags`, specifying additional copy parameters are:

```
// Provided by VK_VERSION_1_4
typedef enum VkHostImageCopyFlagBits {
    VK_HOST_IMAGE_COPY_MEMCPY_BIT = 0x00000001,
    // VK_HOST_IMAGE_COPY_MEMCPY is a legacy alias
    VK_HOST_IMAGE_COPY_MEMCPY = VK_HOST_IMAGE_COPY_MEMCPY_BIT,
    // Provided by VK_EXT_host_image_copy
    VK_HOST_IMAGE_COPY_MEMCPY_BIT_EXT = VK_HOST_IMAGE_COPY_MEMCPY_BIT,
    // Provided by VK_EXT_host_image_copy
    // VK_HOST_IMAGE_COPY_MEMCPY_EXT is a legacy alias
    VK_HOST_IMAGE_COPY_MEMCPY_EXT = VK_HOST_IMAGE_COPY_MEMCPY_BIT,
} VkHostImageCopyFlagBits;
```

```
// Provided by VK_EXT_host_image_copy
// Equivalent to VkHostImageCopyFlagBits
typedef VkHostImageCopyFlagBits VkHostImageCopyFlagBitsEXT;
```

- `VK_HOST_IMAGE_COPY_MEMCPY_BIT` specifies that no memory layout swizzling is to be applied during data copy. For copies between memory and images, this flag indicates that image data in host memory is swizzled in exactly the same way as the image data on the device. Using this flag indicates that the implementations **may** use a simple memory copy to transfer the data between the host memory and the device memory. The format of the swizzled data in host memory is platform dependent and is not defined in this specification.

```
// Provided by VK_VERSION_1_4
typedef VkFlags VkHostImageCopyFlags;
```

```
// Provided by VK_EXT_host_image_copy
// Equivalent to VkHostImageCopyFlags
typedef VkHostImageCopyFlags VkHostImageCopyFlagsEXT;
```

`VkHostImageCopyFlags` is a bitmask type for setting a mask of zero or more `VkHostImageCopyFlagBits`.

To copy data from an image object to another image object using the host, call:

```
// Provided by VK_VERSION_1_4
VkResult vkCopyImageToImage(
    VkDevice                                device,
    const VkCopyImageToImageInfo*          pCopyImageToImageInfo);
```

```
// Provided by VK_EXT_host_image_copy
// Equivalent to vkCopyImageToImage
VkResult vkCopyImageToImageEXT(
    VkDevice                                device,
    const VkCopyImageToImageInfo*          pCopyImageToImageInfo);
```

- **device** is the device which owns `pCopyImageToImageInfo->srcImage` and `pCopyImageToImageInfo->dstImage`.
- **pCopyImageToImageInfo** is a pointer to a `VkCopyImageToImageInfo` structure describing the copy parameters.

This command is functionally similar to `vkCmdCopyImage2`, except it is executed on the host. The memory of `pCopyImageToImageInfo->srcImage` and `pCopyImageToImageInfo->dstImage` is accessed by the host as if `coherent`.

NOTE

If the device has written to the memory of `pCopyImageToImageInfo->srcImage`, it is not automatically made available to the host. Before this copy command can be called, a memory barrier for this image **must** have been issued on the device with the second `synchronization scope` including `VK_PIPELINE_STAGE_HOST_BIT` and `VK_ACCESS_HOST_READ_BIT`.

Because queue submissions `automatically make host memory visible to the device`, there would not be a need for a memory barrier before using the results of this copy operation in `pCopyMemoryToImageInfo->dstImage` on the device.

Valid Usage (Implicit)

- VUID-vkCopyImageToImage-device-parameter **device** **must** be a valid `VkDevice` handle
- VUID-vkCopyImageToImage-pCopyImageToImageInfo-parameter **pCopyImageToImageInfo** **must** be a valid pointer to a valid `VkCopyImageToImageInfo` structure

An application can use indirect copies when the copy parameters are not known during the command buffer creation time.

```
// Provided by VK_KHR_copy_memory_indirect
void vkCmdCopyMemoryIndirectKHR(

24.7. Image Copies With Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```
// Provided by VK_VERSION_1_0
void vkCmdBlitImage(
    VkCommandBuffer                commandBuffer,
    VkImage                        srcImage,
    VkImageLayout                  srcImageLayout,
    VkImage                        dstImage,
    VkImageLayout                  dstImageLayout,
    uint32_t                       regionCount,
    const VkImageBlit*             pRegions,
    VkFilter                       filter);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of `VkImageBlit` structures specifying the regions to blit.
- `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.

`vkCmdBlitImage` **must** not be used for multisampled source or destination images. Use `vkCmdResolveImage` for this purpose.

As the sizes of the source and destination extents **can** differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

- For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in [unnormalized to integer conversion](#):

$$u_{\text{base}} = i + \frac{1}{2}$$

$$v_{\text{base}} = j + \frac{1}{2}$$

$$w_{\text{base}} = k + \frac{1}{2}$$

- These base coordinates are then offset by the first destination offset:

$$u_{\text{offset}} = u_{\text{base}} - x_{\text{dst0}}$$

$$v_{\text{offset}} = v_{\text{base}} - y_{\text{dst0}}$$

$$W_{\text{offset}} = W_{\text{base}} - Z_{\text{dst0}}$$

$$a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}}$$

- The scale is determined from the source and destination regions, and applied to the offset coordinates:

$$\text{scale}_u = (x_{\text{src1}} - x_{\text{src0}}) / (x_{\text{dst1}} - x_{\text{dst0}})$$

$$\text{scale}_v = (y_{\text{src1}} - y_{\text{src0}}) / (y_{\text{dst1}} - y_{\text{dst0}})$$

$$\text{scale}_w = (z_{\text{src1}} - z_{\text{src0}}) / (z_{\text{dst1}} - z_{\text{dst0}})$$

$$u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u$$

$$v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v$$

$$w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w$$

- Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from `srcImage`:

$$u = u_{\text{scaled}} + x_{\text{src0}}$$

$$v = v_{\text{scaled}} + y_{\text{src0}}$$

$$w = w_{\text{scaled}} + z_{\text{src0}}$$

$$q = \text{mipLevel}$$

$$a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}}$$

These coordinates are used to sample from the source image, as described in [Image Operations chapter](#), with the filter mode equal to that of `filter`, a mipmap mode of `VK_SAMPLER_MIPMAP_MODE_NEAREST` and an address mode of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`. Implementations **must** clamp at the edge of the

source image, and **may** additionally clamp to the edge of the source region.

NOTE

Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation-dependent, the exact results of a blitting operation are also implementation-dependent.

Blits are done layer by layer starting with the `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by `dstOffsets[0].z` and `dstOffsets[1].z` are sampled from slices in the source region bounded by `srcOffsets[0].z` and `srcOffsets[1].z`. If the `filter` parameter is `VK_FILTER_LINEAR` then the value sampled from the source image is taken by doing linear filtering using the interpolated `z` coordinate represented by `w` in the previous equations. If the `filter` parameter is `VK_FILTER_NEAREST` then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats **can** only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats **must** match.
- Format conversions on unorm, snorm, scaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.

A more extensible version of the blit image command is defined below.

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```
// Provided by VK_VERSION_1_3
void vkCmdBlitImage2(
    VkCommandBuffer          commandBuffer,
    const VkBlitImageInfo2*  pBlitImageInfo);
```

```
// Provided by VK_KHR_copy_commands2
// Equivalent to vkCmdBlitImage2
void vkCmdBlitImage2KHR(
    VkCommandBuffer          commandBuffer,
    const VkBlitImageInfo2*  pBlitImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

24.8. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```
// Provided by VK_VERSION_1_0
void vkCmdResolveImage(
    VkCommandBuffer          commandBuffer,
    VkImage                  srcImage,
    VkImageLayout             srcImageLayout,
    VkImage                  dstImage,
    VkImageLayout             dstImageLayout,
    uint32_t                 regionCount,
    const VkImageResolve*     pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of `VkImageResolve` structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination.

If the source format is a floating-point or normalized type, the resolve mode is chosen as implementation-dependent behavior. If the resolve mode requires to calculate the result from multiple samples, such as by computing an average or weighted average of the samples, the values

for each pixel are resolved with implementation-defined numerical precision.

If the [numeric format](#) of [srcImage](#) uses sRGB encoding and the resolve mode requires the implementation to convert the samples to floating-point to perform the calculations, the implementation **should** convert samples from nonlinear to linear before resolving the samples as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). In this case, the implementation **must** convert the linear averaged value to nonlinear before writing the resolved result to [dstImage](#). If the [maintenance10](#) feature is enabled, whether a nonlinear to linear conversion happens for sRGB encoded resolve is controlled by [resolveSrgbFormatAppliesTransferFunction](#).

If the source format is an integer type, a single sample’s value is selected for each pixel.

[srcOffset](#) and [dstOffset](#) select the initial [x](#), [y](#), and [z](#) offsets in texels of the sub-regions of the source and destination image data. [extent](#) is the size in texels of the source image to resolve in [width](#), [height](#) and [depth](#). Each element of [pRegions](#) **must** be a region that is contained within its corresponding image.

Resolves are done layer by layer starting with [baseArrayLayer](#) member of [srcSubresource](#) for the source and [dstSubresource](#) for the destination. [layerCount](#) layers are resolved to the destination image.

The **VkImageResolve** structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers  srcSubresource;
    VkOffset3D                srcOffset;
    VkImageSubresourceLayers  dstSubresource;
    VkOffset3D                dstOffset;
    VkExtent3D                extent;
} VkImageResolve;
```

- **srcSubresource** and **dstSubresource** are **VkImageSubresourceLayers** structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported. **VkImageResolve2** **can** support resolve of depth/stencil images with **maintenance10** instead.

- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`.

- VUID-VkImageResolve-layerCount-08804
If one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member **must** be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`

`srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- VUID-VkImageResolve-dstSubresource-parameter
`dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```
// Provided by VK_VERSION_1_3
void vkCmdResolveImage2(
    VkCommandBuffer                                commandBuffer,
    const VkResolveImageInfo2*                      pResolveImageInfo);
```

```
// Provided by VK_KHR_copy_commands2
// Equivalent to vkCmdResolveImage2
void vkCmdResolveImage2KHR(
    VkCommandBuffer                                commandBuffer,
    const VkResolveImageInfo2*                      pResolveImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `pResolveImageInfo` is a pointer to a `VkResolveImageInfo2` structure describing the resolve parameters.

This command is functionally identical to `vkCmdResolveImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

- VUID-vkCmdResolveImage2-commandBuffer-01838

- VUID-vkCmdResolveImage2-commandBuffer-01839
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image

Conditional Rendering

vkCmdResolveImage2 is not affected by [conditional rendering](#)

The [VkResolveImageInfo2](#) structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkResolveImageInfo2 {
    VkStructureType    sType;
    const void*        pNext;
    VkImage             srcImage;
    VkImageLayout      srcImageLayout;
    VkImage             dstImage;
    VkImageLayout      dstImageLayout;
    uint32_t           regionCount;
    const VkImageResolve2* pRegions;
} VkResolveImageInfo2;
```

```
// Provided by VK_KHR_copy_commands2
// Equivalent to VkResolveImageInfo2
typedef VkResolveImageInfo2 VkResolveImageInfo2KHR;
```

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the resolve.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the resolve.
- **regionCount** is the number of regions to resolve.
- **pRegions** is a pointer to an array of [VkImageResolve2](#) structures specifying the regions to resolve.

If the source format is a floating-point or normalized type, the resolve mode is chosen as implementation-dependent behavior, unless [VkResolveImageModeInfoKHR](#) is included in the **pNext**

chain, in which case it is defined by `VkResolveImageModeInfoKHR::resolveMode`. If the resolve mode requires to calculate the result from multiple samples, such as by computing an average or weighted average of the samples, the values for each pixel are resolved with implementation-defined numerical precision.

If the `numeric format` of `srcImage` uses sRGB encoding and the resolve mode requires the implementation to convert the samples to floating-point to perform the calculations, the implementation **should** convert samples from nonlinear to linear before resolving the samples as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). In this case, the implementation **must** convert the linear averaged value to nonlinear before writing the resolved result to `dstImage`. If the `maintenance10` feature is enabled, whether a nonlinear to linear conversion happens for sRGB encoded resolve is controlled by `resolveSrgbFormatAppliesTransferFunction`. If `VkResolveImageModeInfoKHR` is included in the `pNext` chain, this default behavior **can** be overridden with `VK_RESOLVE_IMAGE_SKIP_TRANSFER_FUNCTION_BIT_KHR` or `VK_RESOLVE_IMAGE_ENABLE_TRANSFER_FUNCTION_BIT_KHR` flags.

If the source format is an integer type, a single sample’s value is selected for each pixel, unless `VkResolveImageModeInfoKHR` is included in the `pNext` chain, in which case it is defined by `VkResolveImageModeInfoKHR::resolveMode` or `VkResolveImageModeInfoKHR::stencilResolveMode` depending on which aspect is being resolved.

Chapter 25. Drawing Commands

Drawing commands (commands with **Draw** in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline, or if the **shaderObject** feature is enabled, any **shader objects** bound to graphics stages. A graphics pipeline or a combination of one or more graphics shader objects **must** be bound to a command buffer before any drawing commands are recorded in that command buffer.

Drawing can be achieved in two modes:

- **Programmable Mesh Shading**, the mesh shader assembles primitives, or
- **Programmable Primitive Shading**, the input primitives are assembled as follows.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the **pInputAssemblyState** member of the **VkGraphicsPipelineCreateInfo** structure, which is of type **VkPipelineInputAssemblyStateCreateInfo**:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology       topology;
    VkBool32                  primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **topology** is a **VkPrimitiveTopology** defining the primitive topology, as described below.
- **primitiveRestartEnable** controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (**vkCmdDrawIndexed**, **vkCmdDrawMultiIndexedEXT**, and **vkCmdDrawIndexedIndirect**), and the special index value is either 0xFFFFFFFF when the **indexType** parameter of Vulkan 1.4 or **vkCmdBindIndexBuffer2** or **vkCmdBindIndexBuffer** is equal to **VK_INDEX_TYPE_UINT32**; 0xFF when **indexType** is equal to **VK_INDEX_TYPE_UINT8**; or 0xFFFF when **indexType** is equal to **VK_INDEX_TYPE_UINT16**. Primitive restart is not allowed for “list” topologies, unless one of the features **primitiveTopologyPatchListRestart** (for **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST**) or **primitiveTopologyListRestart** (for all other list topologies) is enabled. If the **primitiveRestartIndex** feature is enabled, **vkCmdSetPrimitiveRestartIndexEXT** can be used to set a custom index for primitive restart.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices,

but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the `vertexOffset` value to the index value.

Valid Usage

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06252
If the `primitiveTopologyListRestart` feature is not enabled, and `topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, `primitiveRestartEnable` **must** be `VK_FALSE`
- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06253
If the `primitiveTopologyPatchListRestart` feature is not enabled, and `topology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `primitiveRestartEnable` **must** be `VK_FALSE`
- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429
If the `geometryShader` feature is not enabled, `topology` **must** not be any of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`
- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00430
If the `tessellationShader` feature is not enabled, `topology` **must** not be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`
- VUID-VkPipelineInputAssemblyStateCreateInfo-triangleFans-04452
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, `topology` **must** not be `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`

Valid Usage (Implicit)

- VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType
`sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO`
- VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext
`pNext` **must** be `NULL`
- VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zerobitmask
`flags` **must** be `0`
- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter
`topology` **must** be a valid `VkPrimitiveTopology` value

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;
```

`VkPipelineInputAssemblyStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To [dynamically control](#) whether a special vertex index value is treated as restarting the assembly of primitives, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveRestartEnable(
    VkCommandBuffer          commandBuffer,
    VkBool32                  primitiveRestartEnable);
```

```
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
// Equivalent to vkCmdSetPrimitiveRestartEnable
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer          commandBuffer,
    VkBool32                  primitiveRestartEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`

This command sets the primitive restart enable for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPrimitiveRestartEnable-None-08970

At least one of the following **must** be true:

- the `extendedDynamicState2` feature is enabled
- the `shaderObject` feature is enabled
- the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

Command Properties

Primary Secondary	Both	Outside	VK_QUEUE_GRAPHICS_BIT	State

Conditional Rendering

`vkCmdSetPrimitiveRestartEnable` is not affected by `conditional rendering`

To `dynamically control` which special vertex index value is treated as restarting the assembly of primitives, call:

```
// Provided by VK_EXT_primitive_restart_index
void vkCmdSetPrimitiveRestartIndexEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 primitiveRestartIndex);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartIndex` controls which special vertex index value is treated as restarting the assembly of primitives. This overrides the default restart index value as defined as part of the description of the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` state. Default values are applied when binding an index buffer.

This command sets a custom primitive restart index for subsequent drawing commands. Binding

an index buffer invalidates the custom index value.

Valid Usage

- VUID-vkCmdSetPrimitiveRestartIndexEXT-primitiveRestartIndex-12395
The `primitiveRestartIndex` feature **must** be enabled

25.1. Primitive Topologies

Primitive topology determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective

topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders. In the case of mesh shading the only effective topology is defined by the execution mode of the mesh shader.

The primitive topologies defined by [VkPrimitiveTopology](#) are:

```
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- [VK_PRIMITIVE_TOPOLOGY_POINT_LIST](#) specifies a series of [separate point primitives](#).
- [VK_PRIMITIVE_TOPOLOGY_LINE_LIST](#) specifies a series of [separate line primitives](#).
- [VK_PRIMITIVE_TOPOLOGY_LINE_STRIP](#) specifies a series of [connected line primitives](#) with consecutive lines sharing a vertex.
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST](#) specifies a series of [separate triangle primitives](#).
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP](#) specifies a series of [connected triangle primitives](#) with consecutive triangles sharing an edge.
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN](#) specifies a series of [connected triangle primitives](#) with all triangles sharing a common vertex. If the [VK_KHR_portability_subset](#) extension is enabled, and [VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans](#) is [VK_FALSE](#), then triangle fans are not supported by the implementation, and [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN](#) **must** not be used.
- [VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY](#) specifies a series of [separate line primitives with adjacency](#).
- [VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY](#) specifies a series of [connected line primitives with adjacency](#), with consecutive primitives sharing three vertices.
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY](#) specifies a series of [separate triangle primitives with adjacency](#).
- [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY](#) specifies [connected triangle primitives with adjacency](#), with consecutive triangles sharing an edge.
- [VK_PRIMITIVE_TOPOLOGY_PATCH_LIST](#) specifies [separate patch primitives](#).

Each primitive topology, and its construction from a list of vertices, is described in detail below

with a supporting diagram, according to the following key:

	Vertex	A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.
5	Vertex Number	Sequence position of a vertex within the provided vertex data.
	Provoking Vertex	Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading .
	Primitive Edge	An edge connecting the points of a main primitive.
	Adjacency Edge	Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader .
	Winding Order	The relative order in which vertices are defined within a primitive, used in the facing determination . This ordering has no specific start or end point.

The diagrams are supported with mathematical definitions where the vertices (v) and primitives (p) are numbered starting from 0; v_0 is the first vertex in the provided data and p_0 is the first primitive in the set of primitives defined by the vertices and topology.

To [dynamically set](#) primitive topology, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveTopology(
    VkCommandBuffer          commandBuffer,
    VkPrimitiveTopology       primitiveTopology);
```

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
// Equivalent to vkCmdSetPrimitiveTopology
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer          commandBuffer,
    VkPrimitiveTopology       primitiveTopology);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveTopology` specifies the primitive topology to use for drawing.

This command sets the primitive topology for subsequent drawing commands when drawing using [shader objects](#), or when the graphics pipeline is created with [VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY](#) set in [VkPipelineDynamicStateCreateInfo::pDynamicStates](#). Otherwise, this state is specified by the [VkPipelineInputAssemblyStateCreateInfo::topology](#) value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetPrimitiveTopology-None-08971
At least one of the following **must** be true:

- the `extendedDynamicState` feature is enabled
- the `shaderObject` feature is enabled

25.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

Table 30. Topology Classes

Topology Class	Primitive Topology
Point	VK_PRIMITIVE_TOPOLOGY_POINT_LIST
Line	VK_PRIMITIVE_TOPOLOGY_LINE_LIST , VK_PRIMITIVE_TOPOLOGY_LINE_STRIP , VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY , VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY
Triangle	VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST , VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP , VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN , VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY , VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY
Patch	VK_PRIMITIVE_TOPOLOGY_PATCH_LIST

25.1.2. Point Lists

When the topology is [VK_PRIMITIVE_TOPOLOGY_POINT_LIST](#), each consecutive vertex defines a single point primitive, according to the equation:

$$p_i = \{v_i\}$$

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to **vertexCount**.

25.1.3. Line Lists

When the primitive topology is [VK_PRIMITIVE_TOPOLOGY_LINE_LIST](#), each consecutive pair of vertices defines a single line primitive, according to the equation:

$$p_i = \{v_{2i}, v_{2i+1}\}$$

The number of primitives generated is equal to $\lceil \text{vertexCount}/2 \rceil$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for p_i is v_{2i} .

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for p_i is v_{2i+1} .

25.1.4. Line Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:

$$p_i = \{v_i, v_{i+1}\}$$

The number of primitives generated is equal to $\max(0, \text{vertexCount}-1)$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for p_i is v_i .

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for p_i is v_{i+1} .

25.1.5. Triangle Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

$$p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\}$$

The number of primitives generated is equal to $\lceil \text{vertexCount}/3 \rceil$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for p_i is v_{3i} .

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for p_i is v_{3i+2} .

25.1.6. Triangle Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

$$p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\}$$

The number of primitives generated is equal to $\max(0, \text{vertexCount}-2)$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for p_i is v_i .

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for p_i is v_{i+2} .

NOTE

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

25.1.7. Triangle Fans

When the primitive topology is [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN](#), triangle primitives are defined around a shared common vertex, according to the equation:

$$p_i = \{v_{i+1}, v_{i+2}, v_0\}$$

The number of primitives generated is equal to $\max(0, \text{vertexCount} - 2)$.

When the `provokingVertexMode` is [VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT](#), the provoking vertex for p_i is v_{i+1} .

When the `provokingVertexMode` is [VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT](#), the provoking vertex for p_i is v_{i+2} .

NOTE

If the [VK_KHR_portability_subset](#) extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is [VK_FALSE](#), then triangle fans are not supported by the implementation, and [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN](#) **must** not be used.

25.1.8. Line Lists With Adjacency

When the primitive topology is [VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY](#), each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

$$p_i = \{v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a [geometry shader](#).

The number of primitives generated is equal to $\lfloor \text{vertexCount} / 4 \rfloor$.

When the `provokingVertexMode` is [VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT](#), the provoking vertex for p_i is v_{4i+1} .

When the `provokingVertexMode` is [VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT](#), the provoking vertex for p_i is v_{4i+2} .

25.1.9. Line Strips With Adjacency

When the primitive topology is [VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY](#), one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

$$p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a [geometry shader](#).

The number of primitives generated is equal to $\max(0, \text{vertexCount} - 3)$.

When the `provokingVertexMode` is [VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT](#), the

provoking vertex for p_i is v_{i+1} .

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for p_i is v_{i+2} .

25.1.10. Triangle Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

$$p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\}$$

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a [geometry shader](#).

The number of primitives generated is equal to $\lceil \text{vertexCount}/6 \rceil$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for p_i is v_{6i} .

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for p_i is v_{6i+4} .

25.1.11. Triangle Strips With Adjacency

When the primitive topology is [VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY](#), one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, n , is equal to $\lceil \max(0, \text{vertexCount} - 4) / 2 \rceil$.

If $n=1$, the primitive is defined as:

$$p = \{v_0, v_1, v_2, v_5, v_4, v_3\}$$

If $n>1$, the total primitive consists of different vertices according to where it is in the strip:

$$p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0$$

$$p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i-2}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=1$$

$$p_i = \{v_{2i}, v_{2i-2}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=0$$

$$p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+5}, v_{2i+2}, v_{2i-2}\} \text{ when } i=n-1 \text{ and } i\%2=1$$

$$p_i = \{v_{2i}, v_{2i-2}, v_{2i+2}, v_{2i+5}, v_{2i+4}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i\%2=0$$

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a [geometry shader](#).

NOTE

The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

When the `provokingVertexMode` is [VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT](#), the provoking vertex for p_i is always v_{2i} .

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for p_i is always v_{2i+4} .

25.1.12. Patch Lists

When the primitive topology is [VK_PRIMITIVE_TOPOLOGY_PATCH_LIST](#), each consecutive set of m vertices defines a single patch primitive, according to the equation:

$$p_i = \{v_{mi}, v_{mi+1}, \dots, v_{mi+(m-2)}, v_{mi+(m-1)}\}$$

where m is equal to [VkPipelineTessellationStateCreateInfo::patchControlPoints](#).

Patch lists are never passed to [vertex post-processing](#), and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to $\lceil \text{vertexCount} / m \rceil$.

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

25.2. Effective Primitive Topology

The effective primitive topology is the primitive topology that is consumed or produced by a given stage of the graphics pipeline. The interpretation of this topology depends on the active shader stages and other state set in the graphics pipeline.

25.2.1. Vertex Input Assembler Topology

This is the topology set when the `VK_SHADER_STAGE_VERTEX_BIT` stage is used and `Programmable Primitive Shading` occurs. It **can** be set with `VkPipelineInputAssemblyStateCreateInfo::topology` or `vkCmdSetPrimitiveTopology`.

25.2.2. Clip Space Topology

This is the output of the last pre-rasterization shader stage involved.

- If `VK_SHADER_STAGE_VERTEX_BIT` is the last pre-rasterization stage, the topology is not changed from what was set in the `input assembly`.
- If `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` is the last pre-rasterization stage, the topology depends on the `OpExecutionMode` found in either `tessellation stage`.
 - The `Isolines Execution Mode` is in line `topology class`.
 - The `Triangles` and `Quads Execution Mode` is in triangle `topology class`.
 - The `PointMode Execution Mode` is in point `topology class` and will take precedence over the other tessellation stage `Execution Mode`.
- If `VK_SHADER_STAGE_GEOMETRY_BIT` is the last pre-rasterization stage, the topology depends on the `OpExecutionMode` found in this shader stage.
 - The `OutputPoints Execution Mode` is in point `topology class`.
 - The `OutputLineStrip Execution Mode` is in line `topology class`.
 - The `OutputTriangleStrip Execution Mode` is in triangle `topology class`.
- If `VK_SHADER_STAGE_MESH_BIT_EXT` is the last pre-rasterization stage, the topology depends on the `OpExecutionMode` found in this shader stage.
 - The `OutputPoints Execution Mode` is in point `topology class`.
 - The `OutputLinesEXT Execution Mode` is in line `topology class`.
 - The `OutputTrianglesEXT Execution Mode` is in triangle `topology class`.

25.2.3. Rasterization Input Topology

After clipping and viewport transformations, the `Polygon Mode` **can** set a topology as an input for rasterization. This **can** be different from what was used in `Clip Space Topology`.

If `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` or `vkCmdSetRasterizerDiscardEnable::rasterizerDiscardEnable` is set to `VK_FALSE`, then this Rasterization Input Topology is not observed.

If the `clip space topology` is in triangle `topology class` then `VK_POLYGON_MODE_LINE` will turn it into line topology and `VK_POLYGON_MODE_POINT` will turn it into point topology.

If the `clip space topology` is in line `topology class` then `VK_POLYGON_MODE_POINT` will turn it into point topology.

25.3. Primitive Order

Primitives generated by [drawing commands](#) progress through the stages of the [graphics pipeline](#) in *primitive order*. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the [VkDrawIndirectCommand](#) are stored in [buffer](#), from lower indirect buffer addresses to higher addresses.
3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.
4. The order in which primitives are specified by a drawing command:
 - For non-indexed draws, from vertices with a lower numbered [vertexIndex](#) to a higher numbered [vertexIndex](#).
 - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.
 - For draws using mesh shaders, the order is provided by [mesh shading](#).

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by [tessellation](#).
6. If geometry shading is active, by the order new primitives are generated by [geometry shading](#).
7. If the [polygon mode](#) is not [VK_POLYGON_MODE_FILL](#), by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define [rasterization order](#), which determines the order in which fragments output results to a framebuffer.

25.4. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations **can** have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the [vertexIndex](#) and the [instanceIndex](#). How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential [vertexIndex](#) to the vertex shader. The sequential index is generated automatically by the device (see [Fixed-Function Vertex Processing](#)

for details on both specifying the vertex attributes indexed by `vertexIndex`, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:

- `vkCmdDraw`
- `vkCmdDrawIndirect`
- `vkCmdDrawIndirectCount`
- `vkCmdDrawIndirectCountKHR`
- `vkCmdDrawMultiEXT`
- Indexed drawing commands read index values from an *index buffer* and use this to compute the `vertexIndex` value for the vertex shader. These commands are:
 - `vkCmdDrawIndexed`
 - `vkCmdDrawIndexedIndirect`
 - `vkCmdDrawIndexedIndirectCount`
 - `vkCmdDrawIndexedIndirectCountKHR`
 - `vkCmdDrawMultiIndexedEXT`

For indexed drawing commands, indices are sourced from a range of memory bound to the command buffer, referred to as the *bound index buffer range*, and specified by one of the following commands.

To bind an address range as an index buffer to a command buffer, call:

```
// Provided by VK_KHR_device_address_commands
void vkCmdBindIndexBuffer3KHR(
    VkCommandBuffer          commandBuffer,
    const VkBindIndexBuffer3InfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkBindIndexBuffer3InfoKHR` structure defining parameters of this command.

The *bound index buffer range* is set to the range of memory indicated by `pInfo->addressRange`.

If the `nullDescriptor` feature is enabled, `pInfo->addressRange.size` and `pInfo->addressRange.address` **can** be 0. When the size and address are 0, every index read from this binding will return a value of zero.

Conditional Rendering

vkCmdBindIndexBuffer is not affected by **conditional rendering**

Possible values of `vkCmdBindIndexBuffer2::indexType` and `vkCmdBindIndexBuffer::indexType`, specifying the size of indices, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    // Provided by VK_VERSION_1_4
    VK_INDEX_TYPE_UINT8 = 1000265000,
    // Provided by VK_KHR_acceleration_structure
    VK_INDEX_TYPE_NONE_KHR = 1000165000,
    // Provided by VK_KHR_index_type_uint8
    VK_INDEX_TYPE_UINT8_KHR = VK_INDEX_TYPE_UINT8,
} VkIndexType;
```

- `VK_INDEX_TYPE_UINT16` specifies that indices are 16-bit unsigned integer values.
- `VK_INDEX_TYPE_UINT32` specifies that indices are 32-bit unsigned integer values.
- `VK_INDEX_TYPE_NONE_KHR` specifies that no indices are provided.
- `VK_INDEX_TYPE_UINT8` specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as *indirect* drawing commands.

All drawing commands interact with the `robustBufferAccess` feature.

To record a non-indexed draw, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDraw(
    VkCommandBuffer          commandBuffer,
    uint32_t                 vertexCount,
    uint32_t                 instanceCount,
    uint32_t                 firstVertex,
    uint32_t                 firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `vertexCount` consecutive vertex indices with the first `vertexIndex` value equal to `firstVertex`. The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and

increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

Conditional Rendering

`vkCmdDraw` is affected by [conditional rendering](#)

To record an indexed draw, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer          commandBuffer,
    uint32_t                 indexCount,
    uint32_t                 instanceCount,
    uint32_t                 firstIndex,
    int32_t                  vertexOffset,
    uint32_t                 firstInstance);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **indexCount** is the number of vertices to draw.
- **instanceCount** is the number of instances to draw.
- **firstIndex** is the base index within the index buffer.
- **vertexOffset** is the value added to the vertex index before indexing into the vertex buffer.
- **firstInstance** is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and **indexCount** vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the **vkCmdBindIndexBuffer2::indexType** or the **vkCmdBindIndexBuffer::indexType** parameter with which the buffer was bound.

The first vertex index is read from **indexAddress** + (**firstIndex** × **indexSize**), where **indexAddress** is the effective address specified for the index buffer by **vkCmdBindIndexBuffer3KHR**, **vkCmdBindIndexBuffer2**, or **vkCmdBindIndexBuffer**, and **indexSize** is the byte size of the type specified by **indexType**. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the **indexType** is **VK_INDEX_TYPE_UINT8** or **VK_INDEX_TYPE_UINT16**) and have **vertexOffset** added to them, before being supplied as the **vertexIndex** value.

The primitives are drawn **instanceCount** times with **instanceIndex** starting with **firstInstance** and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

Conditional Rendering

`vkCmdDrawIndexed` is affected by `conditional rendering`

To record an ordered sequence of draws which have no state changes between them, call:

```
// Provided by VK_EXT_multi_draw
void vkCmdDrawMultiEXT(
    VkCommandBuffer                      commandBuffer,
    uint32_t                             drawCount,
    const VkMultiDrawInfoEXT*            pVertexInfo,
    uint32_t                             instanceCount,
    uint32_t                             firstInstance,
    uint32_t                             stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `pVertexInfo` is a pointer to an array of `VkMultiDrawInfoEXT` with vertex information to be drawn.
- `instanceCount` is the number of instances per draw.
- `firstInstance` is the instance ID of the first instance in each draw.
- `stride` is the byte stride between consecutive elements of `pVertexInfo`.

The number of draws recorded is `drawCount`, with each draw reading, sequentially, a `firstVertex` and a `vertexCount` from `pVertexInfo`. For each recorded draw, primitives are assembled as for `vkCmdDraw`, and drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and sequentially for each instance.

Conditional Rendering

`vkCmdDrawMultiEXT` is affected by `conditional rendering`

To record an ordered sequence of indexed draws which have no state changes between them, call:

```
// Provided by VK_EXT_multi_draw
void vkCmdDrawMultiIndexedEXT(
    VkCommandBuffer                                commandBuffer,
    uint32_t                                        drawCount,
    const VkMultiDrawIndexedInfoEXT*               pIndexInfo,
    uint32_t                                        instanceCount,
    uint32_t                                        firstInstance,
    uint32_t                                        stride,
    const int32_t*                                  pVertexOffset);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `pIndexInfo` is a pointer to an array of `VkMultiDrawIndexedInfoEXT` with index information to be drawn.
- `instanceCount` is the number of instances per draw.
- `firstInstance` is the instance ID of the first instance in each draw.
- `stride` is the byte stride between consecutive elements of `pIndexInfo`.
- `pVertexOffset` is `NULL` or a pointer to the value added to the vertex index before indexing into the vertex buffer. When specified, `VkMultiDrawIndexedInfoEXT::offset` is ignored.

The number of draws recorded is `drawCount`, with each draw reading, sequentially, a `firstIndex` and an `indexCount` from `pIndexInfo`. For each recorded draw, primitives are assembled as for `vkCmdDrawIndexed`, and drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and sequentially for each instance. If `pVertexOffset` is `NULL`, a `vertexOffset` is also read from `pIndexInfo`, otherwise the value from dereferencing `pVertexOffset` is used.

To record a non-indexed indirect drawing command, call:

```
// Provided by VK_KHR_device_address_commands
void vkCmdDrawIndirect2KHR(
    VkCommandBuffer                      commandBuffer,
    const VkDrawIndirect2InfoKHR*       pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkDrawIndirect2InfoKHR` structure defining parameters of this command.

The parameters of each draw are encoded in an array of `VkDrawIndirectCommand` structures.

Conditional Rendering

`vkCmdDrawIndirect2KHR` is affected by `conditional rendering`

To record a non-indexed indirect drawing command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    uint32_t                 drawCount,
    uint32_t                 stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirect` behaves similarly to `vkCmdDraw` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

To record a non-indexed indirect drawing command, call:

```
// Provided by VK_KHR_device_address_commands with VK_KHR_draw_indirect_count or
VK_VERSION_1_2
void vkCmdDrawIndirectCount2KHR(
    VkCommandBuffer                commandBuffer,
    const VkDrawIndirectCount2InfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkDrawIndirectCount2InfoKHR` structure defining parameters of this

command.

`vkCmdDrawIndirectCount2KHR` behaves similarly to `vkCmdDrawIndirect2KHR` except that the draw count is read by the device from an address range during execution. The command will read an unsigned 32-bit integer from `pInfo->countAddressRange` and use this as the draw count.

Conditional Rendering

`vkCmdDrawIndirectCount2KHR` is affected by [conditional rendering](#)

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```
// Provided by VK_VERSION_1_2
void vkCmdDrawIndirectCount(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    VkBuffer                 countBuffer,
    VkDeviceSize             countBufferOffset,
    uint32_t                 maxDrawCount,
    uint32_t                 stride);
```

```
// Provided by VK_KHR_draw_indirect_count
// Equivalent to vkCmdDrawIndirectCount
void vkCmdDrawIndirectCountKHR(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    VkBuffer                 countBuffer,
    VkDeviceSize             countBufferOffset,
    uint32_t                 maxDrawCount,
    uint32_t                 stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCount` behaves similarly to `vkCmdDrawIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

Conditional Rendering

vkCmdDrawIndirectCount is affected by [conditional rendering](#)

To record an indexed indirect drawing command, call:

```
// Provided by VK_KHR_device_address_commands
void vkCmdDrawIndexedIndirect2KHR(
    VkCommandBuffer                commandBuffer,
    const VkDrawIndirect2InfoKHR*  pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkDrawIndirect2InfoKHR` structure defining parameters of this command.

`vkCmdDrawIndexedIndirect2KHR` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from an address range during execution. `pInfo->drawCount` draws are executed by the command, with parameters taken from `pInfo->addressRange` starting at `addressRange.address` and increasing by `addressRange.stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures.

Conditional Rendering

`vkCmdDrawIndexedIndirect2KHR` is affected by [conditional rendering](#)

To record an indexed indirect drawing command, call:

```
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexedIndirect(
    VkCommandBuffer          commandBuffer,
    VkBuffer                 buffer,
    VkDeviceSize             offset,
    uint32_t                 drawCount,
    uint32_t                 stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

Conditional Rendering

`vkCmdDrawIndexedIndirect` is affected by [conditional rendering](#)

The `VkDrawIndexedIndirectCommand` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t    indexCount;
    uint32_t    instanceCount;
    uint32_t    firstIndex;
    int32_t     vertexOffset;
    uint32_t    firstInstance;
} VkDrawIndexedIndirectCommand;
```

- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndexedIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDrawIndexed`.

Valid Usage

- VUID-VkDrawIndexedIndirectCommand-pNext-09461

If the bound graphics pipeline state was created with

`VkPipelineVertexInputDivisorStateCreateInfo` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfo::pVertexBindingDivisors` has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorProperties::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must** be 0

- VUID-VkDrawIndexedIndirectCommand-None-09462

- VUID-VkDrawIndexedIndirectCommand-firstInstance-00554

If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must** be 0

To record a non-indexed indirect drawing command, call:

```
// Provided by VK_KHR_device_address_commands with VK_KHR_draw_indirect_count or
VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount2KHR(
    VkCommandBuffer                commandBuffer,
    const VkDrawIndirectCount2InfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pInfo` is a pointer to a `VkDrawIndirectCount2InfoKHR` structure defining parameters of this command.

`vkCmdDrawIndexedIndirectCount2KHR` behaves similarly to `vkCmdDrawIndexedIndirect2KHR` except that the draw count is read by the device from an address range during execution. The command will read an unsigned 32-bit integer from `pInfo->countAddressRange` and use this as the draw count.

Conditional Rendering

`vkCmdDrawIndexedIndirectCount2KHR` is affected by [conditional rendering](#)

To record an indexed draw call with a draw call count sourced from a buffer, call:

```
// Provided by VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount(
    VkCommandBuffer          commandBuffer,
    VkBuffer                  buffer,
    VkDeviceSize              offset,
    VkBuffer                  countBuffer,
    VkDeviceSize              countBufferOffset,
    uint32_t                  maxDrawCount,
    uint32_t                  stride);
```

```
// Provided by VK_KHR_draw_indirect_count
// Equivalent to vkCmdDrawIndexedIndirectCount
void vkCmdDrawIndexedIndirectCountKHR(
    VkCommandBuffer          commandBuffer,
    VkBuffer                  buffer,
    VkDeviceSize              offset,
    VkBuffer                  countBuffer,
    VkDeviceSize              countBufferOffset,
    uint32_t                  maxDrawCount,
    uint32_t                  stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirectCount` behaves similarly to `vkCmdDrawIndexedIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

25.4.1. Drawing Transform Feedback

It is possible to draw vertex data that was previously captured during active **transform feedback** by binding one or more of the transform feedback buffers as vertex buffers. A pipeline barrier is required between using the buffers as transform feedback buffers and vertex buffers to ensure all writes to the transform feedback buffers are visible when the data is read as vertex attributes. The source access is **VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT** and the destination access is **VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT** for the pipeline stages **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** and **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** respectively. The value written to the counter buffer by **vkCmdEndTransformFeedbackEXT** **can** be used to determine the vertex count for the draw. A pipeline barrier is required between using the counter buffer for **vkCmdEndTransformFeedbackEXT** and **vkCmdDrawIndirectByteCountEXT** where the source access is **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT** and the destination access is **VK_ACCESS_INDIRECT_COMMAND_READ_BIT** for the pipeline stages **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT** and **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** respectively.

To record a non-indexed draw call, where the vertex count is based on a byte count read from a memory range and the passed in vertex stride parameter, call:

```
// Provided by VK_KHR_device_address_commands with VK_EXT_transform_feedback
void vkCmdDrawIndirectByteCount2EXT(
    VkCommandBuffer                commandBuffer,
    uint32_t                       instanceCount,
    uint32_t                       firstInstance,
    const VkBindTransformFeedbackBuffer2InfoEXT* pCounterInfo,
    uint32_t                       counterOffset,
    uint32_t                       vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `pCounterInfo` is a pointer to a `VkBindTransformFeedbackBuffer2InfoEXT` defining the range of memory that the byte count is read from.
- `counterOffset` is subtracted from the byte count.
- `vertexStride` is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the `XfbStride`.

When the command is executed, primitives are assembled in the same way as done with `vkCmdDraw` except the `vertexCount` is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective `vertexCount` is calculated as follows:

```
const uint32_t * counterBufferPtr = (const uint8_t *)counterRange.address;
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective `firstVertex` is zero.

Conditional Rendering

`vkCmdDrawIndirectByteCount2EXT` is affected by [conditional rendering](#)

To record a non-indexed draw call, where the vertex count is based on a byte count read from a buffer and the passed in vertex stride parameter, call:

WARNING

This functionality is superseded by [vkCmdDrawIndirectByteCount2EXT](#). See [Legacy Functionality](#) for more information.

```
// Provided by VK_EXT_transform_feedback
void vkCmdDrawIndirectByteCountEXT(
    VkCommandBuffer          commandBuffer,
    uint32_t                 instanceCount,
    uint32_t                 firstInstance,
    VkBuffer                  counterBuffer,
    VkDeviceSize              counterBufferOffset,
    uint32_t                 counterOffset,
    uint32_t                 vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `counterBuffer` is the buffer handle from where the byte count is read.
- `counterBufferOffset` is the offset into the buffer used to read the byte count, which is used to calculate the vertex count for this draw call.
- `counterOffset` is subtracted from the byte count read from the `counterBuffer` at the `counterBufferOffset`
- `vertexStride` is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the `XfbStride`.

When the command is executed, primitives are assembled in the same way as done with [vkCmdDraw](#) except the `vertexCount` is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective `vertexCount` is calculated as follows:

```
const uint32_t * counterBufferPtr = (const uint8_t *)counterBuffer.address +
counterBufferOffset;
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective `firstVertex` is zero.
